

***PROCEEDINGS OF THE 9TH  
INTERNATIONAL CONFERENCE ON  
INNOVATION AND MANAGEMENT***

**November 14-16, 2012**

Eindhoven, The Netherlands

**Chief Editors**

*Geert Duysters, Arnaldo de Hoyos, Ken Kaminishi*

**Associate Editors**

*Deng Mingran, Ye Jianmu*

**Wuhan University of Technology Press**

**Wuhan, China**

### 【Summary】

The proceedings include operation innovation and its applications, university-industry collaboration, strategic alliance, open innovation and distributed innovation, environmental innovation and sustainable development, product, industrial and regional innovation, organizational, institutional and management innovation, S&T policy, intellectual property and knowledge management, and miscellaneous.

Proceedings of the 9th International Conference on Innovation & Management/ Geert Duysters, Arnoldo de Hoyos, Ken Kaminishi —Wuhan: Wuhan University of Technology Press, 2012.11  
ISBN 978-7-5629-3854-5

# **The 9<sup>th</sup> International Conference on Innovation and Management (ICIM 2012)**

## **Organized and Hosted by**

Eindhoven University of Technology, The Netherlands

## **Co-organized by**

Pontifical Catholic University of Sao Paulo

Yamaguchi University, Japan

Wuhan University of Technology, China

## **Organizing Committee**

Chairman:

Greet DUYSTERS (Eindhoven University of Technology, The Netherlands)

Co-Chairman:

Arnoldo de HOYOS (Pontifical Catholic University of Sao Paulo, Brazil)

HU Shuhua (Wuhan University of Technology, P.R.China)

Ken KAMINISHI (Yamaguchi University, Japan)

## **Executive Committee**

Director:

Greet DUYSTERS (Eindhoven University of Technology, The Netherlands)

Members (Alphabet order)

CHEN Yun(Wuhan University of Technology)

DENG Mingran (Wuhan University of Technology)

HE Shan (Wuhan University of Technology)

JIANG Zhongwei (Yamaguchi University)

Kazuhiro FUKUYO (Yamaguchi University)

Kazuya INABA (Yamaguchi University)

Ken KAMINISHI (Yamaguchi University)

Kees kokke(Eindhoven University of Technology, The Netherlands)

Masakazu Takahashi(Yamaguchi University)

Monique Greve(Eindhoven University of Technology, The Netherlands)

Motonobu KUBO (Yamaguchi University)

Naoki OHSHIMA (Yamaguchi University)

NGUYEN Huu Phuc (Yamaguchi University)

Sakae KAWAMURA (Yamaguchi University)

Shigeyuki HARUYAMA (Yamaguchi University)

Tim de Leeuw(Eindhoven University of Technology, The Netherlands)

Takashi MUKOUYAMA(Yamaguchi University)

Tomohisa KIMURA (Yamaguchi University)

XIE Kefan (Wuhan University of Technology)

YE Jianmu (Wuhan University of Technology)

Yoko ISHINO (Yamaguchi University)

Yoshiyuki MATSUURA (Yamaguchi University)

# CONTENTS

## Part1 Operation Innovation and IT Applications

Association Rules Between Driver Behavior and Auto Parts Maintenance Based on Active Service Li Bing, Wang Hu .....	1
Members' Behavior and Decision-Making Coordination Model in Complex Supply Chains Based on Risk Monitoring Lu Shaohua, Xia Yun .....	6
A Study on Factors Influencing User Participation Behavior in Mobile Community Yang Guangming .....	10
Analysis and Measuring of Real Estate Bubble in China Yu Hualin.....	15
Fuzzy Evaluation for the Product Strategic Aspects of Ready-made Garment Enterprise in Bangladesh Luo Fan, Md. Salah Uddin Rajib.....	21
The Research of Information Strategy of Vigorously Nonferrous Metal Industry Li Ming, HeXuefeng, Jiang Zhangchun.....	27
Recognition of Neo-Tribalism on the Network Tang Yang, Zhu Yinghui.....	32
Modern Digital Signal Processing in Reference to Image Compression Adnan Ahmed Ali Albarahany, Liu Quan .....	36
Strategic Analysis on Logistics and Public Information Sharing Platform of Hubei Province of China Li Mingwei, Min Xiaojun, Ye Zhibin .....	42
A Study on the Materiel Supported Logistics Informatization Evaluation Sun Hengyou, Tang Pengcheng .....	47
Research on the Construction of Competence Model about Network Businessmen Qing Jing.....	53
Analysis on the Yacht Interior Outfitting Modular Partition Design Method Pan Changxue, Meng Shuai, Xu Jin .....	57
The Efficiency Evaluation on Chinese Universities' Input-Output Based on DEA Tian Jingren, Li Sichen .....	62
Analysis of Contribution of Information Industry to National Economy Development in China Yu Xindong, Hu Shuhua.....	67

Effect of Strategic Cost Management on Gaining Competitive Advantages: A Case of Jianfeng Group	
Jiang Xiaomeng .....	72

## **Part 2**

### **University-Industry Collaboration and Strategic Alliance**

What Makes You More Central? Antecedents of Changes in Centrality in Technology-Based Alliance Networks	
Cloudt, Myriam, Bertrand-Cloudt, Daniëlle, Gilsing, Victor .....	78
Between Learning and Competence: The Effect of Alliance Portfolio Diversity on Learning Equilibrium	
Marc Bahlmann, Alexander Alexiev, Brian Tjemkes, Ard-Pieter de Man .....	98
Identifying Universities' Value Potential for Entrepreneurial Ventures	
Olaf Gaus, Matthias G. Raith, Bodo Vogt, Johannes Wildt, Claudia Bremer .....	111
Direct and Indirect Ties to Universities: Firm Heterogeneity, R&D Collaboration and Innovative Performance in the Biopharmaceutical Industry	
Gilsing Victor, Belderbos Rene, Suzuki Shinya .....	117
Alliance Portfolio Diversity and Technological Diversification within Firms: An Empirical Exploration of the Pharmaceutical Industry	
Brenda Bos, Dries Faems, Bart Leten .....	132
Research on the Operating Evaluation Index System of Industry Technology Innovation Strategic Alliance	
Qin Yuanjian, Lu Hui .....	148
Unpacking Incubation Elements and Management Practices	
Thijssen, Sander, Blok, Vincent, Pascucci, Stefano .....	153
The Impact of China Aid and Investment in Africa Development, Opportunities and Challenges	
Abdoulaye Oury Bah, Argelia Munoz Pahuamba, Zhao Fuqiang .....	167
Research on Problems and Countermeasures of Chinese Local Universities in the Strategic Alliance of Industry-University-Research Institute	
Zhang Wenqiang .....	176
Relationship Networks and China's Increasing Presence in Brazil – Looking at Entrepreneurship and Cooperation	
Bandeira de Melo, S.A., Stefani, M.T., Dourado, J.R.S., Guevara, A.J.H. ....	183
Research on Management Mode of the Scientific and Technological Innovation Platform	
Zhou Yanmei .....	196
Collaborative Innovation Ensues Innovation Through Pastiche	
Harry Fulgencio .....	201

Motivations and Risks Analysis of University-Industry-Research Collaboration in China	
Karine Caroline Rakotomalala .....	208
Industry-University-Research Institute Strategic Alliance Model: Classification Standard and Selection Strategy	
Jin Haihe, Liang Jian .....	213
Creating Shared Value Through Strategic Corporate Social Responsibility	
Mark Anthony Camilleri .....	218
Research on Synergistic Innovation Mechanism of Industry Technology Innovation Strategic Alliance: A Case Study of FTTx	
Zhang Hong, Qin Yuanjian, Guo Chen .....	234
Building a Collaborative Innovation Strategic Alliance and Exploring New Modes for Industry-University-Institute Cooperation: Take Wuhan University of Technology, P. R. China as an Example	
Gao Guowei .....	238
Industry-University-Research Teaching Mode of Real Right Law Course	
Ma Hui, Gao Jie .....	243
Research on the Brand Communication Media and Channels of Mobile Internet Age	
Zhou Liang .....	248
Research on Industry-University-Research Institute Strategic Alliances (IUR) Benefit-sharing Mechanisms	
Yan Jin, Jin Haihe .....	253
Study on the Strategic Model of Oversea Mergers and Acquisitions in the Post-Crisis Era: A Perspective from the Core Competence	
Huo Xiaoping .....	258
Analysis on Management Culture Mode and Selection over Large-Scale Enterprise Groups	
Cao Yanrong .....	262
International Trade among Developed and Developing Countries: A New Empirical Analysis	
Yu Xuejiao .....	268

### **Part 3**

## **Environmental Innovation and Sustainable Development**

Innovative Activities within Online Brand Community: A Grounded Analysis Based on Netnography	
Wang Xiaochuan .....	272
Application of the Grey and Multi-Linear Regression Combined Model in Reverse Logistics Predictions	
Sun Shusheng, Du Xiang .....	277

Research on Economic Development Problems of Wuhan City Circle in China from Inclusive Growth Perspective	
Zhao Defang, Pan Huiming .....	282
Research on Blue Management Innovation of Pale-biotic Fossil	
Han Gang, Liu Xueling, Han Lizhuo, Pan Ling, Liu Cunyi, Deng Mingran .....	287
On Construction of Industrial Ecological Culture	
Cheng Ping.....	292
Research on the Coordinating Mechanism of Technology Sharing among Green Building Supply Chain Node Enterprises	
Hu Yan, Wang Zhaosheng, Zhao Chaoli .....	298
Research on Countermeasures to Improve China's Renewable Energy Management	
Qi Xiangdong.....	304
An Empirical Study on Scenic Spot of Travel Brand Influencing Factor on University Students	
Xu Peng .....	311
Harnessing Environmental Sound Technology for Chinese SMEs' Environmental Sustainable Development	
Randriamalala Jean Luc Stevens, Randriamalala Jean Stevenson .....	315
The Study on Performance and Innovation of Spatial Shapes	
Yi Xiduo, Chen Ken.....	321
Analysis on Location Factors of Logistics Industry in the Process of Urban-Rural Integration	
Zhu Zhanfeng, Zhu Yiqingc, Zhu Geng.....	326
The Perceived Destination Image of Hangzhou as Received in the Travel Blogs of Western Tourists	
Xiao Mali, Bao Yafang, Sun Zhia.....	333
The Research on the Sustainable Growth of Listed Companies in Chinese Steel Industry	
Li Guirong, Yang Guoli, Wang Wei.....	340
A Research on Forewarning Appraisal of Urban Carrying Capacity Based on Complex System Vulnerability	
Deng Mingran, Tang Hui, Zhao Fuqiang .....	347
Research on Coordination Support Mechanism of Urban Carrying Capacity	
Xu Xiao, Deng Mingran, Zhao Fuqiang .....	353
Environmental Accounting and GDP in China and India	
Xu Fengju, Alireza Soleimani Damaneh.....	359
Determining Salient Characteristics of Chinese Tourists to Understand the Differences among the Groups	
Abdul Aziz Mubark M, Md. Arifur Rahman, Md. Shariful Alam, Shahabuddin Shibli .....	364

The Impact of Wayfinding Signage System Setting on Visitors' Wayfinding Behavior Model in Theme Park: A Case Study of the Summit in Hong Kong Ocean Park	
Wen Jing, Xiong Wenfei.....	369
The Development and Innovation of Urban Public Transport System	
Wang Junshan .....	375
Study on Rivalrousness Between Midland Intercity Track Transportation and Highway Transportation Based on Logit Model	
Li Xiang, Jiang Huiyuan .....	380
Study on Optimization Mechanism of the Land for Suburban Tourism	
Li Jiangmin, Li Weiwei .....	385
A Probe into American Marine Management Policy	
Ye Jing .....	390
Early Warning Management Mechanism for Fog Navigation Safety in the Three Gorges Reservoir Area	
Jiang Dan, Zhou Caiyun.....	395
An Analysis of Price Elasticity of Demand for Energy Sector in Dominican Republic	
Ma Huimin, Jose Antonio Hernandez .....	400
Analysis of the Status Quo and Improvement of Sports Consumption by the Elderly in Wuhan Urban Area of China	
Chen Yan, Wei Xin.....	406

## **Part 4**

### **Product, Industrial and Regional Innovation**

Multi Dimensions of Proximity and Their Interaction and Impact on Regional Innovation: The Case of Matsue Ruby Project	
Mikiyo Satoh, Ken Kaminisihi, Yoshiyuki Matsuura.....	411
The Concept of Architectural Knowledge of the Product	
Gu Yuanxun .....	420
Utilization of Closed Schools for Regional Revitalization	
Makoto Hadeishi, Kazuhiro Fukuyo.....	425
Exploring Innovativeness of Small and Medium Enterprises in Sri Lankan	
Bandula Jayathilake, Hu Shuhua .....	432
Study on the Convergence of Three Southeast Coastal Provinces' Industrial Structure of China	
Yang Feng, Si Danmin .....	439
Innovation, Integration and Improvement of Clothing Industry	
Wang Qing.....	444

A Study on the Service Innovation of Regional Telecommunication Operation Enterprises	
Chen Wei .....	451
Technology Learning of Integration Innovation Through Informal Relationships: The Case of Machine Tool Industry in China	
Wang Shiming.....	457
A Study on Innovation Situation and Strategy of Guangxi Manufacturing Industry	
Wei Chunbei, Diao Zhaofeng, Ma Jinzhuang .....	462
Study on Innovation Subject Model of Logistics Industry Based on Self-Organization Theory	
Gan Weihua, Ding Ru .....	467
Conversion Mechanism of Product Life Cycle Value Space	
Li Pingping .....	472
Change and Optimization of Henan's Rural Logistics Market in Economic Transition Period	
Pan Jingqiang.....	476
Research on the Brand Upgrade of Embed Outsourcing System's Industry Cluster	
Yan Jingdong, Hu Hui, Jiang Junmin .....	481
Study on Innovations in Advertising Language	
Mao Hao, Mao Ying.....	486
Study on the Innovation Strength of Industrial Enterprises in Harbin of China	
Liu Yang, Ding Yunlong.....	491
Analysis of Interactive Relevance Between Manufacturing Industry and Service	
Hu Shuhua, Liu Yong, Wang Lijun.....	499
Research on Integration Management of Government-Oriented Enterprise Restructuring	
Xu Jiangping .....	504
Research on the Service Innovation and the Formation of Service Competitiveness	
Zhu Xin, Li Ying .....	510
Analysis and Application of Load Forecasting in the Urban Gas System Planning	
Sui Yaoguang .....	515
Inland Shipping Goods Externalities and Their Correction	
Wan Hong, Tao Dexin .....	519
An Analysis on the Differences of CPI among All Provinces and Cities in China: Based on the Analysis of Cross-Sectional Data	
Hu Yunyun, Sun Zehou .....	524
On the Construction of Quality Evaluation Index System for Innovation and Entrepreneurship Education in Research-Oriented Universities	
Feng Yanfei, Tong Xiaoling.....	532
The Analysis of Influence Factors on China Clothing Export	
Huang Jie, Jiang Fuyan .....	538
Financing Risk Model and Countermeasures of the Television Media Industry	
Zhong Yang, Wang Xuejun, Zou Huixia, Sun Qige .....	542

Research on Assessment of Agricultural Products Cold Chain Logistics Vulnerability from the Perspective of Social Responsibility	
Liu Mingfei, Li Jun, Gong Yue .....	547
Empirical Research on China's Regional Innovation Capability Evaluation Based on Factor Analysis	
Wang Tiejun, Wang Cong .....	554
Impact of Financial Support on Economic Development of Export-Oriented Entities: A Case of Xinjiang Horgos Economic Development	
He Wei .....	559
Research on the Evaluation of College Innovation and Entrepreneurship Education Based on Fuzzy Analytical Hierarchy Process	
Wang Qiang, Feng Yanfei.....	565
Research on Radiation Scope of Service Industry in Main China Cities	
Wang Lijun, Li Huitao .....	570
An Empirical Study on the Regional Competitiveness of the Xijiang Economic Belt	
Zhu Jiefei, Ma Lu, Zhou Wei.....	575
Study of the Dynamic Relationship Between China's Industrial Structure and Economic Growth	
Li Huitao, Huang Weiwei .....	581
Research on the Cost and Benefit Management of Introducing High-Level Talents in University	
Sun Xinqing, Cai Jianan, Sun Xiaoxi .....	588
How Sales Promotion Increase Short-Term Sales of Luxury Product in Emerging Economy: A Case of Hennessy in Cambodia	
Dai Fang, Sok Samnang, Yuan Guohua, Xu Yang .....	592
Discusses on Performance Budget Evaluation System	
Zeng Zhihong, Zhang Youtang.....	596
Internationalization of RMB: Benefits, Constraints and Proposals	
Argelia Munoz Pahuamba, Abdoulaye Oury Bah, Ye Jianmu .....	601
Study on SaaS Management Decision-making for Industrial Cluster Based on AHP	
Chen Donglin, Fu Min, Nie Guihua .....	608
A Motivation Mechanism on Disposing Non-Performing Bank Assets	
Li Zhe .....	612
Factors Influencing Current Coffee Consumption Preference and Behavior in China	
Eskinder Asfaw Bantiwalu .....	615
Analysis on Management Innovation of China Insurance Brokerage on MIT Mode	
Liu Meng .....	621
The Construction of Enterprise Culture in Hubei Province of China Based on Experiences of Haier	
Wang Hong .....	627

Analysis on Financial Strength of the Listed Companies in Hubei Province of China You Yi, Lan Mingming, Liu Wanlu .....	632
An Empirical Research on the FDI in Services and the Economic Growth in China Li Cheng, Xu Hongyi .....	638
Analysis on Status and Characteristics of China's Wheat Flour Processing Industrial Structure Niu Yanshao .....	642
The Influence of Investment in Fixed Assets on GDP in Liaoning Province of China Sun Lili, Li Yunhong .....	648

## **Part 5**

### **Organizational, Institutional and Management Innovation**

Proactive Legal Involvement in Partner Selection Process Danielle Duisters, Peter Kamminga, Geert Duysters .....	654
Adoption of Project Portfolio Management as Organizational Innovation: Towards a Conceptual Framework Henk-Jan Haasnoot, Sergey Filippov, Herman Mooi, Mark de Reuver, Robert Boer .....	670
Managing Teams Performing Complex Innovation Projects Oeij, Peter MA, MSc, De Vroome, Ernest, hondt, Steven, Gaspersz, Jeff .....	680
Research on the Identification of Listed Companies' Financial Reporting Fraud: Based on Financial and Nonfinancial Information Perspective Hu Huaxia, Xu Jing, Liao Junjie .....	695
Impact of Micro-Credit Loans on Income and Innovation: An Evidence from Bangladesh Farhana Ferdousi, Shi Chunxia, Mostak Ahmed Galib .....	702
Construction of Internal Risk Management System of Financial Holding Company Guo Chunfeng .....	707
Learning to Graft Nima Amirany, Myriam Cloudt, Ard-Pieter de Man, Marleen Huysman, Mario Schijven .....	712
Research on Cross-Cultural Conflicts and Cross-Cultural Management in International Business Mao Ying, Mao Hao, Zhang Yingkai .....	735
Analysis and Application of Profit, Volume and Continuity Model (PVC) in Enterprise Management Shao Jiayu, Zhu Kai .....	740
Mathematical Analysis of Air Traffic Control Safety Risk Coupling Liu Tangqing, Luo Fan, Yao Guanli .....	746
Research on Credit Risk Management in Industrial and Commercial Companies Based on RAROC Dong Chengyi .....	751

Innovation Through Performance-Based Contracts: A Transaction Cost Economics and Agency Theory Perspective	
Regien Sumo, Wendy van der Valk, Arjan J. van Weele .....	757
The Present Situation, Problems and Countermeasures of High Level Science-Technology Talents: A Case Study of Wuhan City of China	
Xu Aiping, Gao shuang .....	768
Research on the Correlation Between Psychological Capital and Turnover Intention	
Wang Huimei, Qiao Yunli, Li Xuan .....	774
Analyzing Organizational Innovation and Deviation Phenomena by Agent Based Simulation and Case Design	
Tomomi Kobayashi, Satoshi Takahashi, Masaaki Kunigami, Atsushi Yoshikawa, Takao Terano .....	778
Logistics Management Innovation of Tobacco Industry Based on Green Supply Chain Management	
Zheng Zilin .....	792
A Study on Customer Acquisition Cost and Customer Retention Cost: Review and Outlook	
Wu Jianxun .....	799
Exploration and Research of Design Strategy Based on User Experience	
Yang Huan, Chen Xinghai .....	804
Research on Marketing Power Synergy Mode	
Zeng Ziwei, Zhang Xuan .....	809
The Influence of Culture on Work Motivation in Bolivian Managers	
Fernando Nelson Villaverde Chavez .....	817
Reform and Innovation of Publishing Process Based on the Theory of Project Management	
Tian Daoquan .....	822
Justification of Ethical and Unethical Dilemmas in Human Resource	
Navneel Shalendra Prasad, Asa Romeo Asa, Yuan Guohua .....	826
The Cause and Prevention of Major Risks for Securities Company: Taking Hantang Securities as the Case	
Liu Dingping .....	831
Modeling and Simulation of Product Service Systems for Design and Innovation	
Tsuyoshi Koga, Ken Kaminishi .....	835
Game Analysis on Information Carrier of Risk Conduction in Venture Capital	
Shen Jun, Wang Xueqin .....	845
Property Right Innovation and Risk Control for China's Private Capital Accessing the Insurance Industry	
Liu Yicheng .....	850
An Assessment of Intrinsic Versus Extrinsic Motivational Factors in the Namibian Public Sector	
Asa Romeo Asa, Navneel Shalendra Prasad .....	857

Research on the Moral Education Management in Universities Under the Network Environment	
Jiang Xiaoyu, Qian Siyu.....	860
Research on Inclusive Financial System in China: From the Perspective of Financial Support for Disadvantaged Fields	
Wang Jing, Hu Guohui, Lei Yinghui.....	864
Modeling University Researchers' Behaviors: Academic and Applied Researches Balances	
Nguyen Huu Phuc, Yoshiyuki Matsuura, Motonobu Kubo .....	869
Measuring Employee Satisfaction in SMEs Firms	
Asfaw Yilma Demisse, Wei Jianguo.....	877
Research of the Transportation Humanization Development	
Li Jun.....	882
Individual Characteristics and Their Influence on Innovation: A Literature Review	
Georgiana Bălău, Dries Faems, Hans van der Bij.....	887
Innovation of Credit System of Loan Students at Chinese Universities	
Fang Li.....	902
Exploring Effect of Service Innovation on Business Performance of Restaurants in India	
Nilanjan Chattopadhyay Mrinalini Shah.....	907
Application of the "737355" Differentiation Mode to the Talents Training Programs in Higher Vocational Education	
Xu Jiuqing, Wang Jiangren .....	914
Efficient Solutions for Business Operations through Raising Questions—Q10 as a Structured Way of Thinking about Business	
Lu Xu.....	920
Innovation of Social Management in China: A Perspective of Positive Nationality Mentality	
Zhou Fu .....	925
The Establishing of University's Full-Four-Process Entrepreneurial Education Model	
Li Dongmei.....	930
"Five-dimensional Model" of Marketing Management	
Liu Junlin.....	935
Challenges for Strategic Management of Innovation in a High-Tech Firm: The Case of CPqD	
Rodrigo Lima Verde Leal .....	941
Analysis and Effectiveness of a Real Organization's Strategic Human Resource Management	
Li Fang.....	955
The Varying Roles and Styles of the Change Agent	
Li Xiangcai .....	959
On Flexibility Management's Application in Modern Hotel Management	
Cui Wei .....	962

Development and Construction of China Industry Technology Innovation Strategic Alliance: Taking Visico Alliance as an Example	
Chen Yun, Min Lei, Wu Qian .....	975
Study on Independent Directors of Listed Companies in China	
Li Xuehua .....	982
Research on Employee Motivation Mechanism in Modern Enterprises Based on Victor H.Vroom's Expectancy Theory	
Yu Hao, Guo Jianping .....	988
An Analysis of the Gender Gap in Science, Technology and Innovation Fields in Japan	
Yuko Hayashi .....	992
Research on Rural Human Resources Development in Hunan Province under the Rising Strategy of Central China	
Cheng Huijun .....	1000
Research on the Basic Mode of the Innovation	
Xu Dianlong .....	1005
The Brand Operation Based on the Design Management	
Zeng Jin .....	1012
The Analysis of the Policies on Service Innovation in Service-Oriented Enterprise	
Zhang Shaojun .....	1016
Analysis on Management Organization and Regulation Establishment of Postgraduate Instruction	
Sha Chengyu .....	1020
Shared Value Creation: An Innovative Approach on Women's Enterprise Development	
Erika Zoeller V́eras .....	1024
Analysis of the Critical Influential Factors on Healthy Development of University Academic: Based on DEMATEL Method	
Gao Hui, Zhang Zhongjia .....	1031
Performance Evaluation of Budget Management System Based on AHP	
Zeng Weilin .....	1038
The Influence of External Search Strategies on the Innovative Performance of Brazilian Firms	
Carlos Arruda, Anderson Rossi, Gustavo Mendes, Paulo Ferreira .....	1042
Innovative Research of Physical Education Management Based on the Integrative Teaching Ideology	
Zou Wei, Lv Lulu .....	1054
An Empirical Study on Affecting Factors of Independent Innovation in Small and Medium Sci-Tech Firms	
Zhuang Yue, Lu Yuwen .....	1059
An Approach Towards Medical Insurance Business Innovation Based on Japanese Customer Survey Data	
Yoko Ishino .....	1065

A Study on the Enterprise Business Model Based on Industrial Value Chain	
Du Wengeng, Lin Zhongyang .....	1072
Research and Analysis of Budget Methods of Marketing Expenditure Based on Flexibility	
Dai Shengli, Zhou Ying .....	1076
A Study Discussing Cultural Soft Power of the State and Its Enterprises Is the Fundamental Way to Be a Powerful Trading Country	
Wang Haibin .....	1081
The Enlightenment of China's Religious Resources to Management Innovation	
Zhang Yong .....	1086
The Construction of University Marine Culture Core Value System: From a Cultural Management Perspective	
Wang Xiao .....	1091
How to Construct "Living" Enterprise Culture?	
Jiang Wei .....	1097
A Discussion of Management Mechanism Based on Marketing Channel Risk Conduction Mechanism	
Zhang Lili .....	1101
Innovation Mechanism of Academic Journals	
Rong Cuihong, Hu Guoliang .....	1107
The Advantages of Brand Management Innovation in Product Competition	
Qi Yi, He Fang .....	1111

## **Part 6**

### **S&T Policy, Intellectual Property and Knowledge Management**

Knowledge Management Based on the Cultural Historical Activity Theory	
Du Lunfang .....	1115
Comparisons of Chinese & British University Library Homepages	
Lv Jingping .....	1125
Analyses on Risks of Intellectual Property Rights in Enterprises' International Operations	
Peng Shaohua .....	1133
Applicability of Knowledge Management in Managing Venture Capital Fund	
Xiu Long, Yang Qing .....	1137
Effects of Information Technology Function on Tacit Knowledge Transfer Effectiveness	
Sun Jianbin, Luo Xianming .....	1144
External Network, Absorptive Capacity and Performance: The Affecting Mechanism	
Liu Lu .....	1149

The Intellectual Structure of the Non-Technological Innovation Field: An Author Co-Citation Analysis	
Matej Černe, Robert Kaše, Miha Škerlavaj.....	1154
Analysis of CCHP and Distributed System on Energy Consumption in Northeast China	
Zhang Yi, Zhou Mingyue, Liu Jinyuan,Wang Huibin .....	1181
Analysis of Coordination Degree of China’s Financial Development and Economic Development Based on Systems Engineering	
Diao Jiewen, Guo Yajuan .....	1185
Empirical Research on the Effect of Scientific and Technological Innovation on the Export of High-Tech Products in China	
Du Xiufang, Yan Xiaofei, Yang Yang .....	1191
The Economic Dynamic Efficiency in China Based on DEA-Malmquist	
Jiang Bo, Li Mengyi.....	1198
A Game Model Between Governments and Enterprises in the Green Supply Chain of the Home Appliance Industry	
Xu Ai, Gao Shufeng .....	1204
Construction on Internal Control Evaluation System in Perspective of Organization Immunity	
Dai Chunlan, Peng Quan, Ding Xiaoshu .....	1210
FDI Trade and Its Effects on Agricultural Development in Nigeria: Evidence from Time Series Analysis	
Oji-Okoro Izuchukwu, Huang Huiping, Abba Shehu Abubakar, Edun Adetunji Olufemi .....	1216
Analysis of Problems of Corporate Intellectual Property Strategy and Countermeasures	
Chen Yongzhi, Xiong Yingzi.....	1224
The Performance of Socially Responsible Investment Funds in China	
Xu Lihui, Xia Dan, Xiao Jing.....	1229
A Reaseach on Mutual Influence Mechanism Between Psychological Capital and Knowledge Transferring Based on the Mediation Effect	
Tang Hui, Zhao Fuqiang, Deng Mingran .....	1233
Countermeasures of Developing Higher Vocational College Students’ Practical Ability	
Wang Bin .....	1239
Research on the Private Financing in China-Analysis of the Effectiveness of Financial Reform in Wenzhou of China	
Wang Fang .....	1243
Research on Real Estate Bubble in Wuhan City of China	
Huang Song, Yu Jiali .....	1248
Research on Financing Risk Control Based on the Technology and Finance Operation Mode	
Zhang Youtang, Li Sicheng .....	1252
Research on Disclosure of Other Comprehensive Income for A-Shares Market	
Huang Jiating .....	1258

## Part 7 Miscellaneous

Measuring Market Liquidity at Shanghai Stock Exchange Based on the Generalized Dynamic Factor Model	1263
Cui Dezhi .....	
Micro & Macro Evidence on Innovation and Economic Performance of Algerian Firms	1267
Metaiche Mohammed El Amine, Benhabib Abderrezak .....	
The Inter-Correlation Analysis Between Remuneration Satisfaction and the Behaviour of Staff Demission in Original Equipment Manufacturer	1283
Hu Yaqi, Liu Qiang, Shi Changyun .....	
The Research on Company's Investment: An Empirical Study of Marks & Spencer	1288
Li Chaoxin .....	
Needs Analysis and Innovation of ESP Teaching	1293
Liu Xiongyou .....	
Research on the Impact of Pay Fairness on Pay Satisfaction in OEM Companies	1298
Liu Qiang, Hu Yaqi .....	
Modeling and Analysis of University Library's Books Utilization Ratio	1303
Chen Zhenhua .....	
An Investigation into the Impact of Investor Relations on the Turnover Rate in the Capital Market	1310
Bian Na .....	
Study of the Correlation Between Dominant Indicator of University Presidents and University Ranking	1315
Cai Meng, Xu Hongyi .....	
A Probe into the Automated English Learning Administration Mode in Colleges	1321
Chen Feng .....	
Practice and Development of Construction Engineering Quality Insurance of China	1326
Yang Shuangquan .....	
Research on Panic Purchase's Behavior Mechanism	1332
Xie Liren, Chen Junmei, Zhang Mingqin .....	
AHP-Based on Evaluation System of Bilingual Teaching Construct: A Case Study in Yangtze University	1336
Qian Xiuyun, Qian Siyu, Chen Mengjiao .....	
The Empirical Research on Relationship Between Fixed Assets Investment and Economic Growth	1340
Wang Xigang, Zhang Haiyan .....	
Research on the Construction of College Campus Culture from the Perspective of Harmony Society	1346
Li Liguo, Fang Xiaoqing .....	
Research on Construction and Management of Color Order of Brand Image	1349
He Fang, Cheng Shun .....	

On Theoretical Logic of Introduction System Engineering to University Moral Education Model Construction	
Shen Gewu, Yang Aixia	1353
Study on the Evaluation Index System of “Three Bases and One Hub” Based on AHP Model: Taking Central Areas in China as an Example	
Zhou Hongliang	1359
On Strategies and Practical Approaches for College Students’ Integrity Education in the View of Game Theory	
Wu Hailong	1364
On Family Education Between China and America and Children’s Innovation Capacity	
Deng Hong, Ning Mei, Liu Xiaoyue	1368
Analysis on Cyber Language from Economics of Language	
Ma Yunxia, Li Yanchun, Nie Guihua	1373
On Creative Ability of Chinese Youth and Its Cultivation	
Chen Yiran, Liu Xiaoyue, Ning Mei	1379
Research on High-Tech Enterprise Growth Mechanism in the View of Dynamic Capabilities	
Ma Lu, Qiao Jun Guo, Liu Qing	1384

# Association Rules Between Driver Behavior and Auto Parts Maintenance Based on Active Service\*

Li Bing, Wang Hu

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: libing860911@163.com, wanghu61@126.com)

**Abstract:** Although car users are making more and more complaints, there are still many issues which can be avoided through active service by service providers in advance. We can get many customers' characteristics, such as driving proficiency, driving habits, road conditions and so on from customer's raw materials. All these features will affect the probability of auto fault. In this paper, we take driving habits for example. Firstly, we analyze the association between driving habits and motor vehicle parts, and then discover the comprehensive factor for a group of customers. Finally, we can identify the best time of the required services for every motor vehicle parts.

**Keywords:** Active service; Association rules; Behavior prediction; Driving habits

## 1 Introduction

In recent years, the capacity of auto manufacturers to reduce costs in the manufacturing sector has been fully tap, and the profitability of the enterprise profit margin is decreasing. In this context, the entire automobile market began to focus on the development of after-sales service which is a new profit growth point. The traditional service model is a passive-type services, namely, "find fault - problem diagnosis - solution." This service model can not meet the expectations of customer, as a result, service providers should predict the characteristics of maintenance services, and provide customers with active service based on user behavior characteristics and vehicle attributes.

In their study, Federico Mancosu<sup>[1]</sup> gave his idea about how to improve vehicle active safety by modified on tyre, vehicle and road design characteristics. Isamil Dagi<sup>[2]</sup> developed a dynamic planner and investigate situation pattern for appropriate goal deduction. Their works give us a wonderful inspiration when we try to find the method about how to evaluate the behavior of driver. An amusing test item related to customer behavior which be included of the test paper of competition of modeling creation hold in China<sup>[3]</sup> also inspire us for our research on the customer behavior prediction.

According to theory of vehicle maintenance, the occurrence of vehicle component failure follows certain rules and can be described, the failure curve is similar to "bath panel" shape. Car trouble can be divided into early failure period, occasional failure period and failure of depletion period. The early failure period and failure of depletion period obey normal distribution or Weibull distribution, while occasional failure period obeys exponential distribution. However, there are a wide variety of auto parts, not all parts are strictly adhered to these three periods, and some parts may have only one or two stages. Yu Jiang<sup>[4]</sup> studied the availability of vehicles through four factors of the weather conditions, maintenance conditions, road conditions, and establish a availability simulation model to determine the best operating temperature and maintenance mileage, so as to provide support for auto repair services.

## 2 Collection of Customer Raw Data

Car after-sale service business has accumulated a lot of data and information about customers, such as mileage records, customer basic information, amendment record, maintenance manuals, customer feedback and suggestions, customer survey information. These data are directly accessible, while customers' features are obtained indirectly through raw data.

There are two kinds of characteristics for customer groups: one is using behavior characteristics. Because customers have a lot of using behavioral characteristics, we only consider to find out the most crucial factors, such as driving proficiency, driving habits, etc. The other features are about customer cars and driving environment related, such as mileage projections, parts' life expectancy and road conditions.

As figure 1 showed, there are six kinds of raw data which can be directly obtained on the left, while five kinds of characteristics are listed on the right. The details of the five characteristics are as follows:

---

\* This paper is supported by Natural Sciences Foundation of China(71071122) and Technology Department of Hubei Province(20102s0014)

1) Mileage projections. Based on past mileage documented data, we can get mileage equation by regression analysis:  $\text{mileage} = b + r \times \text{Time}$ , we can predict customers' daily driving mileage during the next period of time.

2) Road conditions. Road conditions have a great influence on the performance of cars. Suppose two cars are identical. Let them run on two different condition roads. After a period of time, the performance and probability of failure of two cars are certainly not the same. It can be judged by customer basic information and survey data.

3) Proficiency. Suppose a novice driver and an experienced driver drive two identical cars, the damage probability of the former is larger than that of the latter. We can judge a customer's proficiency by repair records, customer basic information and customer survey data.

4) Driving habits. Driver's driving habits are different. For a particular brand of car, they have the same parts, follow the uniform quality control standards, and are produced at the same production line according to a strict assembly process. Therefore the performance index for each engine is almost the same. However, the life of each engine is different. Some run 50 million km with no major repairs, while others run less than 10 million km, with the engine channeling smoke and burning oil. Each owner's driving habits, proper use and maintenance of vehicles are the key. These factors will determine the engine's overhaul mileage .

5) Components' life expectancy. Customers will get a car maintenance guide when they buy a new car. However it is made in accordance with the standard driver, and don't apply to all customers. We can modify the maintenance guide by amendment records and customer feedback.

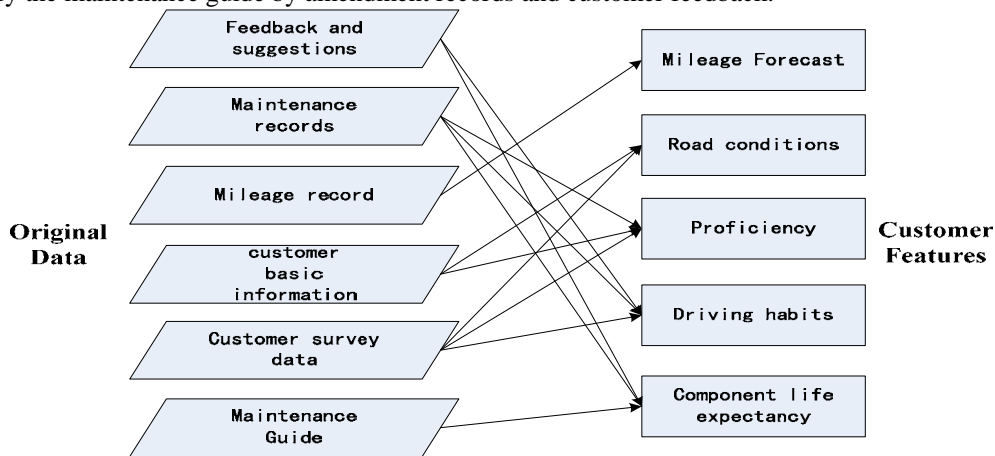

Figure 1 Customer Original Data and Features

### 3 Association between Driving Habits and Motor Vehicle Parts

Customer features, such as road traffic conditions, driving habits and driving proficiency, affect the probability of failure. In this paper, we take driving habits for example, analyze the association between driving habits and motor vehicle parts. and then find out the best service time for each motor vehicle parts.

According to statistics, vehicle maintenance focus on the following eight components<sup>[5]</sup>.1)Engine: the difficult start, reaching less than nominal power indicator of manufacturers, abnormal fuel consumption, abnormal sound, idling exceptions and other issues.2)Clutch: the separation is not complete, skidding, body trembling, abnormal sound and other issues.3)Transmission: the shifting difficulties, abnormal sound, jump stop, chaotic block, fever and other issues.4)The front and rear axles and suspension system: whether the axle, drive shaft, suspension have abnormal noise, or shock-absorber spills oil and other issues.5)Braking system: drag slip, abnormal sound, deviation and so on.6)Steering system: the body jitter, deviation, abnormal sound and so on.7)Tire: early wear and tear, burst, early cracking and so on.8)Body and electrical accessories: body rust and cracks, the refrigeration and heating of air conditioning is abnormal, lifts don't work properly, the quality of seats, interior noise, body vibration. Starter, generator and electric wipers, lighting, turn signals, instrument cluster does not work.

We summarize 14 bad driving habits about automotive customers they are harmful to certain auto parts. (Table 1)

- 1) High speed. No matter which block a car is in, the speed of engine should not exceed 70% of the maximum speed. High speed running for a long time are not allowed.
- 2) Overload running. Overloaded vehicles are prohibited. Once the engine does not work smoothly, they should be immediately changed into a low gear.
- 3) Tire rub step. The tire side is the thinnest. Special attention should be paid to protect the side of tire when across the stairs or road sub-teeth.
- 4) Emergency brake. Tests show that emergency brake at medium speed on a normal road, will make tire tread wear up to 0.91mm-1.20mm, as well as the wear of driving 3000km.
- 5) Clutch pedal. Clutch will be in the semi-separation with the left foot on the clutch pedal when driving, which will not only affect the power output form engine to transmission, but also cause clutch early abrasion.
- 6) Cold start. Good driving habits should firstly preheat the car before start it, unstill the engine coolant reach normal operating temperature (above the minimum 50 °C).
- 7) High gear driving. When a car encounters resistance, and its speed decreases, you should quickly change the gear into a low-level one. High gear driving will cause engine's temperature increasing, power coastdown, fuel consumption, engine wear boosting, and sometimes cause the engine flameout or produce deflagration.
- 8) Shift while clutch isn't complete separate. If the owner shift while clutch isn't complete separate, it will be a fatal injury to the manual transmission.
- 9) Hand brake driving. The best way of controlling travelling speed is changing gear rather than using brake. Driving with hand brake will damage the brake pads badly.
- 10) Turn the steering wheel all the way. Turn the steering wheel all the way will break the power steering system.
- 11) Cross the road sub-teeth. Shock absorbers, springs and suspension components are all vulnerable auto parts. Before cross groove, we should slow down the speed earlier, rather than abruptly cross it, which not only ensure the comfort, but also protect the shock absorbers, springs and suspension.
- 12) Frequently combined switch. Frequently combined switch will increase the risk of damage.
- 13) Force the water spout work. When the water spout was frozen in winter, forcing the water spout work will break the water pump. We should start the car ,and wait until the vehicle temperature is up, and the ice in the water spout is frozen .
- 14) Hold on the window regulator. Many vehicle glass electric switch does not work or can not lift the window glass in place because of the wrong daily operations. When we use the electric window regulator to lift the glass, we must let go in time before the window go down to the end, or rise to the top, otherwise the motor will be damaged.

**Table 1 Driving Habits and Susceptible Auto Parts**

Driving habits	Susceptible Auto Parts	Driving habits	Susceptible Auto Parts
High speed	Engine	shift while clutch isn't complete separate	Transmission
Overload running	Engine	Hand brake driving	Brake System
Tire rub step	Engine, tires	turn the steering wheel all the way	Steering System
Emergency brake	Tires	Cross The road sub-teeth	Body Accessories
Clutch pedal	Clutch, brake system	Frequently for the combined switch	Body Accessories
Cold start	Engine	Force the water spout work	Body Accessories
high gear Driving	Engine	hold on the window regulator	Body Accessories

#### 4 Calculation of Customers Comprehensive Factor

Generally speaking, vehicle maintenance business has thousands of customers. So, customer clustering is essential, That is, divide the customer into a number of groups to manage respectively. Though the best way to get customers' driving habits is questionnaire, it is not realistic for such investigations. We can select a certain percentage of customers to carry out the investigation, assuming that the driving habits from the same customer base are similar. This article assumes that there are 14 driving habits to influence the eight components, For different customers, their driving habits' impact on the same auto parts is not the same. Therefore, each driver has a comprehensive factor to each component.

Suppose there is a customer group with m customers, so that I (i = 1,2, ..., 8), j (j=1,2, ...,14), k(k=1,2,...,m) represent automotive parts, driving habits and customers respectively. The calculation steps of customer comprehension factor CFi are as follows <sup>[6]</sup>:

(1) For all parts, the weight of part  $i$  under the factor  $j$  ( $W_{ij}$ ) was given by experts and saved in the Table Weights.(Table 2)

**Table 2 Weights Table**

Auto Parts	Driving habits				
	$h_1$	$h_2$	...	$h_i$	...
$P_1$	$w_{11}$	$w_{12}$	...	$w_{1i}$	...
$P_2$	$w_{21}$	$w_{22}$	...	$w_{2i}$	...
...	...	...	...	...	...
$P_i$	$w_{i1}$	$w_{i2}$	...	$w_{ij}$	...
...	...	...	...	...	...

(2) by experts or given parts auto parts manufacturer  $i$  Standard Life  $S_i$  (Measured in miles, not time), and parts  $i$  Standard scores  $P_{ij}$ . So you can be part  $i$  Weighted scores  $\sum_{j=1}^{14} P_{ij} w_{ij}$ .

(3) Select a certain percentage of customers ( $n$  customers) from a customer group. We get customer's driving behaviour  $C_{kj}$  though customer's investigation. And then we can find the customer's every part's score  $\sum_{j=1}^{14} (\frac{1}{n} \sum_{k=1}^n C_{kj}) w_{ij}$ .

(4) By the score of customer's score and the standard score of part  $i$ , we can easily get the customers' comprehensive factor  $CF_i$ :

$$CF_i = \frac{\sum_{j=1}^{14} (\frac{1}{n} \sum_{k=1}^n C_{kj}) w_{ij}}{\sum_{j=1}^{14} P_{ij} w_{ij}} \quad (k = 1, 2, \dots, n) \tag{1}$$

(5) Finally, we propose the following approach to predict the conditions for services:

$$L_i = CF_i \times S_i \quad (i = 1, 2, \dots, 8) \tag{2}$$

For each customer of the customer group, auto parts  $i$ 's most possible life is  $L_i$ .

### 5 Service Remind Model

The active service system of automotive services provider is showed in figure 2. It follows B/S structure, so as to facilitate customers to log in at home and view related information. The main process of the system include: collection of the original data, data transmission, data analysis and service releases. The original data, including the driver behavioral data and vehicle status attribute data, is gained from the user interface subsystem and vehicle traveling recorder<sup>[7]</sup>. User interface subsystem helps user interact with the system, and update the system's user information continuously. Data can be transmitted through the Internet.

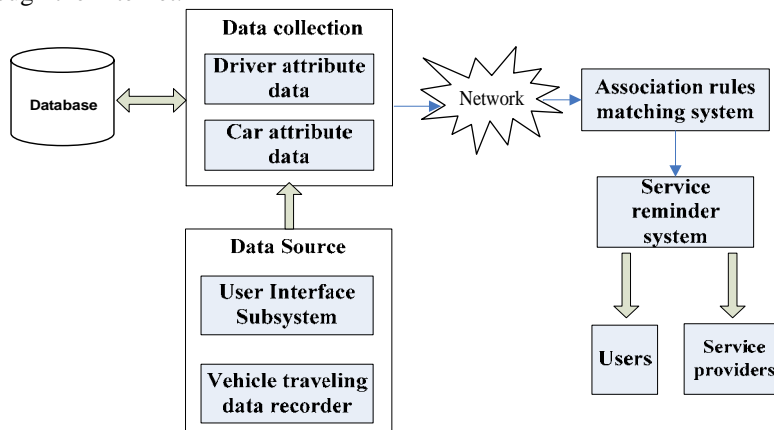

Figure 2 The Framework Map of Active Service System

The main functions of service remind system are to remind customers the best service time. First of all we should determine  $L_i$ ,  $r$  and  $t_i$ .  $L_i$  refers to the life expectancy of auto parts  $i$ .  $r$  refers to customers' daily mileage (km/day);  $t_i$  refers to the date that a customer's auto part  $i$  was checked or replaced last

time. Then customers' best service date is as follows:  $T_i = \frac{L_i}{r} + t_i$ .  $T_i$  refers to the next most likely date that component  $i$  will be checked or replaced, and  $\frac{L_i}{r}$  is the life of part  $i$ .

## 6 Conclusion

When customers use products, their using behavior has a direct impact on the product's performance. Through the analysis of customers' behavior, we can forecast the product's required service content and time, and enhance business's service quality and response level, changing passive service into active service. Therefore, we can improve customer's satisfaction with the use of the product, and avoid the waste of resources because of invalid business service<sup>[8]</sup>. There is already a lot of research on customer clustering. This paper aims to extract the common features of customers, and then convert customers' common features into knowledge. In the future, we will study the differences between customer groups, as well as the differences between individuals within a group, and how these differences impact on customer's service, thus we can provide more sophisticated services for customers.

(E-mail: lu\_shaoua@163.com)

**Abstract:** As customer demand and sustainable development are paid more and more attention, it is reasonable and important to enhance supply chains' reliability and stability through supply chain coordinating by efficiently monitoring and controlling members' behaviors and decision-makings. The principle and process of supply chain members' behavior and decision-making coordination based on risk monitoring are analyzed, the quantitative risk monitoring indicators are designed, and the member's behavior and decision-making coordination model is proposed.

**Key words:** Supply chain management; Coordination; Risk modeling; Behavior and decision-making

## 1 Introduction

Supply chain is combined of members tie together by business processes, so it is in fact a self-adaptive complex system. As supply chains getting more complex, it is getting more and more difficult to maintain their structural reliability and operational stability. A subtle fluctuation on logistics or information flows usually causes reactive adjusts of some members, and then leads to the turbulence of the whole supply chain, initiating supply chain risks: the information asymmetry among members decreases the reasonability and reliability of their behaviors and decisions, and produces aftereffects which are difficult to eliminate; the inherent risks of single members will break through enterprise boundaries and interact with other members', leading to unpredictable effects; and the members operating in multiple supply chains make "cross infection" of risks among different supply chains more possible. Therefore, as customer demand and sustainable development are paid more and more attention, it is reasonable and important to enhance supply chains' reliability and stability through supply chain coordinating by efficiently monitoring and controlling members' behaviors and decision-makings.

Nowadays researches on supply chain coordination focus on 3 aspects: i) information coordination aiming to integrate, share, and optimize information flow among supply chain members; ii) benefit coordination emphasizing on business interaction and resource optimizing within the supply chain system; and iii) behavior and decision-making coordination considering the total competences and operation stability, and emphasizing on uncertainties and dynamic interferences of members' decision-makings.

Information coordination is tightly associated with researches on supply chain modeling, and has gotten numerous achievements, providing technological supports to supply chain practices. Benefit coordination in supply chains has also accumulated a great deal of literatures, and guided supply chain practice to great extent. However, researches in this aspect take benefit and resource allocation as the final goal, emphasizing on the self-compliance of coordination mechanisms. The uncertainty and deviation in mechanism execution are ignored. These researches focus more on such static constraints as production/inventory capabilities and costs/prices, taking key independent variables, such as the environment, process and interferences of members' behaviors, as transparent (or important). As the result, research findings are usually theoretical static coordination, and hard to be applied to practical supply chains which need dynamic coordination mechanisms.

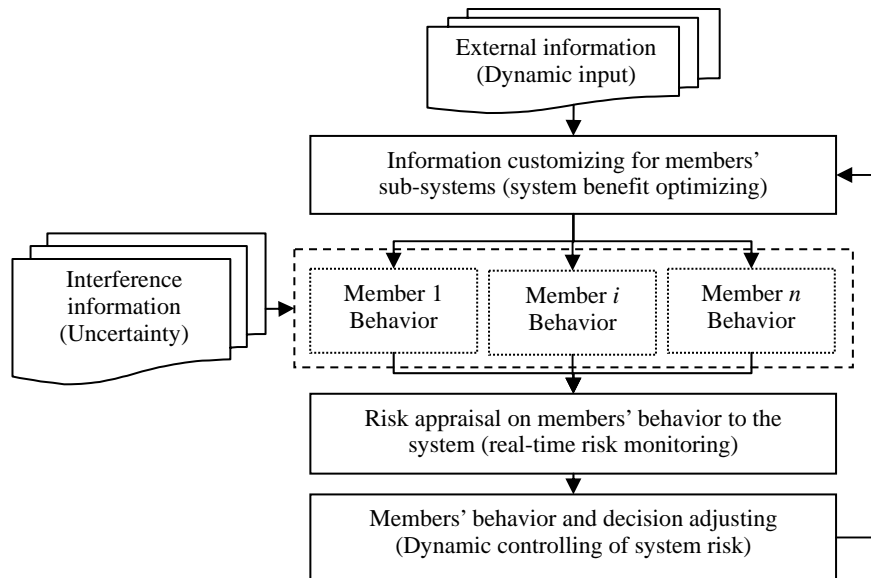

In this paper we propose a coordination framework of supply chain based on members' behavior and decision-making risk monitoring. Firstly, the basic principle and process of members' behavior coordination will be analyzed, and then the risk monitoring model to members' behavior and decision-making is established. The coordination model of members' behavior based on risk monitoring is proposed. Finally, the probable direction of future work is discussed.

## 2 The Principle of Behavior and Decision-Making Coordination among Supply Chain Members

From the aspect of system controlling, the essence of supply chains operation is to transform system inputs (information and resources) into system outputs (production and /or services), through

members' specific behaviors. The coordination mechanism of supply chain is to ensure all elements of the system act timely and exactly, maintaining the system operates stable and effectively. In this means, supply chain coordination is to decompose the system inputs into specific signals to relative members, and stimulate their specific behaviors, so as to get the expected system output.

The coordination process of supply chain members' behavior and decision-making includes 4 basic stages, as described in Figure 1.

**Figure 1 The Process of Members' Behavior and Decision-Making Coordination**

Firstly, the supply chain system receives the inputs (i.e., market demands, customer orders, information of competitors, environment variables, etc.). Taking into account the information like system structure and members' characters, the system-level optimization will be found, the overall benefit maximizing as the core aim. The optimal solution will be mapped as input signals of members' sub-systems, and members are then expected to act upon these "optimal" ways. However, as all members are self-beneficial, and there exists so many uncertainties in their behavior environments, nearly all members will deviate their expected "optimal" ways in their actual works, resulting in unpredictable impacts to the system operation (which we call it Risks). Therefore, there needs a important process to form a close-loop feedback mechanism which traces members' behavior and decision-making, recognizes and appraises their possible risks, optimizes and adjusts members' behavior and decision space, and finally coordinates the whole supply chain system.

### 3 Modeling the System Risk of Members' Behavior and Decision-Making

To coordinate supply chain members' behaviors and decision-makings, we must effectively describe the structure and character of members' behaviors and decision-makings, and correctly analyze the interact mechanism of this structure and character to supply chain systems. It is necessary to establish an indicator system to monitor members' behavior risks to the supply chain.

#### 3.1 Risk elements of members' behavior and decision-making

There are many elements which deter supply chain coordination. They can be classified into two categories. The first is object elements, which is intrinsic to the supply chain system, such as system structure, members' capabilities and risk preferences. Their influences on supply chain operation are relatively stable, and can be decreased but can not be eliminated. The other is the subject elements, which come from members' subjective initiatives. Because of members' different behavior abilities and decision rationalities, these elements have apparent contingency and randomness, and can have great impact to supply chain system stability. Members' individual behaviors may course behavior deviations of other members, even the system failure resulting from the resonance of members' behaviors. The famous Bullwhip Effect is just one of such example.

In supply chains, a lot of member behavior variables can effect the system operation, typical ones are order/supply quantity, production quality, order/supply price, delivery time, and so on. Suppose there

are  $m$  members in a supply chain. For convenience, it is reasonable to suppose that there are  $n$  similar behavior and decision variables for all members, denoted as  $X_i = \{x_{i1}, x_{i2}, \dots, x_{ij}, \dots, x_{in}\}$ ,  $i = 1, 2, \dots, m$ . Here,  $x_{ij}$  means the  $j$ th behavior variable of member  $i$ , and its feasible domain is related to the intrinsic character of the behavior.

### 3.2 The indicator system for members' behavior risk monitoring

In supply chains, members' behavior or decision changes usually lead to fluctuation of the whole supply chain's expected profit,  $\Phi$ , which is the function of all members' behavior and decision combinations, and can be denoted as  $\Phi(X)$ . The partial elasticity of  $\Phi$  to member  $i$ 's behavior or decision

$x_{ij}$ ,  $E_{x_{ij}}^{(1)} = -\frac{x_{ij}}{\Phi} \cdot \frac{\partial \Phi}{\partial x_{ij}}$ ,  $i = 1, 2, \dots, m; j = 1, 2, \dots, n$ , describes how  $\Phi$  changes when  $x_{ij}$  changes but other

members' behaviors and decisions keep unchanged. So it can act as an important indicator which shows the impact of members' behaviors to the supply chain system.

At the mean time, there are also interrelations among different members' behaviors. Or, behavior change of one member will raise behavior changes or decision adjustments of other (several or all) members, leading to the further change of the system's profit expectation. Denote the interference mechanism among member behaviors as  $X_k = X_k(X_i)$ ,  $i, k = 1, 2, \dots, m; i \neq k$ , then the impact of behavior change of one member to the system profit through other members' behavior adjustments can be roughly

described by another indicator,  $E_{x_{ij}}^{(2)} = -\frac{x_{ij}}{\Phi} \cdot \sum_{r=1}^m \sum_{l=1}^n \left( \frac{\partial \Phi}{\partial x_{rl}} \cdot \frac{\partial x_{rl}}{\partial x_{ij}} \right)$ ,  $i=1, 2, \dots, m; j=1, 2, \dots, n$ .

Changes of members' behaviors and decisions can also change the equilibrium of benefit allocation in the system. Denote members' benefits (or utilities) as  $\varphi_k(X)$ ,  $k = 1, 2, \dots, m$ , then, similar to those

discussed above, indicators  $e_{x_{ij}}^{(1)}|_k = -\frac{x_{ij}}{\varphi_k} \cdot \frac{\partial \varphi_k}{\partial x_{ij}}$  and  $e_{x_{ij}}^{(2)}|_k = -\frac{x_{ij}}{\varphi_k} \cdot \sum_{r=1}^m \sum_{l=1}^n \left( \frac{\partial \varphi_k}{\partial x_{rl}} \cdot \frac{\partial x_{rl}}{\partial x_{ij}} \right)$ ,  $k = 1, 2, \dots, m;$

$k \neq i$  approximately describe how the change of member  $i$ 's behavior  $j$  directly and indirectly affects member  $k$ 's benefit (or utility), respectively.

If members' behaviors or decisions fluctuate, i.e.,  $\Delta x_{ij}$ , its direct and indirect impact on the system's profit can be calculated through indicators proposed above, i.e.,  $\Delta \Phi^{(1)} = \frac{\Phi(X^0)}{x_{ij}^0} \Delta x_{ij} \cdot E_{x_{ij}}^{(1)}|_{X=X^0}$

and  $\Delta \Phi^{(2)} = \frac{\Phi(X^0)}{x_{ij}^0} \Delta x_{ij} \cdot E_{x_{ij}}^{(2)}|_{X=X^0}$ . Here,  $X^0$  and  $x_{ij}^0$  are present status of member  $i$ 's behavior or

decision, respectively. Similarly, we can also calculate the changes of other members' benefits (or utilities)  $\Delta \varphi_k^{(1)}$  and  $\Delta \varphi_k^{(2)}$ ,  $k = 1, 2, \dots, m; k \neq i$ , aroused by  $\Delta x_{ij}$ . If the profit change of the system exceeds the preset threshold value  $D$ , or there are deterioration of other members' benefits (or utilities), then the event  $\Delta x_{ij}$  is a risk event, and the risk warning should be taking and the coordination mechanism should be initiated.

## 4 Member Behavior and Decision-Making Coordination Model

Suppose the supply chain is in stable operation, and the system benefit allocation reaches acceptable (or Pareto) equilibrium. Once risk the event happens, i.e.,  $\{\Delta x_{ij} | \Delta \Phi^{(1)} \notin D \cup \Delta \Phi^{(2)} \notin D \cup \Delta \varphi_k^{(1)} < 0 \cup \Delta \varphi_k^{(2)} < 0; i, k = 1, 2, \dots, m; j = 1, 2, \dots, n\}$ , the coordination mechanism will be initiated ensuring members' behaviors combination automatically result in another acceptable equilibrium.

Denote present combination of members' behaviors as  $X^0 = \{X_i^0, X_{-i}^0\}$ , with  $X_{-i}$  meaning the behavior combination of members' other than  $i$ . the system profit is  $\Phi_0 = \Phi(X^0)$ , and members' benefits (or utilities) are  $\varphi_k(X^0)$ ,  $k = 1, 2, \dots, m$ , respectively. When the risk event happens, members adjust their behaviors to  $X^1 = \{X_i^1, X_{-i}^1\}$ , and the expected system profit changes to  $\Phi^{(1)}(X_i^1, X_{-i}^1)$  and  $\Phi^{(2)}(X_i^1, X_{-i}^1)$ , directly and indirectly. At the mean time, members' expected benefits (or utilities) change to  $\varphi_k^{(1)}(X_i^1, X_{-i}^1)$  and  $\varphi_k^{(2)}(X_i^1, X_{-i}^1)$ ,  $k = 1, 2, \dots, m$ , directly and indirectly.

The objective of the coordination mechanism is to dynamically adjust the feasible value domain of vector  $X^1$  according to  $\Delta x_{ij}$ , and then regulate members' behaviors and decision-makings. This is in fact to resolve a multi-person dynamic game, which can be described as the following programming:

$$\text{Max } \Phi(X_i^1, X_{-i}^1) \quad (1)$$

$$\begin{aligned}
s.t. \quad & \Phi^{(1)}(X_i^1, X_i^0) \geq \Phi_0 \\
& \Phi^{(2)}(X_i^1, X_i^{-1}) \geq \Phi_0 \\
& \varphi_k^{(1)}(X_i^1, X_i^0) \geq \varphi_k(X^0), k = 1, 2, \dots, m \\
& \varphi_k^{(2)}(X_i^1, X_i^{-1}) \geq \varphi_k(X^0), k = 1, 2, \dots, m \\
& X_i^1, X_i^{-1} \text{ obey their basic constraints respectively.}
\end{aligned}$$

It is a relatively complex nonlinear programming with a large amount of constraint variables, and can be transformed into a combinatorial optimization problem, which can be solved using heuristic methods. However, the main task of the coordination mechanism is not to find the optimal solution  $X^{1*}$ , but the satisfactory one. A rough feasible solution is enough to regulate the members' behaviors, with shorter solving time, which is vital to realize the real-time coordination.

## 5 Conclusions

Coordination of members' behaviors and decision-makings is necessary to stable operation of supply chains. The principle and process of member's behavior coordination based on risk monitoring are analyzed, the risk monitoring indicators of member behaviors are designed, and the member behavior and decision-making coordination mechanism is established.

Given a specific supply chain, the risk monitoring system and coordination frame can be realized by establishing indicators such as  $E_{x_{ij}}^{(1)}, E_{x_{ij}}^{(2)}, e_{x_{ij}}^{(1)}|_k$  and  $e_{x_{ij}}^{(2)}|_k, i, k = 1, 2, \dots, m; j = 1, 2, \dots, n$ , and the system coordination can be achieved by quickly resolving the model (1) described above.

To make the coordination model practical, the following work should be taken out thereafter:

(1) Describing the behavior structure and decision modes of supply chain members. Member behavior and decision-making are abstract concepts, and a specific behavior usually results from the combination of a lot of basic behavior elements. Only if we can trace these basic elements accurately can we coordinate members' behaviors ultimately.

(2) Finding the interference mechanism among members' behaviors and decision-makings. 3 problems are to be solved here: ①the linkage between system profit and members' behavior and decision-makings,  $\Phi(X)$ ; ②the relationship between members' benefits and members' behavior combinations,  $\varphi_i(X), i=1, 2, \dots, m$ ; ③interferences among members' behaviors and decision-makings,  $X_k \leftarrow X_i, i, k=1, 2, \dots, m; k \neq i$ . A reasonable way to solving these problems is supply chain risk simulating.

(3) Fast-solving the member behavior coordination programming. In supply chain operations, quick response is vital to the coordination mechanism to realize real-time monitoring and dynamic adjusting of members' behaviors and decision-makings. Therefore, it is necessary to refine the coordination programming by specifying members' behavior characters, optimizing the solving algorithms, and solidifying it into the behavior risk simulation systems.

# A Study on Factors Influencing User Participation Behavior in Mobile Community

Yang Guangming

School of Economics and Management, Zhejiang University of Science and Technology, Hangzhou, P.R. China, 310023

(E-mail: Carter\_hust@163.com)

**Abstract:** With the rapid development of mobile networks, mobile communities have gradually become popular, and user participation is the key factor on mobile community development. This paper analyzes the behavior of mobile users to participate in community, and establish a model of factors affecting it. Taking users of mobile community as the survey, a total of 278 valid questionnaires were collected. Perceived usefulness and quality of the mobile community not only directly affect positively mobile community trust, but also indirectly influenced positively participation behavior in mobile community. Perceived costs and perceived risk not only directly affect negatively mobile community trust, but also indirectly influenced negatively participation behavior in mobile community. Finally, the paper argues the application inspiration of the model.

**Key words:** Mobile community; TAM; Mobile community quality; User participation

## 1 Introduction

Mobile community is an important application of mobile commerce, and is being gradually spread in China. According to the report of CNNIC, there are 318 million of Internet users by phones by the end of June 2011, increased over 14.94 million than 2010. Internet users by phones account for 56.5% in all internet users. Mobile community is a users group in mobile Internet, and users can enjoy all applications just like virtual community in Internet. Compared to traditional wired Internet, the biggest advantage of mobile Internet is its universal connectivity, also known as ubiquitous in nature, that is, the portability of mobile terminal devices. Users can connect to mobile networks by mobile terminals at any place and any time, breaking the constraints of time and space and greatly improving the efficiency of communication. So the user can access to the mobile community at any time and any place.

Another advantage of mobile Internet is the combination of location information, and mobile Internet can capture location information of the users, according to this feature we can develop a lot of different functions from the Internet virtual community services. For example, tourists take pictures and upload to mobile community, so other users can get the source of the pictures, which increases the vividness of this service.

The user proportion of mobile community site is 41.1% at first half of 2011, which is much lower than mobile instant message, mobile news and mobile search. The investigation of international consulting firm Frost&Sullivan revealed a large number of users of Facebook and Twitter from mobile networks, and Mixi Website has more users of mobile networks than wired networks. Renren, Kaixin and Tianya Website have also a mobile access, but with a small scale of users. Compared to the mobile community applications of foreign, domestic mobile community of users is also a very small proportion. So we need to study the factors influencing user's participation behavior in mobile community, and to increase the scale of users of mobile community.

## 2 Literature Review

Attracting the user's participation is the key to the rapid development of mobile communities. At present there are much more research on Internet virtual community than on mobile communities. About mobile communities study some scholars refer to approach about Internet virtual communities' research. Siau and Shen explore the factors influencing the mobile business customer trust. They think that trust in mobile business can be divided into initial trust and continuous trust, and the factors affecting initial trust in mobile business are perceived technology feasibility, familiar, reputation, information quality, third-party certification and attractive incentives. Han et al found that trust and recognition are adjustment factors which social demand

and self-expression affect the motivation for participation in virtual communities. Because the users use mobile business services at the first time, the users do not use the experience to follow, trust propensity, mobile business reputation, the perception of the characteristics of mobile commerce site, and the familiarity of the mobile services affect jointly the company's initial consumer trust.

Lin studied personal value and trust theory in mobile business, he found if the users are not satisfied with system and customer value, they would not continue to use mobile business services, and trust play an important role in use behavior of continuous mobile business service. Hsu found that perceived usefulness significantly affect the user preferences, and thus affect the online gaming community on loyalty. Zhang believes that mobile community services have the following five features: mobile services, user-friendly interface and easy operation, privacy protection, effective search engine and user-friendly community management, improved the profit model, these features will attract mobile users to participate in community. When the customers use mobile community services, in addition to making benefits, they also need to pay certain costs and take some risks, including the perception of cost, security and privacy risk of leakage. Cost is one of the factors that the customers need to consider. The users can compare to the cost of using Internet, and get the perception of cost of mobile business. In comparison, the perceived cost is visible, but the risk is invisible. Mobile community bases on wireless network, compared to wired networks, and are easier to leak information, be intercepted and destructed. So there exists a greater risk.

### 3 Research Model

There are many factors affecting user participation behavior in mobile community, so how to build a model to evaluate these factors is very important. The existing study is to investigate the behavior of Internet virtual communities, a relatively rarely involved in small mobile community. Extend these studies to the mobile community applications, the paper moves to build a user community of the factors involved in the model, and through empirical analysis found a significant impact on the mobile community user behavior factors. Model assumes that there are four factors, including perceived usefulness, perceived cost, perceived risk and the quality of the community jointly decided to move the mobile user community's trust. Antecedent of trust by the trust variables affect the behavior of users in the mobile community. Mobile users will directly affect the community's trust in mobile community user behavior, while perceived usefulness and quality of the mobile community is also considered a direct impact on the behavior of users to participate in the mobile community.

Previous studies have shown that perceived usefulness of technology affect consumer attitudes, and affect new technology adoption and usage behavior. Davis proposed a technology acceptance model which is popular, and perceived usefulness is a main factor in the technology acceptance model, and usefulness indicates that users can improve its performance because of using new technology. When studying the impact of trust on online shopping, many researchers introduce the technology acceptance model, and examine the relationship between trust and technology acceptance model, and confirm empirically that trust and perceived usefulness have a significant impact on motivation of online shopping. Lin argue that trust affect significantly usage intention of mobile stock. Kim examine the relationship between motivation and trust on mobile banking, and confirm empirically that relative benefits and initial trust of mobile banking have a significant impact on usage intention of mobile banking. Extending the discussion to the context of mobile community, we posit that:

H1: Perceived usefulness positively affect user behavior of participation in mobile community.

H2: Perceived usefulness positively affect user trust to mobile community.

Previous studies argue that the cost is the negative cost of users. Consumers use mobile community services, they will have to pay a certain amount of money, time, energy and stamina. If the users think mobile social community is useful for their own, his perception of the acceptability of the cost will be high, and it will affect his sense of trust in mobile community. We can make assumptions:

H3: perceived cost significantly negatively impact on user trust in mobile community.

Bauer introduced psychological concept of "perceived risk" to the study of consumer behavior, and argue that for any purchase it will bring a certain the consequences that is difficult to accurately

predict, and some of the consequences are unpleasant, so it produces perceived risk. Featherman thinks that the consumers mainly pay attention to privacy risks and safety risks in online consumer behavior. Taking into account the uncertainty of the mobile community and immature, the user's perception of risk may influence consumer trust in mobile community as an important factor. User perception of risk is based on the reputation of the mobile community, scale and privacy policies, in addition to data transmission speed and stability, the wireless network coverage and data encryption and so on. Therefore, we posit that:

Figure 1 Research Model

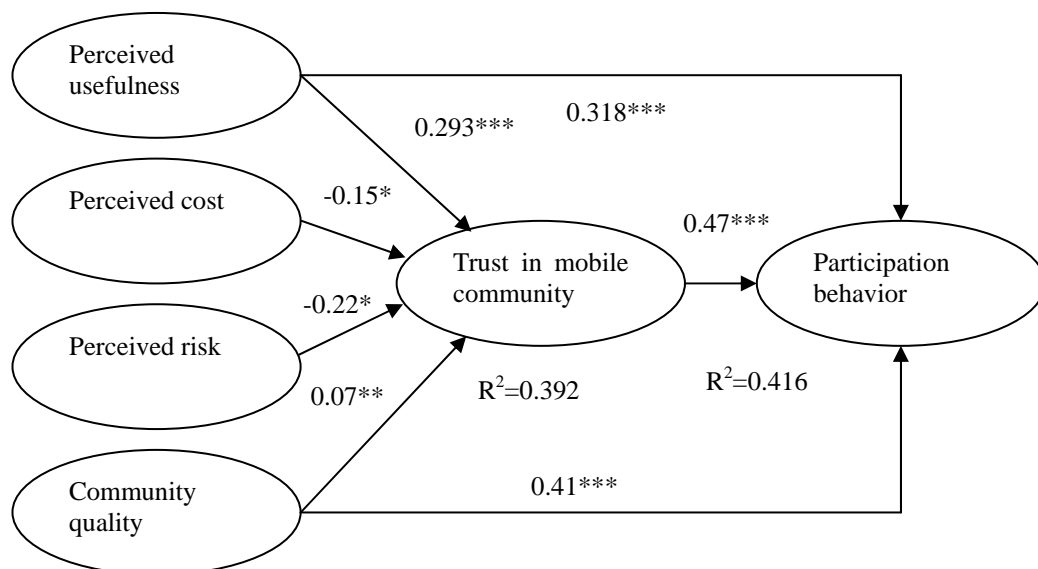

Figure 2 Model Results  
 (\*p<0.05, \*\*p<0.01, \*\*\*p<0.001)

H4: perceived risk significantly negatively impact on user trust in mobile community.

In this virtual mobile community environment, through community platform to attract users to display applications and services to achieve value. Mobile community platform, so the whole

process of using the user plays a very important role. Mobile users within the community are affected not only by the behavior of the impact of trust, but also by the quality of the mobile community platform. Most existing research on e-commerce website quality evaluation, rarely involves the quality of the mobile community platform. Huizingh think that a website can be divided into two main parts: the site content and site design. The former mainly refers to the web site contains a wide variety of information, transactions and entertainment, etc.; web design refers to how a website to present to the user, and how to make use of the website user interface, more convenient to use information. Loiacono and others find useful, entertaining, interactive information and complementary relationship is a measure of the quality dimensions of e-commerce sites. Some scholars evaluate the quality of the site from other website design, content, privacy, response time, and visual appeal and so on. Extending the result of extant studies to the context of mobile community, we hypothesize that:

**Table 1 Standard  $\alpha$  and CR**

	PU	PC	PR	MCQ	MCT	UMC
Cronbach's $\alpha$	0.826	0.874	0.879	0.841	0.819	0.890
CR	0.901	0.899	0.945	0.954	0.927	0.933

H5: Quality of mobile community significantly positively impact on the trust in mobile community.

H6: Quality of mobile community significantly positively impact on the user's participation behavior in mobile community.

Many studies show that consumers trust affect consumer motivation of purchase products and services through the network. The more consumer confidence in e-commerce site, the more likely they proceed in corresponding transactions. Extending these studies to the mobile community applications, we assume:

H7: user trust in mobile community significantly positively impact on the user participation behavior in mobile community.

#### 4 Data Processing and Hypothesis Testing

In this study, principal component analysis and confirmatory factor analysis are used to test the model. The first is the principal component analysis; we calculate sample data for the KMO value and Bartlett tests, software for data processing, the results show that, KMO value of 0.839, Bartlett test significant at 0.001 levels, indicating that the data is suitable for principal component analysis. The maximum variance after orthogonal rotation method after the load factor and the variance matrix is omitted. Six factors were extracted, explaining 75.960% of the variance. The index in the corresponding load factor is much larger than the cross-load on other factors that can effectively reflect the indicators, and corresponding factor scale has good validity. Cronbach's values of the factor and composite reliability are as shown in Table 1, the standard values and CR values are greater than 0.800 indicate scale has good reliability and the measurement items have good content consistency.

In this paper, PLS Graph3.0 is used to estimate the structural model. Model the final result of the operation is shown in Figure 2. Perceived usefulness of mobile community have a significant positive impact on trust and participation in mobile communities, and that is to verify the hypothesis H1 and H2. Perceived costs and perceived risk were significant levels significantly under the conditions of 0.5, that is to verify the hypothesis H3 and H4. Mobile community quality significantly affect mobile community trust and participation, and the path coefficient is 0.41 between mobile community quality and mobile community participation, it is larger, indicating that the quality of the mobile community has an important impact on mobile community participation. Trust in mobile community has a significant positive impact on mobile community participation under the conditions of significance level of 0.001. From calculation results of the software, it shows that the study data and model analysis is reasonable.

#### 5 Conclusion

Based on technology acceptance and innovation diffusion theory, this paper build a user

adoption of mobile community factor model under the context of mobile business, and proceed in data collection and analysis. Empirical results show that the assumptions have been verified. Perceived usefulness has a significant positive impact on trust and participation in mobile community. Through the technology acceptance model application in the mobile community environment, this paper further expands the explanatory power of the technology acceptance model. Meanwhile, the mobile community service providers should use various measures to enhance the user's perceived usefulness. On the one hand the information should be content rich mobile community, to enhance the entertainment and communication of real-time to attract more users, the other to be innovative mobile community applications to increase user stickiness, such as providing upload and download free trial listening and using. The quality of the mobile community significantly affects trust and participation in mobile community. Community interface should be user-friendly mobile, easy to operate and the user's mobile phone should be connected to a fast moving community, each specific application response time should be rapid. These areas can effectively improve the quality of the user's perception of the mobile community. Also in this research found that, due to various brands of mobile Internet software is different, and some mobile phones for different communities require different specialized client software, which increases the complexity of the user using the mobile community, reduce the user's mobile community perception of the quality. Shortcomings of this study is that mobile users to participate in community impact factor is different new changes according to the continued use of time, some users may often after a period of continued use, and some may be later used occasionally, and some may no longer use. In response to these, this article does not distinguish between the user's continued uses of time; follow-up study can be considered to continue in-depth exploration.

## Analysis and Measuring of Real Estate Bubble in China

Yu Hualin

Department of Economics and Management, Huaxia College of Wuhan University of Technology,  
Wuhan, P.R.China, 430223  
(E-mail: chenzhenhua@whut.edu.cn)

**Abstract:** Since the market-oriented reforms of China's housing system from 1991, the prices of real estate have experienced a sustained rise. In particular, the rate of increase of average price of Chinese residential real estate has become more than 12% since 2004. This paper uses the measurement of Indicator Approach to find out that a series of indicators of measurement of the real estate bubble have reached and exceeded the warning line, such as the proportion of the real estate investment in GDP, housing price-earnings ratio, rents-sales ratio, which indicate that the appearance of China's real estate bubble and the trend of amplification. This paper is intended for the government to take appropriate and proportionate measures to ease the real estate bubble gradually and to provide a basis for "soft landing" of the real estate bubble.

**Key words:** Real estate bubble; Measurement; Housing price-earnings ratio; Rents-sales ratio

### 1 Introduction

Real estate, as a kind of physical assets, involves the terminal of long industrial chains of numerous industries. At the same time, it's the underlying assets of many financial derivatives and it's in a position affecting the situation as a whole. Game of the multi-stakeholders has made the price of real estate rise continually, resulting in the real estate bubble. This paper uses the measurement of Indicator Approach to find out that a series of indicators of measurement of the real estate bubble have reached and exceeded the warning line, such as the proportion of the real estate investment in GDP, housing price-earnings ratio, rents-sales ratio, ect, which indicate that the appearance of China's real estate bubble and the trend of amplification.

### 2 Trend of the Price of Real Estate in China

**Table 1 Annual Average Price of Commercial Housing and Growth Rate from 1991 to 2011 in China**

Year	Average Price of Commercial Housing (Yuan)	Growth Rate
1991	786.2	
1992	994.7	26.52 %
1993	1291.5	29.84 %
1994	1408.6	9.07 %
1995	1590.9	12.94 %
1996	1866.4	13.55 %
1997	1997.2	26.52 %
1998	2061.6	10.56 %
1999	2052.6	0.44 %
2000	2111.6	2.87 %
2001	2169.7	2.75 %
2002	2250.2	3.71 %
2003	2359.5	4.86 %
2004	2713.9	15.02 %
2005	3167.7	16.72 %
2006	3366.8	6.29 %
2007	3864	14.77 %

2008	3919	1.42 %
2009	4695	19.80 %
2010	5029	7.11 %
2011	5381	6.9 %

Source: Statistical Yearbook

From the above table, we can see that the product attributes of housing are also reflected in its price changes since the market-oriented reforms of China's housing system in 1991. From 1991 to the present, the price of real estate in China experienced a sustained rise. From 1991 to 1997, the demand of the Chinese people for housing in this stage burst out after a long-term suppression, resulting in the rapid growth of the housing prices and the investment boom. And the real estate bubble broke out in Hai nai and other provinces. As China's regulation on real estate, real estate prices in China from 1998 to 2003 were in a steadily rising phase, while the real estate prices showed a rapid growth trend since 2004. The prices grew faster than GDP growth rate in most of these years. The commercial housing prices in 2008 kept basically unchanged in comparison with those in 2007, whereas the prices rose rapidly in 2009, reaching the record 21.10%. But the annual growth rate back down again below 10% in 2010. Compared with the year of 2010, the prices increased 6.9%, while the growth rate dropped 0.6%.

### 3 Measurement of the Real Estate Bubble in China

#### 3.1 Definition of real estate bubble

In "the New Palgrave Dictionary of Economics" (1998), C.P. Kindleberger made a definition of "Bubble": "Whereas a boom or bubble is characterized by a rush out of money into real or longer-term financial assets, based on expectations of a continued rise in the price of the asset. More speculators who acquire the benefits from the difference of assets are attracted into the market. The irrational price and unsupportive conditions result in the change of expectation and the slump in the prices, and often lead to financial crisis or economic crisis." This definition vividly describes the bubble from the generation, expansion to breakdown.

Professor Joseph Stiglitz, Nobel Laureate in Economics, made a concise definition of "bubble": If the reason for the rise in prices is that investors believe that they will sell at a higher price, but the price of basic elements can not be adjusted, then there is a bubble.

From the above definition, we can sum up two main characteristics of the bubble: Firstly, imbalance of supply and demand; secondly, serious speculation. According to the above characteristics, the real estate bubble is defined as: "a manifestation of the bubble economy in the real estate, whose essence is the deviation of the price of the real estate from its value. Generally, the bubble presents in the rocketing price of the land and housing, and also in the deviation of the market price from the support of the user.

#### 3.2 Choice of the measurement indicators and decision of threshold of real estate bubble

The current methods of measurement of real estate bubble are the evaluation method of indicator, the market correction method, the statistical test method and the theoretical price method. However, for the reasons that it's difficult to determine the theoretical price of the real estate, in practice, the evaluation method of indicator is adopted to measure the real estate bubble. In this paper, the author selects the indicator of supply, demand and speculative value to make a comprehensive measure of China's real estate bubble.

##### 3.2.1 Indicator of supply

The indicator of supply mainly monitors whether the supply is excessive and whether the overheated investment occurs. The monitoring method is make horizontal comparison with the overall macroeconomic situation. The main indicators are: the proportion of real estate investment in the total fixed investment, the proportion of real estate investment in GDP, etc. in this paper, the proportion of real estate investment in GDP is adopted, which is widely used. This indicator directly reflects whether the proportion of real estate investment in the national economy is reasonable. And it's also a basic indicator to evaluate whether the expansion of the real estate investment is excessive.

Based on international experience, real estate investment-GDP ratio is generally between 3 and 8%, the construction peak is about 8%, so the threshold of the indicators is identified as 8%.

##### 3.2.2 Indicator of demand

The indicator of demand is used to monitor the non-speculative demand, which can be measured by the relationship between demand and price, the main indicators are: The housing price- earning ratio, the ratio of the growth rate of real estate and that of GDP, the ratio of the growth rate of real estate and income growth. The most comprehensive indicator is the price-earnings ratio, which reflects the relative purchasing power of residents on the housing, as well as the affordability of families for the housing price.

The ideal situation is to maintain the ratio of the housing price and average family income within a reasonable range. World Bank regards it as 3:6. The ratio is 4:6 in developing countries while generally it's 1.8: 5.5 in the developed countries. Therefore, the threshold of the indicator is identified as 7.

### 3.2.3 Indicator of speculative value

The indicator that reflects the speculative degree is the ratio of sales price of real estate and the rents, that is, rents-sales ratio. The reason why the rents-sales ratio can be able to reflect the speculative degree is that the rent is the basis to support the housing price, and that renting a house is an alternative to buying it. Meanwhile, the rent is mainly affected by the supply and demand of the market, and thus the speculative elements are relatively low. In normal circumstances, the rents should be synchronized with the housing prices, that is, the rents-sales ratio should remain stable. If the housing price that is detached from the housing price is unilaterally rapidly rising and the rents-sales ratio turns out to be abnormal, it indicates that degree of speculation in the real estate market is strengthened.

The rents-sales ratio is the ratio of the real estate price and the market rent levels, but as it is difficult to obtain the absolute value of the nationwide rent, we defines the rents-sales ratio as the comparison of the change between the price index of housing sales and that of the rents. In normal circumstances, the change of the price index of housing sales and that of the rents should be approximately equal. The threshold of this indicator is defined as 1.

## 3.3 Calculation of the real estate bubble

### 3.3.1 Proportion of real estate investment in GDP

**Table 2 Proportion of Real Estate Investment in GDP from 1991 to 2011**

Year	Investment for Real Estate (hundred million Yuan)	Gross Domestic Product -GDP (hundred million Yuan)	Proportion of Real Estate Investment in GDP
1991	336.2	21781.5	1.54 %
1992	731.2	26923.5	2.72 %
1993	1937.5	35333.9	5.48 %
1994	2554.1	48197.9	5.30 %
1995	3149	60793.7	5.18 %
1996	3216.4	71176.6	4.52 %
1997	3178.3702	78973	4.02 %
1998	3614.2292	84402.3	4.28 %
1999	4103.2024	89677.1	4.58 %
2000	4984.0529	99214.6	5.02 %
2001	6344.1107	109655.2	5.79 %
2002	7790.9223	120332.7	6.47 %
2003	10153.8009	135822.8	7.48 %
2004	13158.2516	159878.3	8.23 %
2005	15909.2471	184937.4	8.60 %
2006	19422.9174	216314.4	8.98 %
2007	25288.8373	265810.3	9.51 %
2008	31203.1942	314045.4	9.94 %
2009	36231.7	335352.9	10.80 %
2010	48267	397983	12.13 %
2011	61740	471564	13.09 %

Source: Statistical Yearbook

From the statistics in the above table, we can see that the proportion of the real estate investment in the GDP in China showed a rising trend year by year since 1997. By the year of 2004, the proportion exceeded the threshold of 8% in 2004, especially this indicator exceeded the threshold of 9 percent in 2007, while it's more than 10 percent in 2009. In 2010, the overall real estate investment in China grew rapidly, the total investment reached 4.8267 trillion Yuan, and this indicator came to 12.13%. In 2011, the total investment reached 6.1740 Yuan. In this year, the growth of real estate investment obviously slowed down, but the total amount of investment still hit the previous record by increasing 27.9%. Because of restrictions on the purchase, loan and price, the growth of national average house prices significantly slowed down, only 6.9%. This fully reflects that the investment for real estate is overextended and overheated and it signifies the emergence of early warning in the index of supply.

### 3.3.2 Housing price-earnings ratio

The housing price-earnings ratio is the ratio of housing price and household income, which is mainly used to measure whether the house price stays at a reasonable level that the residents' income can afford. It is a direct reflection of the matching degree of the level of house price and demand for living of the residents and also it's directly related to the happiness of the Chinese people.

**Table 3 Housing Price-Earning Ratio of Urban Residents from 1991 to 2011 in China**

Year	Household Earnings (Yuan)	Average total price of a housing (Yuan)	Housing Price- Earning Ratio
1991	5833.1	38292.66	6.565
1992	6829.6	49611.66	7.264
1993	8531.2	64977.95	7.617
1994	11467.5	72537.27	6.325
1995	13833.9	83759.29	6.055
1996	15484.5	98268.16	6.346
1997	16461.4	113405.01	6.889

Source: From the Database of Development Research Center of Information Network of State Council in China

From the indicator calculated in the table, the local real estate bubble turned out in the years of 1992 and 1993. From the year of 1997 to 2003, the indicator exceeded the threshold of 7. As the rise of China's urban per capita disposable income and the improvement per capita living space, the price of housing increased reasonably and the housing price-earning ratio maintained more stable, about 6.8. From 2003 to 2007, as the price grew faster than the growth rate of per capita disposable income, the housing price-earnings ratio increased significantly. From the year of 2004, this indicator exceeded the warning line once again, and showed a wandering upward trend, which reflected that the relative

purchasing power of residents on housing prices continued to decline and the real demand was squeezed by the speculative demand. In 2007, the indicator came to 7.758. Urban per capita living space in 2008 continued to be improved, and the housing price basically kept unchanged. And thus, the price-earnings ratio was significantly lowered, which was 7.053. In 2009, with the recovery of the real estate market, the real estate price in China rose largely, and thus the price-earnings ratio rose accordingly, which hit a new record of 7.996. In 2010, as the regulation on the real estate of the government, driven by the growth of the urban residents' disposable income, the housing price went down, which came to 7.76. And in 2011, it went continually down, approaching 7.5.2010.

### 3.3.3 Rents-sales ratio

Rents-Sales Ratio, generally speaking, the ordinary consumers regard it as the proportion between the housing rents and sales price. It refers to the ratio between the monthly rent per square meter of construction area and the price per square meter of construction area. It can also be viewed as the ratio between the monthly rent and the total housing price. The rents-sales ratio is an international indicator to measure whether the real estate market runs well or not in a certain region. The international standard is between 1 : 200 and 1 : 300. The higher the ratio, the bigger the investment demand for real estate. If the ratio is below 1 : 300, it means that the value of the housing investment becomes relatively smaller and that the real estate bubble turns out. If it's higher than 1:200, it indicates that the investment potential of real estate market in this region is relatively large. Whether the ratio is higher than 1 : 200 or lower than 1 : 300, it always indicates the housing price is deviated from the rational and actual housing price.

**Table 4 Rents-Sales Ratio from 1998 to 2009**

Year	Sales Price Indices of Housing	Rental Price Indices of housing
1998	106.4	102.4
1999	103.1	98.5
2000	101.8	102.4
2001	101.4	102.8
2002	103.7	100.8
2003	104.8	101.9
2004	109.7	105.5
2005	107.6	106.7
2006	105.5	103.5
2007	107.6	103.8
2008	106.5	102
2009	105.8	100.6

Source: From the Database of Development Research Center of Information Network of State Council in China

From the above table, before the year 2002, sales price index of housing and the rental price index kept in a synchronized state, which revealed that the extent of speculative degree of real estate market at this stage was limited. However, the sales price index of housing was deviated from the rental price index and showed the trend of unilateral rise, which was speculative, obviously not driven by the normal demand.

## 4 Conclusions

From the measurement of indicators of supply, demand and speculative value, it can be concluded that since the China's market-oriented reforms in 1991, the real estate market has experienced the sustained rapid growth, showing signs of prosperity or even "bubble". In particular, since 2004, the proportion of real estate investment in GDP, housing price-earning ratio and rents-sales ratio have exceeded the normal threshold, which sent early warning information from the extent of supply, demand and speculative value. So we can conclude that since 2004, China's real estate bubble turned out and it showed the trend of magnification.

But we should recognize rationally that "bubble" itself is not absolutely bad thing: In the course of development of any developed countries, real estate industry experienced a "bubble". As long as there is

growth and hope in the industry, bubble will occur, because bubble is linked with expectation and confidence.

Moderate and controlled bubble will give a positive market signal: The real estate market will maintain a continuous upward trend in a long time. Then the consumers will have faith and feel that their wealth has indeed increased, and thus they will form the confidence and desire for consumption. The wealth effect will increase their spending in other areas. And accordingly, the rise in overall consumption will stimulate further social production, and then the cycle of economic will grow rapidly. At another level, moderate and controlled bubble will attract more capital investment. The fields that are closely related to the real estate market will maintain a reasonable growth, such as steel, cement, building materials, housing decoration market. This part of growth is in turn transformed into social consumption, which will avoid overcapacity of production. We should only be vigilant against the excessive, alienation and man-made misleading "bubble".

# Fuzzy Evaluation for the Product Strategic Aspects of Ready-made Garment Enterprise in Bangladesh

Luo Fan, Md. Salah Uddin Rajib

School of Management, Wuhan University of Technology, Wuhan, 430070, P.R China

(Email: sailluof@126.com, rajibais71@gmail.com)

**Abstract:** This paper aims to find out the critical factors of success in Ready-made Garment (RMG) industry of Bangladesh, especially from manufacturing engineering aspects. Basically, garment product must be competitive in terms of quality, cost and time, so the evaluation index system for the product strategic aspects has been constructed in this paper. Fuzzy analytical hierarchy process (FAHP) has been used to give evaluation to the product strategic aspects of ready-made garment enterprise of Bangladesh so that the managers can adopt the effective product strategies.

**Key words:** Engineering aspects; Ready-made Garments (RMG); AHP; Strategy; Innovative environment; Bangladesh

## 1 Introduction

A wider range of risks and uncertainties are involved with the international market than the home market. Different producer/buyer culture, business infrastructure, economic conditions, legal systems can create difficult challenges. It is agreed that an organization that is selling its product to the international market i.e., an international enterprise may adopt one of three product policies. They are; universal product, country-tailored, and modified product policy <sup>[1]</sup>. It is agreed that the product policy has to be combined with the strategy to win the market. On the basis of strategy organization may seeks to consume different amount of cost, time and quality.

Bangladesh, a developing country has achieved a good recognition in the RMG sector in international market. According to the Bangladesh Garment Manufacturers & Exporters Association (BGMEA), there are 2915 enlisted members (firms) in Bangladesh. Trade preferences schemes of BGMEA have concentrated on USA, EU, Canada, Japan, Australia, South Africa, Switzerland, Norway and New Zealand. To ensure the sustainable success and competitiveness, this paper tries to find out the critical factors from the strategic engineering aspects to market the product. The evaluation index system for the product strategic aspects is constructed. Fuzzy analytical hierarchy process (FAHP) is used to give evaluation to the product strategic aspects of ready-made garment enterprise of Bangladesh.

## 2 Literature Review

Basically, three different dimensions—quality, cost and time are involved with any product development. It is referred as strategic triangle also (e.g., Ansari, S. 1997) <sup>[2]</sup>. Organization can be unbeaten when it can produce product with the minimum cost, can ensure the highest quality and can hand over the product with the shortest possible time. But, the optimum achievement of the three dimensions simultaneously is difficult. Moreover the term ‘quality’ is relative. The term can be mutually defined with the generic strategy (Differentiation, Cost leadership and focus) of M. Porter. Product may be customized or standardized also. It is agreed that customized products have different features leading to different production costs and eventually different pricing policies <sup>[3]</sup>. Lee et al. (2001) suggested a product design that will support the mass customization <sup>[4]</sup>. It is expected that mass customization will reduce the excessive cost with keeping the opportunity of product variants within a family. Product characteristics, relationship-based selling and value received relative to price are embedded in the product quality under the context of business-to-business marketing <sup>[5][6]</sup>. Technical skill has been embedded in the quality also considering the foreign market <sup>[7]</sup>. In addition to the product quality, international technical reputation, international market orientation, and some sort of strategic orientation has been focused in case of foreign market by researcher (e.g., Roger Calantone et. al, .2000) also <sup>[8]</sup>.

Improving product quality may decrease the speed of development <sup>[9]</sup>. Time is a big term as it has many dimensions and it is associated with the different phase of the product. Time is associated with the design selected during the early stage of product conceptualization <sup>[10]</sup>. Time efficiency indicates managing resources constraints efficiently in terms of time. Therefore, scope of time efficiency is involved at every stage of business; from the supply chain management to the marketing of the product. In contemporary research, time efficiency has been a subject of innovation area also. Innovation speed

represents how quickly an idea moves from conception to a product in the marketplace <sup>[11]</sup>.

The optimum integration of quality, cost and time is still a vital area of research. Chen et al. (2012) recently use repertory grids technique and neural network to propose a quality, time and cost oriented strategy during product concept generation and selection <sup>[12]</sup>.

### 3 Methodology

On the basis of literature review, a primary questionnaire was developed. In primary questionnaire, there were 8 sub-factors under the ‘quality’, 10 sub-factors were under ‘time’, and 10 sub-factors were under ‘cost’. Data has been collected from the listed organization of BGMEA. Bangladesh Garment Manufacturers and Exporters Association (BGMEA) is the leading association in the RMG sector of Bangladesh. Data have been collected from the executive level. After discussion with the experts, factors were reduced. In final questionnaire 7, 9 and 7 sub-factors have been used under quality, cost and time respectively. MATLAB software has been used for the mathematical computing of Fuzzy analytical hierarchy process (FAHP). Fuzzy Analytical Hierarchy Process is as follow:

#### 3.1 Fuzzy set

If  $X$  is the universe of discourse and its elements are denoted by  $x$ , then a fuzzy set  $A$  in  $X$  is defined as a set of ordered pairs:

$$A = \{x, \mu_A(x) \mid x \in X\} \tag{1}$$

#### 3.2 Factor selection for the measurement

Table 1 represents the list of factors. There are two levels. The first hierarchy factor is  $F = \{F_i\}$ , ( $i = 1, 2, \dots, m$ ), which comes from the second hierarchy factor and  $\{F_{ij}\}$  ( $j = 1, 2, \dots, n$ )

#### 3.3 Evaluation index ( $\vee$ ) for the selected factors

Four different stages have been used in the evaluation scale to identify the critical factors of products’ strategic aspects. They are very highly responsible ( $V_1$ ), highly responsible ( $V_2$ ), medium responsible ( $V_3$ ) and normal responsible ( $V_4$ ) for the strategic success.

#### 3.4 Weight ( $A$ ) assessment for the selected factors

1 – 9 ratio scale has been used to formulate the decision matrix. Decision Matrix  $D$  has been formulated on the basis of the opinion of several experts consisting with the rules of Analytic Hierarchy Process (AHP). Largest Eigenvalue ( $\lambda_{max}$ ) has been used to calculate the Consistency Index ( $CI$ ) and consequently Consistency Ratio ( $CR$ ).

#### 3.5 Factor evaluation matrix $R_i$

Evaluation matrix ( $R_i$ ) has been formulated after collecting the opinion of a group of executives and professional.  $r_{ijk}$  is a membership grade that ultimately indicates the degree of evaluation grade. Evaluators’ opinion  $F_{ij}$  belongs to  $V_k$  ( $k = 1, 2, 3, 4$ ).  $1, 2, 3, \dots, n$  in  $R_i$  indicate the number of basic factors.  $1, 2, \dots, m$  indicate the evaluation factors i.e., evaluation sets  $V$ .

$$R_i = \begin{Bmatrix} r_{i11} & r_{i12} & \dots & r_{im} \\ r_{i21} & r_{i22} & \dots & r_{i2m} \\ \dots & \dots & \dots & \dots \\ r_{in1} & r_{in2} & \dots & r_{inm} \end{Bmatrix} \quad (i = 1, 2, 3, 4) \tag{2}$$

#### 3.6 Fuzzy comprehensive evaluation

Fuzzy comprehensive evaluation method is started from the lower level to the higher level in a multi-hierarchy evaluation problem. Fuzzy evaluation set in the second hierarchy:

$$B_i = A_i * R_i = (b_{i1}, b_{i2}, b_{i3}, b_{i4}) \tag{3}$$

In which  $b_{ik} = \bigwedge_{i=1}^n (a_{ij} \wedge r_{ijk}) \quad (i = 1,2,3,4; \quad k = 1,2,3,4)$

$B_1$  has been used to indicate the membership grade of evaluation object  $F_i$  to evaluation element  $V_k$  with comprehensive evaluation to each factor  $F_{ij}$ . After the second level of hierarchy, 1<sup>st</sup> level of fuzzy evaluation comes in the hierarchy.

$$\tilde{R} = \begin{Bmatrix} B_1 \\ B_2 \\ B_3 \\ B_4 \end{Bmatrix} = \begin{Bmatrix} A_1 * \tilde{R}_1 \\ A_2 * \tilde{R}_2 \\ A_3 * \tilde{R}_3 \\ A_4 * \tilde{R}_4 \end{Bmatrix} = [R_{ij}]_{4 \times 4} \tag{4}$$

Fuzzy comprehensive evaluation of second hierarchy;  $B = A * R = (b_1, b_2, b_3, b_4)$

In which

$$b_k = \bigwedge_{i=1}^n (a_{ij} \wedge r_{ijk}) \quad (k = 1,2,3,4) \tag{5}$$

**3.7 Handling the evaluation results**

The used grade weighted vector is  $\mu_v = (1, 0.75, 0.50, 0.25)$ . The comprehensive value can be divided into several intervals as [1, 0.75]. [0.75, 0.50]. [0.50, 0.25]. [0.25, 0] corresponding to very highly responsible, highly responsible, medium responsible and normal responsible. Calculated comprehensive value into the mentioned intervals represents the visually state of the critical strategic aspect of product. The parameter is a product of weighted vector  $\mu_v$  and  $B_k$ .

$$N = \mu_v * B_k^T = \mu_v * (b_1, b_2, \dots, b_k)^T \tag{6}$$

**4 Fuzzy Evaluation for the Index System of Garment Product Strategic Aspects in Bangladesh**

**4.1 The evaluation index system for garment product strategic aspects**

Combining some scholars' research results, the factors of garment product strategic aspects including quality, cost and time, the evaluation index system for the product strategic aspects is constructed. Table 1 represents the evaluation index system for the product strategic aspects.

**Table 1 The Evaluation Index System for the Garment Product Strategic Aspects**

	Factors	Sub-factors
The evaluation index system for the Garment product strategic aspects	Quality	Product Features Engineering Requirement Target Group Quality of Required Material Service Delivery Relationship-based selling Technical Skill
	Cost	Price Cost of Required Material Marketability Customizability Innovativeness Sustainability (Less Fluctuation) Performance Volume Affectivity
	Time	Modularity/innovation Lead-time Supply Chain Product Life time Reliability (Schedule maintaining) Complexity of Integrating Different Phase Flexibility of Time

**4.2 Fuzzy evaluation for the garment product strategic aspects**

Data have been collected from the executive level of the listed organization of BGMEA. For the basic factor decision, twenty executive opinions have been collected on binary mode. Table 2 represents the statistics of decision to identify the indexes of strategic aspects of garments product from the ‘time’. Statistics of ‘quality’ and ‘cost’ has not been presented there. Table 2 has been presented as an example of mathematical calculation.

**Table 2 Critical Factors of Strategic Aspects for Time**

	Element	Grade	$V_1$	$V_2$	$V_3$	$V_4$
			VHR	HR	MR	NR
1	Modularity/Innovation		3	13	4	0
2	Lead-time		5	12	3	0
3	Supply chain		5	14	1	0
4	Product Life Time		4	12	3	0
5	Reliability (Schedule Maintaining)		3	10	5	2
6	Complexity of Integrating Different Phase		3	8	8	1
7	Flexibility of Time		2	12	6	0

The Evaluation Matrix ( $\tilde{R}_3$ ) has been formulated from the basic matrix (table 2),

$$\tilde{R}_3 = \begin{bmatrix} 0.15 & 0.65 & 0.20 & 0 \\ 0.25 & 0.60 & 0.15 & 0 \\ 0.25 & 0.70 & 0.05 & 0 \\ 0.20 & 0.60 & 0.15 & 0 \\ 0.15 & 0.50 & 0.25 & 0.10 \\ 0.15 & 0.40 & 0.40 & 0.05 \\ 0.10 & 0.60 & 0.30 & 0 \end{bmatrix}$$

The weights ( $A_i$ ) has been determined by several experts in terms of 1-9 ratio scale value in decisions matrix  $D_i$

$$D_3 = \begin{bmatrix} 1 & 1/3 & 1 & 3 & 3 & 5 & 7 \\ 3 & 1 & 3 & 5 & 5 & 7 & 9 \\ 1 & 1/3 & 1 & 3 & 3 & 5 & 7 \\ 1/3 & 1/5 & 1/3 & 1 & 1 & 3 & 5 \\ 1/3 & 1/5 & 1/3 & 1 & 1 & 3 & 5 \\ 1/5 & 1/7 & 1/5 & 1/3 & 1/3 & 1 & 3 \\ 1/7 & 1/9 & 1/7 & 1/5 & 1/5 & 1/3 & 1 \end{bmatrix}$$

The priority vector has been calculated after the normalization of weight matrix.

$$A_1 = [0.4144 \quad 0.2202 \quad 0.0392 \quad 0.0957 \quad 0.0957 \quad 0.0957 \quad 0.0392]$$

$$A_2 = [0.2627 \quad 0.1271 \quad 0.1271 \quad 0.0564 \quad 0.0564 \quad 0.2627 \quad 0.0257 \quad 0.0564 \quad 0.0257]$$

$$A_3 = [0.1878 \quad 0.3856 \quad 0.1878 \quad 0.0862 \quad 0.0862 \quad 0.0428 \quad 0.0237]$$

$$A = [0.1429 \quad 0.4286 \quad 0.4286]$$

The calculated consistency ratio is 0.02, 0.02, 0.03 and 0 respectively which are below than 0.1 (C.R <0.1). Hence consistency is acceptable. The fuzzy evaluation (equ. 5) gives the following results,

$$\tilde{B}_i = A_i * \tilde{R}_i = \bigvee_{i=1}^4 (a_i \wedge r_{ij})$$

$$\tilde{B}_1 = [0.13 \quad 0.33 \quad 0.42 \quad 0.11], \tilde{B}_2 = [0.11 \quad 0.55 \quad 0.30 \quad 0.04], \tilde{B}_3 = [0.21 \quad 0.61 \quad 0.16 \quad 0.01]$$

$$\text{Now, } \tilde{B} = A * \left[ \tilde{B}_1, \tilde{B}_2, \tilde{B}_3 \right]^T = (0.13, 0.51, 0.30, 0.05)$$

Fuzzy evaluation has been corresponds with the different sub-factors systematically. That means  $\tilde{B}_1, \tilde{B}_2, \tilde{B}_3$  and  $\tilde{B}$  has been corresponds with  $F_1, F_2, F_3$  and  $F$ .

Fuzzy comprehensive value has been determined by parametric representation method:

$$N_1 = \mu * \tilde{B}_1^T = (1, 0.75, 0.50, 0.25) * (0.13, 0.33, 0.42, 0.11)^T = 0.62$$

$$N_2 = \mu * \tilde{B}_2^T = (1, 0.75, 0.50, 0.25) * (0.11, 0.55, 0.30, 0.04)^T = 0.68$$

$$N_3 = \mu * \tilde{B}_3^T = (1, 0.75, 0.50, 0.25) * (0.21, 0.61, 0.16, 0.01)^T = 0.75$$

$$N = \mu * \tilde{B}^T = (1, 0.75, 0.50, 0.25) * (0.13, 0.51, 0.30, 0.05)^T = 0.68$$

The defuzzification shows that concentration on the factors of ‘time’ is more required to enhance the strength of strategic engineering aspects of garment industry of Bangladesh. ‘Cost’ and ‘Quality’ is in second and third position respectively.

## 5 Conclusions

This paper aims to review the strategic aspects of RMG sector of Bangladesh. The paper reviews the strategic aspects requirement from the point of resource based view. It is agreed that resource based view (RBV) can be effective when it is matched with the contingency theory of the organization. Firm must be able to deploy the resources in ways that match the market conditions they face<sup>[13]</sup>. The result indicates that RMG sector should concentrate more on the ‘time’ issue under the current situation. However, they must be conscious about the three dimensions quality-cost-time simultaneously. J. Rodriguez-Pinto et al. (2011) mentioned that Firm should remain vigilant to shift the emphasis from speed to quality or vice versa during the development of the new product<sup>[14]</sup>. The statement is logical for the RMG sector of Bangladesh also. Efficiency of ‘time’ issue with others dimensions can promise a prospect for the RMG sector of Bangladesh. ‘Time’ with its different factors (lead time, innovation speed, supply chain, flexibility etc) can be investigated more keenly in future to handle them efficiently.

The competition in the international market is increasing day by day. Developing countries, like Bangladesh have to increase efficiency in all aspects to survive in the international market. This paper explores the situation from the strategic aspects of the resource based view of the organization. FAHP approach has been used as it is agreed that fuzzy logic helps to code the sense of human beings.

The fuzzy evaluation suggests manager of the RMG industry of Bangladesh to be more concerned about the ‘time’ factor. The combination of FAHP, RBV and contingency theory suggests RMG managers for sound management of ‘time’ regarding innovation, lead-time, supply chain, product life time, reliability, different phase integration complexity and flexibility in current situations.

**Abstract:** This paper analyses the main problems of the domestic vigorously nonferrous metal industry, and bases on it puts forward the development direction of its IT strategy. It takes information strategy of an typical electrolytic aluminum enterprise as the case and discusses the way to accelerate the step of informatization.

**Key words:** Vigorously nonferrous metal industry; Informatization; Information Strategy

## 1 Introduction

With the deepening of the management reform of China's nonferrous metals enterprise, the informatization work gradually shows its importance. Its core content is to speed up the automatic control technology research during the production process and improve the informatization level of operation and management. In the production control process, it uses some new technologies and new equipments such as automatic and intelligent monitoring instruments to modify the traditional processing technology in mining, milling and smelting and gradually to realize the automatic control process, thus to stabilize the production process, improve the efficiency and enhance the competitive ability of the enterprise. In the business management, it uses database technology, network technology and simulation technology, artificial intelligence and logistics technology, etc, and takes supply chain management as the base to rapidly, effectively, dynamically and coordinately configuration various resources to realize the integration of technology, management and people.

## 2 The Overview on the Condition and Problems of Nonferrous Metals Enterprise Informatization

At present, there are some problems in China's nonferrous metals enterprises, such as low efficiency, high consumption, more rough machining products and less exquisite products, high cost and poor international competitiveness. China has strengthened the informatization work to promote industrialization and industrial optimization. It provides the opportunity for nonferrous metal industry to change the backward status. In recent years, the nonferrous metal industry has done a lot of work in informatization and has obtained a certain result, but there are also some problems mainly in the following respects.

### 2.1 The enterprise's information consciousness is enhancing year by year

Most large key non-ferrous metals enterprise and part of the small and medium-sized enterprise has fully realized the importance of the enterprise's informatization for reducing the production cost and improving the core competitiveness. They could bring the informatization construction into the overall development planning process. In these enterprises, the information organizations usually have comprehensive computer centers, information centers and information management departments. Their investments of informatization are well-planned; capitals are in place; structures are reasonable. And at the same time, they pay more attention to the personnel training in enterprise information. Of course, there are also many small and medium enterprises and individual large enterprises lack proper understanding of enterprise management informatization. They have no clear information development planning. In these enterprises, there aren't special information institutions and information technology talents, they lack the understanding of the basic theory and the concept of informatization, their informatization work usually accompanies with randomness.

---

\* This paper is supported by Science Foundation of Science and Technology Department of Guangxi Province, "The Research and Application of Real-time Control System on SCM of Automobile Manufactory" (No: 10100002-1)

## **2.2 Enterprise information infrastructure has new progress**

According to statistic, in recent years, more than 70% of the large non-ferrous metals enterprise through the management information system applications, has established a 100 M / 1000 M the layer 3 switching backbone or are to set up their own internal backbone, network node is usually covered most of the post, but to the enterprise has not been extended to workshop location and individual management department. They use more advanced hardware device, and the Internet is used to connect the one/signs line or ISDN line level. But there are also many small and medium-sized enterprises have no unified and overall planning to the construction of internal local area network. Many of the enterprise's individual department only built this department within the scope of the local area network, these results in numerous internal local area network system of department level with poor compatibility. And part of these enterprises have not any form of local area network, these enterprises' information infrastructures are limited to use a single computer in individual departments.

## **2.3 All kinds of management software preliminarily get popular applications**

Non-ferrous metal enterprise management software's implementation and application levels are uneven and different. The overall operation effect is poor. The implementation situation and effect of management software's are as follows. Enterprise management software universal system of personnel salary, financial management, product enters sells saves and sales management are more , and the enterprise in a certain scale generally get some degree of application. While software's which can reflect the characteristics of the non-ferrous metal industry production planning system, production management system and quality management system are less and get less successful application. Software's are more used in a single computer, while less shared through the network system, even if are shared is also more in the door instead of through integration in the whole enterprise. Management system and production control system are often separated and hard to realize control integration. Software's which improve the work efficiency are more, and for the decision support are less. In short, the internal utility of management software system has not been fully utilized, and the internal "information island" phenomenon of enterprises is serious. The application effect of large comprehensive and integrate management software, such as ERP, CRM, is poor. According to the survey, enterprises who strictly implemented ERP system are less. On the market, there are less powerful comprehensive management software systems with industry characteristics and the low enterprise implementation level by addition lead to that those early invested network hardware facilities of quite a number of enterprises become idle and cause serious waste. At the same time, the comprehensive management level of these enterprises has not significant improvement because of the early huge investment on hardware.

# **3 A Typical Smelting Aluminium Enterprise Information Development Strategy**

## **3.1 Analysis on the present situation of Enterprise informatization**

In 2005, this enterprise completed the hardware construction in the office building. Based on it, there are following 5 application software subsystems. (1) Financial management system. This enterprise use UFIDA financial software, but she only uses several modules, while other modules haven't be used, such as procurement, sales management and decision support subsystem. (2) Industrial control system. All of the main workshops have a computer control system, but the automation degree is low, a part of workshops have introduced advanced Germany's ELAS industrial control system, but if they want to transplant their data reports into other management system, they need to do further interface development work. (3) Salary management system. Salary management system used by personnel department is still based on FOXBASE database which compiled in the early 1990s. (4) Material management system. It can help the business enterprise realize the inventory management in the warehouse, the workshop production secondary warehouse and the alumina warehouse; realize the equipment maintenance management in fixed assets, and realize the matching purchase plan management, supplier management, in-out warehouse management and realize the data interface with financial system. (5) Office automation system. The enterprise has set up an office automation system in the office network, but the content in the information sharing module need to be enriched, and the workflow is being consummated. In addition, the Web site of the enterprise has been built.

## **3.2 Strategy analysis on enterprise informatization development**

The information development strategy of this enterprise takes customer demand as the guide and regards the establish and perfect manufacturing execution system and enterprise resource planning as the key point in order to promote the integration of production control information and enterprise

management information and comprehensively enhance the overall level of enterprise informatization and realize the efficient collaborative operation of supply chain. According to the information development strategy, the enterprise's future three main development goals are shown in figure 1 as below.

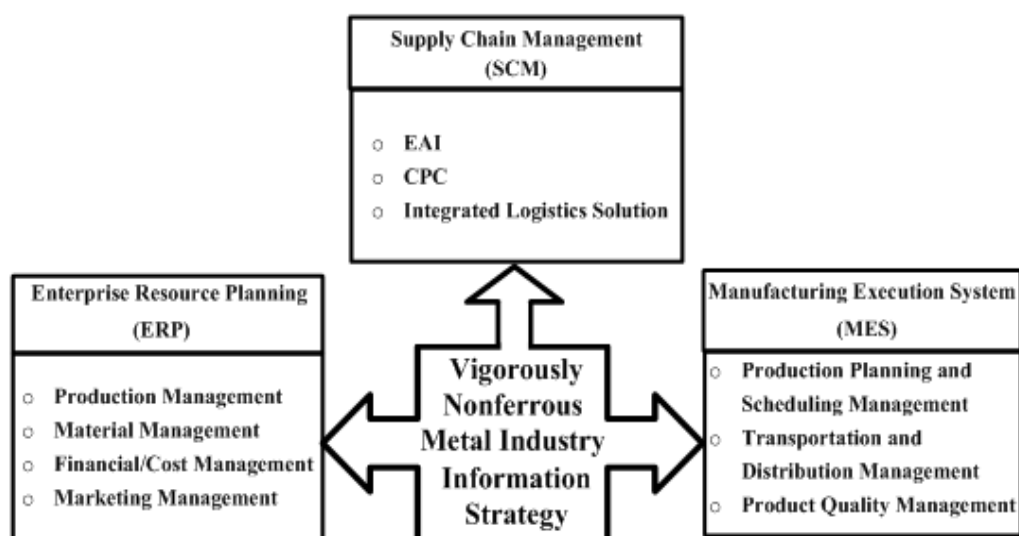

Figure 1 Information Strategy of Vigorously Nonferrous Metal Enterprise

### (1) Manufacturing Execution Systems (MES)

Through the implementation of MES, enterprises can realize the production monitoring and management. MES can also support the real time data collection of production. In a good general framework of information system in an aluminum processing enterprise, the MES at least should include following functions, such as production work order management, project management, homework assignments scheduling and tracking management, production performance and material tracking, location management of materials, batch segmentation and combination, quality management and energy management etc.. The specific functions are as follows. In data collection, it can rapidly collect the real-time process data of control system and the data acquisition system; can provide the interface of data processing and input; to collect and organize the production test data as well as filter and check the collected process data and test data, and in a long time preserve the production data. In field controlling, it can real-time monitor the production site and provide dynamic flow chart. All levels of managers can respectively browse and inquires the data they are concern with and monitor the flow accurately. MES can also provide visualization analysis tools on production data. It helps managers analyze the production status and find out the reason of production accidents and what affects the quality of products. It can also help managers make efficient decisions and optimize the process of manufacturing and operation. In the information querying, MES can realize the querying of the test data; can automatically produce report forms of shifts, days, weeks, ten-days and months and set up a quality data ledger to provide basic data for other applications, such as production management system and management system.

In addition, through the implementation of MES, enterprises can overcome the problems brought by data delays during the production operation process and human factors and strengthen the supervision of production. They can find the hidden trouble existed in the production in time so that they can reduce or eliminate accidents, stable the production, improve the efficiency and level of the production scheduling and reduce the production cost.

### (2) Enterprise Resource Planning (ERP)

To establish and perfect modern enterprise management information system is the key of non-ferrous metals enterprise informatization, and ERP is on behalf of the latest development of modern enterprise management systems. It is the direction of enterprise information work. With the increasing popularity of information technology and enterprise efficiency, ERP has got some degree of application in nonferrous metals enterprise. A part of enterprises have implemented ERP system and have made staggered results. A few enterprises adopted the ERP system of SAP Company in Germany and more chooses domestic ERP system, such as UFIDA and Kingdee after a comprehensive consideration.

Through the ERP project implementation, in financial, enterprises can regulate cost accounting method to realize financial first-level calculation and the period charge budget control of the material purchasing and management fee, operating and manufacturing expense, and automatic control of the foreign pay of cash flow to strengthen the capital risk control management. In human resource, enterprise can achieve the complete system for the future salary and welfare management to lay the foundation for the group centralized human resources management. In marketing, enterprise can realize systematic customer credit control and sales price management to get customer management unified. This systematic marketing system makes marketing centralized management get further deepening. In material management, this enterprise has realized first-degree inventory management and has also realized the business model unity of China Aluminum major raw material quality inspection sampling. They have established a unified China Aluminum material classification and coding system and realized the unified management of suppliers. They have also realized the automatic identification standard according to production consumption, real-time inventory and quality information. It makes the organization more targeted than ever before. They have also straightened out the basic management in mine, and have unified purchasing management. They have realized the unity of responsibility and power inside the system. And to meet the management needs, they have realized the business data sharing on different levels.

In addition, the implementation of ERP will have certain effect on the quality of the employees, business strategy, management thought, the management mode and management method, management mechanism, the management foundation, business process and the organization structure of the enterprise. It needs to set up a scientific, standardized and strict business management foundation to ensure that the ERP system can implement smoothly and consolidate results as well. Therefore, in the ERP application process, we must combine it with the enterprise's actual status and base on the management innovation of the enterprise.

### **(3) Based on the developed material management system to realize supply chain management**

Based on the completed material management system of the enterprise, it transplants some data in production system and strengthens the cost control to the production plan and transportation for the raw materials to realize the complete logistics tracking system. It brings basic modules of the ERP management in, and the data form a unified format in the financial system. It also establishes appropriate statistical analysis and decision support system and realizes the management mode which integrates the MES and ERP together in the supply chain. After the successful implementation of the supply chain management, enterprises can improve competitiveness, market share, customer satisfaction and obtain the biggest profit. Supply chain management takes business cooperation, cooperative competition and win-win principle as the basic operation mode. Through the use of modern enterprise management technology, information technology, network technology and integration technology to effectively plan and control the information flow, logistics, cash flow, and traffic flows in the entire supply chain, so that to make customers, vendors, suppliers, manufacturers and service providers become a complete nets chain structure and form a competitive strategy alliance.

## **4 Conclusion**

With China's accession to the WTO, the competition between the enterprises at home and abroad is inevitable. Non-ferrous metal industries also are facing opportunities and challenges. They must recognize enterprise present problems and consider the user as the center and take the market as the leading factor. They must make full use of the existing IT infrastructure to speed up the construction of the modern enterprise information management platform, to perfect production control and management informatization level and to accelerate supply chain management. They must accomplish information fusion in the production field, circulation field and related field and give full play to the information advantages. In addition, in the information process, they must strengthen the function of the management, and practically run enterprise development strategy through the daily operation process to meet the challenges of the information with standardized management, constantly update management idea and the management method and keep steady development in innovation. Only in this way, nonferrous metal industries can rapidly increase international competitiveness and occupy a place in the future competition.

## Recognition of Neo-Tribalism on the Network

Tang Yang, Zhu Yinghui,

School of Art and Literature, Wuhan University of Technology, Wuhan. P. R. China, 430072

(E-mail: ytang@cumt.edu.cn, zhufly@sohu.com)

**Abstract:** The neo-tribalism refers to a new kind of classification of people, who are not tied by same blood, customs or traditions but by similar conceptions, interests, or living styles. These new tribes mainly congregate on the internet, aging from teens to twenties. This essay concentrates on analyzing how these juveniles' neo-tribes exert their influence on the society and how they interact with other social members through the Internet. Because their behaviors inevitably reflect various social phenomena, their appearance often presents a kind of social trend, ideology, or public opinion, which will guide or affect the other juveniles' behavior positively or negatively. So, it is necessary for us to explore these neo-tribes in order to make them beautiful music notes in the construction of the harmony society.

**Key words:** Neo-tribalism; Reactive interaction; Evocative interaction; Proactive interaction

### 1 Introduction

Since the talk show “Lu Yu’s Appointment” broadcasted the series of programs “The Neo-tribalism” on CCTV, neo-tribes like the LOHAS, the Freeters, the OTAKU come into view of the public in succession. Thereafter, more than 300 hundred tribes like Zhangsan Zu, Shengnv Zu, Kenlaos Zu emerge on the Internet with an unexpected speed. More and more young people are attracted by them, from adoring, imitating to confusing. Such contradictory impact on the youth rouses the public sensation in different ways. Some socialists think that although the neo-tribes first appear as virtual groups on the Internet, they reflect people’s unsatisfied need in the real world; some politicians infer that they represent the special interest of certain groups; some psychologists study how their proposals guide their performance. More and more people immerse to find out more behind the veil of the neo-tribes. In a sense, the more we know about the neo-tribes on the Internet, the more we are clear about our society. So, in this essay, the author tries to help recognize these neo-tribes by illustrating their social interaction with the outside world.

### 2 What is Neo-Tribalism?

#### 2.1 Definition of neo-tribe

The neo-tribalism refers to the state of existing as a neo-tribe, and its significance lies in how we interpret the meaning of a neo-tribe. Neo-tribe is a coined word, and its “new” is embodied in the differences from traditional tribes in three ways. First, the tribe members have no blood relations, no common ancestors or even no customs and traditions; they only share the similar conception of values, hobbies, or living styles. Second, neo-tribes don’t live on certain land, but on a virtual world—Internet. Third, neo-tribes are mainly constructed by young people who are active on the Internet; and they are born as soon as they disappear, suddenly like the wind.

#### 2.2 Reasons for the existence of neo-tribes

The making of neo-tribes has two necessary elements: one is the human nature to belong to a group—even in a total strange society; the other is the Internet, which offers them a freer, more tolerate virtual space to communicate and congregate. That’s why we cannot deny the fact that the neo-tribes do exist in our society.

We can illustrate the reasons from angles of different sciences. In a philosopher’s view, the social existence decides human’s consciousness and human’s consciousness counter-reflects the social existence (Karl Marx).<sup>[1]</sup> The existence of neo-tribes is the result of the counteraction of objective world and subjective human desire. A psychologist will explain it in this way: one cannot live without any influence from his living circumstance. However, he never passively accepts any influence, but actively affects the circumstance, and such mutual interaction keeps on going all the time.<sup>[2]</sup> As a sociologist states, living in the kaleidoscope-like society, people prefer to manifest their differences in life attitudes, social behaviors or living habits which derive from their different social experiences and feelings. But in some particular aspects, they still show the astonishing

similarity.<sup>[3]</sup> Then, according to the above reasons, when a certain amount of individuals accumulate their similar characters to such an extent that they gain enough popularity and begin to affect the others or the society, a neo-tribe was born, and their beliefs, values and activities make a kind of neo-tribalism.

### 2.3 Categories of the current neo-tribes

At present, there are more than 300 neo-tribes appearing on the Internet. Their names not only embody the common features of their members, but also publicize their unique characters from the other groups. According to their pursued values and main characters, they are classified into the following types:

(1) Show the distinctive lifestyles, such as the LOHAS, the Freeters, the BoBos, the OTAKUs, the Zhangsangs, etc.

(2) Show the unusual patterns of consumption, such as the Moonlight, the Sleek, the window-shoppers, the feeling-followers etc.

(3) Show the multiple attitudes towards a specific problem. For example, the different attitudes towards marriage bring about the flash marriage group, the Shengnv, the concealing-marriage group, the marry-upon-graduation etc.

(4) Show the yielding attitude to some social facts, such as the child slave, the mortgage slave, the certificate slave, the exam slave, etc.

(5) Show the special hobbies or interests, such as the Cat Lover, the Hitchhiker, the Wise Traveler, the Shaiwang (those who love to show their privacy on the Internet), etc.

### 2.4 Characters of neo-tribalism

Today's neo-tribalism is largely supported by the youth, so it reflects the youth's common characters.

(1) Volunteer members. Growing up in democratic social surroundings, the young prefer to be independent and free. They tend to regard themselves as members in a neo-tribe as long as they accept its beliefs, values, attitudes or interests.

(2) Loose organization structure. The neo-tribe members congregate for the shared conceptions, interests or hobbies in some aspect, but not for an aimed target. Like the bystanders, attracted by something new or unusual, they are doomed to disperse at any time.

(3) Fluid members and changeable attitudes. There is no strict limit or a sharp distinction between neo-tribes, and the young members inadvertently care about that. They love the fun, casualness, and relaxation to join in a tribe and later convert to another as their attitudes and mood change.

(4) Surprise booming. The neo-tribes are never threatened by the young's unfaithfulness. To the contrary, the new will always appear when the old has not gone, for the young people's changeable lifestyles and diversified values make them alive all the time. Because of them, the social life becomes more colorful and more complex. So knowing them, we can discern how the social phenomena reflect and act on people's psychology.

## 3 How the Neo-Nribes interact with the society?

The neo-tribes are born in the particular social environment, and in turn react on it. As we know, an individual often interacts with his outer settings in three ways: the reactive interaction, the evocative interaction and the proactive interaction.<sup>[4]</sup> As similar individuals tend to congregate groups and reveal their characters as integrity, the neo-tribes do interact with their dependent society in the similar way.

### 3.1 The reactive interaction

The reactive interaction defines that when facing the same environment, different neo-tribes will sense it, experience it and interpret it in different ways. For example, when the newly graduates aged twenties encounter the choices about their future, some decide to be *Kaowan Zu* (the "stable job seekers"), for they think the public servants as the only ideal jobs worthy to be struggling; some prefer to be "*Bihun Zu*", marrying upon graduation to escape pressures from the job competition; others are determined to be "*Ant Tribes*", striving for their goals from zero and springing up from the lowest substrata in the metropolis. The different choices are mainly due to the individual differences, which derive from different psychological factors, congenital conditions and posteriori circumstances (Defleur, 1975).<sup>[5]</sup> Such differences contribute to people's

different character development and behavioral mode, which can best explain the phenomena that the young people with the similar education background take the totally different ways after graduation.

### **3.2 The evocative interaction**

The evocative interaction means that some representative characters and conducts of the neo-tribes will arouse the public's particular attention or reaction to them. The public pays different attention to social groups, and to the weak groups, they usually treat them with sympathy and compassion. But, if some weak groups, with the aid of the media, continue to express their emotions and emphasize their demands, they will strengthen the public's concern and force them to react extraordinarily. At that time, the sympathetic attitudes will escalate to offer help. For example, "*Taoxin Zu*", (the salary seekers), represented by peasant workers and contracted workers, often obtain the social support and relief by evoking the public's sense of justice and responsibilities. Once the press helps them appeal in public, the involved entrepreneurs will be denounced for their illegality and dishonesty. Another group, "*Fang Nu*", who are under the pressure of house mortgage, try to make themselves heard by the central government. As a result, a series of related policies are put in place to help better their living conditions. The media help circulate the social groups' worries, concerns and demands in the public sphere, which make "the present oppressed realize the oppression, and the present oppression become much heavier"(Karl Marx). To enter the public domain by arousing the public's attention is an effective way for neo-tribes to be recognized by the society.

### **3.3 The proactive interaction**

The proactive interaction refers to the phenomenon that an individual in a neo-tribe can actively choose and construct his favorite circumstances, and in turn, the preferred circumstances help build his personal characters. For instance, the *Lehuo Zu* (also called *LOHAS*, "Life styles of Health and Sustainability" for short) advocate the healthy, low-carbon, environment-friendly living style. In their lives, they prefer walking to driving, the recyclable to the disposal, and the natural food to the processed. Consequently, such lives help shape their natural, simple and positive characters. The same case in point is the *Lv Zu* (the travel fans). Loving nature and travel is the main reason for them to create every chance to travel, and travelling in nature frequently contributes a lot to mold their vigorous, frank and adventurous characters. So, no matter how the society develops, human beings will never feel satisfied with their environment. They tend to select and construct a suitable environment to meet their need. And at the same time, they are constrained and influenced by their chosen environment. The two parties are always in the course of dynamic interaction.

## **4 The Influence the Neo-Tribalism Exerts on the Social Life**

### **4.1 The neo-tribalism interferes with the social perception**

The social perception mainly refers to the cognition and understanding of human.<sup>[6]</sup> It studies a complicated process that how people judge others' motives, characters, intentions or attitudes by social communication. Like dropping a small pebble in the still lake, the emergence of neo-tribalism usually creates far-reaching ripples and affects the society perception. For instance, when the society is aware of the coming and blooming of a new tribe, it gets the "first impression" from its novel name. But the name seems to concentrate more to attract eyeballs than to elaborate itself clearly. As a result, the false association of names often interfere with the system of social perception, producing some psychological suggestions such as stereotyped image, halo effect etc. and causing some radical attitudes. Once the social attitudes toward a neo-tribe have come into being, many factitious obstacles will be set unavoidably between their interactions.

### **4.2 The neo-tribalism affect young people's character development.**

When the neo-tribalism is prevailing on the Internet, young people are most liable to be infected. Because they are at the sensitive stage, their body, mind and character are easily changed by the outside influence. When plunging into the Internet without any protection from their belief or value, they tend to accept more before they can perceive the righteous and the wicked, which will contribute to the making of a marginal personality. According to a study, people with marginal characters are more likely to break the established norms and ignore the social orders or principles. The young with marginal personalities usually appear some characters like wandering soul, conflicting values which will make them behave disorderly or suffer the mental anxiety. If they keep this kind of uncertainty in the process

of building their life values or world values, they will lose the power to make judgment between the good and the evil. They will find themselves playing all kinds of roles in the reality but to their sadness, they cannot recognize their real selves. They belong to such susceptible population and tend to be misled by the seemingly fantastic neo-tribes.

## 5 Conclusion

Nowadays, China is concentrating on building a harmonious society. To the government, knowing these neo-tribes is the best way to know her people, for she can adjust the existing policies which could have hurt people's interest in some way, and invent the new to bring more benefits to them. At the same time, the public are invited to judge the legality of neo-tribalism, which determines, in a way, the lifespan of some tribes. To those with positive spirit, the public is tolerant and helpful to promote their growth; to those with negative intention, (usually confusing people's conscience and defying the established order), the public will launch a nationwide argument to test their values. Once the consensus is achieved, people can reject their further erosion voluntarily. Thus, the positive ones will live longer than the negative, for human beings are inclined to pursue and support the virtue and the truth in any society. Only by doing so, the neo-tribalism and the society can really achieve a kind of cooperative harmony.

# Modern Digital Signal Processing in Reference to Image Compression

Adnan Ahmed Ali Albarahany, Liu Quan,

School of Information Engineering, Wuhan University of Technology, Wuhan, P.R. China, 430070

E-mail: fadnanz@hotmail.com, quanliu@whut.edu.cn

**Abstract:** The purpose of this purpose is to compress images while maintaining acceptable image quality. This is achieved by dividing the image in blocks of 8×8 pixels and applying a discrete cosine transform (DCT) on the partitioned image. The resulting coefficients are quantized; less significant coefficients are cut off. After quantization, two encoding steps are made, zero run length encoding (RLE) followed by an entropy coding. Part of the JPEG encoding is lossy, and part is lossless. JPEG allows for some flexibility in the different stages, not every option is explored. Here the entropy coding will only be briefly discussed and the file structure definitions will not be considered.

**Key Words:** Modern digital signal; Processing; Image Compression

## 1 Introduction

A digital signal processor (DSP) is a specialized microprocessor with an architecture optimized for the fast operational needs of digital signal processing (Yovits, Marshall C., 199 & Liptak, Béla G. , 2006 ). Also signal processing is an area of systems engineering, electrical engineering and applied mathematics that deals with operations on or analysis of signals, or measurements of time-varying or spatially-varying physical quantities. Signals of interest can include sound, images, and sensor data, for example biological data such as electrocardiograms, control system signals, telecommunication transmission signals, and many others. According to Alan V. Oppenheim and Ronald W. Schafer, the principles of signal processing can be found in the classical numerical analysis techniques of the 17th century. They further state that the "digitalization" or digital refinement of these techniques can be found in the digital control systems of the 1940s and 1950s (Oppenheim, Alan V.; Schafer, Ronald, 1975).

Digital signal processing algorithms typically require a large number of mathematical operations to be performed quickly and repeatedly on a set of data. Signals (perhaps from audio or video sensors) are constantly converted from analog to digital, manipulated digitally, and then converted back to analog form. Many DSP applications have constraints on latency; that is, for the system to work, the DSP operation must be completed within some fixed time, and deferred processing is not viable. Most general-purpose microprocessors and operating systems can execute DSP algorithms successfully, but are not suitable for use in portable devices such as mobile phones and PDAs because of power supply and space constraints. A specialized digital signal processor, however, will tend to provide a lower-cost solution, with better performance, lower latency, and no requirements for specialized cooling or large batteries. The architecture of a digital signal processor is optimized specifically for digital signal processing. Most also support some of the features as an applications processor or microcontroller, since signal processing is rarely the only task of a system. Some useful features for optimizing DSP algorithms are outlined below.

### 1.1 Typical Operations and Applications

The goals of signal processing can roughly be divided into the following categories.

(1) Signal acquisition and reconstruction, which involves measuring a physical signal, storing it, and possibly later rebuilding the original signal or an approximation thereof. For digital systems, this typically includes sampling and quantization.

(2) Quality improvement, such as noise reduction, image enhancement, and echo cancellation.

(3) Signal compression, including audio compression, image compression, and video compression.

(4) Feature extraction, such as image understanding and speech recognition.

In communication systems, signal processing may occur at OSI layer 1, the Physical Layer (modulation, equalization, multiplexing, etc.) in the seven layer OSI model, as well as at OSI layer 6, the Presentation Layer (source coding, including analog-to-digital conversion and data compression).

## 2 Categories of Signal Processing

### 2.1 Analog signal processing

Analog signal processing is for signals that have not been digitized, as in legacy radio, telephone, radar, and television systems. This involves linear electronic circuits such as passive filters, active filters, additive mixes, integrators and delay lines. It also involves non-linear circuits such as commanders, multiplications voltage control filters, and voltage controlled oscillators and phase –locked loops.

NB:- ADC = Analog Digital Converter

Figure 1 A Simple Block Diagram of A Typical Digital Signal Processing System

### 2.2 Discrete time signal processing

Discrete time signal processing is for sampled signals that are considered as defined only at discrete points in time, and as such are quantized in time, but not in magnitude. Analog discrete-time signal processing is a technology based on electronic devices such as sample and hold circuits, analog time-division multiplexers, analog delay lines and analog feedback shift registers. This technology was a predecessor of digital signal processing and is still used in advanced processing of gigahertz signals. The concept of discrete-time signal processing also refers to a theoretical discipline that establishes a mathematical basis for digital signal processing, without taking quantization error into consideration.

### 2.3 Digital signal processing

Digital signal processing is the processing of digitized discrete time sampled signals. Processing is done by general-purpose computers or by digital circuits such as ASTICs, field programmable gate arrays or specialized digital signal processors (DSP chips). Typical arithmetical operations include fixed- point and floating -point, real-valued and complex-valued, multiplication and addition. Other typical operations supported by the hardware are circular buffers and look-up tables. Examples of algorithms are the Fast Fourier transforms (FFT), finite impulse response (FIR) filter, Infinite impulse response (IIR) filter, and adaptive filters such as the Wiener and Kalman filters.

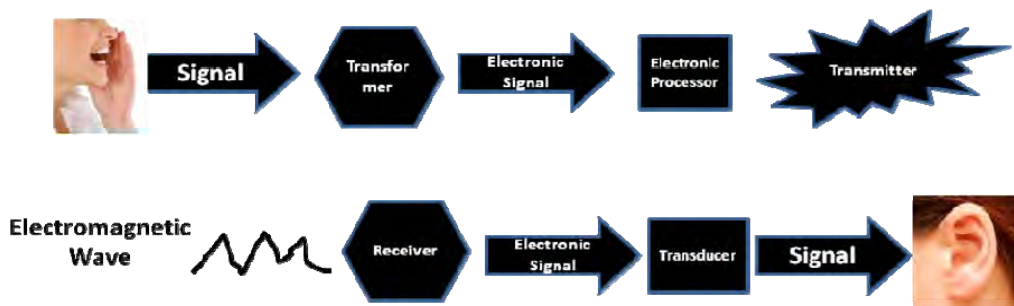

Figure 2 A typical Digital Processing System

The amount of information required to store pictures on modern computers is quite large in relation to the amount of bandwidth commonly available to transmit them over the Internet and applications like video where many thousands of pictures are required would be prohibitively intensive for use on most systems if there wasn't a way to reduce the storage requirements of these pictures (G. K. Wallace, 1991).

A still image is a sensory signal that contains significant amount of redundant information which exists in their canonical forms. Image data compression is the technique of reducing the redundancies in image data required to maintain a given quantity of information. Therefore, data storage requirements and communication costs are decreased. In digital image compression, data redundancy is the main issue and better compression can be achieved by reducing more data redundancy with a degree of quality. There are three types of basic data redundancies: coding redundancy, inter-pixel redundancy, and perceptual redundancy.

Coding redundancy occurs when the codes assigned to a set of events such as the pixel values of an image have not been selected to take full advantage of the probabilities of the events (Jian Jiun Ding and Jiun De Huang, 2007). Inter-pixel redundancy usually refers to the correlations

between the structural or geometric relationships of the objects in an image. Due to the high correlation between the neighboring pixels, any given pixel can be easily predicted from the values of its neighboring pixels, so the information carried by individual pixels can be relatively small. Any information is said to be perceptually redundant if certain information simply has less relative importance than other information in terms of the human perceptual system. For instance, all the neighboring pixels in the smooth region of a natural image have a very high degree of similarity and this insignificant variation in the values of the neighboring pixels is not noticeable to the human eye. The data size of Fig. 1(a) is 83,261 bytes, and the data size of Fig. 1(b) that is compressed by JPEG is 15,138 bytes which is approximately 1/5 of the former one. As the result, it is hard to distinguish Figure 3 (a) and Figure 1(b).

Figure 3 (a) Original Image (83,261 bytes).

Figure 3 (b) JPEG Compressed Image (15,138 bytes)

### 3 Basic Ideas Analysis of Still Image

#### 3.1 Pixel

In digital image, a pixel is a single point in a raster image. The pixel is the smallest addressable screen element shown in Fig. 4 below; it is the smallest unit of picture that can be controlled. Each pixel has its own address. The address of a pixel corresponds to its coordinates. Pixels are normally arranged in a 2-dimensional grid, and are often represented using dots or squares. Each pixel is a sample of an original image; more samples typically provide more accurate representations of the original. The intensity of each pixel is variable. In color image systems, a color is typically represented by three or four component intensities such as red, green, and blue.

Figure 4 Pixel is Smallest Element of an Image

#### 3.2 RGB color image and grayscale image

When the eye perceives an image on a computer monitor, it is in actually perceiving a large collection of finite color elements, or pixels. Each of these pixels is in and of itself composed of three dots of light; a green dot, a blue dot, and a red dot. The color the eye perceives at each pixel is a result of varying intensities of green, red, and blue light emanating from that location. A color image can thus be represented as 3 matrixes of values, each corresponding to the brightness of a particular color in each pixel. Therefore, a full color image can be reconstructed by superimposing these three matrixes of

“RGB”. If an image is measured by an intensity matrix with the relative intensity being represented as a color between black and white, it would appear to be a grayscale image shown in Figure 4.

**3.3 Grayscale**

The intensity of a pixel is expressed within a given range between a minimum and a maximum, inclusive. This range is represented in an abstract way as a range from 0 (total absence, black) and 1 (total presence, white), with any fractional values in between. This notation is used in academic papers, but it must be noted that this does not define what "black" or "white" is in terms of colorimetry. In computing, although the grayscale can be computed through rational numbers, image pixels are stored in binary. Some early grayscale monitors can only show up to sixteen (4-bit) different shades shown in Fig. 5 below, but today grayscale images intended for visual display are commonly stored with 8 bits per sampled pixel, which allows 256 different intensities to be recorded, typically on a non-linear scale. The precision provided by this format is barely sufficient to avoid visible banding artifacts, but very convenient for programming due to the fact that a single pixel then occupies a single byte.

**Figure 5 4-bit grayscale**

**3.4 YUV color space**

What exactly is YUV when talking about video? Indeed it’s a way of breaking the brightness and colors in the image down into numbers, and it’s a little different from RGB, Just as a refresher, most cameras take the light coming into the lens, and convert that into 3 sets of numbers, one for Red, one for Green, and one for Blue. This is called RG. There is one big problem with RGB color – it’s tough to work with. If we need to lower the brightness uniformly on an image, we need to do it to all 3 colors. There’s also a lot of redundancy in the data. To combat this redundancy, there is a different way of storing the information called YCbCr, which breaks the signal down into a Y, or luminance channel, and 2 channels that store color info without brightness info – a Blue channel and a Red channel that don’t contain any brightness.

The correct way to abbreviate this would be Y, Cb, and Cr. However, I want you to try saying YCbCr 10 times, and compare that with saying RGB 10 times. Y, Cb, Cr, is a mouthful. Some engineer somewhere decided that saying YCbCr was just too inconvenient, and borrowed another color term, YUV, to use instead. Technically speaking, saying “YUV” to describe YCbCr is not accurate at all, but the name stuck, and so now, most people who are talking about YCbCr use the term YUV incorrectly. Below in Figure 2, there is a graphic from the Wikimedia Commons site that shows RGB breakdowns of a frame (See figure 6 below).

**Figure 6 A color image is made up of three matrices**

As you can see, the full color image is separated into a Red channel, a Green Channel, and a Blue channel. In the above figure we observed that the same image, broken down into YUV channels. In the case of a color RGB picture a point-wise transform is made to the YUV (luminance, blue chrominance, red chrominance) color space. This space in some sense is more efficient to be decor related than the RGB space and will allow for better quantization later. The transform is given by:

$$\begin{bmatrix} Y \\ U \\ V \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.1687 & -0.3313 & 0.5 \\ 0.5 & -0.4187 & -0.0813 \end{bmatrix} \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} 0 \\ 0.5 \\ 0.5 \end{bmatrix},$$

And the inverse transform is

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1.402 \\ 1 & -0.3444 & -0.71414 \\ 1 & 1.772 & 0 \end{bmatrix} \begin{bmatrix} Y \\ U - 0.5 \\ V - 0.5 \end{bmatrix}.$$

### 4 Basic Image Compressed Model

The JPEG compression process contains three primary parts as shown in Fig. 7. First, to prepare for processing, the matrix representing the image is divided into 8x8 squares. Here the size was dependent on the balance between image quality and the processing power of the time and passed through the encoding process in chunks. To reverse the compression and display a close approximation to the original image the compressed data is fed into the reverse process as shown in Fig. 8. These figures illustrate the special case of single-component image compression. Color image compression can then be approximately regarded as compression of multiple grayscale images, which are either compressed entirely one at a time, or are compressed by alternately interleaving 8x8 sample blocks from each in turn.

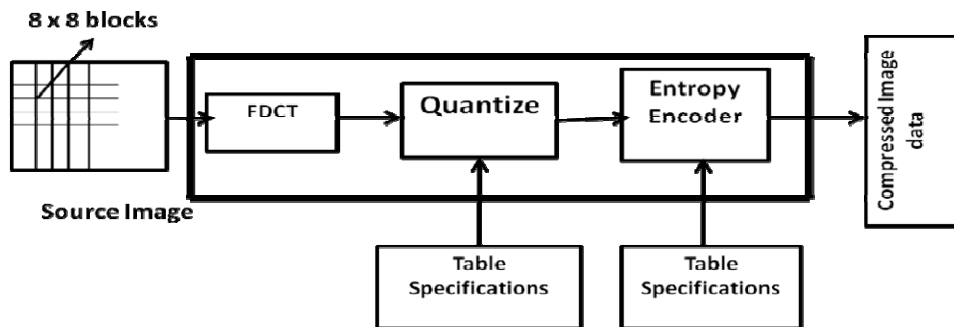

Figure 7 JPEG Encoding Flow Chart

Where by FDCT =Forward Discrete Cosine Transform.

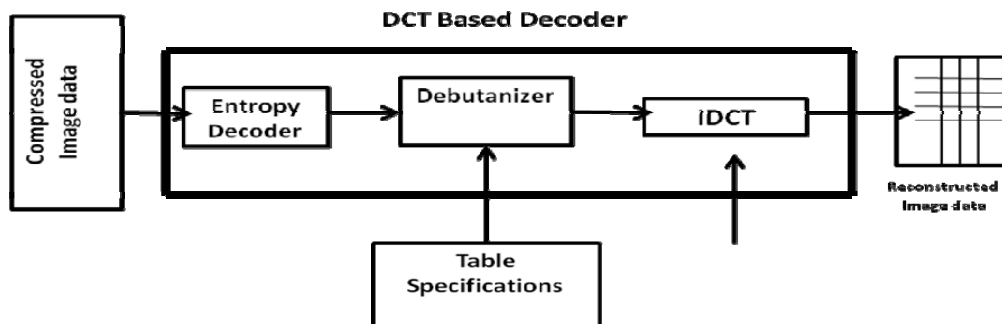

Figure 8 JPEG Decoding Flow Chart

Where by Discrete Cosine Transform.

## 5 Conclusion

Modern signal processors (DSP's) yield greater performance; this is due to both technological and architectural advancements like lower design rules, fast-access two-level cache. Not all DSP's provide the same speed and many kinds of signal processors exist, each one of them being better suited for a specific task, Before the JPEG 2000, the JPEG lossy compression scheme is one of the most popular and versatile compression schemes in widespread use. The term "JPEG" is an acronym for the Joint Photographic Experts Group which created the standard. The JPEG can efficiently compress image without severe distortion and cost less for implement. Due to this, modern digital signal processing became the focus in this article. And this paper investigates JPEG compressing process by dividing the image in blocks of 8×8 pixels and applying a discrete cosine transform on the partitioned image.

(E-mail: 467827811@qq.com)

**Abstract:** This paper mainly analyses Hubei Province's modern logistics and its logistics information technology development status, and compares Hubei Province's logistics status with eastern coastal Provinces' logistics development status. To analyze and research the necessity of building Hubei Province's logistics and public information sharing platform from the aspects of economy, environment and policy.

**Key Word:** Logistics; Logistics Information; Information Sharing Platform

### 1 Introduction

In today's economic society, which is made up of consumption, production and circulation, logistics has become a tool to shorten the distance between producers and consumers both in time and space. Because, no matter producers or consumers; they both don't want to spend too much time on circulation, which makes the function of logistics become more and more important. Logistics and public information sharing platform as an information sharing platform can help to shorten circulation time, it can quickly and efficiently handle a variety of information that produced from all aspects of manufacturing, transportation, handling, processing, distribution, etc, and deliver these information accurately and quickly to all the related enterprises and logistics companies and relevant government departments that on the logistics chain through logistics and public information sharing platform. <sup>[1]</sup>

### 2 The Logistics Status of Hubei Province of China

In recent years, the logistics industry of Hubei Province has being in a strong development situation, and it is transiting from the initial stage to the stage of rapid development. Gradually, it has become the pillar industry of Hubei Province's economic development, and made very important contributions to the Province's economic development. However, for the present, the overall development of logistics industry in Hubei Province is still very low, and it has a big gap compared to the eastern coastal Provinces. Besides, there are a range of issues, such as the economic development is limited, the technological level is low, and the logistics information resources are single and fragmented, and the government policies do not reach the designed position, and so on.

#### 2.1 The status of Hubei Province's logistics industry development

From 2006 to 2010, the total logistics operation of Hubei Province has increased from 1.7586 trillion Yuan to 3.5257 trillion Yuan, the annual average growth is 14.2%; among this the logistics added value has increased from 54.2 billion Yuan to 110 billion Yuan, the annual average growth is 14.6%, accounts for Hubei Province's GDP is about 7%. Among them, the volume of goods transported has increased from 529 million tons to 969 million tons, the annual average growth is 14.3%; and the cargo turnover has increased from 173 billion tons per kilometer in the year of 2006 to 336.7 billion tons per kilometer in 2010, the annual average growth is 18.1%. Up to the year of 2010, logistics costs accounts for the Province's GDP is about 17.6%. Although the level of its development is better than the national average, it is still has a big gap compared to the eastern coastal Provinces. Table 1 shows the statistics of the logistics development indicators in Hubei Province from 2006 to 2010.

**Table 1 Statistics of the Logistics Development Indicators in Hubei Province from 2006 to 2010**

Index Years	Gross social logistics(unit: one hundred million Yuan)	The added value of the logistics industry (unit: one hundred million Yuan)	Cargo traffic(unit: one hundred million Yuan)	Goods transportation turnover(unit: one hundred million tons per kilometer)	Logistics cost account for GDP (unit: %)
2006	17586	542	5.29	1730	18.2
2007	21158	660	5.85	1911	18.1

2008	24813	799	7.58	2700	18.1
2009	27309	903	8.27	2808	17.7
2010	35275	1100	9.69	3367	17.6

It is easy to see from the table that most of the logistics industries in Hubei Province in recent years have maintained a rapid speed of development and the logistics indicators are well improved.<sup>[2]</sup>

Based on this favorable development trend, in “the Twelfth Five-Year Plan” period, Hubei Provincial government will do its best to promote the construction of a modern logistics network system, and unite all its prefecture-level cities to construct a modern logistics circle. The logistics circle makes Wuhan city as its center, and relying on the natural advantages of the Yangtze River economic belt, to drive the development of logistics industry and build the logistics circle in all the prefecture-level cities of Hubei Province. Currently, Hubei has already built a logistics circle that makes Wuhan city as its center and other eight prefecture-level cities like Tianmen, E'zhou, Xiaogan, Huangshi, Huanggang, Xiantao, Qianjiang and Xianning as its extension. And it has built the logistics network, which can not only coordinate the economic development of Hubei Province, but also to promote the formation of the integration of Hubei Province's logistics industry. Table 2 lists its neighboring cities' logistics bases that have been built or under been constructing and the total investment of each logistics base.

**Table 2 Other Prefecture-Level Cities' Logistics Bases and Their Total Investment**

Name of the logistics base	Total investment (a hundred million)	Name of the logistics base	Total investment (a hundred million)
The logistics base of Huangshi	9.2	The logistics commercial center of Taipingxi port	68
Comprehensive logistics base of E'Huang	14	Logistics distribution center of Yizhong	1.8
Feature agricultural products logistics base of Xianning	2.6	Comprehensive logistics base of Jingzhou	8.7
Comprehensive logistics base of Xiantao	7.5	Agricultural products transport logistics base in Jingmen	8
Feature agricultural products logistics base of Xiaogan	0.42	Contrary comprehensive logistics base	12
Logistics circle of Yijing	1.1	Distribution model logistics base of Shiyan	4.4
”Wujiagang-Xiaoting” logistics base of Yichang	16.3	Agriculture products logistics base of Suizhou	9.9

## 2.2 The resources condition of logistics information in Hubei Province

Hubei Province is located in the hinterland of the central plains and it has a convenient transportation. In our country, it plays an important role in transportation. The role of Hubei Province's transportation network plays the role of communicating north and south, linking the east and west. Compared with other Provinces, it has inherent geographical advantages. As we all know, not only Jingjiu and Jinguang railway but also Yangtze river and Hanjiang river across it. Depend on these advantages, Hubei Province has formed a comprehensive logistics transport network that is made up of railways, waterways, roads, pipelines, and aviations, play the role of connecting the logistics of the urban and rural areas and communicating internal and external Province logistics.

In the construction of the public information platform, it has initially formed a more perfect personal and digital communications, cable television and computer networks, the comprehensive communication capabilities significantly enhanced. As long as rapid development of unlimited electronic technology such as GPRS tracking technology, RFID, wireless data communication technology, intelligent transportation technology, wireless data communication technology, research and development of electronic data interchange technology, geographic information systems technology, and MMDS multi channel microwave transmission technology, brought the information technology development of Hubei Province in the front of the whole country, and provide an enabling technology to its modern logistics information construction.

Today, the Hubei provincial government has taken the development of logistics as a key task to develop its economy, and has come up with clear ideas and relevant policies to promote its logistics

development, and they have formulated a series of logistics planning that suitable for the actual economic situation and political situation of Hubei Province. And they proposed to rectify the existing logistics companies, completely changed the small scale, scattered, and disorder management situation, to provide a favorable environment for the development of the modern logistics and the construction of logistics and public information sharing platform in Hubei Province. To strengthen on Hubei Province's modern logistics development of organization and management, full play the role of all government sectors, it has established a modern logistics joint conference system that leded by Hubei Province development reform Committee, joint financial, traffic, police, trade, business, land resources, and logistics enterprise, etc, total 15 sectors, and provide a favorable policy support for the construction of Hubei Province's modern logistics information and logistics and public information sharing platform. [3]

In addition, there are many universities in Hubei Province. Wuhan City alone has more than one million students, which can provides a wealth of human resources for the development of its logistics information and logistics and public information sharing platform. Now, many colleges in the Province based on the current market needs have offered various logistics courses, relevant research institutions also have active research the modern logistics, and the Province is focus on training and introducing logistics professionals, and it also vigorously carried out logistics talents education, then laying a solid foundation for Hubei Province's development of modern logistics and construction of logistics and public information sharing platform.

At present, the logistics information in Hubei Province both in economic, technical, policy and human resources are maturing and promoting the development of modern logistics in Hubei Province and the establishment of logistics public information platform.

### 3 The Comparison Between Hubei Province's Logistics and Our Country's Other Coastal Provinces Logistics

China has a vast territory, the economic development of the three regions of eastern, central and western is unbalanced, the economic development of eastern coastal areas is rapid, the logistics demand is flourish and the logistics development is in a higher level; however, due to economic, regional, and national policy reasons for the restrictions in the central and western regions, the development of the logistics is in a low level, developing the logistics industry is difficult. Table 3 is the list of Forbes 2006 about the logistics development of Chinese city.

**Table 3 The List of Forbes 2006 about the Logistics Development of Chinese City**

ranks	cities	the size of market index	operating cost index	transport index	Provinces and cities
1	Shanghai	0.47109	0.86421	0.00000	Shanghai city
2	Guangzhou	0.47992	0.88395	0.02751	Guangdong Province
3	Ningbo	0.44307	0.73395	0.14721	Zhejiang Province
4	Hang Zhou	0.37607	0.75868	0.18584	Zhejiang Province
5	Yantai	0.20746	0.58211	0.21071	Shandong Province
6	Jinhua	0.34811	0.63289	0.29909	Zhejiang Province
7	Beijing	0.42335	1.00000	0.21744	Beijing city
8	Jinan	0.27044	0.66763	0.24641	Shandong Province
9	Dongguan	0.66395	0.46079	0.44747	Guangdong Province
10	Shenzhen	1.00000	0.83658	0.30348	Guangdong Province
11	Wuxi	0.30682	0.54868	0.36348	Jiangsu Province
12	Tianjin	0.23608	0.89500	0.02312	Tianjin city
13	Fuzhou	0.23213	0.55579	0.30465	Fujian Province
14	Yueyang	0.17280	0.27500	0.38045	Hunan Province
15	Dalian	0.17681	0.71421	0.07550	Liaoning Province
16	Nanjing	0.23327	0.83421	0.14106	Jiangsu Province
17	Wuhan	0.14631	0.60474	0.07316	Hubei Province

It can be seen from the table that the logistics development of Hubei Province only Wuhan in the top 17 cities and it ranks 17<sup>th</sup>. Wuhan represents the center of the economic development and the core of

logistics development of Hubei Province, its development directly impacts on the economic development of the whole Province. However, the eastern coastal Provinces such as Shandong, Zhejiang, Jiangsu, Guangdong, there are more cities in the top 17, from here we can clearly see the gap between the logistics in Hubei Province and the logistics in eastern coastal Provinces. Therefore, if we want the rapid development of the overall economy of Hubei Province, we must strive to reduce the logistics gap with the coastal cities, and make efforts to accelerate the development of modern logistics information technology in Hubei Province. Logistics information sharing platform as an extension of logistics information and support, which plays a very important role, also makes the demand for logistics and public information sharing platform will be more urgent.

#### 4 Conclusion

Although, Hubei Province has a natural advantage on the development of modern logistics, over the past few years, these advantages are not reflected. The reason is, we find that, in Hubei Province, there are independent operations among the logistics bases which have been built or under been building, and there are almost no information exchange and communication between them. This situation not only caused some shortcomings of the logistics information resources, such as single, fragmented, slow update, but also not conducive to the unified management of the government. This makes the Hubei Province is urgent need to build a logistics and public information sharing platform to integrate the fragmented logistics information, and process, handle, integrate, filter, share the mutually inconsistent information and data from different regions, different departments, different channels, then to provide information to support logistics planning and logistics decision-making, for the Province of local governments, businesses, modern logistics information systems support for the Province of small and medium enterprises. The following parts will analyze the necessity of the construction of the logistics public information sharing platform respectively from three aspects; they are economic necessity, environment necessity and policy necessity.

Economic necessity: in the environment of global economic integration, goods are flowing freely with a high speed in the global scale, which promote the cross-border; inter-provincial and cross-sector logistics industries have become more and more sophisticated and effectively promote the prosperity and development of the social economy. In addition, the large-scale combination of electronic commerce field and logistics field is promoting the information technology becoming the core of modern logistics. While as the logistics information platform is the extension and support of information technology, which makes it necessary to construct the information platform.<sup>[5]</sup>At the same time, Hubei Province as the central Province, both the rise of central China and the western development strategy are promoting the fast growth of its economy, this rapid economic growth has attracted many foreign-funded enterprises invested in Hubei Province. As of November 2011, there were 91 enterprise of the world's top 500 have been settled in Hubei and this new economic situation promote Hubei Province must constantly improve the development of its modern logistics industry. Although it has more than 3000 logistics enterprises, large-scale logistics enterprise only account for a quarter of the total number and the number of 3A-class logistics enterprise only 18. Therefore, in order to meet the current needs of the economic development, Hubei Province must establish a safe, reliable and efficient logistics system. To change the current shortcomings in the management of the logistics industry such as small scale operation, low morale of logistics workers, single service function and scattered logistics markets. All of these have forced it to establish a logistics and public information sharing platform to meet the current economic development trend of the logistics industry. And through this platform to integrate the existing logistics resources in the Province, to share the existing resources and give full play to the whole advantage of logistics industry in Hubei Province. Table 4 shows Hubei Province's logistics industry added value, total GDP and the proportion of logistics industry added value in GDP from 2006-2010.

**Table 4 Logistics Industry Added Value, Total GDP and the Proportion of Them from 2006-2010**

Years	logistics industry added value (one hundred million Yuan)	GDP (one hundred million Yuan)	the proportion of logistics industry added value in GDP
2006	542	6590.19	8.22%
2007	660	7617.47	8.66%
2008	799	9333.40	8.56%
2009	903	11328.89	7.97%
2010	1100	12961.10	8.49%

From the table we can see that from 2006 to 2010, the GDP of Hubei is keep rising, but the

proportion of logistics industry added value in GDP change little. This situation limited the economic development, because the logistics industry as a pillar industry of a region's economic growth, its ability to rapid growth directly impact on the region's economic development. According to the present economic growth momentum in Hubei Province, we must change the underdevelopment status of the logistics industry, to increase the proportion of logistics industry added value in the Province's GDP and help it to establish a high level logistics and public information sharing platform to solve the series of problems.

Environmental necessity: for a long time, under the influence of the traditional idea, we pay more attention to the production and development but less emphasis on circulation and environmental protection, which put pressure on our environment and resources, especially in the high-speed economic growth situation. To develop the modern logistics and construct the logistics and public information sharing platform, use modern technology and management methods to integrate various types of logistics information resources, processing, treatment, and then sharing, this can significantly reduce the cost, reduce the rate of empty card rove back and circuitous transport, and reduce the road congestion, emissions and vehicle's fuel consumption. To achieve the transformation of economic growth and improve the management quality and efficiency, at the same time, promoting the development of low-carbon economic social. In addition, the logistics and public information sharing platform can greatly improve the efficiency of the logistics operations. Though the level of information to speed up the documents passing of goods, improve enterprise management level and management efficiency, and to improve cargo security, reduce errors, improve the tracking efficiency of goods and the transaction rates of goods vehicles. At the same time, thanks to the high correlation of modern logistics, which makes all industries that closely related to it such as machinery manufacturing, circulation, postal communication, information services and infrastructure construction have a new development space. Thus, in the new century, as people pay more attention to the conservation of resources and the protection of environment, it is badly in need of establishing a logistics and public information sharing platform to promote the upgrading of the traditional logistics industry and the adjustment of Hubei Province's economic structure.<sup>[3]</sup>

Government necessity: to government departments, logistics and public information sharing platform are also very useful. Late start due to the development of modern logistics in Hubei Province, a lot of logistics enterprises were transformed from traditional transportation and storage enterprises, which makes it very difficult for the government to unified manage and planning them. Through the logistics and public information sharing platform, government departments can directly to manage the logistics companies, can fully grasp the operation status of the logistics market and found its inadequacies, and supervise to improve and control the logistics status. And through this platform also can overall control the logistics market, such as the implementation of online tax returns and management and to supervise some online business. Therefore, the government is in special needs of a logistics and public information sharing platform that can provide multi-service for it, not only to provide services for logistics companies, but also help the government to plan modern logistics development strategy and make modern logistics development policy, and it has an important significance to perfect and develop the modern logistics development of Hubei Province.<sup>[6]</sup>

# A Study on the Materiel Supported Logistics Informatization Evaluation

Sun Hengyou, Tang Pengcheng

Economics College, Huazhong University of Science and Technology, Wuhan, P.R.China, 450000  
Economics and Management College, China University of Geosciences, Wuhan, P.R.China, 430070  
(E-mail:fudongcug@sohu.com, 15827032346@163.com)

**Abstract:** Based on the current system evaluation technology and the special characteristic of materiel supported logistics informatization, this paper gives us three methods about analysis of materiel supported logistics index and systematically analyses the modeling principle of the items of MSLI and proposes system evaluation architecture. This paper also provides some guidance methods for the evaluation of armed MSLI. At last, the components of materiel supported logistics informatization evaluation system are analyzed in detail.

**Key words:** Materiel; Informatization; Items; Evaluation Management System; Evaluation

## 1 Introduction

In China, it is put forward definitely that “vigorously promoting the national economy and social informatization, using informatization to promote industrialization as well as making the most of the late-development advantage to realize great-leap-forward development of social productive force”. On October 9, 2002, Ministry of Information Industry of China firstly takes out the informatization index system for the benefit—“The Basic Index Structure Program of Enterprise Informatization (try out)”, which provides an evaluation foundation and standards for the comprehensive assessment of all kinds enterprises’ information development and application level in China.

For scientific and effective informatization construction, it is necessary to establish a reasonable, efficient and realistic information evaluation index system, according to the statistics, analysis and evaluation of index system data, to lay the foundation for full understanding of the actual situation of materiel supported informatization construction of logistics and provide guidance to materiel supported informatization construction of logistics. Digitization, automation, network, integration, visualization and intelligent of the information management should be gradually realized, and environment of integrated data management should also be built, to realize the whole system, whole process and comprehensive management and monitoring of materiel supported resources as well as provide accurate, fast, and timely information service and scientific basis to guarantee the decision making, so as to realize the “accurate foresee security”, improve the management efficiency and benefits and effectively improve materiel supported the logistics capability and comprehensive management level as well as adapt to needs of the materiel modernization development.

This paper is based on the actual situation of the materiel supported informatization construction, around the aim to improve the management level and guarantee ability of materiel support, according to existing scheme; we put forward a set of basic indicators for materiel supported logistics information.

## 2 The Base of Materiel Supported Logistics Information

Information must firstly include advanced information materiel; secondly the use of advanced information technology for development and utilization of information resource must be included. The two should become the core of information. Because, firstly only by relying on the advanced information materiel to change the traditional pattern of manual operation can it be possible to talk about the high efficiency of information and knowledge production and use; secondly only by high efficiency of information and knowledge production and use can it go up to the knowledge economy, social information economy development. Information is a dynamic process; information is not only a technological revolution, but also a profound understanding revolution and social revolution.

Construction of informatization safeguard of materiel logistics is point to the applying of a series of general modern information technology in the materiel supported logistics, such as computer technology, network technology, database technology, artificial intelligence technology, automatic technology and so on. By deep development and the general use of the materiel supported information resources, the managerial degree of the materiel intensification, together with the reliability and maintainability of the materiel supported as well as the efficiency and level of the management and decision-making should be

improved constantly, so as to improve the economic benefit and combat effectiveness of materiel supported.

### **3 Analysis of Materiel Supported Logistics Index**

In order to get effective index of system evaluation, it is necessary to establish a set of complete and systematic index model system. On the base of study in the structure of the evaluation index system, a variety of methods are used to gain the data of index system and establish hierarchical structure of the quantitative model of the system index, and then to calculate the whole system index with suitable comprehensive evaluation model, at last the results can be applied in decision analysis for decision makers.

#### **3.1 Analysis of materiel supported logistics index**

Materiel supported logistics system is a huge system which is open and complex. The only effective treatment of this system is the qualitative and quantitative method. Quantitative measure is more complex than qualitative measure, but qualitative measure is the basis of quantitative measure, which means that qualitative measure mainly starts with the concept and nature of study object, analyzes the problem by quantitative reasoning and describes the nature of the problem, to lay a solid foundation for further quantitative measure; in actual research process, it often combines the qualitative measure with the quantitative measure, making them complement each other to complete the measure evaluation work of the study object.

Index is the comprehensive signs of measuring the overall goals of system. The index system points toward an organic whole composed by a series of indicators in the evaluation activity, which is a set of scales to measure the evaluation objects. Now, using the method of index system in comprehensive evaluation is widely-held in the social, economic and management sciences for system analysis.

Because of complexity and difficulty of materiel supported logistics informatization evaluation research, the evaluation research should follow the principles that the system should be from senior to low as well as from complex to simple, and the system should be researched by the method of dividing with stratified thinning. Index determination needs to make repeated balance in the dynamic process, some indicators need to be decomposed, and some other indexes need integration or deletion. About the basic methods of index determination, there are three kinds as the following:

##### **3.1.1 Survey modification method**

This is the most general method, in which preliminary draft of index set is drawn up at first by the special experts group, then to widely consult opinions of users, experts and superior leadership on all sides, at last decision is made after the repeated modifications.

##### **3.1.2 Top-down design method**

In this method, first analysis is used to determine the function of the system from the given task as well as determine the measure of system, and then to make evaluation of feasibility, in the end feedback is still needed. The top-down process is dynamic and constantly improving.

##### **3.1.3 Adaptive approximations method**

In adaptive approximations method, firstly index is drafted by the personnel who are responsible for system analysis and evaluation, and the experts who design system and use of units are also invited to bring forward amendments, then to establish the evaluation model after amendments and make modification on the base of the assessment and with reference to the test results of the past, after repeated modification, the final determination of index system structure can be made.

#### **3.2 The standards of materiel supported logistics informatization index system**

The design of materiel supported logistics informatization index system takes "way of entering into system organically" as principle, and materiel information should have global visualization as well as be fast and accurate, so as to make materiel supported informatization cooperate with overall information construction strategy; guide materiel supported informatization established on the basis of benefits, utility, overall planning and sustainable development; make sure the leaders correctly understand and organize the informatization implementation of the work unit.

In line with the following principles to design the materiel supported logistics information evaluation index system:

##### **3.2.1 Testability**

Testability is point to mark quantity of the index. It means that index can be obtained by the method such as the mathematical formula, test instrument, test statistics, etc.

3.2.2 Completeness

Completeness refers to the fact that all indexes which influence performance of the system should be concentrated in the index; collection of index should be extensive, comprehensive and universal.

3.2.3 Independence

Independence means that the index should be irrelevant, and in the system the cross should be reduced, with relative independence.

3.2.4 Objectivity

Objectivity means that the index can reflect the characteristics of the system, and can't vary with each individual.

3.2.5 Sensitivity

When the parameters of system's index change, the performance of the system should response to the change accordingly.

3.2.6 Consistency

Index should be easy to understand and accept as well as easy to form the common language of the study.

3.2.7 Maneuverability

Index should be linked up with existing data as far as possible, and the required new indexes should not only be clearly defined, but also be facilitated for data collection.

3.2.8 Continuity

The design of index system should not only continue in time, but also develop in the content.

**3.3 Index equipment safeguards logistics informatization**

From the aspects of leadership, strategic index, application, benefits, human resources, information security and other aspects, we put forward a set of indexes which are applicable to the objective description of each unit's normalization condition, mainly for the statistical investigation, monitoring and performance measurement. Specific index see table 1: the comprehensive index of the system can be received from weighted index for dimensionless of total index, and it reflects the degree of equipment's safeguarding informatization construction. The specific calculation of weight can refer to the expert scoring method, analytic hierarchy process and fuzzy evaluation method, etc. The decision of the method is in combination with the policy guidance. Due to the limited length, the below table is a rough guide list of level 1 and level 2 indexes for the equipment support logistics information evaluation index system.

**Table 1 Materiel Supported Logistics Informatization Evaluation Index**

First –class index	Second –class index	Constitution of index data
Strategic position	informatization importance	the top leader's position of the informatization work, information planning and budget formulation
	management system	the situation of making informatization management rules, management idea, management model, the control method, management mechanism, the management foundation, business process, organizational structure's obvious improvement and promotion
Infrastructure	the department computer quantity	large , medium and small computer, server, switchboard, workstation and personal computer
	network performance level	export of broadband network
	computer network rate	the rate that computers are connected to the intranet
	information automatic acquisition rate	informatization means that used for acquiring materiel supported logistics data and other resources information
Application situation	office automation system	whether to realize the schedule, receive text management and release information as well as deal with electronic mail, tracking and monitoring of information process, etc.
	the decision informatization level	whether there're data processing system, scheme of prior system, artificial intelligence expert system, etc.
	key business processes	the coverage and quality level of management informatization of main business process
	website construction	the coverage of service object, together with level and content of available service

	network utility ratio	online application rate; online transceiver rate; information sharing degree
	management informatization utility ratio	coverage rate and integration level of management informatization data; whether basic data is timely and effective, and whether its accuracy rate is above 95%
Human resource	informatization skill popularizing rate	the proportion of professional application technical personnel and coverage rate of non-professional informatization training
	electronic level of the study	coverage rate of electronic learning personnel, available degree in the area of studying electronic learning
Security	informatization security measures	information backup, illegal invasion prevention, anti-virus, information security system and cultivation of safety consciousness as well as status of measures application
	the proportion of the informatization investment used for information security	information security cost includes software, hardware, training and human resource spending
Efficiency index	materiel supported logistics guarantee efficiency	efficiency and satisfaction of all the materiel support activities
	materiel transceiver system	time that materiel transceiver is treated by the information system, situation of optimizing resource allocation and transfer
	equipment statistical speed	the shortest time that is needed by a full virtual final account from the statistics instructions' being sent to being completed
	growth index	the reliability of the information system; it is used to evaluate the main economic index of the materiel supported logistics capability and manage the assessment index during the process

#### 4 Structure Design of Materiel Supported Logistics Informatization Evaluation System

According to our research, materiel supported logistics informatization evaluation system is mainly combined with expert system which is an intelligent computer program system to design.

The internal part contains a lot of knowledge and experience of experts' level and can use the human experts' knowledge and methods to solve the problems of the domain, that is, the expert system is a program system which has a large number of specialized knowledge and experience, and it uses artificial intelligence technology and computer technology, based on the knowledge and experience provided by one or more experts of a domain, by reasoning and judgment to the decision-making process of human experts is simulated, so as to solve the complex questions those need human experts to be processed. The system can be divided into the following subsystems, which can make it better to describe system structure. The structure diagram of system evaluation is shown in figure 1.

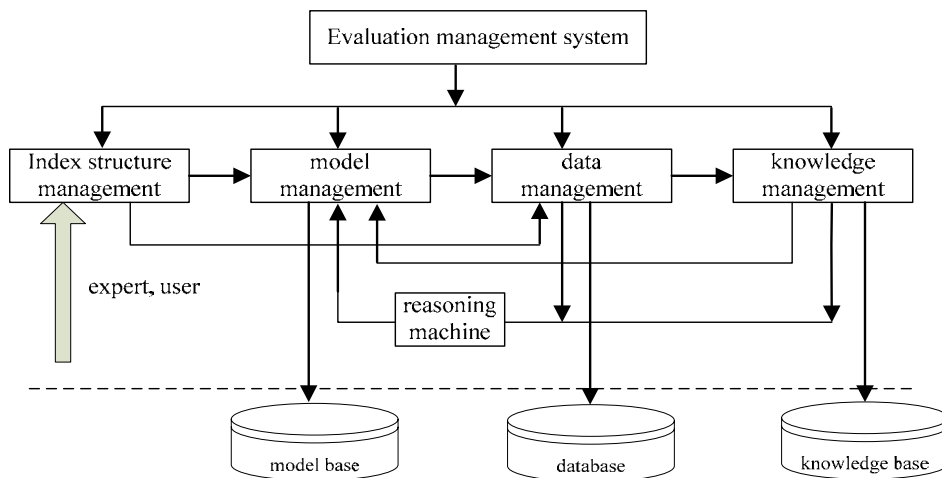

Figure 1 Materiel Supported Logistics Informatization Evaluation System

EMS (evaluation management system) is the top management of evaluation system. The content of the evaluation management includes index system management of equipment support logistics information system, comprehensive evaluation algorithm management, comparative analysis and parameter sensitivity analysis.

#### **4.1 Item structure management**

Index management subsystem establishes reasonable evaluation index system structure according to the users' requirement to the material supported logistics informatization system evaluation, and it which is the most important part of the evaluation process lays a foundation for evaluation management. The subsystem is responsible for not only the establishment, modification and adjustment of the index level structure mode, explanation of each index and acquisition standards of the quantized data, but also the data communication with model management system; the right model is used to quantify index data.

#### **4.2 Model management**

The management subsystem model is mainly responsible for not only the management of the model, but also exchanging information and data with other management subsystems. It can obtain data from database or dialog interface of man machine. Evaluation management subsystem calls reasonable model according to the index system determined by index structure management subsystem, and it also starts the synthetic evaluation of system. It can also turn some half structural model problems into structural model problems and management them.

#### **4.3 Data management**

Data management system is used to manage a variety of data of the entire measure index. It is used to store initial data of areas or the questions and intermediate data information in reasoning process that is the current fact of the processed object. It also includes the illustrative knowledge of the specific problems which have been solved and the current state of the problems needed to be solved.

Its main functions include database management which provides the data exchange interface between database and model library as well as offers performance data to performance management subsystem and finally feeds the rationality analysis of the model evaluation results back to calibration management subsystem.

#### **4.4 Knowledge management**

Knowledge management subsystem is mainly used in the knowledge management work, and knowledge base includes two parts. One of its parts is the information related with current model base and database; the other part is general knowledge and domain knowledge that is used in reasoning process. Most of knowledge represents rules, network, process and other forms. Knowledge base is used to store the special knowledge of expert system in a technology field, including the fact, the feasible operation and rules. In order to establish knowledge base, we must solve the problem of knowledge representation and knowledge acquisition. Knowledge acquisition includes how knowledge engineers get special knowledge from experts; knowledge representation is to solve how to express and store knowledge in the forms computer can understand.

Specialized knowledge and experience of expert system are very important in knowledge base. The key to success for expert system is whether we have a vast amount of knowledge, so knowledge representation becomes the key of expert system's design. In the level of control program, we must decide that which knowledge in knowledge base should be used according to the control strategy and the nature of the problem. The control strategy here is reasoning method. According to whether probability information is required, the fuzzy reasoning or accurate reasoning is decided to be used.

#### **4.5 Reasoning machine**

Reasoning machine uses the memory rules and the control strategy of the program to control the reasoning process, coordinate runtime knowledge calls and have the reasoning ability for many different options in model and the hypothesis, or different state in time. Reasoning machine can reason and draw a conclusion according to the knowledge, rather than the simple search of ready-made answers.

The expert system based on the model has used the model reasoning method. The reasoning method based on the model reasoning according to the model which reflects the internal rules of the objective world. There are a variety of models available to use, such as all parts of system components; the whole structural relationship model; hierarchical model that expresses level relationships, function model that expresses all parts' function and performance, causal model that expresses the causal relationship of all parts and so on. Of course, model based reasoning can only be used in the fields where model is available.

Systematic notion should be used in materiel supported logistics informationization system evaluation; it should be the organic synthesis of each subsystem rather than simple combination. It

should synthesize each subsystem organically rather than simply combination. It also should have satisfactory viewpoint, and materiel supported logistics informationization system is a complex information system, while the proper and optimum system concept doesn't exist in math, so what we should do is to find a satisfactory system and feasible solution. The method of materiel supported logistics informatization system evaluation still needs further research. Over the next years, statistical knowledge should be used in calculating the statistical data and evaluating the results to further test the evaluation model and further analysis on how different index factors have effect on information construction.

## 5 Conclusion

Based on the current situation of materiel supported informatization construction in China, the paper systematically uses three methods, combining with its eight principles to summarize the contents of materiel supported logistics informatization evaluation index which is subdivided based on first and second index. At last, materiel supported logistics informatization evaluation system is given, which is useful for relevant assessment, so as to improve the management level and guarantee ability of materiel support.

## Research on the Construction of Competence Model about Network Businessmen

Qing Jing

School of Politics & Law and Public Administration of Hubei University, Wuhan, China, 430062  
(E-mail:78916790@qq.com)

**Abstract:** Many activities in organization are based on the person's competence, so competence has become an important factor to impact personal performance and organizational benefits. Development of competence has become an increasingly important issue. This paper used network businessmen as the research objects, and adopted the methods such as behavior event interview, questionnaire investigation, and content analysis to structure the competence model of network businessman. The results of this paper revealed the competence of network businessmen, and on the basis of competence model of network business, this paper provided a foundation for the improvement of network businessmen's performance.

**Key words:** Network Businessmen; Competence; Competence model; Factor analysis

### 1 Introduction

Since the concept of competence was proposed in 1970s, many academic researches and applications looked as a central issue and foundation in HR management. In terms of the competence research, an ample of evidences and experiences about competence were harvested in foreign country. Relatively, the researches about competence in China were fewer. Especially, little study was found in.

With the mutually popularizing of Network and the speedy propagation of information, Electronic Commerce have already formatted an importance strength for the current economic development. The businessman who used of Electronic Commerce to carry out business operations is called network businessman. According to the statistics, in 2007, Chinese C2C e-commerce market deals reached 51.8 billion, and in 2008, C2C markets deals had already exceeded 100 billion. This data is expected up to 4,000 billion in 2011. Also, the users of Chinese C2C e-commerce market in 2007 had reached to 48 million, and the total users had reached to 126 million in 2011. It can be seen that network businessmen is a huge groups which has a significant growth prospect.

The competence model will be varied in different culture and different industry. So the foreign competence model was not compatible for the Chinese cultural environment. The research about the competence of network businessmen is in blank space in current academic circles. This paper led the idea of competence management into network businessmen, enriched the theory system of competence. The effect was also beneficial to build the behavior regulations about network businessmen, and realized the effective management of network businessmen.

#### 1.1 Theory connotation of network businessmen's competence

This paper summarized various scholars views about the connotation of competence, summed up the meaning of competence as the following aspects: firstly, competence is closely to performance, and competence can identify between different performance; Secondly, the characteristics of competence are closely connected with work situations, namely, different work situations require different competence; Thirdly, individual competence has different administrative levels; Fourthly, individual competence level can be measured and evaluate objectively.

All in all, network businessmen's competence can fully reveal the high or low level of their competency elements, and is the critical success factor causing high-level work performance of network businessmen. Research on network businessmen' competence, is not only the overview and summary of the success about network businessmen's work from the work practice, but also can guide the future work of the network businessmen through competence research.

#### 1.2 Research significance about network businessmen' competence

In this context, research significance about network businessmen ' competence is particularly notable, mainly manifested in the following aspects:

Firstly, network businessmen has become an important booster of economic growth. In recent years, the rapid development of the Internet economy and E-commercial market has been expanding rapidly. So network businessmen has become an important force of China's economic development;

Secondly, network businessmen require scientific evaluation and guidance. The purpose of competence research is to find the core competencies which can distinguish different performance, which

competencies are directly related to network businessmen's performance; Thirdly, there is lacking of the representative competence model about network businessmen currently. So it is difficult to improve network businessmen ' performance through using competence model. Network businessmen are an emerging group. There are just a dozen years from their emergence to development to today, and their development is accompanied by the growth of Internet industry. Therefore, systematic and in-depth research on network businessmen ' competence, can enrich the competence theory in the domestic and foreign research field, and become the foundation about competence-building theory of network businessmen.

## 2 Analysis about Network Businessmen's Competence Characters

This paper choused network businessmen as the study object, and adopted the methods such as behavior event interview, questionnaire investigation, and content analysis to structure the competence model of network businessmen. This dissertation choused 27 network businessmen, and carried on in-depth interviews. Through the output of interviews, we obtained the Competence Dictionary and the Competence Characteristic Questionnaire about Network Businessmen. According to the interview result and applying the Competence Characteristic Questionnaire about Network Businessmen, carried out questionnaire investigation, and gave out 180 questionnaires.

### 2.1 Acquit ion of network businessmen's competence characters

Network businessmen ' competence characters were acquired mainly through behavioral event interviews of network businessmen.

Interview content mainly involved the key competence characters which can impact work performance. Seen from the industry, network businessmen should have the capacity to accept new things, and be good at grasping the opportunities; From the working content of network businessmen, they should have the interpersonal capacity and communication skills with customers; Judging from the characteristics of the network economy, network businessmen also have a certain network operations expertise and grasp special knowledge about network economy.

Overall, the result of interview showed that the characteristics which affect network businessmen's performance are the following main areas:

(1) **Market awareness:** the capacity to analyze market environment in the face of competitive pressure and the ability to make change, including seizing opportunities, information gathering, information explanation, observation ability, innovation, acceptability, reverse thinking, breakthrough tradition;

(2) **Interpersonal skills:** coordination skill in dealing with various relations and of resources, including the ability of repute, public relation, communication skill, social awareness, teamwork, altruistic behavior, organizational awareness, compliance and so on;

(3) **Personal influence:** mainly is one's own character and behavior, including fairness, objectivity, integrity, honesty, tolerance, reliability, attention to quality, attention to order, following rules, strategy, responsive, creativity, sense of efficiency, and so on;

(4) **Management leadership:** including organizational skills, management ability, decision-making, self control, command and management, achievement-oriented, awareness of rights, clear development goal, challenges and so on;

(5) **Professional skills:** including technical expertise, knowledge, self-education and so on.

### 2.2 Variance analysis of network businessmen's competence characters

Due to the particularities of Network industry, network businessmen should also have its specific competence corresponding to this industry in addition to general competence. According to the result of survey, we analyzed the variance analysis between competence and performance.

s the following table 1

**Table 1 Variance Analysis between Competence and Performance**

Competence	F	Sig	Competence	F	Sig	Competence	F	Sig
Respond quickly	11.425	0.001	Communication skill	8.237	0.005	Upward mobility	11.123	0.001
Strategic thinking	11.425	0.001	Sense of achievement	6.706	0.011	Capturing opportunities	10.259	0.002
Convincing	4.587	0.034	Public-relation ability	6.734	0.011	Overall-situation awareness	5.329	0.023
Social awareness	4.042	0.047	Decision-making capacity	10.501	0.002	Sense of trust	15.757	0.000
Personal prestige	14.300	0.000	Accept new things	13.067	0.000	Responsibility	11.632	0.001

Organizational capacity	9.279	0.003	Breaking through traditional	10.765	0.001	Continuous learning	9.212	0.003
Service awareness	22.373	0.000	Innovation ability	17.368	0.000	Observation skill	12.531	0.001
Team collaboration	35.346	0.000	Understanding	14.019	0.000	Sense of efficiency	13.194	0.001
Emotional stability	5.343	0.023						

From the result in table 1, there are 25 competence characters which significantly correlate with their work performance. Excellence performance groups and common performance groups are different significantly in responded quickly, communication skill and so on (significance level 0.05).

### 3 Construction of Competence Model of Network Businessmen

On the basis of variance analysis, exploratory factor analysis helps us to construct competence model of network businessmen. Firstly on first inspection, we do a KMO appropriate test and Bartlett ball test on important competency data. The result indicates that this data is ideal for factor analysis. Result is in the table 2 below:

**Table 2 KMO Appropriate Test and Bartlett Ball Test**

Bartlett	KMO	.787
	$\chi^2$	1073.909
	df	300
	Sig.	.000

Application of principal component analysis method, this paper finally extracted 7 factors which characteristic value is more than 1, and their cumulative explained variation is 60.79%. The result is in the table 3 below:

**Table 3 Principal Component Analysis**

Factor	Total explanatory variables			Factor loading		
	Total	variance	Communality	Total	variance	Communality
1	6.486	25.946	25.946	6.486	25.946	25.946
2	2.175	8.701	34.647	2.175	8.701	34.647
3	1.675	6.700	41.347	1.675	6.700	41.347
4	1.407	5.628	46.974	1.407	5.628	46.974
5	1.242	4.967	51.941	1.242	4.967	51.941
6	1.116	4.465	56.406	1.116	4.465	56.406
7	1.096	4.384	60.790	1.096	4.384	60.790

According to the result of factor analysis, competence characters which contain in factor 1,2,3,4,5,6,7 are concentrated, so we attempt to name and summary each competence factor. The result is in table 4 below:

**Table 4 Network Businessmen’S Competence Model**

Factor	Name	Competence characters	Correlation
Factor 1	Social contact ability	Social awareness	0.942
		Communication skill	0.886
		Public-relation ability	0.889
Factor 2	Team spirit	Overall-situation awareness	0.530
		Sense of trust	0.538
		Service awareness	0.596

		Team collaboration	0.519
Factor 3	Achievement desire	Upward mobility	0.288
		Capturing opportunities	0.695
		Responsibility	0.622
		Sense of achievement	0.695
Factor 4	Creative thinking	Respond quickly	0.754
		Accept new things	0.600
		Breaking through traditional	0.338
		Innovation ability	0.597
Factor 5	Individual influence	Strategic thinking	0.756
		Convincing	0.571
		Personal prestige	0.550
		Sense of efficiency	0.116
Factor 6	Management and leadership ability	Continuous learning	0.811
		Organizational capacity	0.270
		Decision-making capacity	0.342
Factor 7	Interpersonal perception	Understanding	0.764
		Observation skill	0.452
		Emotional stability	0.211

The result indicated that the competence of network businessmen was composed of seven kinds of factors, such as social contact ability, team spirit, accomplishment desire, creative thinking, individual influence, management and leadership ability, and interpersonal perception.

#### 4 Conclusion

On the summary of the past research results related to competence and competence model, this paper used behavioral event interview and questionnaire method, established the competence model of network businessmen, and provided an objective basis for the improvement of network businessmen's performance.

The competence model of network businessmen constructed in this paper will extend the range of competence research to the group of network businessmen, improve the level of theoretical study of network operators, and promote the performance of network businessmen. It is hoped that network businessmen should develop more orderly and more efficient on the basis of competence model in the future.

# Analysis on the Yacht Interior Outfitting Modular Partition Design Method\*

Pan Changxue, Meng Shuai, Xu Jin

School of Art & Design, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: Ppcx2288@vip.sohu.com, mengshuaixingxing@126.com, mlongxj@163.com)

**Abstract:** Yacht interior outfitting of modular design is an effective method for the yacht manufacturing enterprises to realize the mass customization of yacht interior outfitting, and it is one of the important research directions of yacht. The division of Yacht internal outfitting module is the basis of implementing yacht interior outfitting modular design. The scientific system of modular division can ensure the effective implementation of the modular design and organization of modular production. So study of yacht interior outfitting modular theory, analysis of the basic characteristics of interior outfitting of module partition, and inductive yacht interior outfitting module partition method, are the base of study for modular design in yacht interior outfitting.

**Key words:** Modular; Principle of partition; Partition method; Enumeration method

## 1 Introduction

As an individual consumer product, yacht reflects the user's social status, aesthetic, values. Yacht interior outfitting as the direct interaction interface of yacht and users, is an important part to embody the style and quality of yacht. Different users according to their own aesthetic and value orientation will choose different styles of interior design. Yacht interior outfitting is a complex system, including infrastructure unit (hydropower unit, pipe unit), decoration unit (a furniture unit, wall unit), functional unit (cabin unit, health unit, kitchen unit). Mass customization production model extends the shipbuilding cycle. Using non standardized components makes it difficult to ensure the quality of yacht interior outfitting.

At present domestic yacht interior outfitting is a kind of multiple variety and small batch engineering. Yacht modular design is still in its primary stage, lacking scientific system research of modular theory. The research of yacht interior outfitting module partition method is more deficient. Modular design of yacht interior outfitting is an effective measure to solve the contradiction between yacht outfitting diversification demands and mass production. The research of yacht interior outfitting module partition method is the premise to achieve the yacht modular manufacturing. Yacht mass customization mode is the development direction of modern yacht design. In recent years modular design concept began to transform from naval to civilian ships. In the engineering application aspect, modular design is mainly reflected in the system module partition, module combination, and the use of standard modules between series and even cross series products. This enables a module to be involved in the series products, and then form the diversification of products to meet customer's demand for product diversification<sup>[1]</sup>. The modular design realizes the complex system transformation from the personalized products to the serialization of products, reduces product development costs, shortens production cycle, improves production efficiency, and meanwhile makes the later product maintenance, update, recycling, and recreation more convenient. The purpose of the module partition is to realize the mass production of module based on the high-efficient operation of yacht interior outfitting engineering. Scientific system of module partition can greatly improve the production efficiency, reduce the yacht outfitting costs. Meanwhile independent modules can facilitate the standardization, generalization, and series in design, then promote module's batch and planned production<sup>[2]</sup>. Module partition requires consideration of the limits in production conditions, structural strength, processing technology and other aspects. It is integrated design engineering.

## 2 The Basic Characteristics of Yacht Interior Outfitting Module Partition

### 2.1 The influencing factors

The yacht interior outfitting has its own characteristics compared with Ordinary home decoration

---

\* This paper is supported by the project of Guangdong Province, China and Department of education combined with Enterprise, School and Research department:40-100 feet large high-end yacht design independent R & D and industrialization. Project number:2011B090400156.Guangdong of China Finance NO:438(2011)

and the large ship interior decoration. Yacht interior outfitting has relatively narrow space, at the same time it needs to meet the demand of the user's (owner) aesthetic and its function. Designers need to comprehensively analyze the space, materials, technology and other aspects, and then make the reasonable layout and module partition of Yacht interior outfitting.

## **2.2 Five characteristics of Yacht interior outfitting module partition**

### 1) Identity of module partition

Yacht interior outfitting system includes: pipe system, power system, communication system, wall unit, furniture, sanitary unit, etc. For these systems and unit division, the yacht interior outfitting module partition should follow the identity of module partition, accordingly the divided sub-modules need to be classified into the same type of module library in the partition for the same unit. This division can facilitate the management, update, replacement and the new development of the module.

### 2) Adaptability of module partition

The module level needs to be considered in module division. Module is a relative concept. Each module can be divided into several smaller modules, with the smallest module as the unit member. In the module partition, we need to take the adaptability of module partition into consideration, and make the reasonable division of system-matching module according to the limiting factors such as difficulty in different module productions, module size, and module weight. Rational module partition can greatly improve the yacht interior outfitting module manufacture, installation efficiency; guarantee the precision and quality requirement of interior decoration.

### 3) Independence of module partition

The division of the module changes the complex systems into a relatively simple design unit. Each divided module is able for independent design and manufacture<sup>[3]</sup>. Since modules change into relatively independent units, in collaboration with the general interface finally we can complete the overall interior outfitting production. Independence of module partition can ensure the success of concurrent engineering in design of yacht interior outfitting. Meanwhile, under production condition restrictions, independence of module partition enables the module production to be assisted by module outsourcing or off-site coordination.

### 4) Operability of module partition

Limiting factors such as plant, hoisting, production, installation and other production conditions need to be considered in module partition. Divided module must meet the hoisting equipment practical ability, so as to avoid unnecessary accidents in production. At the same time, the degree of difficulty in installation and manufacture should be taken into account, so that over-complex modules can be simplified as much as possible to reduce the production difficulty. Only with full consideration to the actual production conditions can a more reasonable modules form be designed in the existing conditions.

### 5) Economy of module partition

Module partition on one hand is to meet the demand of mass customization, and on the other hand save the cost of the enterprise. The economy of module is a comprehensive embodiment, including manufacturing costs, maintenance costs, and the bulk of the cost effect. Yacht interior outfitting system in the module partition needs comprehensive analysis from the overall situation to help the yacht enterprise obtain the biggest economic effect.

The above are the basic characteristics of the yacht outfitting modular partition. These characteristics are helpful for modular design of the hull of the yacht or outfitting. Modularity is a general concept. Although only classification and split task needs may be different due to different backgrounds, in practice, it can be used to solve many design problems<sup>[4]</sup>. The characteristics of modular partition are the summarization of specific design practice and experiments. Only in these constraints of the characteristics, we can transform modular design into modular production practice.

## **3 The Modular Division Method of Yacht Interior Outfitting**

### **3.1 Analysis method of the modular division**

Yacht interior outfitting module partition method is related to the degree of module subdivision. Module partition is the foundation of the development of module series and module standardization. Referring other industry's method in the area of module partition is an important way for the research of yacht interior outfitting modular design, and it can provide a train of thought of yacht interior outfitting module partition. This paper summarizes several modular division method based on the basic characteristics of Yacht interior outfitting module partition.

### 3.2 The method of yacht interior outfitting modular partition

#### (1) The yacht interior outfitting modular partition according to region

In recent years, ship design has been developed to unify the shipbuilding form. With the ships' piecewise regional segmentation, which should be pre-installed, becoming increasingly bigger, the large ships' integration platform pre-installation rate is increasingly high, and the package enjoy ever higher modular degree<sup>[5]</sup>. There were some differences between the integration shipbuilding mode of large ships and the modular design of the yacht interior outfitting, but the modular division of the yacht interior outfitting could draw lessons from the respect of modular division. Using the method of modular division, the space of yacht can be divided into: the sitting room area, kitchen, driving control centralization, toilet, master bedroom, the crew bedroom, flying bridge active area etc. (as shown in figure.1). At present, the design of the module has developed to the one that is provided with independent toilet and accommodation modular unit<sup>[6]</sup>. The modules divided by region have the characteristic of independent space. Under the allowed conditions of hoisting and manufacturing, developing the modular block with independent space is the modular development direction. By hoisting the independent regional modules into the boat based on the hull, and then making the partition between regional modules, finally capping, we can finish up the pre-installation of most yacht interior outfitting, instead of putting great labor in the manual processing production of outfitting after sealing the hull. Thus efficiency of construction is greatly improved, and since much work is transferred from the hull to the ground, working environment of workers can be improved.

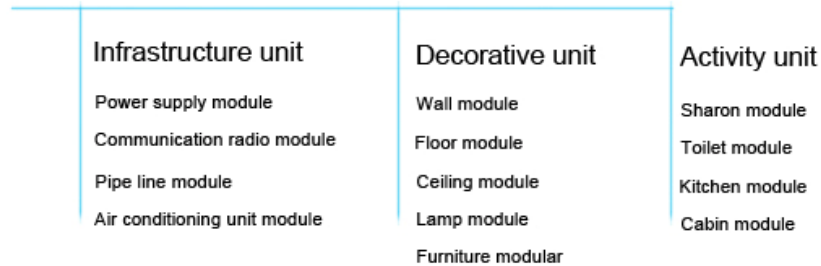

Figure 1 Blue Bird 78ft Yacht Layout Chart

#### (2) The yacht interior outfitting modular partition according to the function

The system engineering of yacht interior outfitting includes a large number of functional parts and function devices. These function facilities ensure the normal operation of the yacht interior outfitting. Dividing by function to decompose the yacht outfitting module is an effective measure of modular partition. According to function, the yacht interior outfitting can be divided into hydropower module, furniture module, floor module, toilet module, main accommodation module, lamps and lanterns module, air conditioning module etc.(as shown in figure.2). Such method of partition is not only convenient for the renewal and the maintenance of the later module, but also raises the profession of manufacturing and improves the quality of the module's quality. This way also facilitates the management of module

organization, thus ensures the smooth development s of yacht interior outfitting process. The modules divided by function could realize modules’ seamless installation through the spatial position, which greatly increased the completeness of interior outfitting. Function module is the basic form of the modular partition in yacht interior outfitting, and based on function module, the further research of modular partition can subdivide reasonable modular manufacturing ways better.

### Yacht interior outfitting system

**Figure 2 Yacht Interior Outfitting System Partition Graph**

(3) The yacht interior outfitting modular partition according to the variable parameter

The division according to the variable parameters is a method of module division on the basis of function or region division. The module unit is divided into a variable module, a fixed module, and semi autonomous modules. This division method serves for modular serialization and standardization of. For example, yacht interior outfitting teak floor module is a variable module. It can be divided into different modulus sizes according to different types of size and spatial dimension. Based on the standard module, the floor can be designed to be 2000\*2000 or 2000\*1000 basic unit size, and then the standard size module can be formed into a series of products, making next owner’s choice convenient. For another instance the toilet can be divided into a fixed immutable module, because no matter how the ship type changes, the demand of toilet for people in the compartment won't have big change. So toilet can be designed to a fixed standard module. This fixed module in different ship types or the same ship type series can be used in the cabin. Semi autonomous module means one that can change its size in local space when realizing link of the interface with other modules. Some of the interfaces of module is constant parameters, but in the other directions, changes can be made according to the design and need of the layout. For example, the living room cabinet module. The living room cabinets in the enclosure wall of the contact portion are not variable, but the cabinet width can be designed to different specifications and sizes according to the owner's needs. This module which can ensure fast installation also can change a different style for owner’s choice.

(4) The yacht interior outfitting modular partition according to the construction schedule

The yacht interior outfitting needs to set up a large number of embedded parts and installation of standard parts. The yacht interior outfitting modules can be considered in accordance with the construction progress of the modules, which is divided into: embedded module, integrated module and installation module. Embedded module includes electricity & water module, wood module and embedded module in the functional module. Installation needs to be laid in these modules to make follow-up module installation smooth, and unnecessary rework and waste of material should be avoided. Installation module refers to the attachment in hull surface beautification space adornment module. These modules include: smallpox module, floor module, wall module, etc. Combination module mainly refers to furniture module and kitchen module, etc. These modules only need to be hoisting aboard after completing the installation of the other modules. Forming the modules into different styles in the space according to the owner’s needs makes the layout of the cabin space more reasonable and beautiful. Module division according to the construction schedule makes the yacht interior outfitting module mounting in good order and well arranged in construction management. It brings great help to construction management greatly shortens the construction period of the yacht outfitting.

These classified methods are not isolated. They link closely with each other, so designers need to make the division according to actual situations. The designers should use these partition methods comprehensively to complete the entire yacht interior outfitting. It also puts forward higher requirements

of the designer. The designer needs to make overall arrangement of the entire process of modular design, production and manufacturing for yacht interior. Modular partition is not a fixed method. With the development of technology and improvement of the production condition, new, more reasonable method will appear for modular partition. But the common purpose of all the modular partition is to improve the yacht outfitting modeler, reduce the yacht's development cost, save labor and realize the upgrade of the yacht industry.

#### **4 Conclusion**

Yacht interior outfitting module partition determines the design, installation, construction technology and other production practice of the yacht module. It is the base of yacht interior outfitting design. Modular partition needs to be associated with the yacht enterprise's production capacity, sales, and marketing to formulate a modular partition method that meets enterprise's development goals so that the market competence of the enterprise can be enhanced. Rational module partition system can improve the construction efficiency of yacht interior outfitting, reduce the labor intensity of workers, and improve the working environment. By building the module database for partitioned module coding, and then forming a standardized, universalized and serialized module system, in the future development of ship type, people can select a suitable module to form a new interior outfitting module combination according to the owner's needs, and finally achieve the purpose of mass customization production for yacht interior outfitting.

# The Efficiency Evaluation on Chinese Universities' Input-Output Based on DEA\*

Tian Jingren, Li Sichen

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: jrtgznc@163.com, lsc-769538951@qq.com)

**Abstract:** This paper constructs the input and output indices system of Chinese universities' teaching departments. Taking one university in China as an example, it measures the comprehensive efficiency, technical efficiency and scale efficiency of the university's teaching departments based on the DEA model. The results show that teaching departments in the university are DEA effectively. For those are not DEA effectively, slack variables of the input and output indices are calculated by using DEA model, and puts forward some improvement measures.

**Key words:** DEA; Teaching departments of university; Input-output; Efficiency evaluation

## 1 Introduction

Recently, The Education Ministry of China claims in *The National Medium-and long-term Framework for Education Reform and Development* that 'the reform will be done in the following fields: management model, competition system, performance evaluation and dynamic management' and 'the regulation of the expenditure of education fund will be made'. In 2011, The Central Research Institute of Education and Science released the evaluation results of certain prestigious universities' performance, this makes all levels' universities realize the importance of performance evaluation whose results determine the annual distribution of education fund, which is made by the Education Ministry. The universities' four basic functions are: cultivating talents, conducting scientific research, serving the society and inheriting and passing down the culture. But the final executors are teaching departments in universities. Therefore, performance evaluation of the universities' departments determines the overall performance evaluation to a certain extent.

Data Envelopment Analysis (DEA) is often applied to the performance evaluation of universities. By using DEA, some researchers analyze the efficiency of input-output of the departments of universities' departments. Such as Cha Yong and Liang Liang (2004), Yin Junming and Wang Pingxin (2011), etc., they have analyzed the efficiency of input-output of some teaching departments of universities by DEA with designing different input and output indices. However, some problems still exist in terms of the construction of evaluation index system and the choice of indices. This paper aims at resolving these problems by applying DEA to measure and analyze a university's efficiency (we call it  $W$  in the paper). Particularly, we focus on the average comprehensive efficiency, technical efficiency and scale efficiency of the departments from 2008 to 2010.

## 2 DEA Model and the Construction of Index System

### 2.1 DEA model $C^2R$ and model $BC^2$

Firstly, we suppose that there are  $n$  DMU (Decision Making Unit) and  $m$  input variables and  $s$  output variables for each unit, and we utilize the vector:

$$X_j = (x_{1j}, x_{2j}, \dots, x_{mj})^T, Y_j = (y_{1j}, y_{2j}, \dots, y_{sj})^T, j = 1, 2, \dots, n. \text{ The signs } (X_j, Y_j) \text{ are used to}$$

symbolize  $DMU_j$ . By using Charnes—Cooper, adding free variables  $s^+$  and  $s^-$ , and introducing  $\varepsilon$ , we gain the following DEA model  $C^2R$ :

---

\* This paper is supported by the humanities and social science research projects of the Education Ministry of China—'University performance budget and the innovation mode design for its appraisal' (project No.10YJAZH128)

$$(D_{1\varepsilon}) \left\{ \begin{array}{l} \min[\theta - \varepsilon(e^{-T} s^- + e^{+T} s^+)] = V_{D_{1\varepsilon}} \\ s.t. \sum_{j=1}^n X_j \lambda_j + s^- = \theta X_0 \\ \sum_{j=1}^n Y_j \lambda_j - s^+ = Y_0 \\ \lambda_j \geq 0, j = 1, 2, \dots, n; s^+ \geq 0; s^- \geq 0 \end{array} \right. \quad (1)$$

In the model,  $e^{-T} = (1, 1, \dots, 1) \in E_m$ ,  $e^{+T} = (1, 1, \dots, 1) \in E_s$  and  $\varepsilon$  is not Archimedes infinitesimal variable.

The model  $C^2R$  can be applied to measure the comprehensive efficiency of each DMU. The method is as follows: on the condition that  $\varepsilon$  is not Archimedes infinitesimal variable, the most possibilities of  $(D_{1\varepsilon})$  is  $\lambda^0, s^{-0}, s^{+0}$ , and  $\theta^0$ . If  $\theta^0 = 1, s^{-0} = 0$  and  $s^{+0} = 0$ ,  $DMU_{j_0}$  is effective.

At the same time, we apply Charnes—Cooper, add free variables  $s^+$  and  $s^-$ , introduce  $\varepsilon$  and add another supposition  $\sum_{j=1}^n \lambda_j = 1$ , we gain DEA model  $BC^2$ :

$$(D_{2\varepsilon}) \left\{ \begin{array}{l} \min[\theta - \varepsilon(\hat{e}^T s^- + e^T s^+)] = V_{D_{2\varepsilon}} \\ s.t. \sum_{j=1}^n \lambda_j X_j + s^- = \theta X_0 \\ \sum_{j=1}^n \lambda_j Y_j - s^+ = Y_0 \\ \sum_{j=1}^n \lambda_j = 1 \\ \lambda_j \geq 0, j = 1, 2, \dots, n \\ s^- \geq 0, s^+ \geq 0 \end{array} \right. \quad (2)$$

In the model,  $\hat{e}^T = (1, 1, \dots, 1) \in E_m$ ,  $e^T = (1, 1, \dots, 1) \in E_s$  and  $\varepsilon$  is not Archimedes infinitesimal variable.

The model  $BC^2$  is applied to the evaluation of technical efficiency. The procedure is as follows: on the conditions that  $\varepsilon$  is, the best possibilities of  $(D_{2\varepsilon})$  is  $\lambda^0, s^{-0}, s^{+0}$ , and  $\theta^0$ , and  $s^{-0} = 0, s^{+0} = 0, DMU_{j_0}$  is effective<sup>[1]P64-68</sup>.

**2.2 The measurement of input- output efficiency by DEA model**

The input-output efficiency of universities is reflected by the comprehensive efficiency which consists of technical and scale efficiency. Scale efficiency is measured by DEA model  $C^2R$ ; Technical efficiency is measured by DEA model  $BC^2$ ; Scale efficiency reflects that whether the units run in suitable investing scale. It equals to the comprehensive efficiency/technical efficiency<sup>[3]P98</sup>.

**2.3 The norm system for measuring input and output of teaching departments**

Universities are non-profit organizations which aim to achieve educational productive efficiency by putting various educational resources into personnel training, scientific researches, social services and cultural inheritance innovations. Educational resources are the integration of manpower, material resources and funds, including tangible and intangible educational resources. As it is apparently more difficult to measure them, this paper will not discuss about intangible educational resources. To sum up, measuring input and output in teaching departments should be based on the principle of ‘simplifying, highlighting and characterizing’, of which simply means the number of measurements should be reduced reasonably, highlighting some measurements appropriately, emphasizing and characterizing the

essence of measurements distinctly uncovered.

### 2.3.1 Input indices

The measurement of input contains three aspects. Firstly, it contains the input in manpower which includes teaching staff and supporting staff. This investment can be indicated by two indices:  $X_1$ , the number of teaching staff and supporting staff;  $X_2$ , salaries and welfare expenses spent on teaching staff and supporting staff. Clearly, these two indices are closely connected, but the former highlights the 'quantity' of manpower and the latter is the 'quality' of manpower (There is a big income gap between teaching staff and supporting staff who have different educational backgrounds and positions, therefore, which is an indicator of quality. Secondly, the input in material resources, i.e. the original value of teaching facilities including furniture and occupied housing, is indicated by  $X_3$ . Thirdly, funds, i.e. the funds spent on the administration of teaching departments and operating funds, contain three indices:  $X_4$ , public spending,  $X_5$ , scientific research expense and  $X_6$ , special business expense. The above six indices can be expressed by the vector  $X = (X_1, X_2, X_3, X_4, X_5, X_6)$ .

### 2.3.2 Output indices

Output index refers to the following aspects: 1) cultivating talents at all levels. This is reflected by two indices: one is  $Y_1$ : student' Jordan numbers; another is  $Y_2$ : revenue of various types' cultivating students; 2) the output of scientific research is reflected by three indices: one is  $Y_3$ : the comprehensive value of teaching (all teaching research will be transferred into certain value); second one is  $Y_4$ : the comprehensive value of scientific researches (all scientific research will be transferred into values); the third one is  $Y_5$ : the revenue from teaching and scientific research fund; 3) the output of serving society which comes from the services provided by the departments, such as consultation and transferring scientific research results, with index  $Y_6$  - social service income; 4) the output of inheriting and passing down culture which come from the activities attended by the departments, With  $Y_7$  - culture innovation achievement score (achievement of different levels is folded into a certain score, then aggregated). All the seven indexes are labeled by the vector  $Y = (Y_1, Y_2, Y_3, Y_4, Y_5, Y_6, Y_7)$ .

## 3 Methodology

In order to keep the secret of some statistic data, the university which we study is called W in this paper. It is a comprehensive university whose main purpose is teaching. It is one of the best universities with sixty years' history. At present, W has 16 teaching departments, among which there are twelve common departments, one department providing the same courses for all students, one department providing preparatory courses, one department providing courses for adults, and one department for vocational education.

### 3.1 The procedures for collecting data

In order to avoid the unnecessary variables, we choose twelve common departments in the input-output efficiency evaluation. Meanwhile, we also take the variable time span into scientific research for consideration. Generally speaking, one research takes 2 or 3 years. So we focus on the research from January, 1, 2008 to December 12, 2010. Each department is regarded as a DMU. Then, we obtain the following data in table 1.

**Table 1 The Average Input and Output of Twelve Departments of W (2008-2010)**

DMU	Input Indices						Output Indices						
	$X_1$	$X_2$	$X_3$	$X_4$	$X_5$	$X_6$	$Y_1$	$Y_2$	$Y_3$	$Y_4$	$Y_5$	$Y_6$	$Y_7$
DMU <sub>1</sub>	75	311	1251	161	65	120	1410	494	52	150	65	10	0
DMU <sub>2</sub>	50	193	860	143	42	85	828	390	48	128	42	5	6
DMU <sub>3</sub>	62	279	980	155	50	78	1180	448	80	168	50	2	0
DMU <sub>4</sub>	55	231	758	121	38	60	886	354	55	120	38	3	0
DMU <sub>5</sub>	78	273	850	195	45	95	1352	554	90	180	45	6	2
DMU <sub>6</sub>	56	199	480	143	45	75	908	445	30	90	45	10	0
DMU <sub>7</sub>	65	276	530	146	58	90	1040	541	62	115	58	3	0
DMU <sub>8</sub>	56	227	745	115	66	75	950	349	50	98	66	5	0
DMU <sub>9</sub>	64	310	558	182	42	80	1140	433	80	124	42	8	6
DMU <sub>10</sub>	66	307	675	175	53	60	1256	565	45	132	53	4	0
DMU <sub>11</sub>	58	276	858	160	45	55	916	385	65	86	45	8	4
DMU <sub>12</sub>	82	316	1350	234	85	120	1520	654	120	168	85	9	8
<b>Total</b>	<b>767</b>	<b>3197</b>	<b>9895</b>	<b>1929</b>	<b>634</b>	<b>993</b>	<b>13386</b>	<b>5612</b>	<b>777</b>	<b>1559</b>	<b>634</b>	<b>73</b>	<b>26</b>

**Note:** The able data are sourced in the financial statements of W.

**Table 2 Values of Comprehensive Evaluation of Teaching and Scientific Research of W**

Types	journal paper (unit: point)			book (unit: point)		honour (unit: point)					
	A	B	C	A	B	A <sub>1</sub>	A <sub>2</sub>	A <sub>3</sub>	B <sub>1</sub>	B <sub>2</sub>	B <sub>3</sub>
teaching	10	5	2	30	15	100	80	50	30	20	10
research	10	5	2	30	15	100	80	50	30	20	10

**Note:** In table 2, A stands for the publications published by national publishing institutions. B and C stand for the publications published by non-national publishing institution. A<sub>1</sub>, A<sub>2</sub> and A<sub>3</sub> stand for honour rank first, second and third at national level. B<sub>1</sub>, B<sub>2</sub> and B<sub>3</sub> stand for honor and first, second and third at provincial level.

**Table 3 The Value of Comprehensive Evaluation of Teaching of W**

Type	best bachelor thesis		best master thesis		best courses			special thesis	
	provincial level	university level	provincial level	university level	national level	provincial level	university level	national level	provincial
teaching result	3	1	5	2	50	20	10	30	20

**Note:** Table 2 and 3 is a framework for the comprehensive evaluation value of teaching and research. There might be other frameworks for different universities.

### 3.2 Selection of input indices and output indices based on DEA

In DEA evaluation of input-output for W, due to the limitation of the number of DMU (teaching department of W), evaluation index of input and output should simple, otherwise it will affect the accuracy of the evaluation by the DEA model. Due to the classification of input indices and output indices, according to statistical analysis, we can calculate the correlation coefficient between input indices and output indices. The highest indicators of the correlation coefficient are selected as input indicators and output indicators. Correlation analysis shows that we choose three input indices and three output indices for using DEA model. They are X<sub>2</sub> (stands for the labour input), X<sub>3</sub> (stands for material input), X<sub>4</sub> (stands for the financial input); Y<sub>1</sub> (stands for the talent output), Y<sub>4</sub> (research output) and Y<sub>6</sub> (stands for the output of serving society). We do not take the index of cultural inheritance into account because its value is zero.

These data are processed by DEAP2.1. Firstly, we set the document introducing parameters: NUMBEROFFIRNIS for 12, NUMBEROFTIMEPERIODS for 1 year, NUMBEROFOUTPUTS for 3 year, NUMBEROFINPUTS for 3. We select the formula 0=INPUT ORIENTATED, 1=VRS, 0=DEA(MULTI—STAGE). Then we obtain the following results (see table 4).

**Table 4 The Results of Performance Evaluation of 12 Departments of W**

DMU	Crest	Vrste	Scale	Evaluation
DMU <sub>1</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>2</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>3</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>4</sub>	0.967	1.000	0.967	Not DEA effective, scale efficiency is incremental
DMU <sub>5</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>6</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>7</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>8</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>9</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>10</sub>	1.000	1.000	1.000	DEA effective, scale efficiency is no change
DMU <sub>11</sub>	0.767	0.824	0.932	Not DEA effective, scale efficiency is incremental
DMU <sub>12</sub>	0.990	1.000	0.990	Not DEA effective, scale efficiency is decreasing
<b>Average</b>	<b>0.977</b>	<b>0.985</b>	<b>0.991</b>	

**Note:** Crste = technical efficiency from CRS DEA; Vrste = technical efficiency from VRS DEA  
Scale = scale efficiency = Crste / Vrste

### 3.3 The analysis of the efficiency evaluation of input-output of teaching department of W's teaching department

Table 4 shows that the means of Crest of the departments is 0.977, the means of Vrste is 0.985, which implies that the ratio of input and output is in good condition. However, the values of three departments are not effective. They are DMU4, DMU11 and DMU12. This is caused by the small scale which is reflected by Vrste value of DMU4 and DMU12, 1.000. The crest and Vrste value of DMU11 is 1.000, it suggests that caused by the inefficient management besides the scale of labour input, financial input and material input are small. The percentage of the effective department is 75%, which indicates that the efficiency of input-output is relatively high. This may owe to the long-term input of teaching and research made by W.

We can also utilize the free variable to measure DUM11, by which we will propose the improvement suggestion. The measurement suggests that DUM11 should reduce the staff's salary and fringe benefit by 171,600 yuan and decrease the material input by 1,207,800 yuan. At the same time, it should increase the scale of student enrolment by 9 and the comprehensive value by 7.

## 4 Conclusion

The efficiency of input-output of the teaching departments determines one university's performance. We set 6 parameters for labour, materials and finance and 7 parameters for output according the four aims of universities. The efficiency of input-output is reflected by comprehensive efficiency which consists of technical and scale efficiency. The comprehensive efficiency is measured by DEA model  $C^2R$ ; technical efficiency is measured by DEA model  $BC^2$ ; and scale efficiency is obtained by using the formula comprehensive efficiency/technical efficiency. We apply these models to a university and particularly measure the comprehensive efficiency, technical efficiency and scale efficiency.

We found that the accuracy of this method is determined by the suitable index system of input-output and its reliability. As a result, the conclusion of this research might be limited due to two aspects: one is that the unit number is small, which determines the number of indices; another is that DEA requires that all units must be homogeneous. However, the disciplines in different departments are different from each other. These two factors may lead to the gap between the research result and reality may occur. Besides, the methods to acquire the index data and the unreasonable setting of evaluation criterion also may affect the accuracy of the evaluation. These problems are worthwhile for the further study.

# Analysis of Contribution of Information Industry to National Economy Development in China

Yu Xindong, Hu Shuhua

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hourenyong@126.com, wljah@foxmail.com)

**Abstract:** The proportion of China's information industry in the GDP after financial crisis has been investigated firstly in this paper. Output value of information industry proportion in the GDP increased gradually from 2001 to 2006, up to 2006, which made up of 25.47% of the GDP. Nevertheless, its proportion in the GDP has started to count less since 2006. According to the Douglas function, the paper analyzes the contribution of information industry to national economy development next. Clear-cut correlation between information industry and the GDP indicates that the increase of one unit of the logarithm of the output value of information industry will cause the increase of the GDP's logarithm by 0.071 units. Finally, the paper expatiates the role of information industry in promoting the industrial structure optimization and upgrading, its economic benefits and its direct and indirect effect on economic growth.

**Key words:** Information industry; Cobb-Douglas production function; Economic contribution

## 1 Introduction

The international financial crisis poses difficulties for the development of China's information industry in 2009. In 2009, the telecommunication services in China reached RMB 2,568.06 billion, up by 14.4%; the telecommunication's main business income was RMB 842.43 billion, up by 3.9%. The above scale manufacturing industry of electronic information products accomplished sales revenue of RMB 5,130.5 billion, up by 0.1%. On the whole, the output value of information industry and its proportion in the GDP is shown as Table 1.

**Table 1 The Proportion of Information Industry in the GDP in China**

Year	Output value of information industry(billion Yuan)	GDP (billion Yuan)	Proportion of Information industry in the GDP
2001	1,499.80	10,965.52	13.68%
2002	1,753.85	12,033.27	14.58%
2003	2,341.00	13,582.28	17.24%
2004	3,173.76	15,987.83	19.85%
2005	3,879.90	18,321.74	21.18%
2006	5,398.38	21,192.35	25.47%
2007	6,328.01	25,730.56	24.59%
2008	5,988.76	30,067.00	19.92%
2009	5,972.93	33,535.30	17.81%

Data Source: China Economic Information Net and "Statistical Yearbook of China"

As seen from Table 1, the output value of information industry increases considerably from 2001 to 2007, and it approaches stable during 2007 to 2009. Meanwhile, its proportion in the GDP gradually rises from 2001 to 2006 and reaches 25.47% in 2006, but starts to fall by degrees after 2006.

## 2 Contribution of Information Industry to National Economy Development in China

The data selected from 2001 to 2009 proclaims the contribution of information industry to national economic development.

### 2.1 Selection of regression model

Cobb-Douglas production function is a common tool for measuring the contribution of economic growth, and its mathematic expression is as follows<sup>[1]</sup>:

$$Q = aK^b L^c \tag{1}$$

Note: Q is output, K is capital, L is labor, and a, b and c are constants.

The feature of Cobb-Douglas production function:

① Its logarithmic form is a linear function

$$\log Q = \log a + b \log K + c \log L \tag{2}$$

② It belongs to homogeneous function, and the type of returns to scale(RTS) can be judged by the numerical value of b+c

b+c > 1, is increasing returns to scale type;

b+c < 1, is decreasing returns to scale type;

b+c=1, is stable returns to scale.

③ The variable K of this function, the index b of L and c respectively are the output flexibility of K and L, which means that the output will increase b%, if K increases 1%; if L increase 1%, the output will increase c%.

In order to further analyze the contribution of information industry to and its effect on economic growth, the technological progress factor will resolve into information technological progress factor and other technological factor, and the specific expression is given as follows:

$$a = a_0 I^d \tag{3}$$

Note: I means the development scale of information industry, d means the output flexibility of information industry and  $a_0$  means all the other technological progress factors except information technological progress factor.

In this case, Cobb-Douglas production function is adapted as follows:

$$Q = a_0 I^d K^b L^c \tag{4}$$

The logarithm of each side of an equation is as follows:

$$\ln Q = \ln a_0 + d \ln I + b \ln K + c \ln L \tag{5}$$

Note: GDP means the gross output, d means the output flexibility of information industry, I means the output value of information industry, K means the fixed assets investment of society and L means total employment of society<sup>[2]</sup>.

### 2.2 Analysis process

“Statistical Yearbook of China” is the source of the GDP, the output value of information industry is approximately replace by the sum of output value of electronic information industry and telecommunication industry, and the fixed assets investment and total employment of society are originated from “Statistical Yearbook of China”, then, the related date is showed by Table 2<sup>[3]</sup>.

**Table 2 Related Data**

Year	GDP	I	K	L
2001	10,965.52	1,499.80	3,721.35	730.25
2002	12,033.27	1,753.85	4,349.99	737.40
2003	13,582.28	2,341.00	5,556.66	744.32
2004	15,987.83	3,173.76	7,047.74	752.00
2005	18,321.74	3,879.90	8,877.36	758.25
2006	21,192.35	5,398.38	10,999.82	764.00
2007	25,730.56	6,328.01	13,732.39	769.90
2008	30,067.00	5,988.76	17,282.84	774.80
2009	34,050.69	5,972.93	22,459.88	779.95

Data source: “Statistical Yearbook of China” and China Economic Information Net. In this Table, the unit of GDP, I and K is billion yuan, and L's unit is million.

Table 3 is the logarithmic of Table 2:

**Table 3 The Logarithmic of Data from Table 2**

Year	lnGDP	lnI	lnK	lnL
2001	11.6051	9.6157	10.5244	11.1986
2002	11.6980	9.7722	10.6805	11.2083
2003	11.8191	10.0609	10.9253	11.2176
2004	11.9822	10.3653	11.1630	11.2279
2005	12.1184	10.5661	11.3938	11.2362
2006	12.2640	10.8964	11.6082	11.2437
2007	12.4580	11.0553	11.8301	11.2514
2008	12.6138	11.0002	12.0601	11.2578
2009	12.7382	10.9976	12.3221	11.2644

Put these data into SPSS to do the multiple linear analysis and the dependency table is showed by Table 4.

**Table 4 Dependency Table**

		lnGDP	lnI	lnK	lnL
Pearson dependency	lnGDP	1	0.952	0.998	0.991
	lnI	0.952	1	0.956	0.976
	lnK	0.998	0.956	1	0.995
	lnL	0.991	0.976	0.995	1

According to Table 4, the dependency between lnGDP and lnI is up to 0.952, therefore, the research on the relationship between these two variables is feasible. The linear equation obtained by regression analysis is given as follows:

$$\text{LnGDP} = 94.088 + 0.071\text{lnI} + 0.890\text{lnK} + 0.263\text{lnL} \quad (6)$$

Note: R<sup>2</sup>=99.7%, F=563.724, D.W.=2.080

### 2.3 Linear conclusion

R<sup>2</sup>=99.7% makes clear that the result of fitting is good, and, through linear equation, the dependency relationship between output value of information industry and GDP during 2001 to 2009 is proved to be obvious. In fact, output value of information industry's logarithm increases one unit will cause the GDP's logarithm increases 0.071 unit.

## 3 Impact of the Information Industry on the Development of National Economics

### 3.1 Upgrading of industrial structure under the influence of information industry

Information technique plays a crucial role in the upgrading of industrial structure because of its powerful permeability and a highly shared feature as a High-tech form. With the rapid development of information, Information technique dominates the upgrading of industrial structure gradually<sup>[4]</sup>.

First, the evolution of information technique and science result in the refinement of the division of social labor, besides, the degree of specialization become higher and higher, which contributes to the establishment of new-merging industries and industrial department. Their constant flourish enlarges the range of the industrial structure and strengthens the connection between different levels and circles in it. What is more, the mutual infiltration between disciplines and the cross-disciplines are widely used in research and application of research achievements. All of these elements force the connection between industries much closer and form a huge and complex industrial system. Therefore, the information technique and the development of information development will benefit for the adjustment of the industrial structure<sup>[5]</sup>.

Second, the improvement of the information industry encourages the reformation of the traditional industry and promotes the upgrading of the industrial structure. The industry cultivates plenty of

inter-disciplinary talents who involve both the informational and traditional industries. At the same time, this kind of industry provides the traditional industry with information techniques, informational equipments and information service, which motivate the whole course of information and improve the competitive ability of traditional industry. As for the traditional industry, it is required to reach a high-level and large field, and drives the information industry to a advanced direction, and enlarges its development scale. Besides, the information technique improves the production of traditional industry and changes its inner structure of production elements.

Lastly, the main function of information industry is the collection of knowledge and information, development, spread, etc. It is a knowledge industry supported by techniques and knowledge. The social knowledge and techniques focus on or come from the information industry. The input of information industry includes visible capital, labor, and invisible talent and so on. Information industry has become a crucial part of the whole development of social economics and strengthened the stability of the development of economics. Meanwhile, the demand income elasticity is higher in information industry, and the potential market is large, however, the cost of production is comparatively lower, which make it more competitive in exploring the market. Therefore, information industry is equipped with some basic requirements that are set for some dominate industries. With the coming of knowledge economic age, information industry will generally replace the status of traditional manufactures such as steel industry, car-making industry, etc, and then become the leading industry of the world<sup>[6]</sup>.

### **3.2 The scale economies effect of information industry**

The Scale Economies Effect is a kind of phenomenon that the income rise and the cost of the unit product falls, which results from the expansion of the scale of production. The scale economies effect of information industry is the main factor facilitating economic growth. The key reasons why information industry has the scale economies effect are as follows. First, the form of assemblage in the field of information industry results in the cost reducing of the whole industry. Take the computer hardware for example. All these years, the constantly upgrading of computer hardware technology and the improving of products' quality and performance with a much lower price was reflected in this. Second, the characteristics of scale economies effect is also manifested in its decentralized management, specialization and globalization, and the latter two provided a favorite condition for information industry manufacturers to reduce production cost in a great deal which in term shows the advantages of scale economy. Third, the advantages in technologies and production process as well as the launch of laws and regulations for the protection of IPR all contribute to the maintenance of scale economy.

Besides, the natural monopoly of information industry makes it have its unique advantages. Information industry department stimulates the social economic development with its lower marginal coast in the process of production and servicing, while reducing the production and servicing cost in other aspects of society. Finally, it will accelerate the economic growth rate in the society. The effect of scale economy in information industry and the space aggregation effect are closely interrelated with each other. The gathering of information industries will result in aggregation effect, which can realize scale economic effect through optimizing the allocation of one's resources in a certain geological area. Through the space aggregation, we can not only reduce the cost but also promote the progress and spread of technology and generate huge profits which will attract more manufacturers to enter. For example, Information and home appliances industries groups in Pearl River delta region in China as well as finished automobile and auto parts industries groups in Shanghai both manifest the space aggregation effect.

### **3.3 The direct and indirect impact of information industry on economic growth**

#### **(1) The direct impact**

It can be seen from the above regression analysis on output value of information industry and gross domestic product (GDP) that information industry is the basic and initial industry in national economy. Besides, it also belongs to the category of advanced technology and modern service industry. The growing development of information industry and growing innovation of information technology have boosted the domestic demand which has gradually enlarged the employment scale and increased foreign trade and revenue which has directly stimulated the economic growth to enlarge the scale of national economy<sup>[7]</sup>.

#### **(2) The indirect and indirect impact**

The indirect impact of information industry on economic growth is mainly embodied as follows: there is a strong connection, including forward relevance and backward relevance, between information industry and other industries. Firstly, the forward relevance is mainly reflected that the development of information industry, to a large extent, depends on the demands of other industries on the information

industry products. That is to say, if the demands of other industries on the information industry products are of a great deal, the development of information industry can effectively promote the development and enlargement of other industries. Secondly, information industry and other industries are connected backward. The development of information industry also relies on the ultimate products of many other departments and industries, which can boost other industries to develop effectively. In this way, information industry and other industries are correlative with each other and help each other forward to push the growth of national economy.

#### 4 Conclusion

The information industry in our country takes a much higher ratio in national economy, and the ratio is ever growing. The output value of information industry has a prominent relation with GDP, that is to say, every 1 unit growth in the output value will result in 0.071 unit growth in GDP's logarithm. So information industry plays a very prominent role in promoting the growth of our national economy. Quick development in information technology facilitates the quick development of information industry in China, and the ever growing ratio of information industry in national economy growth makes information industry a more vital driving force behind our national economy. The information industry will continually boast the adjustment and upgrade of industrial structure and it will gradually grow into the leading industry in the development of our national economy.

# Effect of Strategic Cost Management on Gaining Competitive Advantages: A Case of Jianfeng Group

Jiang Xiaomeng

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: jxm@vip.163.com)

**Abstract:** Enterprises are thrown into a rapidly changing environment by the combination of globalization competition, rapid technological change, new products and the intense competition of the client base. This thesis, by comparative analysis of the strategic cost management and traditional cost management, using of the strategic cost theory and combining with the actual situation of Jianfeng Group, points out that through effective use of cost information and analysis while adjusting the development strategy of the enterprise can enable one to seize the current trend of the market and quickly become a bigger and stronger enterprise.

**Key words:** Strategic management; Strategic cost; Development; Competitive advantage

## 1 Brief Overview of the Strategic Cost Management

It is really a complicated definition about “strategy”. It can be regarded as a multidimensional concept that involves all the important activities of the enterprise, which provides enterprises with a unified sense, a direction sense and a purpose sense. In the meantime, it can also help business to adjust to the changing environment. Strategic cost management and strategic were tied naturally. One purpose of strategic cost management is to provide cost information for the selection and implementation of corporate strategy. Strategic cost management was first proposed in Strategic Management Accounting by the British scholar Kenneth. Symonds in 1981 who mainly studied the relationship of strategic cost management and the core competitiveness of enterprises of which he stressed that the cost management and corporate strategy combined with the strategic development of the enterprise is of great significance. Then the American scholar, Michael. Potter, Jack, Sank extended and developed the theoretical framework of strategic cost management and application methods, especially Michael. Porter applied value chain analysis to strategic control in his books the “competitive advantage” and “Competitive Strategy”. Strategic cost management can be divided into two levels: One is from the cost perspective to analyze, select, and optimize enterprise strategy. The other is the implementation of controlling strategies for cost.

## 2 The Contrast Between Strategic Cost Management and the Traditional Cost Management

The former is the corporate strategy in the cost side; the latter is the plan on the basis of the former in order to improve the effectiveness of cost management systems, methods and measures. <sup>[1]</sup> Compare Strategic cost management with traditional cost management. The backdrop of the strategic management exposes increasingly obvious defects of the traditional cost management performance.

First and for most, the traditional cost management focuses on the consumption of the value of internal production and business activities. As the view of Value Chain, the scope of the traditional cost management essentially used the notion of "value added" rather than the concept of "competitive advantage". From the perspective of strategic management, "value added" exist four defects: First, begin to manage cost after the procurement will lead to lost opportunities for strategic cooperation with the upstream suppliers, which could get the advantage of low-cost suppliers. Second, make the products sold in the end of cost management will lead to lost opportunities for strategic cooperation with downstream buyers and add the cost of the final consumers. Third, it does not consider the cost situation of competitors, which can not reveal the relative cost position compared with them. Forth, it hasn't from the perspective of the industry value chain to give an analysis of the strategic partnership and find ways to reduce costs. <sup>[2]</sup>

Secondly, the goal of traditional cost management is to furthest avoid the cost of the various business activities in order to seek a cost minimization and profit maximization, which is difficult to harmonize with the strategic management objectives. Objectively speaking, the traditional cost management purpose is driven by the initial motivation and direct action of the cost management. Although reducing costs for businesses at any time cannot be ignored, companies rely on new products'

development and that cost increased necessarily. In fact, traditional cost management focus too much on lowering costs in order to reduce costs instead of linking up cost management and competitive advantage, which can enable businesses to lose a good development strategy, affecting the formation of the competitiveness.

Thirdly, the management tools which used by traditional cost management aim to guide, normalize and constraint of the real production and business activities. It is based on real-time field controlling of management thinking. Strategic management focuses not on the implementation of the strategy but rather a strategic decision-making.<sup>[3]</sup> Whether the earlier standard cost control, the cost analysis and the corresponding volume-profit analysis, or the comprehensive quality management and responsibility are all without considering the strategic management of information needs.

Fourthly, traditional cost management only concerns about the cost factors, such as material costs, labor costs, financial costs and management costs while ignoring the implicit cost factors, such as market development, the arrangement of the internal structure, firm size and management culture. It has not been able to fully reveal the true composition of the cost of doing business; such costs will not be able to help managers to strategic decision-making.<sup>[4]</sup>

It is not difficult to conclude that: strategic management theories and methods are widely used in business management practice of traditional cost management, which presents a challenge to adaptive changes. The basic starting of this change include at least three points: First of all, to expand the spatial extent of the cost management, turn the objects from a simple focus on internal activities to outside the enterprise. Secondly, to expand the time range of cost management, elevate the time span from the level of daily management to strategic management. Thirdly, to innovate methods and means of cost management and to meet the demand of the strategic management of cost information better.

### 3 The Path of Strategic Cost Management

The core of the strategic cost management is to seek corporate and sustained competitive advantage, is a comprehensive and forward-looking combination of new cost management techniques, is an important trend in contemporary cost management, which compared to traditional cost management, has the differences below:

(1) Update concept and change thinking to completely break the mindset of 'neglecting efficiency and valuing saving'. We must break the ideological rigidity; update our concepts, from the overall, global, and long-term to consider the cost benefits of enterprise. To overcome the one-sided saving consciousness, we must emphasize the "people-oriented" of management thinking, the scientific and correct cost concepts to achieve cost management by traditional "cost savings" type of transformation to a strategic focus on efficiency ". Of course, the ideological shift of mind, by no means short span of time, we must strive to improve the business managers' ideology and scientific and cultural qualities, to actively learn and absorb foreign advanced cost management theory and methodology, to strengthen the organization building of Cost management and to improve the quality of accountants while creating a large number of cost management engineers so that we can take the road of combining technical and economic.

(2) Expand new areas of enterprise cost management, multi-angle, multi-faceted establish the company's cost management. The traditional cost management focuses on the production process, limits to the areas of production in scope and the manufacturing costs in content. With the development of production management techniques, the concept of cost in the vertical and horizontal has a new expansion. Accordingly, the cost management can no longer be confined to the traditional production process. The vision should be put wide to pay attention to scientific and technological progress and technological development, and continuously expand new areas of enterprise cost management. In the promotion and development of strategic cost management, reforming and improving the traditional cost management make the strategic cost management thinking and the specific cost management methods organically combined, and only in accordance with the requirements of the staff, the whole process of cost management, being strict and scientific to all the costs content involved, can the companies enhance the competitiveness of the products on the market.

(3) Seek new methods of cost management from a strategic height. Merely the traditional cost management at the tactical level, talking about the cost on the cost, limited range of cost reduction is hard to improve the economic efficiency of enterprises. In a market economy, on one hand, within the enterprise must be subordinated to and services to improve efficiency of the management mechanism; on the other hand, the enterprise external intense competition to the market make the viability of

enterprises increasingly "bad", which prompted us to overcome the bound of the traditional mode of thinking that cost can not reduce, to understand the intentions and methods of reducing costs from a strategic perspective. Of course, in order to promote continuous improvement and development of the theory and methods of cost management in China, also should be noted that the summary of the innovative experiences and methods of cost management of their enterprise. In the process of enterprise cost management to introduce a comprehensive strategic management ideas and methods, only innovation to explore and develop new concepts and new ideas, will we be able to find suitable for our own characteristics and requirements of the cost of management theory and management methods to promote the enterprises' economic and social benefits all-round improvement.

(4)Fully mobilize the enthusiasm and creativity of the staff, to improve the employees of businesses to invest in the centripetal force. Per employee directly relates to costs. Only rely on the co-ordination of all staff, joint efforts, the enterprise can cost in the real control in order to achieve the objectives of the strategic cost management. Enterprises should pay attention to the human factor, stress people-oriented, and object to the rule of man, to improve the cohesion of the staff, so as to achieve the goal of lower costs and gain competitive advantage.

#### 4 High Costs Reduce the Competitiveness of the Jianfeng Group

Jianfeng Group, formerly known as Jinhua Cement plant in 1958, In 1988, it implemented the shareholding system reform, which confirmed the establishment of Zhejiang Jianfeng Group Co Ltd. And then, the company of shares listed in the Shanghai Stock Exchange becomes the first listed companies in China's cement industry in July 28, 1993. Jianfeng Group seized the historical opportunity again and again to develop. According to the 2004 Annual Report, Jianfeng Group owned total assets of 2.47 billion RMB, the main business income reached 1.027 billion RMB, profit 24.34 million RMB, taxes of 65.99 million RMB, which are of 11.5 times, 5.7 times and 0.65 times, 5.18 times of the beginning respectively.(see following Figure 1). For now, Jianfeng Group has become a basing on two main industry, cement and medicine, modern large-scale enterprise.

**Figure 1 Data of Jianfeng Group Financial Development in 1993 and 2004**  
(Data from: 1993, 2004 Jianfeng Group Annual Report)

Since to be listed, Jianfeng Group manages steadily and surely with operating profit, the main business income rose year after year (except 2004), the asset size of mid-extended (except 2001), reflects the company's good growth (see following Figure 2).

**Figure 2 Data of Jianfeng Group Financial Development from 1993 to 2004**  
(Data from: 1993-2004 Jianfeng Group Annual Report)

Compared with the company's growth, the profitability doesn't follow the steps; it seems, on the contrary, falling down (see following Figure 3). Although the company makes profit every year, the net margin has paced up and down between 20 million and 40 million with no growth. There is a huge fluctuation in operating profit in the five years from 2000 to 2004 with three years of losses and one year low-profit. The return on net worth is declining with years goes by, listed at the beginning of 19.02% ( highest point ) all the way down to 2.71% in 2004 ( lowest point ). The year 2000 to 2004 were the golden periods of China's cement industry, but Jianfeng group belonging to the cement blocks off profits, which provide food for thought!

**Figure 3 Data of Jianfeng Group Profit Development from 1993 to 2004**  
(Data from: 1993-2004 Jianfeng Group Annual Report)

There are many reasons to explain Jianfeng Group's situation, the most important one is the growing competition in the cement industry. From the cost perspective: 1) Foreign, joint ventures and private enterprises have their tax incentives. But regulate the operation of State-owned enterprises have no tax breaks nor can they evade taxes. 2) Jianfeng Group is one of the oldest state-owned enterprises with a large number of retired staff salaries to pay. Compared with new businesses, the cost is significantly higher. 3) As a veteran of the state-owned enterprises, the state explicitly eliminated a large shaft kiln production lines due to the environmental issues, which not only caused a significant loss of

assets to the Jianfeng Groups, but to put the company living in a disadvantage competitive position due to its incapacity of production making, which also makes its market shares be tied up by others. 4) Jianfeng Group is in strict accordance with national standards to produce cement. Its admixture adding progress has been done seriously and it has put more than all other funded enterprises in terms of environmental input. And such differences in cost caused by the system, history, taxation is very difficult to have a significant change in a short time. The enterprise must resort to external force in order to reduce costs and reverse the market disadvantage.

## 5 Powerful Combination of Spikes From a Strategic Height to Seek a New Cost Management

April 17, 2007, Zhejiang province Jianfeng Group Co., Ltd. notice a cooperation matters which disclosed the cooperation framework between Jianfeng group and Zhongjian Group, specifically as follows: 1) cooperating with Zhongjian group to found a regional specialization Cement Company (hereinafter referred to as "the New Company"), which is committed to enlarge the regional cement business scale and integrate the business and reduce overall operating costs in order to obtain the best economic and social benefits. 2) Zhongjian Group agreed to invest in , at the same time Jianfeng Group audit and evaluate the recent cement business-related assets of Zhejiang part (except shaft kiln), then contribute to the new company through partial retention or/and some realized or/and partial transposition , but the specific proportion need further consultation to determine. 3) The Zhongjian Group agrees to maintain Jianfeng Group's main business relatively stable in the cooperation process. The megamerger between Jianfeng Group and Zhongjian Group is not completed in one day, however it is the inevitable result of joint strategy when Jianfeng Group is aware and assessing the situation that it is impossible to change such institutional and historical factors which made cost disadvantage on their own.

In 1992 Jianfeng Group claimed their development strategy "Based on the building materials, developing for diversification, backed by Jianfeng, facing the world", and begin to involve the diverse business. In 2001 the Group of the encounter, pronounced: "Stressing the large and deregulating the small, highlighting the main business" and it symbolized the end of the diversified development strategy, in this 10 years, the businesses have involved in many areas of cement, pharmaceuticals, ceramics, cable, information technology, wholesale and retail trade, real estate, up to dozens of holding shares of companies (as the following table).

**Table 1 In 2000 Jianfeng Group Holding & Shareholding Enterprises**

Year	Holding subsidiary enterprises (consolidated statements)	Holding subsidiary enterprises (not consolidated statements)	Long-term equity investments enterprises	Total
2000	21	2	16	39

(Data from: 2000 Jianfeng Group Annual report )

In 2001, Jianfeng Group proposed the idea of "Stressing the large and deregulating the small, highlighting the main business", in 2002 to fully implement the strategic approach of "enhanced building materials, grow medicine", persist in the principle to do certain things. According to the Annual Report from 2001 to 2004, Jianfeng Group, under the guidance of "Stressing the large and deregulating the small, highlighting the main business", accomplish following events: the establishment of an investment company, responsible for investment and business cooperation; highlighting the main business, plus investment in the cement and pharmaceutical; restructuring non-core business. Jianfeng Group industry is clearly growing portfolio. In 2001 cement production capacity is 1.5 million tons, the sales income is 300 million Yuan, however in 2004, cement production capacity has reached 3.8 million tons, and sales income rose to more than 500 million. As what has been expected, to the end of "Eleventh Five-Year" period peak cement production capacity will reach 10 million tons; medicine in terms of R & D, production and sales has been strengthened.

Jianfeng Group is well aware that under the existing framework, relying solely on means to improve management and increase labor productivity has been difficult to reverse the disadvantage in terms of cost caused by the formation of institutional and historical reasons, in order to reduce costs in the short term, gain the competitive advantage. To reduce costs in the short term to gain the competitive advantage, it is very difficult, only the application path of cost management mode which is the third innovation, by the formation of strategic alliances, through its own to expand capacity, to reduce the tons of cement costs through economies of scale expansion. Jianfeng Group's strategy is moving toward

bigger and stronger the main industry; especially the cement industry only through cooperation with other strength of the enterprises can help them go out of the dilemma.

## 6 Conclusion

On account of historical and institutional benefits, Jianfeng Group was able to grow and develop greatly .However, due to the same reasons, the cost of Jianfeng is keeping up a high level, leading to the difficulties on the development recent years, the company is big but not strong enough.

Traditional cost management was concerned the value consumption from internal production and business activities, but rarely consider and analyze the external environment, the scopes and means of reducing costs have big limitations, the cost information provided may not meet the development of strategic management of the enterprise. Strategic management not only must focus internal situation, but also clearly know the competitive environment. It is not only necessary to know the upstream suppliers, but also to clearly know the downstream customers and distributors, and to coordinate the relationship with them. Meanwhile, the enterprise also needs to analyze and research the basic situation of the competitors. The Strategic cost management needs a higher perspective and a greater scope to investigate the cost of business, which will more effectively adapt to corporate strategy. <sup>[5]</sup> It depends that Jianfeng Group considers the limitations about self disadvantages for reducing cost, so it can confirm its strategy purpose which contains find the strong industry and make an alliance. The facts have proved that such cooperation can rapidly expand business productivity, through economies scale advantages it rapidly reduces cost, and gains the regional markets competitive advantage.

**Abstract:** Although central network positions have been associated with above average performance effects, an important void that still remains is how firms come to occupy a more central position in the first place. Whereas recently made exogenous explanations have shed some more light on aggregate changes in centrality, they remain silent on an endogenous understanding of how individual firms can come to occupy a more central position. To address this, we argue and demonstrate how heterogeneity in firm-level attributes formed by their possession of pioneering technology, alliance portfolio size and choice for alliance organization drives differences among firms in becoming more central. Based on a sample of technology-based alliances in two different high-tech industries (pharmaceuticals and the broader ICT industry), we find evidence for most of our hypotheses. We contribute to the standing literature by considering changes in position as a dependent variable, which goes beyond the dominant approach in which network structural properties have mostly been treated as independent variables. In this way, we contribute to an emerging literature in which the focus shifts away from how network embeddedness enables and constrains action towards what factors affect and shape a firm's network embeddedness through the lens of its structural position.

**Key words:** Central network positions; Pioneering technology; Betweenness centrality

### 1 Introduction

A growing number of studies has shown that strategic alliances and interfirm networks are particularly relevant for innovation and the development of new technology (Ahuja, 2000a; Gilsing et al., 2008; Phelps, 2010; Sampson, 2007). Especially in technology-based industries, alliances can be considered as conduits through which firms can get access to the complementary resources and knowledge of partners (Gimeno, 2004; Powell et al., 1996). Moreover, it has been argued that a firm's position in an alliance network affects the speed and degree in which access to these external resources can be acquired. More specifically, it has been demonstrated that a central position provides a firm with faster access to high(er) quality external resources and capabilities than a less central one (Powell et al., 1996; Zaheer and Bell, 2005). In line with this, a central position has been demonstrated to carry positive effects on, among others, power (Krackhardt, 1990), reputation (Galaskiewicz, 1979; Stuart, 1998), early adoption of innovations (Rogers, 1971), innovation performance (Powell et al., 1996) and learning (Hamel, 1991).

Although there is a large heterogeneity among firms in network positions (Provan and Sebastian, 1998), a firm's network position is not fixed and may change over time. Here, changes in technology and/or regulation have been advanced as exogenous explanations of changes in positions of individuals in intra-firm networks (Burkhardt and Brass, 1990) as well as of changes in firms' positions in alliance networks (Madhavan et al., 1998). This still leaves open an endogenous understanding of changes in centrality, and in line with this how firms can possibly come to occupy a more central position. The aim of this paper is to address this, by means of which we contribute to the literature along the following lines.

Although the antecedents of tie formation at the dyad level have been well studied in the literature (e.g. Ahuja, 2000b), the dominant focus until now has been on how network structural properties can be used to advantage (Baum et al., 2000; Burt, 1992; Coleman, 1988; Dacin et al. 1999; Powell et al., 1996; Uzzi, 1996; 1997). Our study addresses an important void in the literature given this general negligence of the antecedents of network structural properties (Raab and Kenis, 2009; Salancik, 1995). This echoes Salancik's earlier claim (1995) that network research should move beyond questions on outcome effects of network positions, and consider questions that focus on why certain positions exist or did not exist

before.<sup>1</sup> As a consequence, an inquiry into the antecedents of changes in centrality may help to inform us in how far and in what ways firms can come to occupy a more central position. An implication that follows is that we consider changes in centrality as a dependent variable, which serves as an important contribution to the standing literature in which network structural properties have mostly been treated as independent variables. In this way, we also contribute to an emerging literature in which the focus shifts away from how networks enable and constrain action towards what factors affect and shape networks and their structural properties (Gilsing and Nooteboom 2006; Koka et al., 2006; Madhavan et al., 1998; Rosenkopf and Schilling 2007).

Our empirical setting is formed by two global high-tech industries: pharmaceutical and the broader ICT industry (computers, semi-conductors and telecom). In both industries, interfirm collaboration is a strategic necessity and has led to the formation of so-called 'global' network structures (Schilling, 2009). Our understanding of a global network structure is as follows. Its building blocks are formed by individual dyadic alliances between firms, which collectively make up for an entire network structure that may easily cover a few hundred alliances or even more. Following from this focus on a global network structure, we will focus on Betweenness Centrality (BC) that reflects global centrality. Such a global network structure differs from a firm's individual ego-network, or 'local' network, and its associated degree centrality.

The paper proceeds as follows. The next section presents the theoretical framework and develops four hypotheses. Next we describe the data, variables and methods, and then present our empirical results. In the final section we conclude and discuss the implications of our findings.

## 2 Theory and Hypotheses

### 2.1 Network position: betweenness centrality (BC)

Betweenness centrality (BC) views an actor as being in a favoured position to the extent that it falls on the geodesic paths between other pairs of actors in the network. That is, the more companies depend on a focal firm to make connections with other companies, the higher the BC of the focal firm becomes. Such a position offers a focal firm strategic benefits such as opportunities for brokerage, faster access to diverse and non-redundant information but also visibility as well as power in controlling the flows of information and resources throughout the network (Burt, 1992). As a consequence, a position with high BC will enable firms to extract extraordinary returns from its attractive and powerful position in the network. BC is also of particular relevance in an innovation-based setting as here an increase in a firm's BC will increase the likelihood of being at the crossroads of key information and knowledge flows through the networks. In this way, BC elevates the potential for recombination that contributes to a firm's innovation performance (Gilsing et al., 2008). Apart from acquiring information, BC also offers room for sending information and the build-up of power. Within an innovation context, a high BC may for example support central players in setting and/or maintaining technological standards in their respective industries (Rosenkopf and Padula, 2008).

### 2.2 Antecedents of changes in BC

Burt (1991) suggests that the causal force behind centrality lies in the direct and indirect 'demand' by alters for relations with a focal actor. This is in line with social exchange theory suggesting that a firm must have something of value to offer in order to become or stay attractive to others (Blau, 1964; Emerson, 1962). The implication for inter-firm collaboration is that if a firm aspires to become more central, it must be considered as attractive enough for collaboration in the eyes of others. We refer to what a focal firm has to offer as its possession of *resources* that make others desirous of collaboration. However, whereas 'being in demand' may offer opportunities to occupy a more central position, it will not tell the whole story. Recently, it has been suggested that it is also entrepreneurial behavior or certain actions by 'network entrepreneurs' which would lead to a more central network position (Ozcan and Eisenhardt, 2010; Ahuja et al., 2011). The entrepreneurship literature distinguishes between three mechanisms that serve to understand entrepreneurial behavior in general, namely (1) incentives, (2) opportunity and (3) ability (Minniti and Bygrave, 1999; Shane and Venkataraman, 2000).<sup>2</sup> So, apart

---

<sup>1</sup> More precisely, Salancik phrased this question in terms of bridging positions and referred in particular to structural holes. 'A more telling analysis might explain why the hole exists or why it was not filled before?' (Salancik, 1995: 349).

<sup>2</sup> Although the distinction between incentives, opportunities and ability is used as the three determinants of entrepreneurial action and behavior, it is also used in the resource dependence literature when emphasizing that firms do not only need to be motivated to reduce external dependence but also have the opportunity and ability to do

from opportunities arising from being in demand, a firm must also have an incentive or a motivation to move into a more central position. In addition, it must have the ability to exploit the most attractive opportunity. We consider these three elements - incentives, opportunities and ability - as the mechanisms **2.3 Through which a firm’s possession of resources lead to changes in its centrality.**

We differentiate between both technological and social resources, each of potential value to other firms and, in this way, each forming a different antecedent of how a firm may become more central. Technological resources may be of value to others to the extent that they lack this, and may form a major reason why others are interested in collaboration with a focal firm (Pfeffer and Nowak, 1976; Ahuja, 2000b). Here, we specifically focus on the role of pioneering technology that tends to reflect path-breaking ideas and carries with it the potential of major breakthroughs. Its possession is likely to be associated with high attractiveness to others and may yield opportunities for brokerage accordingly (Ahuja, 2000b; Gulati and Garguilo, 1999), whereas it may also affect a firm’s incentives and ability.

The role of social resources emerges from the social exchange and embeddedness literature, which propose that alliance activity is embedded in a wider network structure from prior and ongoing collaborative relationships (Gulati and Garguilo, 1999; Walker et al., 1997). Here, we consider a firm’s portfolio of direct partners as this may provide it with access to external knowledge and expertise, as held by its direct partners. The more sizeable a firm’s portfolio of direct ties, the more access it may have to heterogeneous sources of knowledge or information, and the higher status it may enjoy among its peers (Ahuja 2000a; Podolny, 1994), both of which may increase a focal firm’s attractiveness to others as well as its incentives and ability.

Both a competence and embeddedness perspective, as discussed above, consider the facilitative role of collaboration and point especially to its benefits. In contrast, a governance view focuses on risks that may be associated with collaboration. It considers knowledge flows between partners as undesirable spillovers that may give rise to opportunism and free-ridership, which diminishes possibilities for appropriating returns of newly created technology (Dhanaraj and Parkhe, 2006; Gulati and Singh, 1998; Nooteboom, 2004). In order to broker among unconnected partners, a firm must not only have something to offer but must also protect itself against imitation or spillover, in order to *remain* attractive to others in the future. This is especially relevant as we consider BC that may be associated with bridging among unconnected partners and collaborating with disembedded ‘strangers’ (Baum et al., 2005). Therefore, we also consider a third antecedent of changes in BC, namely alliance organization. The choice for an alliance organization between equity or non-equity forms a key governance decision that affects the possibilities for mitigating risks that may arise in collaborative processes (Sampson, 2007).

So, we will consider the role of three antecedents, namely a firm’s possession of pioneering technology, its portfolio size and the governance choices through the alliance organization that it makes. More specifically, we argue that firms’ heterogeneity regarding their possession of pioneering technology, the size of their alliance portfolio and their alliance organization choices leads to heterogeneity in their entrepreneurial behavior of moving into a more central position. In line with this, we consider pioneering technology, portfolio size and alliance organization as firm-level antecedents of changes in centrality, whereas the mechanisms *through which* this occurs are formed by (1) incentives, (2) opportunities and (3) ability. In figure 1, this conceptual model is shown.

**Figure 1 Overview of the relationships between antecedents, entrepreneurial behavior mechanisms and Changes in betweenness centrality (BC)**

so (Pfeffer and Salancik, 1978). But it has also been used to explain why people engage in criminal activities (Nooteboom, 2000). Furthermore, it is also compatible with Ahuja’s framework (2000b) that distinguishes between incentives and opportunities when explaining alliance formation, whereas he does not consider a firm’s ability. We argue that to fully understand the entrepreneurial actions that lead to changes in centrality, the role of ability needs to be included as well.

Based on this, we first discuss below the role of pioneering technology, portfolio size and alliance organization separately, as antecedents of changes in a firm's BC. Next, we combine a competence with a governance perspective by jointly considering pioneering technology and alliance organization.

### **Pioneering technology**

Here, we consider how its possession of pioneering technology may affect a firm's BC, through the combination of incentives, opportunities and ability.

*Incentives.* Pioneering technology is formed by completely 'de novo' technology that goes (far) beyond all available solutions. Its creation requires a deliberate managerial choice to explore (far) beyond existing technologies, solutions, approaches in order to arrive at highly original solutions for basic problems based on a deep understanding of their root causes (Ahuja and Lampert, 2001). Its possession does not come by chance but tends to be the result of a persistent strategy of diligently exploring new domains. External collaboration may contribute to this strategy to the extent that it enables a firm to explore these unknown domains and experiment with highly original solutions. So, the possession of pioneering technology may elevate incentives for a focal firm to collaborate with other firms that are entirely disconnected from it. Collaboration with these partners may introduce a focal firm to new solutions or help it to understand problems in profoundly new ways that may help it in the further development of new pioneering technology. In this way, by moving into a broker position through collaboration with unconnected alters, a focal firm may further improve its potential for pioneering recombinations. In addition, when a focal firm lacks the resources or the complementary assets to upscale and commercialize its pioneering technology, it may become highly motivated to collaborate with partners that are well endowed in this respect (Ahuja, 2000b). Partners in possession of these resources and assets tend to occupy more central positions in a network structure than firms that lack these (Podolny, 1994; Ahuja et al., 2009). Collaboration with them may increase a focal firm's own centrality. In sum, the possession of pioneering technology may elevate a focal firm's incentives to collaborate with unconnected and/or with (highly) central others.

*Opportunities.* Pioneering technology might contribute to the emergence of a new technological paradigm with potentially profound consequences for the established status-quo in an industry (Nelson and Winter, 1982). To the extent that it is competence-enhancing it may strengthen the position of incumbents, whereas in case it is competence-destroying it may eventually lead to their demise (Tushman and Anderson, 1986). Given these potentially strategic implications of pioneering technology, other firms may develop a key interest in it. As a consequence, the possession of pioneering technology may strongly elevate the attractiveness of a focal firm to others and thus also provide it with opportunities to move into a more central network position.

*Ability.* Possession of pioneering technology may contribute to a firm's ability to ally with partners from unconnected parts of the network, for two reasons. First, possessing pioneering technology signals that a firm is capable to step into the unknown and to effectively find itself a way through it. This contributes to the build-up of absorptive capacity (Cohen and Levinthal, 1990), and may support a firm in bridging a (very) large technological distance with unconnected partners. Second, to the extent that a focal firm possesses more pioneering technology, it may have more bargaining power when (re)negotiating deals with its existing or new partners (Ahuja et al., 2009). In this way, having pioneering technology may also contribute to the ability to exploit the most attractive opportunities for brokerage.

Overall, pioneering technology carries a positive effect on both the incentives, opportunities and ability for brokering across unconnected partners, leading to an increase in its BC. This suggests our first hypothesis:

*Hypothesis 1: There is a positive relationship between a firm's possession of pioneering technology and an increase in its BC.*

### **Portfolio size**

In line with the literature, we consider the size of a firm's alliance portfolio as the number of its direct partners (Vasudeva and Anand, 2011). Below, we consider how portfolio size may affect a firm's BC through its incentives, opportunities and ability.

*Incentives.* A small-sized portfolio of direct partners may not foresee sufficiently in a focal firm's needs for key external resources and capabilities. As a consequence, a small portfolio may create incentives to move into a broker position and collaborate with alters that are unconnected to the focal firm and its portfolio of direct partners. In this way, through the addition of alliances with one or more unconnected partners, a focal firm may increase the potential for access to novel knowledge and

expertise that is non-redundant with the combined knowledge stock of its existing portfolio of partners.

However, at high levels of direct partners, the addition of one or more unconnected partners may increase two risks. First, there is a risk of cognitive overload as it may become increasingly difficult to be able to absorb and integrate a large number of heterogeneous streams of knowledge arriving at the focal firm. This makes it less attractive to move into a broker position as the addition of an unconnected partner would contribute even further to this risk of cognitive overload due to a large(r) technological distance. Second, there is an increasing risk of a severe incongruity between the different organizational practices and routines that each partner carries (Lavie et al., 2011), a risk that will aggravate dramatically when adding unconnected partners whose behavioral norms and routines may also be (very) different (Hargadon and Sutton, 1997; Burt, 2007). As a consequence, beyond a certain point, a large portfolio may reduce a firm's incentives to move into a broker position. Overall, this suggests that the size of firm's portfolio has a curvilinear effect on its incentives to move into a brokering position.

*Opportunities.* A portfolio of partners may signal a focal firm's standing in a network structure (Powell et al., 1996). The larger the size of its portfolio, the more it may elevate a focal firm's status and contribute to raising its attractiveness in the eyes of disconnected alters. Furthermore, a sizeable portfolio may indicate a focal firm's competence in generating positive alliance outcomes for its partners, which may signal reliability and trustworthiness to others (Wong and Boh, 2010). This may raise interest on their side and generate new partnering opportunities for a focal firm (Kale and Singh, 2007). In this way, the larger a firm's portfolio, the more it may become an attractive 'target' for collaboration, also by unconnected alters that may associate a larger portfolio of a firm with lower collaborative risks and potentially higher rewards.

However, these attractive benefits of a growing portfolio may hold up to a point. The larger a focal firm's portfolio, the higher the risk of spillovers of specific knowledge and expertise of the unconnected partner(s) to this set of direct partners. The unconnected partner may have limited room to mitigate this risk, making it more reluctant in collaborating with a focal firm with a large portfolio. Overall, this suggests that the size of a firm's portfolio has a curvilinear effect on its opportunities to move into a brokering position.

*Ability.* A portfolio of direct ties may be indicative of the presence of a 'portfolio' capability of a focal firm that refers to a firm's ability of managing a set of partners, rather than (individual) dyadic relationships (Wassmer, 2011). In this respect, a portfolio capability may support a focal firm also in brokering by being able to manage the degree of fit and potential conflict with its existing partnerships and achieve synergies here. However, at high levels of direct partners, this capability may get diminished as managerial resources may become too thinly spread, knowledge integration tends to become increasingly complex and there are more partners with less time for monitoring, increasing risks of undesirable spillovers and freeridership. This is in line with the portfolio literature demonstrating that a too diverse portfolio carries a negative effect for a firm's ability to attract value from its portfolio (Faems et al., 2005; Wassmer, 2011; Vasudeva and Anand, 2011). This suggests that the size of firm's portfolio also has a curvilinear effect on its ability to move into a brokering position.

In sum, an alliance portfolio has a curvilinear effect on incentives, opportunities and ability to move into a brokering position. This suggests our second hypothesis:

*Hypothesis 2: There is a curvilinear relationship between the size of a firm's portfolio and an increase in a firm's BC.*

### **Alliance organization**

Technology-based collaboration implies the sharing and/or transfer of knowledge over firm boundaries, which comes with some unique challenges. Especially when knowledge is more tacit and/or complex, its successful exchange and recombination is not assured (Powell et al., 1996), making the organization of the alliance between firms particularly important. In addition, the choice for a certain alliance organization also forms a key governance decision for diminishing risks that may arise in collaborative processes (Gulati and Singh, 1988). In general, joint-ventures (JVs) are considered as well equipped for knowledge sharing between firms, in particular for the exchange of tacit and complex knowledge (Sampson, 2007). In addition, JVs offer greater possibilities for monitoring and control that eases concerns for opportunism and spillovers to partners and/or partners' partners (Gulati, 1995a). However, JVs are costly as they not only require the investment of equity but also employ more formal control and organizing mechanisms such as authority systems, incentive systems and standard operating procedures (Gulati and Singh, 1998). In contrast, bilateral contracts do not offer the advantages to the extent as JVs do. However, their use offers especially flexibility and the ability for speedy responses to unexpected events during collaboration. In addition, they are more effective for terminating a

relationship once objectives have been achieved or when the alliance does not deliver on its objectives. In addition, bilateral contracts are less costly as they do not involve exchange of equity nor do they entail (expensive) hierarchical control mechanisms and procedures (Gulati, 1995a). In sum, bilateral contracts, when compared to JVs, are quick to set-up, cheap to run and easy to terminate (Harrigan, 1988). However, they offer considerably less room for knowledge sharing and the build-up of trust that may help to mitigate collaborative risks (Gulati, 1995a). Below we discuss the role of alliance organization in more detail and specify its effect on changes in a firm's BC, through incentives, opportunities and ability.

*Incentives.* As argued above, JVs offer room for mitigating risks of spillovers and opportunism (Gulati, 1995a). These benefits may become particularly attractive when moving into a brokering position and getting linked to unconnected firms. Partnering with such disembedded firms may increase the risks and uncertainties of collaboration and expose a focal firm to a 'liability of strangers' (Baum et al., 2005). The use of JVs may enable a focal firm to address these elevated risks that come when collaborating with unconnected firms. In this way, the use of JVs may increase incentives to move into a brokering position.

*Opportunities.* As discussed, JVs come with substantial upfront investments. To be able to recoup these investments requires a certain duration of the collaboration. In addition, a certain duration also offers room to build up a common understanding between partners and to exchange more complex and tacit knowledge (Gilsing and Nooteboom, 2006), which further contributes to the exchange and recombination of knowledge between them (Sampson, 2007). In this way, the use of JVs may lead to the development of stronger ties between a firm and its partners over time, through repeated partnering (Gulati, 1995a). The stronger the ties with its partners, the higher the likelihood that a focal firm's partners also become directly connected (Chung et al., 2000), following Granovetter's idea of the 'forbidden triad' (1973) and Gulati's common partner argument (1999). More connectivity and higher density among a firm's partners will lead to a broader diffusion of a focal firm's knowledge and expertise among its partners, which may reduce the unique value of a firm's specific knowledge and expertise. For unconnected firms, this may lower the necessity to collaborate with the focal firm per se, as they may also have a focal firm's partners to turn to, instead of the focal firm itself. Overall, the more a firm relies on the use of JVs, the more likely that the number of opportunities diminishes.

*Ability.* On the one hand, a key strength of JVs is that they may support a firm in collaborating with highly diverse partners. More specifically, JVs support strong information flows between partners, which is especially relevant in alliances between partners with a high technological distance (Sampson, 2007). On the other hand, however, JVs are more costly and difficult to terminate rapidly once a collaboration does not live up to expectations and objectives. Hence, the more a firm makes use of JVs, the lower its ability to respond flexibly to new attractive opportunities for partnering with unconnected alters, which may emerge unexpectedly. In addition, the phenomenon that the use of JVs leads to stronger ties between partners over time (Gulati, 1995a) and may lead to a relatively closed group (Uzzi, 1997) also lowers the ability of a focal firm to hear rapidly about where new, valuable resources and attractive opportunities for partnering and/or brokering may rest throughout the network. Overall, despite the room that JVs offer in bridging a large technological distance with diverse partners, we expect that their lower flexibility and their reduction of a firm's ability to hear about new partnering opportunities will lead to a negative net-effect on a firm's ability to move into a brokering position.

In sum, whereas the use of JVs increases incentives, it reduces opportunities as well as the ability of firms for brokering across unconnected firms in the network. Therefore, we expect overall that the more a firm relies on the use of JVs, the less room for brokerage among unconnected alters that will lower its BC. This suggests our third hypothesis:

*Hypothesis 3: There is a negative relationship between a firm's use of equity-based alliances and an increase in its BC.*

#### **Pioneering technology and alliance organization**

We combine a competence and a governance perspective by considering the interaction between pioneering technology and alliance organization. The 'de-novo' character of pioneering technology may arouse strong interest by others, elevating the risk of spillovers. As the choice for a certain alliance organization may influence this risk, we consider to what extent the combination of pioneering technology and alliance organization leads to changes in a firm's BC through incentives, opportunities and ability.

*Incentives.* As discussed, the possession of pioneering technology may elevate a focal firm's incentives to move into a brokering position. However, brokerage through collaboration with

unconnected others may also increase a focal firm's exposure to collaborative hazards such as undesirable knowledge spillovers and free-ridership. To guard itself against these risks, JVs may form an effective instrument (Sampson, 2007). They may help to protect against spillovers and also allow for the build-up of trust between partners that may mitigate risks of freeridership (Gulati, 1995a; Nooteboom, 2004). In this way, the use of JVs in combination with pioneering technology may further elevate incentives for brokerage by a focal firm among unconnected partners.

*Opportunities.* As discussed, the possession of pioneering technology may yield opportunities to form alliances with unconnected partners. In contrast, the use of JVs may decrease such opportunities, as argued above. This makes it not straightforward to arrive at an unequivocal prediction. On the one hand, possessing pioneering technology in combination with the use of JVs may increase opportunities even further. The risk of undesirable spillovers and/or freeridership that we discussed above, will also be present from the perspective of the unconnected alter(s). From the latter viewpoint, the focal firm is also disembedded and may possibly be tempted to engage in acts of opportunism towards him. The latter may therefore be more willing to engage in collaboration when this takes place by means of JVs, with their potential to mitigate opportunism, rather than by contracts.

*Ability.* As already discussed, possession of pioneering technology may contribute to a firm's ability to ally with unconnected partners in the network, as it may support a focal firm in bridging a large technological distance between unconnected parts of the network. In combination with the use of JVs, this ability may get further strengthened as JVs are particularly effective when collaborating with technologically (highly) diverse partners (Sampson, 2007). As a consequence, the use of JVs in combination with pioneering technology may further amplify the ability of firms to collaborate with partners formerly unconnected to their ego-network, at a large technological distance. These benefits may possibly offset the disadvantages for their ability to move into a more central position, formed by lower flexibility and a reduced ability to hear about new opportunities due to the use of JVs, as discussed above.

In sum, we expect that pioneering technology in combination with the use of JVs further elevate incentives, opportunities and the ability of a focal firm to move into a brokerage position. Therefore, we expect that the room pioneering technology provides to a focal firm to move into a brokerage position, conform hypothesis 1, is further amplified when combined with the use of JVs. This suggests our fourth hypothesis.

*Hypothesis 4: There is a positive relationship between a firm's possession of pioneering technology and its use of equity-based alliances, and an increase in its BC.*

## 2 Methods

### 2.1 Data and sample

We present an analysis of a large sample of 1,697 companies, from 39 countries, with a total number of 3,124 technology alliances. The data on these technology alliances were obtained from the MERIT-CATI databank and cover the period 1990 - 2000. The MERIT-CATI databank contains information on thousands of technology-related inter-firm partnerships. Information is primarily collected on joint ventures with R&D activities and contractual technology alliances such as R&D pacts and joint development agreements (see also Hagedoorn, 2002). We study both types of alliances within two different networks. One network that is made up of biotechnology alliances and one network that is made up of alliances that fall within the broader ICT industry, formed by computers, semi-conductors and telecom.

There are several reasons for choosing these international high-tech sectors as the empirical setting for our study. First, these sectors are generally considered as high-tech sectors because of their R&D intensity, their patent intensity and their high level of new product development (OECD, 1997). Second, these industries are characterized by (broadly) distributed technological knowledge and skills, which creates a strategic necessity for firms to engage in R&D collaboration. As a consequence, interfirm collaboration is a widespread phenomenon in these industries as can be seen from the large number of companies that has engaged in joint R&D (Hagedoorn, 2002). Technological expertise, formed by pioneering technologies, as much as alliance portfolios contribute to a firm's reputation and its ability of having speedy access to external expertise, each of which are critical to firms' survival in high-tech industries (Powell et al., 1996; Gulati, 1999; Hagedoorn, 2002; Sampson, 2007). In addition, previous research has demonstrated that collaborative hazards are especially present in alliances involving technology (Gulati and Singh, 1998), suggesting that also a governance view of collaboration is useful

to consider and therefore the inclusion of alliance organization as a key independent variable that may affect a firm's centrality.

The composition of our sample shows a large degree of variation along different dimensions. Overall, 47% of these technology alliances are domestic, whereas 53% have an international scope. In addition, about one third of the companies in our sample are relatively small with less than 1,000 employees, whereas 25% can be characterized as very large with more than 50,000 employees and 42% of the companies can be considered as intermediate. With respect to R&D intensity, 25% of the companies have an R&D intensity of less than 5%, 22% spends more than 15% of their sales on R&D expenditures and about half of the sample (53%) can be found in intermediate classes. Concerning alliance experience, about 50% of the companies have undertaken 2 alliances or less up to 5 years in the past, around 25% has undertaken 2 to 10 alliances in the past, almost 15% undertook 11 to 20 alliances and 10 % was engaged in over 20 alliances. So, our sample shows sufficient variation regarding international coverage, the size distribution of companies, their R&D intensity and alliance experience.

Information on firms was collected through well-known databases such as Amadeus, Compustat, Disclosure, Osiris, and Worldscope. Data on patents and patent citations at the firm level are taken from the USPTO. Although the use of US data could imply a bias in favour of US companies and against non-US firms, the patent literature suggests several reasons to choose US patent data (see Patel and Pavitt, 1991). These reasons include the importance of the US market, the genuine patent protection offered by US authorities, and the level of technological sophistication of the US market, which makes it almost compulsory for non-US companies to file patents in the USA (Albert, Avery, Narin and McAllister, 1991). Furthermore, to maintain a certain level of consistency, reliability and comparability it is necessary to choose one patenting system instead of several patenting systems across nations (Ahuja and Katila, 2001).

Regarding network boundary specification, we have followed a commonly used approach of using a restriction based on some attribute or characteristic of the actors in the network (Laumann, Marsden and Prensky, 1992). More specifically, an *industry criterion* is applied to restrict membership in the network, as our target population includes only those focal companies that are active in one of the two high-tech industries as defined above. In addition, network boundaries are also set by a defining activity, i.e. *participation in technology alliances*, which serves to select individual actors and the relationship among them in the network. So, boundary specification of the network that we study is formed by alliances that focused on the creation of new technology in these industries. We collected our data by relying on both firms' announcements in industry specific trade journals, industry reports and articles as well as on data from the MERIT-CATI database, a comprehensive database that contains information on R&D partnerships (see e.g. Hagedoorn and Roijackers, 2002). As a consequence, other types of relations between firms that refrain from this, by for example including a focus on marketing or production, are left out from the analysis.

**2.2 Dependent Variable & Estimation Method**

Betweenness centrality (BC) is based on the geodesic paths between all pairs of actors and measured by determining the proportion of how frequently each actors falls in each of these pathways. The variable betweenness centrality (BC) is measured using UCINET VI (Borgatti, Evertt and Freeman, 2002). The betweenness centrality (BC) measure is as follows:

$$Cb(p_k) = \sum_l^n \sum_j^n g_{ij}(p_k)/g_{ij},$$

where n represents the number of points in the network,  $g_{ij}$  represents the number of geodesic paths linking  $p_i$  and  $p_j$  that contain  $p_k$ . This ratio measures betweenness centrality (BC) by adding up the number of times an actor is 'between' other actors and divide it by the maximum possible betweenness (Hanneman, 2001).

The variable betweenness centrality (BC) is highly skewed and, accordingly, the pattern observed in the empirical distribution is better represented by lognormal distributions (see also Laursen and Salter, 2005). More specifically, if heteroscedasticity and/or non-normality are detected, a transformation of the dependent variable is appropriate. As this was the case, we have log-transformed this variable, changing our focal dependent variable into *changes* in betweenness centrality. More specifically, by taking the logarithm of the dependent variable, the explanatory variables have an impact in terms of the amount of percentual change in a firm's BC, i.e. the elasticity is obtained. However, a lognormal transformation neither changes the signs nor the significance of parameters for the key variables in the empirical analysis. We come back to this issue when we present the descriptive statistics of our sample and discuss

whether the conditions of heteroscedasticity and/or non - normality have been met sufficiently indeed.

The natural logarithm of betweenness centrality (BC) only takes non-negative values. Non-negative variables violate one of the main assumptions of the classical linear (OLS) regression model as the dependent variable cannot be normally distributed. The Tobit model is an econometric, biometric model proposed by Tobin (1958) to describe the relationship between a non-negative dependent variable  $y_i$  and an independent variable (or vector)  $x_i$ . Because our data contains variables observed over multiple time periods for the same companies, we use panel tobit analysis.

### 3.3 Independent variables

For the variable pioneering technologies we need a measure that captures the degree to which a firm experiments with technologies that build on no prior technologies. In line with Ahuja and Lampert (2001), this variable is computed as the number of a firm's patents that cite no other patents. Patents must indicate their prior technological lineage by citing all patents that they build on (Podolny and Stuart, 1995; Stuart and Podolny, 1996; Jaffe, Trajtenberg, and Henderson, 1993; Trajtenberg, Henderson, and Jaffe, 1992). Patents that cite no other patents indicate that they have no discernible technological antecedents. Past research has used the relative lack of prior art citations in a patent as an indicator of the *originality* and *creativity* of that patent (Ahuja and Lampert, 2001; Trajtenberg et al., 1992). According to Ahuja and Lampert (2001), the creation of many such patents by a firm reflects its willingness to adopt a pioneering or unprecedented approach in its innovation strategy. Thus, firms that create many patents that cite no other patents are firms that can be regarded as willing to explore technology spaces that have not been explored before. Yearly data on patents and patents citations at the firm level are taken from the USPTO.

The variable portfolio size (PS) is measured by counting the number of different partners with whom a company has collaborated through a technology-based alliance within one year. The variable portfolio size squared is measured by taking the squared term of the variable portfolio size. This variable is included in order to take into account curvilinear effects of portfolio size, in line with the literature (Add REFs).

The variable alliance organization (JV) is measured by taking the degree of joint ventures in the total number of technology partnerships in which a company engages per year.

We also include an interaction effect into the analysis. The variable interaction PT and JV is constructed by multiplying the variable pioneering technologies with the variable alliance organization. Before calculating the interaction term we mean-centred the variables (Aiken and West, 1991) in order to reduce the risk of multicollinearity with the original independent variables.

Furthermore, all independent variables and their interaction terms are lagged for one-year in order to allow for a causal effect on the dependent variable.

### 3.4 Control variables

Consistent with prior research on inter-firm partnerships, we included a number of control variables for specific company characteristics and for some general characteristics of the sectors from which these companies originate.

Technological capital is included as a control variable because it may affect its incentives, opportunities and ability for brokering across unconnected partners. Although it generally may increase opportunities and ability, it may not necessarily increase its incentives due to elevated risks of spillovers. Technological capital will be measured by counting the number of applied US patents each company received per year.

Alliance experience is included as a control variable because firms with more alliance experience have more alliances and thereby may have more partners. These firms may enjoy more opportunities to become more central and we therefore control for this effect. The variable alliance experience refers to the amount of alliance experience that a firm has acquired over the years. In line with the literature, it is measured by a count of a firm's past alliances using a five-year moving window from  $t-5$  to  $t-1$  (Kale and Singh, 1999; Heimeriks and Duysters, 2007). A moving window of five years is considered as an appropriate time frame as the average life-span for alliances is about five years (Kogut, 1988; Gulati, 1999).

The size of a company is included as a control variable because larger firms may have more alliances and/or more partners. As a consequence, larger firms may have wider-reaching industry contacts that may lead to more extensive networks and therefore to possibly better or earlier information on alliance opportunities (Eisenhardt and Schoonhoven, 1996). Seen in this way, larger firms may enjoy more opportunities to become more central than smaller firms and we therefore control for this effect. Firm size is measured in terms of the natural logarithm of the number of employees of a company. R&D

intensity of companies is taken as a control variable as it may indicate the degree of a firm’s absorptive capacity (Cohen and Levinthal, 1990). High absorptive capacity strengthens the ability of firms to recognize the value of highly novel and technologically distant knowledge, which may enable them to collaborate with partners from distant parts of the network. In this way, absorptive capacity may affect the incentives and/or ability of a firm to increase its BC. The variable R&D intensity is measured by a company’s R&D expenditures divided by its sales (standardized by converting the data from national currencies to US dollars).

We also control for differences in a firm’s innovation strategy, emphasizing an exploitation strategy versus a more exploration-oriented strategy. An exploitation strategy can be associated with deepening one’s expertise in a limited area and may provide firms with different incentives, opportunities and/or abilities to search for external knowledge and change its position in the network then firms pursuing an exploration strategy, which may be associated with broadening its knowledge base over different domains. Inclusion of both depth and scope of a firm’s knowledge base enables us to control for these two potential sources of heterogeneity that may potentially affect our dependent variable. In line with Katila and Ahuja (2002), the variable depth is measured by counting how often each citation in the current patents has occurred before (how much the firm exploits existing knowledge) whereas the variable scope is measured by counting how many of the current citations have never occurred before (how much a firm explores new knowledge in its innovation search).

We also control for the role of exogenous factors that could affect a firm’s room to become more central. First, the role of the entire network structure may play a role. Here, we consider the variable network centralization that refers to the overall centralization of the network and is indicative of the tendency of one or a few firms to be more central than others in the network (Freeman, 1979). In this respect, network centralization provides an aggregate measure for the distribution of ties among firms and in this way for the degree in which they are differentiated in terms of their structural position (Madhavan et al., 1998). A more centralized network may provide different incentives and opportunities than a non-centralized network. For example, the more centralized a network is, the fewer opportunities a focal firm may have to become more central, whereas a less centralized network may offer more opportunities to become more central. We computed the network centralization index by the use of UCINET VI to measure the centralization of the entire network (Borgatti, Everett and Freeman, 2002). Second, we control for differences between both sectors by including the variable dummy pharmaceuticals, which is coded 1 for the pharmaceutical sector (including biotech) and 0 for the ICT-sector (computers, semi-conductors and telecom).

Finally, as for the independent variables, all control variables are lagged for one-year in order to allow for a causal effect on the dependent variable.

### 3 Results

Table 1 presents the descriptive statistics (means and standard deviations) and correlations of the dependent and explanatory variables. There are no correlations between the main independent variables that are higher than 0.5 (Hair et al, 1995)<sup>1</sup>. Overall, there do not exist any problems with multicollinearity in our analysis. In addition, table 1 shows high variation for our three independent variables (pioneering technologies, portfolio size and alliance organization), indicating that there is a large degree of heterogeneity among firms in our sample regarding the key independent variables of interest.

**Table 1 Descriptive statistics and bivariate correlations for all variables of the panel tobit analyses<sup>2</sup>**  
(*N* = 3,124; *nr of firms* = 1,697; *years* = 1990-2000)

Variable	Mean	S.D.	1	2	3	4	5	6	7	8	9	10	11	12	13	14
1 ln(Betweenness centrality)	1.29	2.44	1.000													
2 Pioneering technologies (PT)	2.78	8.66	0.259	1.000												

<sup>1</sup> Although there is little correlation between the main independent variables, an expected exception is the correlation between portfolio size (PS) and portfolio size squared. There is also some expected correlation between pioneering technologies (PT) and the interaction effect of pioneering technologies with alliance organization (PT \* JV).

<sup>2</sup> For readability, the descriptive statistics are given for the uncentered variables. If we represent the descriptive statistics for the mean-centered variables, certain count variables such as technological capabilities and portfolio size, would get a negative mean, which is counter-intuitive.

3 Portfolio size (PS)	0.89	1.99	0.436	0.325	1.000

If both heteroscedasticity and non-normality are detected, then a transformation of the dependent variable may be appropriate. We checked for omitted variable bias and other possible confounding effects through the inspection of the possibility of heteroscedasticity. Since the standard test for heteroscedasticity is not applicable in the case of a panel tobit, we use a bootstrap procedure. Bootstrapping typically generates very conservative results.<sup>1</sup> Since our results remained very robust when using the bootstrap procedure (i.e. the same results in terms of sign and significance of the beta coefficients), this indicates that we both have included the most important factors affecting BC and also that our estimators are not biased and there is no problem of heteroscedasticity. However, the skewness of our dependent variable violates the assumption of normality of residuals in the standard Tobit model so that a log transformation of our dependent variable is appropriate.

Table 2 presents the results of the panel tobit analysis with the dependent variable measuring the percentage change in a firm’s centrality. We used a stepwise approach to arrive at our results. Model 1, the base model, only contains the control variables and a constant. Model 2, 3 and 4 also include the variable pioneering technologies, portfolio size and alliance organization respectively. Our final model is number 5 that contains all variables, i.e. our full model. The table indicates that our results are very robust, i.e. all main independent variables have the same signs and the same significance in all of the models. Furthermore, the size of the coefficients of all variables is comparable for all models. Because we have panel tobit models, the goodness-of-fit of the different models can be evaluated using the log likelihood values and a Wald test. As can be seen in the table, model 2, 3 and 4 all have significant higher log likelihood values compared to the base model, model 1. Also, model 3 and 4 have significant higher values for the Wald test compared to the base model. This indicates that model 3 and 4, and to a lesser extent model 2, carry more explanatory power in explaining betweenness centrality (BC) than the base model, model 1. Furthermore, the full model has the highest significant log likelihood values and Wald chi-squared values, indicating that the full model is the best in explaining betweenness centrality (BC) out of all models. Because of the robustness of the results, we will only discuss the results of the full model (model 5).

The possession of pioneering technologies (PT) has a highly significant and positive effect on a firm’s betweenness centrality (BC). This provides support for hypothesis 1, suggesting that pioneering technologies carry a positive effect on incentives, opportunities and ability for brokering across unconnected partners and thus lead to an increase in betweenness centrality.<sup>1</sup> Hypothesis 2 specifies a curvilinear effect of a firm’s portfolio size (PS) on incentives, opportunities and ability to move into a brokering position. Here, the results in table 2 show a highly significant positive linear coefficient and a highly significant negative quadratic coefficient, indicating that portfolio size indeed carries the predicted curvilinear effect. The variable alliance organization (JV) has a highly significant, negative effect on our dependent variable. This provides support for hypothesis 3, predicting that the use of equity-based alliances reduces a firm’s betweenness centrality. Moreover, an additional observation pertains to the differences in the size of the effects of our three independent variables. The effect of portfolio size is larger when compared to the effect of pioneering technologies and far larger than alliance organization, an issue that we will discuss more in-depth in the discussion and conclusions section.

Regarding the interaction effect, hypothesis 4 predicts that the interaction between pioneering technologies and alliance organization will increase a firm’s betweenness centrality. The coefficient of the interaction between pioneering technologies and alliance organization carries the predicted positive sign and is highly significant, indicating strong support for hypothesis 4.

We also controlled for technological capital, alliance experience, firm size, depth and scope, network centralization and differences between sectors of industry<sup>2</sup>. Technological capital is significant

<sup>1</sup> We also tested for a possible (not predicted) curvilinear effect of pioneering technologies. However, the squared term proved to be insignificant.

<sup>2</sup> Since the study period from 1990 to 2000 covers 11 years of observation, we also included annual dummies and a trend variable to test for a structural break in the univariate time series of our dependent variable. However, the

and has a positive effect on a firm's betweenness centrality. However, its significance is weaker compared to the significance of pioneering technologies. Furthermore, the coefficient of technological capital is much smaller than the one of pioneering technologies. So, although technological capital does have a significant positive effect on betweenness centrality, pioneering technologies have a stronger and more significant effect on betweenness centrality. Alliance experience is not significant in the full model, although it has a highly significant positive effect in model 1 and 4, suggesting that more alliance experience positively effects a firm's betweenness centrality. Firm size is highly significant and has a strong effect on a firm's betweenness centrality. R&D intensity does not seem to play an important role, the results don't show any significant effect. Furthermore, the absence of any significant effect of both depth and scope indicates that underlying differences between firms' innovation strategies do not affect their incentives, opportunities and/or ability to become more central. Although the role of network centralization carries the expected negative sign, it does not have a significant effect. Finally, we controlled for differences between sectors of industry. Dummy pharmaceuticals shows a highly significant and positive effect, indicating that the volatility in betweenness centrality (BC) in the pharmaceutical sector (including biotech) is higher compared to the ICT sector (computers, semi-conductors and telecom).

As an additional robustness check we ran the same analyses by using degree centrality instead of betweenness centrality (BC) as the dependent variable<sup>1</sup>. Again, we used a stepwise approach to arrive at our results. In general, the results show that the effects of the independent variables are less significant when using degree centrality as dependent variable. In case the results were significant when using degree centrality, the coefficients were smaller. These results seem to suggest that pioneering technologies, portfolio size and choice for alliance organization play a far more important role in changing a firm's BC compared to its degree centrality.

Finally, we also tested for endogeneity due to reverse causality, following suggestions and evidence in the literature that centrality affects different types of outcomes (Burt, 1992; Powell e.a., 1996). One such possibility may be the effect of centrality on a firm's innovation performance (Ahuja, 2000a; Gilsing et al., 2008), suggesting the possibility of a reverse effect of centrality on the build-up of a firm's pioneering technologies, forming one of our key independent variables. Likewise, centrality may affect the opportunities to form linkages (Podolny, 1994), suggesting the possibility of a reverse effect of centrality on the build-up of a firm's portfolio size. Centrality may also affect the propensity to employ certain governance modes. Being more central may possibly reduce the need for equity-based collaboration as such a powerful position may also offer alternative ways to mitigate opportunism, e.g. by threatening with negative referrals.

Based on two tests in Stata, we found no endogeneity in our sample.<sup>2</sup> One should bear in mind that our dependent variable is formed by *changes* in BC, suggesting that a change in one's position does not affect a firm's pioneering technologies, portfolio size or use of equity over non-equity alliances, at least not on the short term. This further enhances confidence in our empirical findings and also indicates that endogeneity does not form an issue in our study in contrast to empirical studies where the dependent variable is performance-based (Hamilton and Nickerson, 2003; Lee, 2010).

In sum, we find empirical evidence for all four hypotheses whereas our tests rule out the possibility of endogeneity. Overall, this lends credence to the central argument made in this paper that the joint consideration of incentives, opportunities and ability enables us to develop a more comprehensive understanding of how heterogeneity in firm-level attributes, i.e. their pioneering technologies, portfolio size and choice for alliance organization, drives differences among firms regarding changes in their BC.

#### 4 Discussion and Conclusions

Although central positions have been associated with above average performance of firms (Burt, 1992; 2000; Galaskiewicz, 1979; Krackhardt, 1990; Powell et al., 1996; Stuart, 1998), an understanding of the process along which firms come to occupy a more central position still remains underdeveloped. To address this, the aim of this paper has been to develop an endogenous understanding of changes in centrality by considering the role of pioneering technology, portfolio size and the choice for alliance organization as firm-level antecedents. Following our hypotheses and empirical findings, there are a

results of the annual dummies and the trend variable were non-significant.

<sup>1</sup> The results of the analyses with degree centrality as dependent variable are available from the authors upon request.

<sup>2</sup> More specifically, the `.ivreg2` command computes a single-equation instrumental-variables regression and the `.ivendog` command computes a test for endogeneity in a regression estimated via instrumental variables.

number of results that stand out.

First, pioneering technology, portfolio size as well as alliance organization form relevant antecedents of changes in a firm's BC. For pioneering technology we found a positive effect, for the role of alliance portfolio we found a non-linear (curvilinear) effect, whereas for the use of equity alliances we found a negative effect. Second, when considering the interaction effect, we found that the use of JVs (contracts) amplifies (mitigates) the positive effect of pioneering technology. Third, the relative importance of each of the three antecedents differs substantially among them. The role of alliance portfolio size is by far the largest (73%) and is followed by pioneering technology (8%), whereas the role of alliance organization is very limited (0,5%) as is the combination of pioneering technology and the use of JVs (0,01%). We advance an interpretation for this difference in effect sizes below.

The large effect of portfolio size is in line with some key insights as they have emerged in the literature. A sizeable alliance portfolio may signal that a firm is well embedded and possesses status, both of which may contribute to a firm's 'natural right' to initiate partnerships with what it considers as attractive others (Podolny, 1994; Gulati, 1995b). This is in line with the logic of preferential attachment that leads to a dynamic of 'the rich-get-richer' (Powell et al., 2005) as well as with the common idea of a persistent, endogenous network dynamic that leads to replication and incremental change of the network structure over time (Gulati and Gargiulo, 1999). The prominent role of these pervasive mechanisms in alliance networks accounts for the large effect of alliance portfolio as an antecedent of centrality as found in this study. Still, if this serves to explain why the effect of alliance portfolio is readily apparent, a question that still remains is why the role of pioneering technology and most notably alliance organization are relatively small?

The (highly significant) individual effect of pioneering technology does demonstrate that firms in possession of pioneering technology, irrespective of the size of their alliance portfolio, may end up in a more central position than they initially occupied. This is in line with the idea that peripheral players can become more central if they possess valuable technological expertise (Ahuja 2000a; Gulati and Gargiulo, 1999; Oscan and Eisenhardt, 2010), and that they may be more inclined to ally with attractive, central others rather than with peripheral 'peers' conform the notion of structural heterophily (Ahuja et al., 2009). So, our findings also provide evidence for the possibility of potentially poorly embedded firms with valuable pioneering technology that can ally with more central players if they can offer pioneering technology that can not be obtained from others (Ahuja et al., 2009). As this forms the 'exception to the rule' (Gulati and Gargiulo, 1999), however, the size effect of pioneering technology is comparatively smaller than for alliance portfolio size.<sup>1</sup>

Regarding the relatively small effect of alliance organization, there may be different interpretations. First, we argued theoretically that whereas the use of JVs may increase incentives, it may also reduce opportunities as well as the ability of firms for brokering. These opposed effects may to some extent cancel out on each other and lead to a net-effect on BC that is very limited in size. Second, we reiterate that the key premise underlying our logic is formed by one of the core ideas in social exchange theory, namely that an actor (firm) must have something of value to offer in order to become or stay attractive to others (Blau, 1964; Emerson, 1962; Robinson and Stuart, 2006). Seen in this way, alliance organization as such does not create or increase the value of what firms have to offer, but rather affects the degree in which value can be protected and thus be maintained. So, the role of alliance organization is of more secondary importance and therefore makes less of a difference when compared to alliance portfolio and pioneering technology. A third interpretation may be that too much emphasis on protecting its possessions will reduce a firm's attractiveness to others and therefore will only have a very limited effect on an increase in its BC. This seems in line with the very marginal effect of the combination of pioneering technology and the use of JVs. This suggests that possession of pioneering technology asks to be shared with others if one aspires to increase one's BC. A firm can still choose to protect its pioneering technology through the use of JVs, but then has to accept that it pays a price by a lack of an increase in its BC.

Overall, our study contributes to an understanding of what makes firms more central in technology-based alliance networks. This serves as an important complement to exogenous explanations that have been advanced until now, such as changes in technology and regulation (Madhavan et al., 1998)

---

<sup>1</sup> This is in line with the findings by Rosenkopf and Padula (2008) on the formation of 'short-cuts', i.e. ties to (semi) distant firms that may possess unique expertise. Such short-cuts, however, form the less common ties and their value lies 'not in their prevalence but in their scarcity' (Rosenkopf and Padula, 2008: 3).

or changes in environmental conditions (Koka et al., 2006). Although such exogenous explanations can predict aggregate changes in network centrality, they remain silent on an endogenous understanding of how individual firms can come to occupy a more central position. Our study shows that how they can, will be different for different firms. Heterogeneity in firm-level attributes such as their pioneering technology, alliance portfolio size and the use of equity-alliances drives differences among firms in increasing their BC. The mechanisms *through which* each of these affect the room for firms to alter their network position are formed by (1) incentives, (2) opportunities and (3) ability. This joint consideration of both incentives, opportunity and ability is more comprehensive than earlier studies that carried a (implicit) focus on opportunities only (Burt, 1992; Madhavan et al., 1988), opportunities and ability (Burkhardt and Brass, 1990; Lee, 2010) or opportunities and incentives (Shipilov et al., 2010). It is the combination of these three mechanisms and a firm's possession of technological and social resources, and its alliance governance choices, that influence changes in their BC. By considering these antecedents of changes in centrality, we also inform the literature what factors affect and shape networks (Gilsing and Nooteboom 2006; Koka et al., 2006; Madhavan et al., 1998; Rosenkopf and Schilling, 2007). This goes beyond the dominant focus on the role of network structural properties as independent variables and explores the role of firm-level factors that affect and shape these properties.

Secondly, we contribute to an emerging debate in the literature regarding the role of agency in networks. Network research has been criticized for failing to show how actors' intentional action may contribute to the creation of network structures that constrain them at the same time (Emirbayer and Goodwin, 1994; Kilduff and Brass, 2010; Salancik, 1995). Most studies until now have assumed that network structure is exogenous, implicitly suggesting as if firms' network positions are given (Lee, 2010). This view can be criticized as one can also argue that firms may be motivated and capable to pursue certain network positions in anticipation of their performance benefits. What follows from our logic and empirical findings is that the role of incentives, opportunities and ability suggests that firms are deliberately after achieving collaboration with hitherto unconnected partners, implying purposeful behavior. However, what also emerges from our study is that firms may not be pursuing the most central position per se, but rather are interested in collaboration with what they consider as an attractive, unconnected partner. It is foremost collaboration with these partners that is what drives firms, leading them to end up in a more central position as a result. At the same time, there remains a clear uncertain element in this process. Changes in a firm's BC also depends on other collaborative actions going on throughout the entire network that together make up for a (possible) redistribution of positions across firms. Obviously, these network level processes are beyond the control of individual firms and create a certain degree of unpredictability or randomness. Seen in this way, our study suggests that actors' intentional action definitely matters and contributes to the (re)creation of network structures and positions but that there also remains an exogenous process that puts a ceiling on this role of agency in networks.

The implications for managers and firms are that they may have more room to influence their BC in a network than previously assumed in the literature, but not to the extent that they can control this process. The development of a sizeable portfolio of direct partners (around 9 partners), the creation of pioneering technology and the reliance on contracts relative to JVs, in this order, will be supportive for moving into a more central position. But the actions of others in the network as well as (unforeseen) exogenous events will also have their share.

Although this study does reveal some very important aspects of the antecedents of changes in centrality in technology-based alliance networks, it also comes with a number of limitations.

Issues for future research may be as follows. First of all, there is still a clear need for further studies based on a larger variety of forms of inter-firm partnering. Collaboration that covers marketing or production and supply alliances may generate a(n) (entirely) different dynamic than a sole focus on technology alliances as considered here. In how far does possession of pioneering technology still form a relevant antecedent in e.g. a production & supply setting of collaboration where stability and predictability may be much more valued partner attributes than breakthrough expertise? Also governance trade-offs may be made rather differently in these settings and therefore show a different role of JVs versus contracts as found in this study. Another direction for future research may be to consider a broader range of industries such as medium- and low-tech sectors. The question is in how far the antecedents as considered in this study play a role in such different kinds of settings as well. There may be different antecedents that drive heterogeneity among firms in moving into more central positions. Finally, an interesting issue for future research may be to explore in-depth within firms how they actually deal with increasing their BC. Does this require different alliance and/or portfolio capabilities

than has been considered in the literature until now?

We started this paper with an overlooked and intriguing question, namely what makes firms more central in a global, technology-based alliance network? Overall, our study demonstrates that this begins with an appreciation of the role of ‘having path-breaking ideas’ (pioneering technology), ‘how many partners you have’ (portfolio size) and ‘how you organize this collaboration’ (alliance organization) that affects the degree in which firms come to occupy a more central position in a global network structure of technology-based alliances.

## Between Learning and Competence: The Effect of Alliance Portfolio Diversity on Learning Equilibrium

Marc Bahlmann, Alexander Alexiev, Brian Tjemkes, Ard-Pieter de Man

(email: a.p.de.man@vu.nl)

**Abstract :** This paper engages with the recent turn in alliance studies to adopt a portfolio approach. Specifically, we seek to increase our theoretical understanding of how the composition of a focal firm's alliance portfolio in terms of diversity affects its exploitation/ exploration equilibrium. Our analysis suggests that alliance portfolio diversity results in different outcomes for both explorative and exploitative learning, making it difficult to establish the optimal degree of diversity. Analogue to the concept of domain separation, we forward the idea of establishing different degrees of diversity across various domains as a potential solution to this issue.

**Key words:** Alliance portfolio; Exploration; Exploitation; Diversity

### 1 Introduction

Learning and innovating through alliances is considered a critical element in ensuring organizational competitiveness and innovativeness, a challenge increasingly met from an alliance portfolio perspective (Wassmer, 2008). A recurrent problem in both practice and theory revolves around the fundamental issue of addressing both knowledge exploration and exploitation simultaneously (Holmqvist, 2003). Knowledge exploitation allows organizations to acquire "reliability in experiences", leading to increased "productivity, refinement, routinization, production, and elaboration of existing experiences" (*ibid.*: 99). Knowledge exploration, conversely, allows organizations to develop "variety in experiences" (*ibid.*) by experimentation and innovation, thus complementing the limitations of knowledge exploitation. To date, it remains unclear how this equilibrium in exploitative and explorative learning is to be achieved by means of an alliance portfolio approach, such that both explorative and exploitative learning are optimally produced.

When engaged in alliance portfolio management in the face of exploration and exploitation optimization, an organization is confronted with the challenge of designing optimal portfolio diversity. It is agreed that, for either explorative and exploitative learning to thrive, different degrees of portfolio diversity is required (Simsek, 2009; March, 1996). More specifically, literature on alliance portfolio diversity portrays an interesting trade-off: one perspective advocates the great possibilities that stem from building highly diversified alliance portfolios, such as broadened search options and an enriched resource pool (Jiang *et al.*, 2010), resulting in better capabilities for developing new opportunities. The other perspective, however, stresses the potential drawbacks of an increase in portfolio diversity, such as more complexity, potentially more conflicts, and an increase in coordination costs (*ibid.*; Khanna *et al.*, 1998). The main problem lies in the notion that an alliance portfolio geared towards explorative learning goes at the expense of exploitative learning, leading towards a so-called learning trap. An alliance portfolio geared towards exploitative learning goes at the expense of explorative learning, leading towards a competence trap. Managing alliance portfolio diversity can result in a more balanced portfolio but inherently results in sub-optimal performance in terms of exploration and exploitation outcomes (March, 1996). The question, thus, remains how alliance portfolios should be designed from a diversity point-of-view, in order to produce superior exploitative *and* explorative learning.

This paper provides a conceptual solution by distinguishing different domains of diversity, suggesting that maximum levels of explorative and exploitative learning can be attained by the focal firm by managing alliance portfolio diversity across domains. This examination, which is developed analogue to the concept of domain separation (Lavie & Rosenkopf, 2006), is explored by means of two stylized solutions, one developing a parallel design while the other explores a 'core-crust' design. Doing so, we regard explorative learning and exploitative learning as our two dependent variables, whereas we consider three domains of portfolio diversity as independent variables. The trade-off between the two, which is central to March's (1991) framework (Lavie, Stettner & Tushman, 2010), can be regarded as learning equilibrium, which is achieved by different combinations of portfolio diversity domains. The combinatory effects of different types of alliance portfolio diversity on the balance in exploitative and explorative learning by the focal firm, thus, is of central importance to this study.

The contribution of this study is twofold. First, we explicitly address the issue of alliance portfolio diversity in relation to exploration and exploitation outcomes. This results in an increased understanding of the merits and drawbacks of a diversity approach. Second, we specifically concentrate on the multidimensional nature of alliance portfolio diversity, and advance alliance portfolio literature by postulating its interactive nature in relation to explorative and exploitative outcomes at the level of the focal firm. In so doing, this paper acknowledges the inherently problematic issue of reaching optimal exploration and exploitation outcomes while engaged in the struggle for some sort of exploration/exploitation equilibrium.

This study will proceed as follows. First, the topic of learning equilibrium is introduced by drawing on the issue of seeking a balance between knowledge exploration and exploitation. Subsequently, it is theoretically explored how alliance portfolio diversity matters with respect to reaching a state of knowledge exploration and exploitation. Third, it is explored how different types of diversity interact, thus mitigating or reinforcing one another's effect on exploration and exploitation outcomes.

## 2 Theoretical Background

### 2.1 The issue of learning equilibrium

The distinction between knowledge exploration and exploitation (March, 1991) is seminal to the issue of learning equilibrium, which can be defined as a status quo in which inter-firm knowledge exploration and exploitation is balanced to a degree that allows the focal firm to maximize its benefits from both learning processes. The exact equilibrium necessary to be achieved is dependent on the specific context. However, both processes can be regarded to produce a trade-off effect, meaning that one exists at the expense of the other.

Exploitative learning serves the purpose of refining and extending existing technologies or capabilities. As such, the focus is on learning as a routinized process by building on the current knowledge base and supporting the current nature of the firm's activities (Hagedoorn & Duysters, 2002). Explorative learning, by contrast, is characterized by search and experimentation, and focused on exploring new technologies or potential opportunities. It involves a non-routinized, discontinuous (Simsek, 2009) type of learning, and potentially effects the firm's current competencies and knowledge base significantly (March, 1991). Explorative learning processes are, subsequently, to be considered very different from its exploitative counterpart, especially when it comes down to degree of experimentation, duration, and certainty.

Reaching some sort of equilibrium is considered key, and indeed, fundamental to organizational survival and long-run adaptation (Gupta, Smith & Shalley, 2006). The logic behind this is straightforward; an organization exclusively engaged in explorative behavior will inevitably gain little returns from its explorative knowledge, while an organization predominantly engaged in exploitative behavior will inevitably suffer from an obsolescent body of knowledge (Levinthal & March, 1993). In essence, this dilemma revolves around focusing on improving an organization's short-term performance through exploitation on the one hand, or increasing an organization's long-term adaptability through exploration on the other (Phelps, 2010). Some degree of knowledge exploration, thus, is deemed necessary to overcome the hazards of knowledge exploitation, and *vice versa*. Although both knowledge exploration and exploitation processes were initially considered from an intra-organizational perspective (March, 1991), it is increasingly commonplace to regard both processes from an inter-organizational or alliance perspective (Holmqvist, 2003; Lavie & Rosenkopf, 2006).

In seeking learning equilibrium, complicating factors are likely to arise. March (1991) even regards knowledge exploitation and exploration fundamentally incompatible, a position for which he provides three basic arguments. First of all, exploration and exploitation compete for the same set of organizational resources, which are by definition limited (*ibid.*; Gupta *et al.*, 2006). But more interestingly, both types of knowledge behavior are sensitive to reiteration behavior, meaning that knowledge exploration behavior is likely to lead to more knowledge exploration while knowledge exploitation behavior is likely to lead to more knowledge exploitation (*ibid.*). Organizations, thus, need to be aware of the danger of getting excessively involved in either type of knowledge behavior. Third, knowledge exploration requires a very different mindset compared to that of knowledge exploitation. Or, as March puts it, "exploiting interesting ideas often thrives on commitment more than thoughtfulness, narrowness more than breadth, cohesiveness more than openness" (1996: 280). Exploration is to a greater degree associated with "flexibility, decentralization, and loose cultures", whereas exploitation is associated with "efficiency, centralization, and tight cultures" (Jansen *et al.*, 2009: 797). These

fundamental differences invoke organizations to overly specialize in either one of both types of knowledge behavior. Levitt & March (1988) already recognized this mechanism, terming it competency trap, preventing organizations from reaping the benefits of either knowledge exploration or exploitation processes. In this paper we refer to the process of organizations specializing too much in knowledge exploration as a ‘learning trap’, and the process of organizations specializing too much in knowledge exploitation as a ‘competency trap’.

Combining exploration and exploitation therefore can be thought of as a challenging and hazardous undertaking, requiring constant moderation and effort by a focal firm’s management. Even more so since both types of knowledge behaviors increasingly take place in the inter-organizational domain, like in the case of learning alliances. Collaboration with other firms is considered to facilitate learning by providing access to new knowledge residing externally (knowledge exploration), and/ or by teaming up in leveraging existing knowledge (knowledge exploitation) (Lavie & Rosenkopf, 2006). Learning alliances, thus, can serve as vehicles of learning through knowledge transfer and development as well as vehicles of value creation through knowledge utilization (Bernard Nielsen & Nielsen, 2009; Hoffmann, 2007).

### 2.2 Alliance portfolios and learning equilibrium

In general, a firm’s alliance portfolio encompasses both standalone alliances and collaborative networks (Parise & Casher, 2003), of which the latter can be thought of to take form as a clique-like structure in a firm’s overall alliance portfolio (Rowly, Baum, Shipilov, Greve & Rao, 2004). In the majority of studies, alliance portfolio’s are simply defined as “a firm’s set of direct ties” (Ozcan & Eisenhardt, 2009: 246) or “all the alliances of the focal firm” (Hoffman, 2007: 827). As such, the alliance portfolio literature basically has adopted an ego-network approach towards studying the antecedents and consequences of strategic alliance portfolios.

A central issue dominating the alliance portfolio literature revolves around how a firm can generate, configure, and develop a high performing alliance portfolio and how it contributes to firm performance (e.g. Ozcan & Eisenhardt, 2009; Lavie, 2007; Heimeriks, Klijn & Reuer, 2009; George, Zahra, Wheatley & Khan, 2001), whereby most studies explicitly address the issue of explaining economic or financial performance differences. Apart from some notable exceptions (Dyer & Nobeoka, 2000; Sarkar *et al.*, 2009), relatively little studies explicitly seek to understand the relationship between alliance portfolio composition and firm performance from an innovation or knowledge perspective. Notwithstanding the fact that alliance portfolio research is predominantly skewed towards understanding economic performance differences, knowledge governance practices and learning have nevertheless been found to maximize the returns of the portfolio of alliances (Parise & Casher, 2003; Sarkar *et al.*, 2009). This view is understandable as more and more organizations engage in interorganizational relationships with the explicit purpose of enhancing one’s knowledge base (Lichtenthaler & Lichtenthaler, 2009; Hoffmann, 2007; Inkpen, 1998). Learning therefore is inherently linked to alliance portfolio management.

Ample attention has been provided to the issue of alliance portfolio diversity and firm performance (*ibid.*), yet little attention exists for the influence of portfolio diversity on explorative and exploitative learning outcomes. More specifically, no attention exists for the interaction effects among various forms of portfolio diversity in the face of explorative and exploitative learning in an ambidextrous context. Below, this study will continue with a conceptual exploration of how these various forms of alliance portfolio diversity may affect explorative and exploitative outcomes.

## 3 Propositions

In the face of reaching a state of learning equilibrium, the diversity of an alliance portfolio is likely to play a pivotal part.<sup>1</sup> Portfolio diversity is defined as the degree of variation in alliance portfolio

---

<sup>1</sup> Important to note, in this respect, is that the composition of a firm’s alliance portfolio, and specifically its state of equilibrium, is contingent on factors both external *and* internal to the focal firm. Changes in exogenous uncertainty, for instance, may cause a firm to develop its alliance portfolio more in the direction of knowledge exploration, thereby shifting this uncertain undertaking from its internal organization towards its external set of relations (Hoffmann, 2007; Brady & Davies, 2004). Likewise, the focal firm’s internal resources and strategic choices will also influence the evolution of a firm’s alliance portfolio (*ibid.*; Dittrich, Duysters & De Man, 2007). Such and other factors may cause a firm to adopt a dominant composition or design for its alliance portfolio (i.e. predominantly focused on exploration or exploitation), thus moving away from a state of learning equilibrium. For this study we choose to focus on portfolio level construct only, meaning that we will neglect environmental or

partners. Following Jiang *et al.* (2010), this degree in variation encompasses three domains. First, as a function of their differences in resources and capabilities as well as knowledge and technologies (i.e., partner diversity), second as a result of differences in functional background (i.e., functional diversity), and third as a result of differences in governance type (i.e., governance diversity) (Jiang, Tao & Santoro, 2010; Beamish & Goerzen, 2005).

We build on these three diversity domains to develop our propositions. We first establish a ground framework in which we propose that partner diversity, functional diversity, and governance diversity differentially affect, respectively, exploitative and explorative learning outcomes. Building on this framework we then present two stylized solutions – one following a parallel design, the other a ‘core-crust’ design – on how firms may configure their portfolio in order to achieve the twofold objective of optimizing exploitative and explorative learning.

### **3.1 Alliance portfolio partner diversity**

The issue of alliance portfolio partner diversity revolves around what type of partners to incorporate in the portfolio, and related to this, what type of portfolio orientation is necessary for the focal firm to achieve its (learning) goals. The composition of a focal firm’s alliance portfolio reflects the amount of horizontal differentiation, meaning the differences in unranked characteristics such as innovative orientation, functional specialization, size, *et cetera*. In other words, portfolio composition reflects portfolio heterogeneity or diversity, which is certain to affect its innovative outcomes (Luo & Deng, 2009) for an increase in network diversity implies an increase in the availability of novel knowledge accessible to the focal firm (Phelps, 2010).

When taking into consideration that innovation encompasses both explorative and exploitative outcomes, the picture becomes somewhat more nuanced. As discussed above, explorative learning is essentially different from exploitative learning. This fundamental difference must be taken into account when devising an alliance portfolio built for supporting learning processes.

The nature of explorative learning, being inherently aimed at discontinuous learning and experimentation (Simsek, 2009), implies a dependence on variation or diversity rather than uniformity. Explorative learning, thus, is expected to thrive when supported by an alliance portfolio characterized by high levels of diversity. The potential value of diversity in relation to explorative learning lies in the following. First, a focal firm with an alliance portfolio characterized by partner diversity is expected to reach more heterogeneity in its problem-solving arsenal (Simsek, 2009), for it is allowed to consider multiple perspectives in its search for a solution. In addition, this will also allow the organization to develop more advanced capabilities in dealing with a wide range of perspectives. A set of heterogeneous contacts, which are contacts holding varying social positions and characteristics, broadens the scope of knowledge available. This contrasts heavily with an alliance portfolio made up of relatively homogeneous organizations, for instance when all organizations are active in the same industry. It wouldn’t allow the focal firm to consider multiple perspectives on an issue, as alliance portfolio members are more likely to regard their environment similarly (Simsek, 2009).

Tying in to this latter notion, a focal firm’s current world view is likely to be challenged when its alliance portfolio is characterized by high levels of diversity. As such, a diverse portfolio holds more opportunities to engage into combining familiar and unfamiliar knowledge (Fleming, 2001). This is an important factor as inventions and new knowledge creation often thrive on the combination of different, disparate pieces of knowledge (Amin & Cohendet, 2004). Phrased differently, the more distant alliance partners are in terms of knowledge base, the greater the potential opportunities for engaging in explorative learning. On the contrary, the closer alliance partners are to the focal firm, i.e. the more homogenous its alliance portfolio, the more likely the focal firm is to find knowledge close to its current knowledge base. This subsequently limits its potential for explorative learning (Simsek, 2009).

Diversity, in the face of explorative learning, can stem from industrial, national, and organizational variation. An alliance portfolio characterized by industry diversity is likely to offer the focal firm a variety of resources and perspectives, thus providing superior learning and resource potential (Jiang *et al.*, 2010). An alliance portfolio characterized by national diversity, likewise, increases the potential for tapping into additional capabilities and augmenting different knowledge bases (*ibid.*; Lane, Salk & Lyles, 2001; Lubatkin, Florin & Lane, 2001). Similarly, the presence of different types of organizations in a focal firm’s alliance portfolio will provide the potential of tapping into different pools of resources and capabilities (Harrison, Hitt, Hoskisson & Ireland, 2001).

*Proposition 1a: Alliance portfolio partner diversity is positively related to explorative learning at the level of the focal firm, such that an increase in portfolio partner diversity results in higher levels of explorative learning.*

Exploitative learning fundamentally differs from explorative learning, and should be addressed accordingly. As noted above, exploitative learning is characterized by routinized, standardized learning processes, as it is aimed at refining and extending existing technologies or capabilities. This notion suggests different type of partners and subsequently a different alliance portfolio composition for successfully realizing exploitative learning.

Taking the characteristics of exploitative learning into consideration, it is important to realize that “exploiting interesting ideas often thrives on commitment more than thoughtfulness, narrowness more than breadth, cohesiveness more than openness” (March, 1996: 280), and as such require an efficient portfolio organization, characterized by centralization and tight cultures (Jansen *et al.*, 2009). A high level of alliance portfolio diversity is likely to conflict with producing an efficient portfolio aimed at exploitative learning.

The reason for this is to be found in the difficulty and complexity of governance associated with high levels of alliance portfolio diversity. Processes of exploitation are likely to be hampered by the presence of procedural differences (Simsek, 2009), and advancements taking place in the network are more difficult to monitor and manage. Also, the costs of knowledge integration are likely to rise with an increase in portfolio diversity, implying a shift away from the desired level of portfolio efficiency required for successful knowledge exploitation.

When viewing this from the perspective of industry diversity, partners from different industries are likely to hamper the manageability and efficiency needed when engaged in the process of exploitative learning, as a result of a misfit in routines and processes. Increased management complexity is also prone to occur when viewing this process from the domains of organizational and national diversity.

*Proposition 1b: Alliance portfolio partner diversity is negatively associated with exploitative learning at the level of the focal firm, such that an increase in portfolio partner diversity results in lower levels of exploitative learning.*

The negative trade-off between explorative and exploitative learning as a consequence of alliance portfolio partner diversity suggests that a balance must be achieved in terms of the degree of partner diversity characterizing an ambidextrous alliance portfolio. From the above it follows that, in essence, when an alliance portfolio is characterized by a so-called dominant design, i.e. a high or low level of diversity, mechanisms are likely to arise that deter the process of reaching a balance in exploitative and explorative learning. On the other hand, a balanced alliance portfolio aimed at reaching learning equilibrium implies that the focal firm always generates suboptimal results in terms of its explorative and exploitative outcomes. From the viewpoint of maximizing exploitative learning, the portfolio should be characterized by a homogenous configuration, while maximizing explorative learning requires a diversified portfolio configuration.

### **3.2 Alliance portfolio functional diversity**

Strategic alliances can serve a range of functional purposes (Jiang *et al.*, 2010), varying from marketing, manufacturing, R&D, *et cetera*. Essential to note, in this respect, is that particular types of functions serve exploration purposes (e.g. R&D or learning alliances, also called upstream alliances) with the aim of broadening technology or competence base, whereas other types of alliance functions serve exploitation purposes (e.g. marketing, manufacturing, and distribution alliances, also called downstream alliances), with the aim of leveraging existing resources and knowledge (*ibid.*). Past research has found that firms with different types of functional alliances (R&D, distribution, marketing) in their portfolios are more likely to hold a central position in industry networks, resulting in higher growth rates (Powell, Koput & Smith-Doerr, 1996) and higher firm level performance (Baum, Silverman, & Calabrese, 2000). The degree of diversity in terms of functional type is likely to affect explorative and exploitative outcomes at the level of the focal firm as well.

The amount of exploitative learning taking place at the focal firm level will depend on the amount or share of exploitative alliances present in the focal firm’s alliance portfolio. Likewise, the amount of explorative learning taking place at the focal firm level is dependent on the number or share of explorative alliances in the firm’s alliance portfolio. Thus, a tension arises that is inherent to an alliance portfolio: in order to raise the level of either explorative or exploitative learning, the number of either explorative or exploitative alliances needs to be increased. An increase in exploitative alliances, however, will shift the balance in learning equilibrium towards exploitative learning outcomes, while an increase in explorative alliances will shift the balance towards explorative learning.

This dynamic requires a different approach towards the concept of diversity compared to diversity as a function of partner characteristics. Whereas the underlying logic of the influence of diversity in the case of partner characteristics rests on the idea of diversity as variation, the underlying logic behind the influence of functional diversity rests on the idea of diversity as separation (Harrison & Klein, 2007). Diversity as separation defines the level of diversity as a function of juxtaposition: alliances represent opposite positions by being qualified as either downstream (exploitative) or upstream (explorative). In turn, this implies that homogeneity in alliance portfolios stems from having either many downstream alliances (as opposed to upstream alliances) or many upstream alliances (as opposed to its downstream counterpart). Maximum alliance portfolio functional diversity, thus, is attained when a balance is achieved in the share of upstream and downstream alliances present in an ambidextrous alliance portfolio, resulting in learning equilibrium as well.

*Proposition 2: Alliance portfolio functional diversity has a curvilinear association to explorative learning and exploitative learning at the level of the focal firm.*

This proposition suggests, similar to (but not the same as) the concept of partner diversity discussed above, that a hybrid alliance portfolio design results in suboptimal returns in terms of explorative or exploitative learning, while a portfolio design characterized by high levels of homogeneity (i.e., either upstream or downstream alliances) generates optimal returns on either explorative or exploitative learning, but always at the expense of one another.

### **3.3 Alliance portfolio governance diversity**

Alliances can take many forms in terms of governance, which reflect either approaches based on control or trust (De Man & Roijakkers, 2009) in order to deal with a certain degree of risk. In essence, the type of governance structure chosen for any given alliance reflects the degree of mutual trust. The higher the level of trust among alliance partners, the stronger the alliance tie relationally speaking, and the lower the need for formal control mechanisms. Conversely, the lower the level of trust among alliance partners, the weaker the alliance tie relationally speaking, the greater the perceived risk for opportunistic behavior, and the higher the need for formal control mechanisms (Jiang *et al.*, 2010). Equity-based governance structures can be regarded to reflect great need for control, while non-equity based governance structures reflect trust-based relationships. Alliance form matters when dealing with issues related to explorative and exploitative learning. Or, as Inkpen puts it, “any general theory of alliances, including one that focuses on learning, is destined to be limited in explanatory power unless the theory deals with alliance form” (2000a: 778).

The issue of alliance form in relation to explorative and exploitative learning revolves around the newness of the knowledge involved. Explorative learning is, as noted above, more experimental and non-routinized of nature, thus involving the generation and development of more innovative, new, tacit knowledge for either parties. Exploitative learning, by contrasts, is less experimental of nature, involving the extension of the current knowledge base. The level of knowledge newness is likely to be lower in this case.

As Contractor & Ra (2002) note, newer, more experimental knowledge is more likely to be tacit than codified. The less codified the type of learning involved (i.e. explorative learning), the less likely equity-based, formal governance structures are used in order to support the transfer (*ibid.*). This implies that explorative learning at the focal firm is greatest in non-equity designed alliances, built on trust rather than control in terms of governance structure (Kogut, 1988; Kogut & Zander, 1993; Shenkar & Li, 1999). The dilemma of disclosure or knowledge leakage aids the choice for a trust-based alliance form. From a portfolio perspective, this means that an alliance portfolio characterized by high numbers of non-equity, trust-based ties yields the most explorative learning. Conversely, the less new the knowledge or learning involved, the more likely the knowledge involved is codified. Codified knowledge is, by definition, more sensitive to leakage (Contractor & Ra, 2002), suggesting that alliance partners are more likely to choose alliance form based on the need for control. Formally designed alliances, characterized by high levels of control and low levels of trust, therefore can be considered to yield more exploitative learning (Kogut, 1988; Kogut & Zander, 1993; Shenkar & Li, 1999). From a portfolio perspective, this means that an alliance portfolio characterized by high numbers of equity, control-based ties yields the most exploitative learning. This implies that a combination of equity and non-equity-based alliances is required in order to reach a state of learning equilibrium.

Parallel to the concept of functional alliance portfolio diversity, the underlying logic behind the influence of governance diversity rests on the idea of diversity as separation (Harrison & Klein, 2007). Again, diversity as separation defines the level of diversity as a function of juxtaposition: alliances represent opposite positions by being qualified as either equity (exploitative) or non-equity based

(explorative). In turn, this implies that homogeneity in alliance portfolios stems from having either many equity alliances (as opposed to non-equity alliances) or many non-equity alliances (as opposed to its equity counterpart). Maximum alliance portfolio governance diversity, thus, is attained when a balance is achieved in the share of equity and non-equity alliances present in an ambidextrous alliance portfolio.

*Proposition 3: Alliance portfolio functional diversity has a curvilinear association to explorative learning and exploitative learning at the level of the focal firm.*

Analogue to the concept of functional alliance portfolio diversity, a hybrid alliance portfolio design results in suboptimal returns in terms of explorative or exploitative learning, while a portfolio design characterized by high levels of homogeneity (i.e. either equity or non-equity alliances) generates optimal returns on either explorative or exploitative learning.

**Figure 1 Base-Line Conceptual Model**

**3.4 Variation across portfolio diversity domains: towards design solutions**

From the theoretical argument above it has become evident that the sources of disequilibrium in terms of knowledge exploration and exploitation are to be found across different domains of diversity. The analysis shows that there is more to the alliance portfolio than the construct initially implies. The inherently multidimensional characteristics of alliance portfolios make them interesting yet treacherous terrains to advance our understanding of exploitation/ exploration dynamics. The question of how alliance portfolio characteristics affect exploration and exploitation outcomes is inherently a multidimensional question.

The model above demonstrates the difficulty of reaching a state of equilibrium in terms of exploration and exploitation, while at the same time achieving optimal results for both learning processes. An increase in portfolio partner diversity in, for instance, the partner domain will lead to an increase in explorative learning on the one hand, but on the other hand will result in diminishing exploitative learning, resulting in a subsequent state of disequilibrium.

In addition, the conceptual model exhibits the inherent difficulty of optimizing both explorative and exploitative learning through an alliance portfolio diversity approach. Based on the analysis above, and analogue to the concept of domain separation developed by Lavie & Rosenkopf (2006), we develop two stylized solutions in order to demonstrate how suboptimal levels of exploration and/or exploitation can be addressed by varying portfolio diversity levels across domains. The concept of domain separation seeks to provide an alternative, organizational level, mode of balancing exploration and exploitation by suggesting the possibility of “exploring in one domain while simultaneously exploiting in another” (*ibid.*, 130), for instance by means of the creation of a R&D-partnership (exploration) through a recurrent alliance partner (exploitation). The two stylized solutions offered in this paper serve the purpose of advancing our thinking on alliance portfolios and exploration/exploitation outcomes (see table 1). As such, the main purpose of this approach is to generate verifiable propositions.

The first stylized solution seeks to reach optimal levels of exploration and exploitation through building an ambidextrous alliance portfolio consisting of various levels of diversity across the three diversity domains discussed above. The primary philosophy here is that optimal degrees of exploration and exploitation can never be attained by designing an alliance portfolio according to one type of

diversity only. Instead, optimal levels of exploration and exploitation can be reached by managing portfolio diversity across different domains of diversity simultaneously.

The second stylized solution offers a different approach. It explores the strategy of creating a core alliance portfolio characterized by intermediate levels of diversity in all diversity domains, thereby purposefully seeking a state of suboptimal learning equilibrium across all domains. This suboptimal, intermediate state of learning equilibrium, however, is suggested to provide the focal firm with ample opportunities to temporally shift its learning focus towards either explorative or exploitative learning. Thus, optimal levels of exploration and exploitation are attained over time. Both portfolio design solutions are further elaborated on below.

*Stylized solution 1: Reaching optimum through a parallel design*

As outlined above, optimizing explorative and exploitative learning through designing an alliance portfolio based on partner, functional, or governance diversity is destined to result in suboptimal levels for either or both exploration and exploitation. Three basic reasons lie at the heart of this portfolio management problem: 1) an alliance portfolio ideally configured for explorative learning goes at the expense of exploitative learning, 2) an alliance portfolio ideally configured for exploitative learning goes at the expense of explorative learning, and 3) an alliance portfolio characterized by an intermediate level of diversity is likely to result in suboptimal outcomes for both explorative and exploitative learning. Constructing an alliance portfolio characterized by intermediate levels of diversity, hence, cannot be considered a solution when striving for optimal results on both exploration and exploitation.

An alliance portfolio configured towards explorative learning on, for instance, the partner diversity dimension is characterized by high levels of portfolio heterogeneity (according to the notion of diversity as variation (Harrison & Klein, 2007)). This inherently leads to a negative trade-off effect, at the expense of exploitative learning, also termed a learning trap (March, 1991; 1996). Although there may be very good reasons for a focal firm to construct its core alliance portfolio such that it yields primarily explorative learning, like in the case of a biotechnology firm, neglecting exploitative learning will inevitably cause problems to occur with respect to leveraging existing knowledge (March, 1991; Lavie & Rosenkopf, 2006). The negative trade-off effect between explorative and exploitative learning as a result of building a heterogeneous core alliance portfolio in the partner diversity domain may be countered by investing in an additional alliance portfolio that functions as secondary to the core alliance portfolio, and is configured for exploitative purposes according to the functional or governance domain. As such, the negative trade-off effect is repaired by allowing a different level of diversity to occur in a different domain of diversity.

Similarly, an alliance portfolio configured towards exploitative learning on the partner diversity dimension, inherently leads to a negative trade-off effect at the expense of explorative learning, also termed a competence trap (March, 1991; 1996). Again, the negative trade-off effect caused by a dominant portfolio design in terms of partner diversity can be mitigated by configuring the alliance portfolio towards explorative learning in the functional or governance domain.

In a similar vein, optimizing explorative and exploitative learning through functional or governance diversity is likely to result in suboptimal results on exploration and exploitation at the best. Again, an alliance portfolio designed for explorative learning from a functional or governance diversity perspective isn't likely to produce significant exploitative learning, while an alliance portfolio designed for exploitative learning isn't likely to yield any significant explorative learning outcomes. In addition, and similar to the case of partner diversity, a mixed configuration for both functional and governance diversity is likely to result in suboptimal outcomes for both explorative and exploitative learning.

From a functional diversity perspective an alliance portfolio geared towards exploration is to consist of upstream alliances mainly, for explorative learning is most likely to stem from alliances aimed at generating or developing new knowledge and capabilities. A focal firm's core alliance portfolio built around upstream alliances primarily, is likely to result in diminishing levels of exploitative learning. Likewise, an alliance portfolio geared towards exploitation is to consist of downstream alliances mostly, inevitably resulting in diminishing degrees of explorative outcomes. A heterogeneous portfolio in terms of functional alliances is likely to result in suboptimal performance for both explorative and exploitative learning.

A negative trade-off effect as a result of creating a core alliance portfolio geared towards exploration in the functional domain, can be mitigated by adopting diversity levels in the partner or governance domain level appropriate for exploitation. For instance, the trade-off effects of an alliance portfolio consisting of primarily upstream alliances can be mitigated by homogeneity in the partner domain. And, *vice versa*, the partner and governance dimension can be applied to mitigate negative

trade-off effects at the expense of explorative learning as a consequence of configuring the alliance portfolio towards exploitative learning from a functional perspective.

From a governance perspective, trust-based, non-equity alliances are more likely to generate explorative learning, while control-based, equity alliances yield higher levels of exploitation levels. Following the logic of diversity as separation (Harrison & Klein, 2007), alliance portfolio governance diversity is expected to produce maximum results in terms of either explorative or exploitative learning when following a dominant design logic (i.e. homogeneity). Again, a focal firm is expected to see little explorative learning to occur when its alliance portfolio consists of downstream alliances mainly, while an alliance portfolio design consisting of upstream alliances primarily will go at the expense of exploitative learning. Like in the case of functional diversity, an intermediate level of diversity is expected to yield suboptimal returns in terms of both explorative and exploitative learning.

Following its functional counterpart, a negative trade-off effect as a result of creating a core alliance portfolio geared towards exploration in the governance domain theoretically can be mitigated by adopting appropriate diversity levels in the partner or functional domain level. For instance, the trade-off effects of an alliance portfolio consisting of primarily non-equity based alliances can be mitigated by homogeneity in the partner or functional domain. In all, this suggests the following:

*Proposition 4: Optimal levels of both exploration and exploitation can be attained by varying levels of diversity across domains, such that an alliance portfolio geared towards exploration (exploitation) in one domain is matched by a portfolio design geared towards exploitation (exploration) in another domain.*

Constructing an alliance portfolio with varying degrees of diversity across domains in an ambidextrous manner does require the focal firm to actively steer and manage different degrees of diversity simultaneously. This has two major disadvantages. First, given that modern enterprises tend to maintain dozens of alliances in their portfolio at any given time, the effort of managing three dimensions of this alliance portfolio in an integral manner becomes an extremely complex and challenging commitment. Second, alliance portfolios are not only hard to monitor and manage (Parise & Casher, 2003), but also difficult to change in terms of strategic or learning intent (Koza & Lewin, 1998). It will prove highly complex, but above all, time consuming to alter each of the three domains of diversity such that it corresponds better to changing market conditions. In light of this complexity, we forward stylized solution 2 below.

*Stylized solution 2: Reaching optimum through a 'core-crust' design*

Recognizing the difficulty of changing the dynamic of an ambidextrously designed alliance portfolio harvesting varying levels of diversity across domains, solution 2 suggests a different approach. As we will outline below, this solution allows the focal firm to respond to changing market conditions, with corresponding alterations in exploitation or exploration demands, more swiftly.

In essence, this solution departs from the notion that an alliance portfolio characterized by suboptimal levels of exploitation and exploration as a result of intermediate levels of diversity across all three domains, offers the focal firm the opportunity to temporally shift its focus towards either exploration or exploitation in order to optimize of either type of learning when the circumstances require a focal firm to do so. Thus, this solution suggests a focal firm to build a core alliance portfolio designed to attain intermediate levels of explorative and exploitative learning, and to optimize one of both by temporally constructing an additional portfolio aimed at either exploitation or exploration. The focus, hence, lies in purposefully seeking *temporal learning disequilibrium* in order to reach optimal results.

Consider the example of a pharmaceutical firm. To successfully develop (i.e., explore) and commercialize (i.e., exploit) a medicine, pharmaceutical firms depend on their alliance portfolio, as it is too costly and risky for them to market new medicines completely autonomously. Initially, a firm may decide to design its alliance portfolio such that it sub optimizes exploitative and explorative learning through moderate levels of partner, functional, and governance diversity. However, during the research and development stage of a new medicine this firm may decide to temporarily augment its portfolio diversity, to the end of explorative learning, by engaging in new alliances with different partners, upstream functionality and equity-based. Once the medicine is fully developed and tested, it needs to be brought to the market. To this end, the firm may dissolve its R&D-oriented alliances and replace them by ones that enable it to realize exploitative outcomes. That is, it may establish alliances with more homogeneous partners possessing downstream functionality, and preferably organize them through non-equity arrangements. Taken together, the focal firm in this example shifts its focus on exploration and exploitation through time, while its core alliance portfolio remains intact.

This solution carries a number of advantages in comparison to solution 1. Most notably, the level of complexity in terms of managing the core portfolio decreases, as all domains of portfolio are characterized by intermediate levels of diversity. But more importantly, this solution allows a company to dedicate its attention to a core portfolio for most of the time, allowing the alliance portfolio to reach more or less stable and predictable learning outcomes. The possibility of maximizing explorative or exploitative learning through a secondary, temporal portfolio does not affect the core all too significantly.

*Proposition 5: Purposefully departing from a suboptimal state of exploration and exploitation through intermediate levels of diversity across all diversity domains, allows the focal firm to temporally change its alliance portfolio design in favor of either exploitation or exploration when changing market conditions demand for optimizing one of both learning processes.*

**Table 1 Two Alliance Portfolio Solutions**

	<b>Parallel equilibrium</b>	<b>Core-crust model of equilibrium</b>
Description	Exploitative and explorative learning are realized through balancing domain diversity in alliance portfolio design	Exploitative and explorative learning are realized through temporarily augmenting a core alliance portfolio design
Theoretical rationale	Optimal degrees of exploration and exploitation can never be attained by designing an alliance portfolio according to one type of diversity only. Optimal levels of exploration and exploitation can be reached by managing portfolio diversity across different domains of diversity simultaneously	Optimal degrees of exploration and exploitation can never be attained by designing an alliance portfolio according to aligning three types of diversity. Optimal levels of exploration and exploitation can be reached by managing portfolio diversity across time
Benefits	<ul style="list-style-type: none"> <li>- Sustained exploitative and explorative learning</li> <li>- More dedicated alliances in portfolio; less opportunistic behavior</li> </ul>	<ul style="list-style-type: none"> <li>- Flexibility realizing exploitative and explorative learning</li> <li>Nucleus of dedicated alliance partners; inter-partner learning</li> </ul>
Risks	<ul style="list-style-type: none"> <li>- Risk of temporary learning and/or competence traps</li> <li>- Highly dependent of changing market conditions</li> </ul>	<ul style="list-style-type: none"> <li>- Temporal changes to portfolio increases risk of opportunistic behavior</li> </ul>
Illustration	Pharmaceutical firm fundamentally adjusts alliance portfolio design to reach optimal levels of exploration and exploitation at all times	Pharmaceutical firm temporarily adjusts alliance portfolio design to match with requirements of distinct product development stages

#### 4 Discussion and Conclusion

This paper set out to conceptually explore under what conditions of alliance portfolio diversity a desired state of learning equilibrium could be attained, such that both explorative and exploitative learning are optimally produced. In part, the theoretical exploration revealed a complex, multidimensional role for the concept of portfolio diversity in the advancement of both explorative and exploitative learning. In essence, diversity affects explorative and exploitative learning differently, suggesting that an increase in diversity positively effects explorative learning at the expense of exploitative learning in the partner domain. Conversely, a decrease in partner diversity positively effects exploitative learning at the expense of explorative learning. Propositions 1a-b address this notion. In the case of both functional and governance diversity, intermediate levels of diversity are expected to yield suboptimal returns for both explorative and exploitative learning, while a homogenous diversity design yields either explorative or exploitative learning. Propositions 2 and 3 articulate this notion by stating a curvilinear association. It implies that a focal firm’s top management is to carefully and consciously monitor and regulate their alliance portfolio design. How exactly remains unclear in extant literature. This paper makes a first stylized effort in order to fill this lacuna.

To overcome this problem of design, which in our view is inherent to ambidextrously designed alliance portfolios especially, the focal firm faces the challenge of managing portfolio diversity analogue to the concept of domain separation (Lavie & Rosenkopf, 2006). It requires management to regard a

focal firm's alliance portfolio as a multidimensional phenomenon, especially when viewed from a diversity perspective.

This perspective offers a focal firm's management to align its alliance portfolio in the face of learning equilibrium, by managing diversity across different domains. Distinguishing three forms of diversity – namely partner, functional, and governance diversity – this perspective allows a focal firm to design an alliance portfolio with differential diversity characteristics. By means of stylized solution 1 'parallel design', it is proposed that high(er) levels of diversity in one domain, for example the partner domain, may be compensated by low(er) levels of diversity in another domain, for example the functional domain. This allows the focal firm to meet the design demands in terms of portfolio diversity, when engaged in reaching desired states of explorative and exploitative learning outcomes. Proposition 4 addresses this specific issue.

Stylized solution 2 'core-crust design' further explores the domain separation concept. Instead of approaching the challenge of reaching an optimal learning equilibrium from an ambidextrous perspective, however, this solution seeks to reach such a desired state of learning over time. It suggests a focal firm to purposefully build a core alliance portfolio characterized by intermediate levels of diversity across all domains, thus accepting a permanent state of suboptimal exploration and exploitation. Subsequently, a focal firm is advised to seek optimal levels of either exploration or exploitation by building a second, temporal portfolio geared exclusively to either type of learning. Proposition 5 articulates this position.

Besides advancing our theoretical understanding of alliance portfolio dynamics, this paper can also be interpreted as an endeavor to forward our understanding of exploration/ exploitation-dynamics. Whereas initially both types of learning were regarded as fundamentally incompatible (March, 1996), the concept of domain separation appears to allow for a successful combination of explorative and exploitative enterprises in the context of an ambidextrously designed alliance portfolio.

This paper, thus, provides an original contribution in two distinct ways: first, it forwards the idea of various forms of alliance partner diversity (Jiang *et al.*, 2010) in relation to the concept of learning equilibrium. Second, it expands on the idea of domain separation (Lavie & Rosenkopf, 2006), which was originally conceived in the context of dyadic alliances, translating it to the domain of alliance portfolios. The two stylized solutions discussed above materialize this contribution.

The analysis in this paper limits itself in a number of ways. The focus is on the effect of 1) diversity on 2) ambidextrously designed alliance portfolios, in the face of 3) exploitation/ exploration equilibrium. Alliance portfolio structure is left out of the equation, as is a whole range of potential factors exogenous to the alliance portfolio or focal firm. In addition, factors internal to the focal firm are not taken into account. Finally, it is of a purely conceptual nature. Future research may test the propositions first by means of a longitudinal case study to obtain in-depth insight in alliance portfolio development (i.e., core-crust dynamics). Subsequently, a survey would enrich our understanding by providing generalizations.

To conclude, we engaged with the recent turn in alliance studies to adopt a portfolio approach. Specifically, we advanced prior literature on alliance portfolios and exploitative and explorative learning by proposing how the composition of a focal firm's alliance portfolio in terms of diversity affects its exploitation/ exploration equilibrium. Our analysis suggests that alliance portfolio diversity results in different outcomes for both explorative and exploitative learning, making it difficult to establish the optimal degree of diversity. Analogue to the concept of domain separation, we forward the idea of establishing different degrees of diversity across various domains enabling firms to adopt two solutions: parallel design focusing on parallel logic and core-crust design focusing on temporal separation.

**Abstract:** The paper presents a joint research project of the Universities of Dortmund, Frankfurt and Magdeburg called Uni:prise – Universities as Enterprises. It deals with the identification of universities' value-creating potentials, and it investigates future issues of the university system, in particular the institutions and actors involved in developing research and higher-education capacities in the course of an entrepreneurial process. In detail the project concentrates on the following key questions: What are the underlying innovation and investment processes in science? What are the goals and means, costs and benefits of science for researchers, students, and the economy? How can improvements in the field of opportunity research be identified and designed for use? What kind of opportunities can be recognized for advanced academic autonomy by using performance related distribution systems? And finally efforts are made to create business models for the core potentials of the entrepreneurial university in research, teaching and technology transfer.

**Key words:** Value-creating potential; Entrepreneurial opportunities; Business model

### 1 Introduction

The research is based on theoretical as well as on empirical economic and social science approaches and methods. The project design aims in addressing three levels of investigation, divided into three phases. The first phase includes the model level, institution level and player level. The second phase contains the evaluation of the empirical and theoretical research concerning every level. The third phase covers the documentation of the results of all three levels followed by feedback towards universities in the interaction. Finally the relations between the addressed research questions and the employed research methods are discussed. Historically seen this specific discussion is rather young and started at the beginning of the new millennium when regarding the development and arrangement of the knowledge society which increasingly focused on economic utilization of scientific knowledge. In the course of that a central importance is assigned to the universities as engines of the development of innovations. International discussion of universities as potential cores of added value chains, i.e. from the finding of ideas to the utilization of innovative potentials, therefore has increasingly taken into account knowledge and technology transfer as means to the creation of value generating processes. While the institutional research (university research) has paid attention especially to the system analysis of a reform-driven construct named "Higher Education" since the 70s of the 20th century, in the course of the 90s a different concept, coming from business administration and called „New Public Management“, had been applied to the question of how to make universities more effective as well as efficient in research, teaching and administration. This development has also been described as a disciplinary shift from sociology to economics. Now the purpose was to implement efficiency-rising attempts in research, teaching and (self) management of universities, like expense account and achievement calculation, purpose arrangements, identification number development, incentive systems, optimization in the use of resources, and to introduce and internally launch new governance structures.

All these considerations have in common that they pursue an increase of institutional autonomy of universities which enables them to improve the quality of research and teaching constantly even while they have to deal with quickly changing conditions, such as degressive developments concerning the universities global budgets. At the same time the impact of third means income should rise for the fulfilment of excellency criteria as well as in order to increase the power to compete in a developing international university market. In this context a socio-political desideratum arises for the management

of a university: to make the results of excellent research and education quality increasingly available to the local economy. A necessary condition for initiating this process successfully lies in the arrangement of a knowledge transfer, a task which rises, in addition, in complexity because the research and development process on the part of the universities should be done starting from basic research up to final application, e.g. by trading partners.

## 2 The Creation of Value-Added Support

The creation of the added value chain in the transfer process on the part of the economically-cooperating university goes along with new challenges. A transformation process linked with it should lead to an Entrepreneurial University which finances itself no more exclusively from tax means, but also as a market participant equipped with the competence to produce innovative spin offs. With this aim accomplished the university would be even in the role of a public-private entrepreneur. Originally being an institution of public right in Germany, exclusively paid from tax means, a university may widen into to a market participant with the developing competence for innovative Spin outs, possibly in the form of a public-private think tank.

The first steps at an early stage of development into such a direction are recognizable in Germany in particular in those universities which have marked their profile significantly as "entrepreneurial universities". As a prominent example one can point out the University of Technology of Munich (TUM) one of the first three universities taken up within the scope of the excellency initiative in the conveyor line "Zukunftskonzept" (plan for the future), which wants to realize the conjunction of research excellency and entrepreneurship. For a science economy which wants to take relation on such transformation scenarios the first step would be doing research by creating a suitable model. Central questions to be discussed would have the following focus:

a. An economically relevant question in general is targeting the role as well as the function of universities as public and publicly funded institutions. Public funding is considered to be essential because of the necessity to make publicly available offers for higher education linked with the question, whether the state as a supplier takes the role of a social entrepreneur. Taking in account the acceptance that a degressively running public financing of the educational sector can not be substituted completely the question has to be answered by science-economic research exactly what kind of value generating structures can be found to bring up a transfer-supported, scientific utilization combined with (re)financing options in addition (Weisbrod 1998). Besides, special attention should be paid to the analysis of economical potential of usable knowledge basins which integrate applicable research (patenting/licensing, spin-offs/start-ups, public-private-partnerships, order research, extended workbenches, intrapreneurship, profit centres), as well as special formats of teaching in higher education (work accompanying continuing education, coaching, studies on private costs, international management, lifelong learning, train-the-trainer-concepts). For the invention, development and utilization of these potentials a transfer draft at microtheoretical level is to be developed which is compatible with given structures and offers incentives to motivate actors within and outside universities to participate.

b. In a parallel investigation it has to be discussed under inclusion of the effect of market failure to what extent resources can not be made available by the market efficiently. If a market failure is recognizable under this condition, state interventions are judged as being necessary. For instance, it is assumed that universities make new knowledge, as well as new technologies available as public goods characterized by a non-exclusivity concerning their utilization. Announcing the research results by publication or market launch means an advantage also to those economic subjects who are not included into the prize and profit system of the utilization. Given research and development are financed privately, these so-called spillover effects led to a lower investment in Research&Development (Arrow 1962). This indicates that in the analysis of university and market the classical causes for market failure in the neoclassical model (public goods, asymmetric information, external effects, monopolies / cartels) have to be discussed anew. Therefore it is important firstly to check the relevance of reasons for single market failure in the context of modern universities. Afterwards the present state financing policy should be analyzed concerning its propriety and, in a second step, attempts to create an optimization are brought to discussion.

c. To make universities capable of entrepreneurial acting and awake their sensibility for the importance of creating incentives for co-operations with actors from in and outside the institution, both described research ropes should be flanked by economic research on business models. These ropes will

be used later on to recognize added value potentials from research and teaching and to prepare as well as to transform them for getting them into the market (Osterwalder, Pigneur 2009). The special challenge consists in developing commercial model constructions in particular for knowledge-based projects so that they have a potentially high transference value. With the help of the central commercial model components like use promise (which use is donated for customers and enterprises?), added value generation (how there originates a demanded achievement?) and profit model (by which and how money is earned?) commercial model types should be identified that show a very extensive basis of common characteristics, so that the part which must be worked out for each individual business differs minimally. For knowledge-based commercial models for projects with an expectable high degree of innovation, the analysis options leading to high growth effects is, in addition, especially interesting.

d. The universities meet these challenges in an institutional way: On the one hand organizational processes are optimized by a steadily improved management, on the other hand, the problems are answered by growth of institutionalizing processes. This leads to more and more service centers often characterized rightly as „island solutions“ in the overall university because of their incomplete interlinking within their university and their personnel's sole occupation with "third sphere professionals". Examples are computer centers, libraries, transfer agencies, places of the scientific continuing education, university didactics, multimedia information centers, career services, Alumni organizations or "houses of competences" in which general and special skills are tied together to new qualification profiles. Up to now attempts for a systematic integration led to more institutional answers, as for example the establishment of more functional jobs as support to already existing leading positions. Left out of consideration are the exchange processes necessary between the departments as well as systematic requirements of the universities and their executive management. At this institution level (Mesolevel) it requires suitable business models to make services transparent, countable, billable and steerable in a targeted manner, so that they are placed in the position to act autonomously and strategically effective.

e. The research perspective would remain limited and hardly connectable with the model level, if identified actors (key players on the microlevel) would not be included into the examination of the processes on the institutional level. The methodological framework of empirical social research should be employed in both, qualitative and quantitative studies in order to be able to identify the strengths and weaknesses as well as opportunities and threats actors in their institutions can recognize (SWOT analysis). The perspectives of this investigation will be directed mainly on business-related issues looking for entrepreneurial attitudes of the interviewees while looking for potential in research and development.

f. Actors at universities such as scientists and managers consider entrepreneurship to be risky. This is an important reason for entrepreneurial opportunities not to be realized. This phenomenon has both, rational and irrational components. In economic science the subject is highly relevant because it has a significant impact on the entrepreneurial involvement of actors in and outside of science. Using methods from the still young discipline of Neuroeconomics a framework for special research studies has recently been developed in laboratory tests in order to analyse the rationalization of irrational and emotional aversions. These tests hopefully will deliver the basis for engineering a training for recognition of entrepreneurial opportunities. The actors on the microlevel identified earlier who have been classified by their universities' facilities and services under a business perspective during their interviews before, now are ready to run through a selection of the mentioned examination settings. The results are finally supporting the reflection on how the actor's behaviour and preferences are influencing a university's business model.

### **3 Project Design, Key Questions and Interdisciplinary State of Research**

The research on the model as the macro level, framing the whole topic while asking for „Universities as Social Enterprises“, is based on the initial condition of a determining market failure theory, coupled with reflections on „Social Entrepreneurship“. The question how a university is conceivable as a social enterprise relates to the little explored area of business model research in this context.

On the side of empirical research, especially on the level of control processes in universities (meso level), management changes and the introduction of innovations in higher education are focused.

The project level to identify and interview university actors as key players in the process of institutionalization, using qualitative and quantitative social research methods (micro level) is connected

with the issue of knowledge management and self management in the context of teaching and learning processes at universities. What is new is the inclusion of neuro-economical research approaches in the consideration of attraction and aversion when dealing with the implementation of innovations in the university system.

This empirical economic research, in close cooperation with the neurosciences, promotes the topic of incentive structures and how they can promote risk-bearing entrepreneurial action. With regard to the implementation of intrinsically motivated initiatives and the assumption of responsibility as a fact in the change of management processes institutional conditions are influencing what actually happens in terms of quality and modernization (such as job security and limits in personal advancement development). Therefore the interdependence between the anticipatory actor and the changing institution plays a significant role. To put the point as a question: How much entrepreneurial spirit allows an institution and by whom can an institution be developed which does neither create nor offer incentives for their actors?

The starting position in the international research reveals desiderata for the discussion of the future importance as well as the embedded meaning concerning how research, teaching and development will look like in a globalized world which depends more than ever on courageous and energetic entrepreneurial universities. The topics merged and scientific disciplines put to use in this investigation, however, especially focus on the importance of business models for knowledge-based institutions. The architecture developed for this research project can be tracked by the clarification of certain key concepts and their characterization in international research. It is important to start with a central prerequisite for studying the „Entrepreneurial University“ which is due to the Theory of Market Failure and its possible implications for economic policy (Fritsch et al. 2007). It is important that the discussion is redirected to potential reasons for market failure, pointing out the importance of external effects (Maskin 1994). Institutions of the state, such as universities, have been understood as transmitters of externalities already in the mid 70ies of the nineteenth century (McKean 1975). Nevertheless, the paradigm for growth processes remained to be the private sector. Can incentives as they arise e.g. by external effects be transmitted to the public sector too? If so it would make sense to analyse research on a private sector and its effects on endogenous growth (Corriveau 1998). A related question is, what effects subsidization of education with public funds has on competition among students, teachers and institutions. On the one hand people are provided for with public money who in turn make their gains in education available for the private sector. On the other hand public educational institutions are subsidized although they are primarily oriented towards institutional parameters targeting institutional growth in first instance. This discussion is part of a discussion on approaches to a reform of higher education subsidies (Barbaro 2003). How far public institutions like universities are meant to take over the role of an initiator of supporting science based entrepreneurial start-ups already leads the discussion into the field of possible interaction between science and economy and their respective interfaces between their primary interests and markets (Mayer-Krahmer, Kulicke 2002). However, it turns out that institutions instead of relying on entrepreneurial activities rather tend to take money on fees as the example of tuition fees demonstrates. Finally the normative question has to be answered how much of a market in higher education is appropriate and how much tuition appears to be justifiable (Schmidtchen 2005). This goes back to the question just what kind of an entrepreneur a public university should be allowed to be? This question of appropriateness is discussed from an entrepreneurial point of view (Bok 2003) as well as from standpoints of legal science and sociology (Weingart 2008). At this point – right before the beginning of the last decade – more and more the idea of a university as a social entrepreneur comes into play, starting with a general discussion on universities as social entrepreneurs but already stressing the aspects of commercialization of education and research (Powell, Owen-Smith 1998), while in the USA researchers already had started to analyze the competitive edge of universities for some time in research based on their strengths and weaknesses in comparison with industrial suppliers (Rosenberg, Nelson 1994). In order to make education and R&D attractive for more private companies the idea emerged to transmit single elements of the idea of social entrepreneurship to private companies by highlighting their corporate social responsibility (Kotler, Lee 2005).

#### Conclusions and Recommendations

All these approaches towards entrepreneurial universities, though, are fundamentally dependent on the development, design and implementation of business models raising economic growth. This marks a major research desideratum which, at the same time, is one of the most important challenges in economy of science and all cooperating academic disciplines (Gaus, Raith 2012). The term “business model” has become popular during the Dot-Com Boom in the late nineties. Since then the academic literature

dealing with the issue is currently still inconsistent and fragmented. After the definition of the concept and its inherited elements had been discussed first (Osterwalder et al. 2005; Pateli, Giaglis 2004) different perspectives were established. The survey and mapping of internal processes resulted in enterprise models useful for applications in existing companies. The view towards surroundings and network of a company allows, however, to create business models for the analysis and synthesis of start-up projects. Although there is no universally accepted definition for the term „business model“, the general expectation is, that a business model is something any entrepreneur would profit from. The benefits of “business model” as a concept has been discussed controversially (Porter 2001, Magretta 2002). Hence, the amount of publications in this field is growing rapidly (Morris et al. 2005, George&Bock 2010). Concerning the perspective of research in entrepreneurship the practical application of health-business models and the subsequent adaptation to changing environmental conditions are of interest (Amit, Zott, 2001; Guenzel, Wilker 2010). The business model, at this point, is understood as a means for entrepreneurs to present all elements of their business in parallel as well as in their relations and to enable them to alter the presentation easily and quickly to find out most about best solutions.

Finally it is highly interesting so see how sociology refers to this topic from a perspective in Higher Education and Institutional Research. In sociological literature universities are understood as systemic knowledge networks which initiate continuing processes. These are influenced by individual and by institutional actors (Bender 2001). Not the temporarily existent network of different actors is supposed to be the contextual precondition for the creation of new scientific knowledge in first instance, but the institutional form in which it is performed (Callon et al. 1986). For the organization of research and teaching in faculties and departments this is associated with „Multi-divisionären Unternehmensformen“ (North 2002). This means that institutions, including universities, are able to generate value in going through these processes.

# Direct and Indirect Ties to Universities: Firm Heterogeneity, R&D Collaboration and Innovative Performance in the Biopharmaceutical Industry

Gilsing Victor<sup>1</sup>, Belderbos Rene<sup>2</sup>, Suzuki Shinya<sup>2</sup>

1 Centre for Innovation Research, Tilburg, Nederland

2 K.U. Leuven, Leuven, Belgium

(E-mail: v.a.gilsing@tilburguniversity.edu, Rene.Belderbos@econ.kuleuven.be, Shinya.Suzuki@econ.kuleuven.be)

**Abstract:** In knowledge intensive industries, firms often conduct collaborative research both with universities and with other firms, but the implications of such simultaneous engagement in R&D collaboration with different types of partners has not received due attention. We examine whether there are potential complementarities or incongruities related to simultaneous engagement in multiple types of research collaborations, and potential heterogeneity among firms in the benefits of collaboration. Drawing on panel data for 40 major pharmaceutical firms, we find that positive effects of direct university collaboration are restricted to firms with sufficient absorptive capacity to assimilate scientific knowledge. Firms lacking such capacity instead benefit from 'indirect' ties with universities (collaboration with university-centred dedicated biotech firms) while direct university collaboration only undermines the benefits of their inter-firm research alliances.

**Key words:** R&D collaboration; Alliances portfolios; Industry-science linkages

## 1 Introduction

Knowledge-intensive industries and science-based industries in particular, have been characterized by an intensification of the interactions between universities and firms (e.g. Hall et al., 2000; Cassiman et al., 2008). Firms increasingly look towards public science as one of the key sources for rapid and privileged access to new knowledge (Cockburn and Henderson, 2000; Zucker, et al., 1998; Mowery, 1998; Bruneel et al., 2010). This puts the need for external knowledge sourcing from universities high on the corporate agenda in order to keep at the forefront of the ongoing creation of new, state-of-the-art knowledge (Cohen et al., 2002; Mowery and Nelson, 1999; Balconi and Laboranti, 2006). Prior research on industry-science linkages has shown that research collaboration with university scientists is an important means for effective scientific knowledge sourcing and that this may yield a positive effect on a firm's innovative performance (Zucker and Darby, 2001; Zucker, et al., 2002; George et al, 2002; Cassiman et al., 2008). More specifically, such business-university R&D collaboration may enhance firms' capacity to generate high impact technologies and introduce new products to the market (Belderbos et al, 2004b; Faems et al., 2005; Cassiman et al. 2008).

In the literature, there are two different, seemingly conflicting views on firm - university collaboration. In the industry-science literature on the one hand, the importance is stressed of *direct* collaboration with universities, which is especially useful in knowledge-intensive industries (see Cohen et al., 2002). The idea is that in these industries it is important for firms to collaborate directly with universities in order to source state-of-the-art expertise as developed at public research organizations and universities (Zucker and Darby, 2001; Zucker et al., 2002; 2002; Cassiman et al., 2008). It has been demonstrated that direct collaboration with universities appears to be the realm of firms with substantial internal R&D capabilities (Belderbos et al, 2004b; Nakamura et al., 2003) and it has been suggested that active involvement in scientific research and in research collaboration is highly conditional on the availability of human capital and the adoption of specialised organizational practices and routines in R&D (Gambardella, 1992; Cockburn et al, 1999). On the other hand, studies in the innovation and strategic collaboration literature have demonstrated that even in the pharmaceutical biotechnology industry, the most science-based of all industries (e.g. Cohen et al., 2002), large pharmaceutical companies do not necessarily engage in frequent research collaborations with universities. Instead, the practice of collaboration with entrepreneurial dedicated biotech firms (DBFs) that are themselves strongly linked to universities and embedded in academic networks, is more common (Powell et al., 1996; Pisano, 1991; George et al., 2002; Stuart et al., 2007).

A first objective of this paper is to consider the potential differential performance implications of direct collaboration when compared to indirect, 'brokered' ties to academia. We distinguish three types

of collaborations: direct collaborative research with universities, direct research alliances with firms, and 'indirect' ties to universities through research collaboration with dedicated biotechnology firms (DBFs) that do have strong research ties with universities. The latter may serve as a conduit for the transfer of relevant scientific knowledge to firms lacking effective capabilities to be involved in direct research collaboration with universities. Our analysis focuses on this role of firm heterogeneity in the effectiveness of different types of research collaboration (D'Este, 2005; Cassiman et al., 2008). Specifically, we examine the moderating role of firms' absorptive capacity (Cohen and Levinthal, 1990; Zahra and George, 2002) for scientific knowledge as indicated by the intensity of involvement by the firms' R&D personnel in publication efforts. Our aim is to shed some more light on the heterogeneity in industry - science collaboration and on why some types of linkages may be more attractive than others (George et al., 2002).

Apart from collaboration with universities, collaboration with other companies has been demonstrated to be particularly useful for firms in knowledge-intensive industries (e.g. Hagedoorn, 2002; Powell et al. 1996). A broad literature on inter-firm alliances has demonstrated that a firm's direct ties, indirect ties, and its network position (i.e. centrality) may contribute to its innovative performance (e.g. Ahuja, 2000; Gilsing et al., 2008). More recent work has taken a portfolio perspective on technology alliances (Rothaermel and Deeds, 2004; Ahuja 2000; Lavie, 2007; Sampson, 2007; Goertzen, 2007). A portfolio perspective points to the aggregate properties (i.e. synergies and liabilities) of a set of alliances that may affect innovative performance, which is likely to remain unnoticed when focusing on individual alliances only (Wassmer and Dussauge, 2011). One such aggregate property is formed by diversity of partners in a portfolio, which is generally considered to be positive for a firm's innovative performance due to its potential for recombination (George et al., 2001; Laursen and Salter, 2006; Phelps, 2010). However, this literature has focused primarily on inter-firm alliances and has not examined how portfolio effects are influenced when universities are also considered as collaboration partners.

Hence, the second objective of this paper is to examine whether there are potential complementarities or incongruities related to simultaneous engagement in collaboration with multiple partner types, and in how far this may differ across firms. As the logic of scientific discovery differs profoundly from the logic that characterizes the development of new technologies and their practical applications (Hall et al., 2000; Nelson, 2004), a combination of collaboration with both firms and universities may lead to a degree of diversity that it is difficult to manage effectively. Our key argument is that direct collaboration with universities and with firms may be less compatible as they require different collaborative routines and research practices, while indirect collaboration and inter-firm alliances may be more likely to complement each other in the pursuit of positive innovation outcomes. Moreover, we argue that differences in firms' absorptive capacity and R&D strategy lead to differences in how far they will benefit from direct or indirect collaboration with academia and from a combination of inter-firm and direct university-firm collaboration. This heterogeneity has been a largely ignored issue in the literature on university-firm collaboration thus far (George et al., 2001; 2002; Cassiman et al., 2008).

We empirically investigate these questions using panel data describing the innovative performance (as measured by citation weighted patent counts), R&D collaboration strategies, and scientific publication efforts of 40 large biopharmaceutical firms with home base in the US, Europe and Japan during 1995-2002.

## 2 Theoretical Background

### *Direct collaboration between firms and universities*

In the life sciences and the biopharmaceutical industry, public science forms one of the key sources for rapid and privileged access to new, state-of-the-art knowledge (Cockburn and Henderson, 2000; Zucker, et al., 1998; Mowery, 1998). In general, direct collaboration with universities tends to be in more uncertain areas and further away from commercialization. Although new scientific knowledge gets disseminated through publications, an important part of it tends to be non-codified and can only be exchanged through close interaction between individuals, through teams of university and firm scientists (Zucker et al., 1998; 2002; Cassiman et al., 2008). This tacit and sticky nature of scientific knowledge induces a necessity for firms to create direct links to the scientific community. The creation of direct ties allows for the build-up of trust (Gulati, 1995a), forming an important prerequisite for the efficient exchange of tacit knowledge. Direct collaboration also reduces the likelihood of noisiness in information

exchange and of fine-grained specificities getting lost, which mitigates the risk of misunderstanding on the side of firms (Ahuja, 2000). Furthermore, the importance has been demonstrated of direct involvement of corporate researchers in scientific research and academic networks in their function of 'boundary spanners' or 'gatekeepers' (Tushman, 1977; Zucker et al., 1998; 2002; Zucker and Darby, 2001; Löfsten and Lindelöf, 2002; Carayol, 2003; Baba et al., 2009). This role may provide firms with a timing advantage regarding the moment that they learn about new scientific findings (Fabrizio, 2009). Taken together, direct collaboration may enable firms to better decode advances in fundamental research and evaluate its quality and usefulness. In this way, direct collaboration may support a firm in pursuing in-house basic R&D and contribute to increasing its R&D productivity (Gambardella, 1992; Cockburn and Henderson, 2000; Zucker and Darby 2001; Zucker et al., 2002; Fleming and Sorenson, 2004).

The benefits of direct collaboration with universities notwithstanding, they come at a price as there are also various kinds of barriers to knowledge exchange with them (Hall et al., 2001; Bruneel et al., 2010). First, there can be a large cognitive distance between universities and firms (Nooteboom et al., 2007). Scientists' focus on understanding fundamental problems and industrial researchers' focus on application-related issues yields a large cognitive distance between the two. As a consequence, these differences in cognition may create a risk that both parties do not sufficiently understand each other, with firms asking the 'wrong' knowledge questions and not being able to understand the answers they get, whereas scientists may misinterpret the questions or be unable to come up with an unequivocal answer (Gittelman and Kogut, 2003). Second, the institutional logic of scientific discovery is an entirely different one than the institutional logic that characterizes industrial development of new technologies and their practical applications. Science forms a separate 'epistemic community' with its own practices and routines that conflict with the routines and practices in firms that are specifically geared towards the upscaling and commercialization of (scientific) inventions (Allen, 1977; Tushman, 1997). Scientists tend to focus on research that is considered to be interesting and valuable by the scientific community, whereas firms' researchers will make choices based on what is considered to be useful for the creation of new products, processes and/or services (Gittelman and Kogut, 2003; Nelson, 2004). Furthermore, university scientists will be keen on disclosing quickly, in order to gain academic recognition and prestige, whereas industrial researchers may wish to keep information secret to facilitate value appropriation. Hence, institutional norms governing knowledge creation at universities differ profoundly when compared with firms (Dasgupta and David, 1994), and even with the assignment of 'gatekeepers' a large cognitive and institutional distance is likely to remain (Gittelman and Kogut, 2003). Altogether these barriers, combined with the insecure benefits, may mitigate the positive effect of direct collaboration with universities on a firm's innovative performance.

#### *Indirect ties between firms and universities*

Indirect ties imply that a firm is indirectly connected to a university through a common partner (Gulati, 1995b). Following the idea of structural embeddedness, indirect ties can offer firms the benefit of reducing the amount of time, costs and resources to gather and assimilate external information (Granovetter, 1985; Ahuja, 2000; Nahapiet and Ghoshal, 1998; Shane and Cable, 2002). In addition, through its indirect ties, a firm can receive information about relevant developments and knowledge beyond its core areas of expertise. In this way, indirect partners may also fulfill a 'radar' function by bringing broader information to the attention of the focal firm, far beyond its direct ties, and that it may miss otherwise (Freeman, 1991; Ahuja, 2000). Although the larger the social distance in a network, the smaller the probability of effective knowledge flows is, a two-step reach may generally suffice. It strikes a careful balance between accessing knowledge with a higher novelty value and being not too far away so that knowledge flows can still occur (Singh, 2003; Li and Rowley, 2002). This is in line with Burt's argument that brokerage is especially useful among unconnected indirect contacts in an ego-network rather than among indirect contacts beyond an ego-network (Burt, 2007). Furthermore, brokerage between two unconnected partners is more valuable to the extent that there is more tacit knowledge involved at a larger distance between them, and to the extent that behavioral norms and routines residing with each contact are more distant from one another (Hargadon and Sutton, 1997; Burt, 2007). As firms and universities exhibit substantial differences both in their (tacit) knowledge base and in their norms and institutionalized practices, these conditions seem to apply well in this context.

This general reasoning may explain why DBFs can serve as effective brokers between universities and (large) pharmaceutical companies (Stuart et al., 2007). Following the concept of relative absorptive capacity (Lane and Lubatkin, 1998), pharmaceutical firms may be better able to learn from universities via DBFs because they share similar knowledge and have compatible values and similar operational

priorities. For academic scientists, collaboration with DBFs is also attractive as they have sufficient absorptive capacity and are used to the norms and institutionalized practices in academia (Gittelman and Kogut, 2003). In this way, DBFs can act as intermediary organizations that tap into the knowledge and capabilities of academic scientists and manage the selection of scientific inventions in order to create commercially valuable technological innovations. More specifically, they may serve as value-added 'liaisons' by obtaining intellectual property from universities and by exchanging it with downstream partners, often after considerable own investments in subsequent development of the technology. This makes brokering an attractive role for DBFs, because the more agreements and collaborations they have with universities, the more they may be able to attract revenue-generating alliances with down-stream partners (George et al., 2002; Stuart et al., 2007).

The benefits of indirect ties notwithstanding, indirect ties also have drawbacks. Information from indirect ties may not be perfect but can be rather 'noisy' (e.g. Ahuja, 2000). It passes through a common partner, which may interpret and attach meaning to this information in a different way than the focal firm. In this process, fine-grained specificities may get lost and not reach the focal firm or possibly lead to misunderstanding from its side. In addition, the broker role of DBFs also implies the sharing of IP rights and an associated risk of distributional conflicts.

### **Hypotheses**

The extant literature suggests that there are benefits and costs involved with direct and indirect collaboration with universities. The degree to which benefits are likely to outweigh costs will vary among firms. We expect an important degree of firm heterogeneity, originating from the firm's R&D strategy and organization, which is likely to affect its capacity to absorb scientific knowledge and its ability to bridge profoundly different institutional environments (Cassiman and Gambardella, 2009). Prior research has shown that firms differ persistently in their knowledge base profiles and their institutionalized practices and routines in the field of R&D (D'Este, 2005; Bercovitz and Feldman, 2007; Cassiman et al., 2008).

An important aspect of R&D organization is the degree to which firms place particular emphasis on basic research rather than focusing only on applied research and development (Rosenberg, 1990; Bercovitz and Feldman, 2007; Fabrizio, 2009). Firms may hire in-house scientists, provide corporate support for their publication efforts in scientific journals and encourage them to comply with the norms and institutionalized practices as they operate in academia (Gittelman and Kogut, 2003). Such an adaptation of a firm's R&D organization focusing on the role of 'open science' and fundamental research, as apposed to applied research, may help firms to attract high quality researchers at relatively low cost (Stern, 1999) and provide legitimacy and reputation in the academic community, facilitating a degree of privileged access to frontier development in relevant academic fields (Cockburn and Henderson, 1998). It forms a supportive, science-oriented R&D organization that contributes to the build-up of 'scientific absorptive capacity'. Such scientific absorptive capacity contributes to easier communication with university researchers and to bridging the institutional distance with them, enhancing the build-up of trust between both parties. The role of trust is not only important for the exchange of tacit knowledge but also to alleviate the risk of conflict over the distribution of intellectual property rights (Bruneel et al., 2010).

Taken together, these factors are important organizational and contextual factors for successful collaboration between universities and firms (Mora-Valentin, 2004) formed by teams composed of researchers from both sides. These teams, working together at the 'laboratory bench', form a key transfer mechanism when knowledge has a large tacit component (Zucker et al., 2002; Balconi and Laboranti, 2006). Direct collaboration may be instrumental in speeding up the transfer of frontier academic knowledge to the firm (Fabrizio, 2009), potentially providing first mover advantages in applied research and leading to higher value inventions. For firms with a more outspoken science orientation in their R&D organization and a high scientific absorptive capacity, direct collaboration is likely to provide innovative performance benefits.

In contrast, indirect ties to universities through collaboration with DBFs may not contribute much to the innovative performance of firms with high scientific absorptive capacity for two reasons. First, to the extent that a focal firm has more scientific absorptive capacity, it may have more useful and unique expertise that other firms may want to acquire. DBFs, as the common partner between a focal firm and a university, often have alliances with other firms, creating a pathway for undesirable spillovers from the focal firm. Second, firms with high scientific absorptive capacity may be more interested in specific, fine-grained and tacit information that can only be obtained in direct exchange, whereas the less specific and noisier nature of indirect information may contribute little to their innovative performance.

Firms with low scientific absorptive capacity generally can have more to gain and less to lose from indirect ties to universities, for their innovative performance. First, they may not be able to effectively assimilate external knowledge and do not have a R&D organization that is well equipped to bridge institutional differences with academia. Here indirect ties to universities, through DBFs, are more likely to be effective in scientific knowledge sourcing. DBFs may serve both as a 'cognitive bridge' and as an 'institutional bridge', such that the focal firm can avoid the fundamental adaptations to its R&D organization necessary for direct collaboration. Second, firms with low scientific absorptive capacity have a comparatively limited research expertise and may have less to lose from potential knowledge spillovers through DBFs. In addition, the more general and rather noisy nature of indirect information may be offset by the benefits of providing a more comprehensive overview on unfamiliar domains and on key new developments, which firms with low scientific absorptive capacity are likely to lack. Indirect ties are therefore most likely to provide innovative performance benefits.

The above arguments lead to two related hypotheses:

**Hypothesis 1:** *For firms with low scientific absorptive capacity, indirect collaborative ties to universities have a positive impact on their innovative performance.*

**Hypothesis 2:** *For firms with high scientific absorptive capacity, direct collaboration with academia has a positive impact on their innovative performance.*

*University collaboration and inter-firm collaboration combined*

For firms in knowledge-intensive industries, research alliances with other firms have shown to be useful and performance improving (e.g. Powell et al. 1996; Rothaermel and Deeds, 2004; Ahuja 2000; Owen-Smith and Powell, 2004; Goertzen, 2007; Phelps, 2010). In addition, recent studies have emphasized that a combination of different types of technology collaborations is beneficial for innovative performance outcomes, as diversity of partners provide complementary insights and holds the promise of knowledge recombination (Belderbos, et al., 2006; Baum et al., 2000; Lavie 2007; Hoffman, 2007; Wassmer, 2010). However, it has also been noted that too much diversity in a firm's collaborative efforts with other firms may reduce the effectiveness of collaborations. Managerial resources may become too thinly spread, knowledge integration tends to become increasingly complex and firms generally start to suffer from information overload (Mowery et al., 1996; Lavie and Miller, 2008).

The difficulty of combining different collaboration strategies is likely to be more pronounced where it concerns efforts to collaborate with universities as well as private firms. While university collaboration is likely to be characterized by an emphasis on exploration, prioritizing projects with uncertain outcomes and higher risks of failure (Hall et al, 2000; Belderbos et al., 2004; 2006), technology collaboration with firms is generally aimed at applied research and more downstream parts of the innovation process (Faems et al., 2005). As noted above, the academic logic of scientific discovery differs profoundly from an industrial logic that characterizes the development of new technologies and their practical applications (Hall et al., 2000; Nelson, 2004).

Firms combining the two types of collaboration may face a number of obstacles. First, the large cognitive distance between firms and universities, at the dyad level, elevates the degree of cognitive diversity of a firm's entire portfolio. To deal with this diversity implies that firms need to deploy more (learning) resources to augment absorptive capacity, whereas the potential for synergy and recombination across its different partner types is reduced (Vasudeva and Anand, 2011). Second, there is a large institutional distance between a focal firm's partners on the one hand and its university partner(s) on the other. While effective direct collaboration with universities requires an adaptation of the R&D organization to improve its scientific absorptive capacity, effective collaboration with firms require a different research organization, different organizational routines, and different alliance capabilities. This implies a severe risk of incongruity between different organizational practices and routines (cf. Lavie et al., 2011), as the practices, routines and capabilities required for collaboration with universities differ profoundly from those that are geared towards collaboration with firms (Arora and Gambardella, 1990; Cockburn et al., 1999; Gittelman and Kogut, 2003; Belderbos et al., 2004; 2006; Faems et al., 2005; Bruneel et al., 2010). As a consequence, combining direct collaboration with universities and R&D alliances with firms requires the bridging of both distance and diversity, cognitively and institutionally. In general, this will pose a heavy burden on a firm's resources and capabilities because it not only increases organizational costs to reconcile the different demands but also elevates complexity that renders the collaborations less effective, making it difficult to combine the two. These arguments lead to the following hypothesis:

**Hypothesis 3:** *A strategy of combining direct collaboration with universities and*

*collaboration with firms has a negative effect on a firm's innovative performance.*

As argued above, a firm's R&D strategy and organization shapes both its ability to bridge cognitive distance and institutional distance, depending on the emphasis the firm places on developing new knowledge versus applying existing knowledge (Cassiman and Valentini, 2009). Below we argue that firms make this trade-off in a heterogeneous manner, which affects their ability to combine university collaboration with inter-firm collaboration. In general, firms possessing high scientific absorptive capacity will have a R&D organization with a focus on fundamental research. These firms will have more resources and capabilities at their disposal to bridge both the cognitive and institutional distance with universities.

A focus on fundamental research may influence the motivation and ability to innovate by providing key knowledge inputs to a firm's innovation process. The availability of state-of-the-art knowledge and expertise may encourage firms to invest in upscaling and commercialization (Dosi, 1982). In addition, notwithstanding the difficulty to combine basic, scientific research with applied research, the focus on basic and scientific research may have compensating benefits, increasing the effectiveness of applied research (Cassiman and Veugelers, 2006; Dasgupta and David, 1994). Organizations that are involved in basic research as part of their technology development activities may develop a deeper understanding of the fundamental principles of the phenomena under study (Rosenberg, 1990). Based on this understanding and by discovering novel causal relationships, scientific research can assess which trajectories may probably become dead-ends and which ones will be much more promising (Fleming and Sorenson, 2004). It may provide firms with a better understanding of the potential implications of applied research (Cassiman et al., 2008; Cassiman and Valentini, 2009; Gambardella, 1992) and may also provide them with heuristics that enable them to better assess the likelihood of success of certain innovation trajectories (Fleming and Sorenson, 2004). The efficiency of applied research may improve as firms may be better able to anticipate the results of research experiments without performing them, helping to prioritize innovation projects based on their expected values (Fabrizio, 2009). These capabilities will aid firms in the effective selection and focus of applied inter-firm research collaborations and may help them to correctly interpret and build on the outcomes of such applied research, increasing the effectiveness of applied collaborative research efforts with other firms. High scientific absorptive capacity then supports a focal firm in its ability to mitigate or neutralize the diseconomies of joint engagement in university and inter-firm alliances as argued above.

**Hypothesis 4:** *Firms with high scientific absorptive capacity are able to mitigate the negative impact of joint engagement in direct collaboration with universities and inter-firm R&D collaboration on innovative performance*

As noted above, for firms with low scientific absorptive capacity, a combination of direct collaboration with universities and research collaboration with firms will be above and beyond their capabilities. As these firms lack the ability to bridge the large cognitive and institutional distance with universities, the elevated diversity of their portfolio will carry a negative effect on their innovative performance. However, the potential diseconomies related to the diversity in collaboration partners is not likely to be pronounced if inter-firm collaboration is combined with indirect ties to universities. The latter do not require any profound changes to the R&D organization nor to their alliance capabilities, since the indirect ties to universities research through DBFs allow the firm to maintain its focus on firms only in its alliance portfolio. Moreover, the brokering role by DBFs eliminates the problem of bridging the large institutional distance with universities and supports firms in bridging the cognitive distance with universities. Low scientific absorptive capacity firms share similar characteristics -in terms of knowledge bases, values, and operational priorities - with DBFs as compared to universities, and this facilitates learning. Thus we hypothesize:

**Hypothesis 5:** *Low absorptive capacity firms experience no negative performance consequences of a strategy combining indirect ties to universities with inter-firm R&D collaboration.*

## **Data and Empirical Methods**

### *Sample and Data*

We constructed a panel dataset (1995-2002) on 40 of the largest EU, US and Japanese pharmaceutical firms. The firms were selected from the 2004 EU Industrial R&D Investment Scoreboard'. This scoreboard lists the top 500 corporate investors in R&D based in the EU, and the top 500 companies based outside the EU. We collected information on the firms' patent applications at the European Patent Office (EPO) at the consolidated level, i.e. taking into account patents of the parent

firm and all its consolidated (majority-owned) subsidiaries. We also collected information on the scientific publication efforts of the firms. We extracted publication data from yearly updates of the Science Citation Index database of ISI/Thomson Scientific, including peer-reviewed papers of the types article, letter, note and review. Alliance data were drawn from the CATI database (Hagedoorn, 2002) on strategic alliances as well as the RECAP (Recombinant Capital) database. The latter alliance database is a comprehensive source on publicly announced alliances in the biomedical fields collected from press releases, SEC filings, and industry presentations. Finally, we collected accounting data from the Worldscope and Compustat databases. In all this resulted in an almost balanced panel dataset on firms' citation weighted patents with 309 observations.<sup>1</sup>

#### *Variables and Measures*

We measure the innovative performance of the sample firms (the dependent variable) in a particular year as the count the number of forward patent citations received by the patents applied for by the firm in the biotechnology field in a year. We measure patent citations over a fixed time window of 5 years. This 'weighting' by the forward patent citations allows controlling for variation in the value and technological importance of patented inventions (Harhoff et al, 1999; Hall et al, 2005). In particular in the pharmaceutical industry, patents and patent citations are a relevant indicator of innovative performance and closely linked to market valuation (Harhoff et al., 2003, Hall et al., 2005)

We construct three different R&D collaboration variables to capture engagement in the different collaboration strategies by the pharmaceutical firms. The number of direct R&D collaboration agreements with universities is calculated by drawing on the RECAP database. We focus on research collaborations and exclude licensing and other non-collaborative agreements, while limiting the count to alliances in the biotech field to maintain consistence with the focus of the dependent variable. The number of indirect ties to universities brokered by dedicated biotech firms is measured as the number of research collaborations in biotechnology between universities and the DBF partners of the pharmaceutical firm. Finally, the number of inter-firm R&D alliances is the number of cooperative research agreements in the biotech field with partner firms that are not collaborating directly on biotech research with universities (drawing on the CATI database). We count the number of active collaborations and ties in a year. We identify the first and final years of the period during which the agreements were valid if information was available. In case no information was available on the dissolution of agreements, the length of the agreement was assumed to be five years (Stuart, 2000; Lavie, 2007).

A firm's scientific absorptive capacity is measured as the number of scientific publications on which the firm or its subsidiaries are listed as the affiliations of one of the authors. We scale the number of publications by the number of prior patent applications to avoid that the measure is picking up a mere size effect and to ensure that it is reflective of the orientation towards scientific research of the firms' R&D activities. Engagement in in-house scientific research as evidenced by scientific publications is a clear indication of the presence of in-house scientists and an R&D organization facilitating the absorption and utilization of scientific knowledge (e.g. Gambardella, 1992; Cockburn and Henderson, 1998).

Our analysis controls for the impact of unobserved firm heterogeneity by including fixed firm effects. In addition, we include a set of time-variant firm characteristics that are likely to affect the innovative performance of firms. We control for a firm's research and development expenditures in the biotechnology field in the past year, since the technological performance of firms is influenced by the amount of capital invested in R&D activities. As data on R&D expenditures dedicated to biotechnology is not available, we estimate the relevant R&D input by multiplying a firm's total R&D expenditures by the share of its biotechnological activity in the total technological activity. The share of biotechnological innovation activity is approximated by the share of biotechnology patents in the total number of the firm's patents. Our analysis also controls for potential differences across firms in the propensity to patent by including the patent to R&D expenditure ratio, and includes the main effect of scientific absorptive capacity measured as firm's publication count scaled by its patent applications. The empirical models include year dummies to account for time-specific factors that may affect the number of firms' patents and citations.

All explanatory variables are measured one year prior to the dependent variable. Summary statistics

---

<sup>1</sup> In a few cases, we observe the firms shorter than the 8-year period, e.g. if the firm was created as the result of a merger (e.g. AstraZeneca and Aventis).

and correlations for the variables are provided in Tables 1 and 2.

**Table 1 Descriptives**

### Methods

Since the dependent variable takes nonnegative integer values, we use Negative Binomial Regression models to relate innovative performance to collaboration strategies and scientific absorptive capacity. To investigate the heterogeneous effect of alliances for firms with different scientific absorptive capacity, we conduct split sample analysis by dividing the sample into two subsamples: firms with high and low scientific absorptive capacity. For the division of the sample, we use as a cutoff point the median value of the average scientific absorptive capacity during the investigation period. Hypotheses 1 and 2 are then tested by examining the coefficients for indirect collaborative ties and direct university collaboration of the two subsamples. Hypotheses 3 and 4 are tested by including the interaction effect between inter-firm alliances and direct university collaboration. Hypothesis 5 is tested by including the interaction effect of inter-firm alliances and indirect ties to universities in the subsample analysis on low absorptive capacity firms. All interacted variables are demeaned before interactive measures are calculated.

### Empirical Results

The results of the fixed effects Negative Binomial Analysis relating the firms' innovative performance to their collaboration strategies and the other firm characteristics are presented in Table 2. We first estimated models on the full sample (Model 1), and subsequently estimate models separately for firms with a high and low scientific absorptive capacity (Models 2 and 3). In Models 4 to 6, we test specifications with the interaction term between university collaboration and inter-firm collaboration included (hypotheses 3 and 4).

In Model 1, we do not find a significant effect of direct collaborations with university on the innovative performance of the pharmaceutical firms, while inter-firm R&D collaborations have a positive and significant impact. When we split the sample into two groups based on firms' scientific absorptive capacity however, contrasting results are observed. Direct collaborations with universities have a positive and significant effect on innovative performance for firms with high absorptive capacity, in support of Hypothesis 1. In contrast, indirect ties to universities have a positive and significant impact on innovative performance for low absorptive capacity firms, which supports Hypothesis 2.

The results of Model 4 (full sample), with the interaction terms included, show no significant impact of combining direct university collaboration, or indirect university ties, with inter-firm R&D collaboration. In the split sample analysis, however, we observe a negative effect of the interaction term between direct university collaboration and inter-firm alliances for low absorptive capacity firms (Model 6), in support of Hypothesis 3. No such significant effect is observed for high absorptive capacity firms (Model 5), as suggested by Hypothesis 4. The interaction effects between indirect university ties and inter-firm R&D alliances are insignificant throughout, suggesting that negative performance consequences are restricted to the combination of direct collaboration with universities and firms. This is consistent with the prediction of Hypothesis 5.

In non-linear models, the sign and significance of the interaction variable is no definitive indication of the sign and significance of the moderating effect the interacted variables have on each other. To examine more precisely the negative interaction effect between direct university ties and inter-firm alliances in Model 6, we calculated the value and standard error of the cross-derivative for all sample observations in this model. The cross-derivative took negative values for more than 94 percent of sample observations and was significantly negative (at the 10 percent level) for 63 percent of the sample observations. These findings confirm that firms with low scientific absorptive capacity experience see the benefits of inter-firm alliances significantly reduced when they simultaneously engage in direct collaboration with universities.

### Discussion and Conclusions

In the literature, two different views on firm - university collaboration co-exist. In the industry-science literature the importance of direct collaboration between firms and universities is endorsed, especially in knowledge-intensive industries (Cohen et al., 2002; Zucker and Darby, 2001; Zucker et al., 2001; 2002). On the other hand, in the innovation and strategic alliance literature the role of brokerage through DBFs, as specialized go-betweens, is emphasized (Powell et al., 1996; George et al., 2002; Pisano, 1991; Stuart et al., 2007). We have argued that the degree of a firm's scientific absorptive capacity forms an important contingency factor that determines to what extent firms can benefit from collaboration with universities, direct, or through indirect ties brokered by DBFs. Our results provide support for these ideas and corresponding hypotheses. Firms with high scientific absorptive capacity benefit mostly from direct collaboration with universities, whereas for firms with low scientific absorptive capacity indirect collaboration forms the best strategy to improve innovative performance.

A second issue addressed in this study is how a combination of direct collaboration with universities and research collaboration with firms affects a firm's innovative performance. Our findings indicate that for firms with low scientific absorptive capacity, the effect of joint collaboration strategies with universities and firms is distinctly negative, while for high absorptive capacity firms such joint collaboration strategies are neutral in impact. As we argued, combining the two requires the bridging of both distance and diversity, cognitively and institutionally, within a firm's portfolio of collaborations. As this will pose a high burden on a firm's resources and capabilities, it becomes difficult to combine the two effectively. For firms with low scientific absorptive capacity, an appropriate strategy to remedy this is formed by a combination of indirect ties to universities and research collaboration with firms. Direct university collaboration undermines the benefits of their inter-firm research alliances. In contrast, firms with high scientific absorptive capacity are better able to mitigate the negative impact of joint engagement in direct collaboration with universities and research collaboration with firms. Although this is in line with earlier findings that firms with large internal knowledge stocks are most likely to combine this with different external linkages strategies (Arora and Gambardella, 1990), our findings show that this may not necessarily boost a firm's innovative performance. High scientific absorptive capacity is effective to remedy the negative effect of such a dual strategy, but does not suffice for obtaining synergy benefits from it.

Our study contributes to a variety of strands in the literature on R&D collaboration, alliances and innovation. We inform the industry - science literature by demonstrating that the value of direct collaboration with universities is not useful for all firms, but contingent on the level of a firm's scientific absorptive capacity. If firms have a relatively low level of scientific absorptive capacity, a far more effective strategy is formed by collaborating with DBFs to establish indirect ties to university research. The existence of an alternative strategy to source scientific knowledge through indirect ties forms an overlooked issue in this literature and counters the common idea that in science-based industries, one should be proximate and collaborate directly with PROs (Zucker and Darby, 2001; Zucker et al., 2002; Arundel and Geuna, 2004; Cassiman et al., 2008). Furthermore, we inform this literature by showing that the effectiveness of direct collaboration with universities is also influenced by the degree to which firms simultaneously collaborate with other firms. Both types of collaboration need to be considered in combination in order to account for their mutual influence.

Our findings also inform the innovation and strategic collaboration literature by showing that a strategy of indirect ties to universities only works for firms with relatively low levels of scientific absorptive capacity. For high scientific absorptive capacity firms, indirect collaboration is not effective as it brings little new information and may increase the risk of spillovers via DBFs to their competitors. The emphasis in the strategic alliance literature has been particularly placed on the value of the brokerage role fulfilled by DBFs (Pisano, 1991; Howells, 2006; Stuart et al., 2007), implicitly treating the firm partners of DBFs as a homogenous group with similar resources and in-house expertise. The latter forms a serious omission as our findings show that there is substantial firm heterogeneity in the degree of scientific absorptive capacity and hence the benefits of brokered ties.

We also contribute to the (alliance) portfolio literature in a number of ways. In this literature, diversity of a firm's portfolio of collaborations has been demonstrated to carry a positive effect (e.g. Phelps, 2010) or a curvilinear effect (e.g. Deeds and Hill, 1996) on performance. Here, portfolios have mostly been considered as consisting of alliances with various firms as partners, but generally not as including universities as partners. Our analysis has considered a higher degree of diversity by including both firms and universities in firms' collaboration portfolios, to include consideration of the role of

different partner *types*. This brings along a new coordination issue as firms need to bridge not only cognitive distances but also institutional distances among their different partners, with the degree of diversity increasing both along the cognitive and institutional dimension. This increases not only a firm's organizational costs to reconcile the different demands, but also elevates complexity that may render the collaborations less effective. As a consequence, combining inter-firm alliances and direct collaboration with universities can have a distinctive negative effect on a firm's innovative performance; unless it disposes over high scientific absorptive capacity that allows it to mitigate the negative performance consequences. Hence, the performance effects of a portfolio that is configured by firms and universities are moderated by a firm's scientific absorptive capacity. In this way, we also shed some more light on the role of contingency factors that may enhance or inhibit portfolio effects, which has been an important void in the literature until now (Wassmer, 2011).

A limitation of our study is that we do not consider partner attributes such as their differences in technological expertise and/or nationality. In a similar vein, we do not control for heterogeneity in the strength and/or reputation of the universities that firms collaborate with (Stuart et al., 2007). This suggests an interesting issue for future research as it has been suggested that collaborations with partners with rich resources tend to provide firms with access to more valuable knowledge that may elevate the potential for recombination with their internal knowledge base (Dyer and Singh, 1998; Srivastava and Gnyawali, 2011). Another limitation of our study may be formed by the potential lack of generalization beyond science-based industries. The findings of our study may only be generalized to other industries to the extent that these are also characterized by a key role of public research in industrial innovation and the ability of intermediary firms that can effectively secure the intellectual property rights for novel scientific inventions. Examples of this may be formed, among others, by microelectronics, advanced materials and nanotechnology (Lavie and Drori, 2011; Baba et al., 2009).

Overall, we contribute to a more in-depth understanding of the still poorly understood, multifaceted nature of the links between science and industry (e.g. George et al., 2002; Bruneel et al, 2010). More specifically, we shed some more light on how university collaboration - direct or indirect - contributes to a firm's innovative performance, an issue that still remains understudied. Furthermore, we may explain a somewhat paradoxical issue. Given that direct collaboration with academia is highly skewed among firms (Belderbos et al., 2006; Cassiman et al., 2008), how is the majority of firms still able to survive and prosper without direct collaboration with academia? Especially as they operate in science-based fields in which there is an ongoing intensification of the interactions between universities and industry such as in pharmaceutical biotechnology (e.g. Hall et al., 2000; Owen-Smith et al., 2004; Branstetter and Ogura, 2005). This is all the more relevant as other direct routes to academia, other than formal collaboration such as transfer of personnel, scientific publications, investing in start-ups will also require sufficient scientific absorptive capacity. We show that by seeking indirect ties with universities, firms may be able to remedy their lack of scientific absorptive capacity and still reap benefits of university research.

(E-mail: b.h.bos@rug.nl, d.l.m.faems@rug.nl, bart.leten@vlerick.com)

**Abstract:** Whereas existing studies have examined the impact of alliance portfolio diversity on firms' technological performance (i.e. number of patent applications), this study will analyse its effect on firms' technological diversification (i.e. variety of patent applications in terms of technological classes). In this way, we are able to evaluate the impact of alliance portfolios on the quality of technology portfolios rather than its impact on the quantitative output. Merging data from the Thomson SDC database and the EPO database, we create a unique panel dataset (i.e. between 1995 and 2002) for the 43 largest Pharmaceutical firms. The results show that alliance portfolio industry diversity has a positive impact, while alliance portfolio functional diversity has a U-shape relationship with firms' technological diversification. Jointly, these findings indicate that alliance portfolios can be used as a strategic tool to diversify firms' technological capabilities.

**Key words:** Alliance portfolios; Industry diversity; Functional diversity; Geographical diversity; Technological diversification

### 1 Introduction

Firms increasingly use open innovation models in which they rely on strategic alliances, or 'any voluntary initiated interfirm cooperative agreement that involves knowledge sharing, or co-development' (Gulati, 1995, p. 619), to complement their internal innovation activities (Hagedoorn, 2002; Cassiman and Veugelers, 2006; Faems et al., 2010). Although the literature initially focused on individual alliances, various scholars have stressed the importance of evaluating all operational alliances of a firm together as a portfolio (George et al., 2001; Lavie, 2007; Wassmer, 2010; Wassmer and Dussauge, 2011). At the portfolio level, synergies and constraints between alliances can be identified (Parise and Casher, 2003), which can subsequently help to increase the overall value of a firm's alliance portfolio (Wassmer and Dussauge, 2011)

Recent studies on alliance portfolios (e.g. Nooteboom et al., 2007; Luo and Deng, 2009; Phelps, 2010; Vasudeva and Anand, 2011) have examined the effect of alliance portfolio diversity, i.e. the extent to which a firm forms alliances with different types of partners, on the technology portfolio of firms. In general, these studies suggest that a moderate level of diversity results in a larger technology portfolio, i.e. the number of patents increases, rather than a low or high level of diversity. At the same time, the literature remains relatively silent on the impact of alliance portfolio diversity on the technological diversification of firms, i.e. the ability of firms to patent in a variety of technological domains. This gap is important, because in order to increase our understanding of alliance portfolios, it is important to evaluate its impact on the quantity as well as the quality of technology portfolios as argued by Antonelli and Calderini (2008). Furthermore, several studies find a positive impact of technological diversification on the financial and innovation performance of companies (Antonelli and Calderini, 2008; Belderbos et al., 2010; Chen and Chang, 2010).

Hence, the goal of this study is to explore the relationship between alliance portfolio diversity and technological diversification. Based on the organizational learning theory and the knowledge-based view of the firm, we hypothesize that access to a variety of knowledge contributes to the creation of new linkages and combinations, and therefore, has a positive impact on technological diversification. Following Jiang et al. (2010) and Duysters and Lokshin (2011), we argue that alliance portfolio diversity is a multi-dimensional construct. More specifically, this study distinguishes between the effect of alliance portfolio industry diversity, alliance portfolio functional diversity and alliance portfolio geographical diversity. These dimensions are motivated by different mechanisms and strategic reasons.

In order to test our hypotheses, a unique panel dataset is created, comprising archival data on alliance activities from the Thompson SDC database and data on patent applications from the EPO database for the 43 largest Pharmaceutical firms. For each firm, we subsequently created alliance portfolios and patent portfolios for a time period of eight years (1995 – 2002). Based on the results of a

Hausman test, we estimated our models by conducting fixed effects regression analyses.

The results of our study show that alliance portfolio diversity has a significant impact on the technological diversification of firms. More specifically, we found support for a positive effect of alliance portfolio industry diversity. For the other hypotheses, the nature of the relationships diverted from what was hypothesized. Alliance portfolio functional diversity is shown to have a U-shape relation with firms' technological diversification, whereas the relation between alliance portfolio geographical diversity and technological diversification is found to be insignificant.

Our findings contribute to existing alliance portfolio research by empirically demonstrating that alliance portfolio diversity does not only influence the *size* of firms' patent portfolios, but also has a substantial impact on the *composition* of the patent portfolio. In this way, this research shows that access to a variety of knowledge sources not only facilitates the development of new ideas and knowledge, as argued by the organizational learning theory and the knowledge-based view, but it also broadens the scope of this new knowledge. This is an interesting contribution to the existing literature, because it indicates that firms can rely on alliance portfolios as a strategic tool to diversify their technological portfolio. Our study also emphasizes the need to make an explicit distinction between different dimensions of alliance portfolio diversity, showing that alliance portfolio industry diversity, alliance portfolio functional diversity, and alliance portfolio geographical diversity have a differential impact on technological diversification.

This paper will now proceed as follows; the next section will discuss the theoretical background of this study by relating alliance portfolio diversity to technological diversification. We also elaborate on the different dimensions of alliance portfolio diversity and subsequently derive the hypotheses. Thereafter, the methodology is described that is used to conduct this study and the empirical results are presented. The remaining sections will discuss the results in more depth, suggest avenues for further research and conclude the main findings of this study.

## 2 Alliance Portfolio Diversity and Technological Portfolios

One of the most frequently studied compositional characteristics of firms' alliance portfolios is its diversity. Alliance portfolio diversity is commonly conceptualized as the extent to which a firm forms alliances with different types of partners (Luo and Deng, 2009; Sarkar et al., 2009; Faems et al., 2010; Sivakumar et al., 2011) or gains access to different types of knowledge, i.e. the diversity of patents owned by the alliance partners (Phelps, 2010; Lin, 2011; Vasudeva and Anand, 2011).

A portfolio of different types of alliances exposes companies to many and a variety of ideas and knowledge, which contributes to the development of innovations (George et al., 2001). In accordance, Duysters and Lokshin (2011) find that alliance portfolios of innovators are more diverse in terms of type of partners and nationalities than firms that do not innovate. On the other hand, diverse portfolios are also more complex to manage and more vulnerable to conflicts. This increases coordination and managerial costs (Jiang et al., 2010).

While the majority of the existing literature (e.g. Luo and Deng, 2009; Sarkar et al., 2009; Faems et al., 2010; Sivakumar et al., 2011) measures alliance portfolio diversity as a single dimension, recently scholars have started to study diversity in more detail by developing multi-dimensional constructs (Jiang et al., 2010; Duysters and Lokshin, 2011). Duysters and Lokshin (2011) extend the type of partner with a distinction between national and international alliances. In addition, rather than only looking at the characteristics of the alliance partners, Jiang et al. (2010) consider the characteristics of the alliances themselves, such as their functional purposes and governance structures.

Recent research has examined whether alliance portfolio diversity increases the *size* of firms' technology portfolios, i.e. the generation of patents. Although these studies operationalize the construct 'alliance portfolio diversity' in different ways, they reach the same conclusion, namely that the relationship is found to have an inverted U-shape (Nooteboom et al., 2007; Luo and Deng, 2009). This indicates that a moderate level of alliance portfolio diversity leads to a higher level of technological performance in comparison to a low or high level of diversity. An overview of the existing literature that examines this relationship is provided in table 1.

In addition, Vasudeva and Anand (2011) have examined the impact of alliance portfolios on the *importance* of a firm's technology portfolio, i.e. the number of citations that a patent portfolio received, rather than the effect on its size. The results of their study show an inverted U-shaped relation with the number of citations that a technology portfolio received.

**Table 1 The Existing Literature on the Link between Alliance Portfolio Diversity and Technology Portfolios**

Article	Theoretical Background	Independent Variable	Operationalization	Dependent Variable	Operationalization	Result
Nooteboom et al. (2007)	Resource-based view; organizational learning; absorptive capacity	Cognitive distance	Average of the correlations between the focal firm's technology profile and that of each of its alliance partners	Technological performance	Number of patents, with a distinction between more exploitative and explorative patents	Inverted U-shaped relation, with a stronger effect in exploration than in exploitation
Luo and Deng (2009)	Social network; organizational learning; organizational ecology and institutional perspectives	Similarity	Percentage of similar partners in a focal DBF's alliance portfolio	Innovation	Number of patents issued to the firm in a year	Inverted U-shaped relation
Phelps (2010)	Recombinatory search; social network	Network technological diversity	Knowledge distance between a focal actor and each of its partners and the distances among the partners	Exploratory innovation	New patent citations divided by total patent citations for each year per firm (7 year window)	Positive effect
Vasudeva and Anand (2011)	Absorptive capacity; organizational learning	Technological diversity	Pooling of the patents of all alliance partners in each focal firm's portfolio	Knowledge utilization from portfolio	Citation-weighted patent count in the lagged five-year window following an observation year	Inverted U-shaped relation

Furthermore, Phelps (2010) only focuses on exploratory innovations and finds that a highly diversified alliance portfolio is positively related to this type of innovations, which is measured by counting only the new patent citations. However, most companies actually conduct exploratory and exploitative activities simultaneously. They commonly use knowledge that is very similar to their own knowledge to exploit existing activities and knowledge that is very diverse for exploratory activities (Tushman and O'Reilly, 1996). This indicates that a balance between access to similar and diverse knowledge yields the largest amount of new patents, which advocates composing an alliance portfolio with a moderate level of diversity.

While the existing literature concentrates on the economies of scale, i.e. the generation of more patents (citations), the performance advantage in R&D activities appears to lie in economies of scope (Quintana-García and Benavides-Velasco, 2008). Rather than counting the number of (cited) patents, examining the impact on the diversity of the patents, i.e. the technological diversification of firms, can yield interesting results. Moreover, Antonelli and Calderini (2008) state that it is important to evaluate both the quantity as well as the quality of technology portfolios in order to get a real understanding of the technological competences of firms. However, to the extent of our knowledge, the relationship between alliance portfolio diversity and technological diversification has remained unexplored. Next, the concept of technological diversification will be briefly discussed, where after we will elaborate on its relationship with alliance portfolio diversity.

### 3 The Relevance of Technological Diversification

Quintana-García and Benavides-Velasco (2008) define technological diversification as 'the diversity in the knowledge system and principles underlying the nature of products and their methods of production' (p. 492), or, to put it differently, it is the ability of firms to patent in different technological domains. It can also be seen as a reflection of a firm's knowledge portfolio.

A small number of studies have studied the impact of technological diversification on the financial performance of firms (see table 2 for an overview). First of all, the study of Antonelli and Calderini (2008) shows that technological diversification has, next to the number of patents, a positive and significant effect on the market share of the studied companies. Second, Chen and Chang (2010) find that firms with a diverse technology portfolio have a higher market value, measured by stocks,

compared to companies with a more focused portfolio. Moreover, the study of Belderbos et al. (2010) shows a peak in the financial performance of firms, when their technology portfolio is balanced in terms of explorative and exploitative activities, i.e. a high level of technological diversification. Technological diversification can also enhance a firm's investments in R&D as found by Garcia-Vega (2006).

**Table 2 The existing literature on the effect of technological diversification**

Article	Theoretical Background	Independent Variable	Operationalization	Dependent Variable	Operationalization	Result
Garcia-Vega (2006)	No specific theory is addressed	Diversification	1 – Herfindahl index of concentration of a patent portfolio	Innovative activity	(1) R&D intensity (R&D / sales) (2) Number of patents	Positive relations
Leten et al. (2007)	No specific theory is addressed	Technological diversification	The spread of the patent portfolio over technological classes (Herfindahl index)	Patents	Yearly number of firm EPO applications	Inverted U-shaped relation
Antonelli and Calderini (2008)	Economics of knowledge	Knowledge compositeness	Weighted measure of differentiation that provides a fair account of the knowledge compositeness of company's portfolio.	(Technological ) Market share	(1) Relative share of patents owned by each car maker over the patent production in a given year. (2) Markets shares	One and two year positive lagged effects
Quintana-García and Benavides-Velasco (2008)	Evolutionary theory and technological trajectories; organizational learning; absorptive capacity	Technological diversification	Herfindahl index: $1 - \sum(p_i^2)$ , where p is the proportion in a firm of patents in technological field i.	Innovative competence	Number of patents granted by the firm in a year	Positive relation (larger impact on exploratory innovative competence than on exploitative innovative competence)
Belderbos et al. (2010)	Absorptive capacity	Technological activities	Share of explorative technological activities (situated in a technology domain that is new or unfamiliar to the firm in the past 5 years)	Financial performance	Tobin's Q, which is a ratio of the market value of a firm and the book value of the firm's assets	An inverted U-shape
Chen and Chang (2010)	No specific theory is addressed	HHI of patents	Herfindahl index of patent classes of a firm	Market value	Average stock price of a company in a given year multiplied by the number of common stock shares outstanding	Negative relation
Phelps (2010)	Recombinatory search; social network	Technological diversification	The spread of the patent portfolio over technological classes (Herfindahl index)	Exploratory innovation	New patent citations divided by total patent citations for each year per firm (7 year window)	Positive relation

Furthermore, owning patents in a large variety of technological fields facilitates the creation of new patents as technological diversification is found to increase the number of (cited) patents (Garcia-Vega,

2006; Quintana-García and Benavides-Velasco, 2008; Phelps, 2010). On the other hand, the results of Leten et al. (2007) show an inverted U-shaped relation between technological diversification and the number of patent applications, indicating that a moderate level of technological diversification leads to the highest technological performance. They argue that besides the positive effects of a higher level of technological diversification, there also additional coordination and integration costs.

Finally, Quintana-García and Benavides-Velasco (2008) have examined how technological diversification affects different types of innovation, i.e. exploration and exploitation. Although positive and significant results are found for both types, technological diversification has a larger effect on exploratory patents. Moreover, these authors stress that it is important for firms to develop capabilities to balance exploratory and exploitative activities. The positive effect of technological diversity on exploratory innovation is also confirmed by Phelps (2010). In his study, technological diversification is found to increase the relative share of new patent citations.

In conclusion, the above standing studies clearly show the positive impact of technological diversification on the financial and innovation performance of firms (see also table 2). As we already briefly addressed in the previous section, the link between alliance portfolio diversity and technological diversification has not been studied so far. This is an interesting gap, because both alliance portfolios and technological diversification are shown to be valuable for firms. Moreover, existing research has shown that alliance portfolio diversity has a significant impact on the quantity of firms' technology portfolio, whereas it is also interesting to examine whether it affects the quality of technology portfolios. Next, we will explore the relationship between alliance portfolio diversity and technological diversification in more depth. In this current study, we also aim to examine the effect of different dimensions of alliance portfolio diversity. Three dimensions will be considered to have an influence, namely alliance portfolio industry diversity, alliance portfolio functional diversity and alliance portfolio geographical diversity.

#### **4 The Relationship Between Different Types of Alliance Portfolio Diversity and Technological Diversification**

According to organizational learning theories, access to heterogeneous contexts facilitates the creation of new knowledge. A diverse alliance portfolio exposes a firm to variety of knowledge, ideas and experiences (Levitt and March, 1988; Levinthal and March, 1993; George et al., 2001), which facilitates the creation of new linkages between internal knowledge and incoming, i.e. external, knowledge (Cohen and Levinthal, 1990; Lin, 2011). The above standing process of combining internal and external knowledge can result in the creation of patents in unfamiliar technological domains, which subsequently increases the diversity of a firm's technology portfolio.

Moreover, the exposure to multiple sources of knowledge minimizes the risk that existing capabilities will be exhausted, i.e. problems of redundancy (Vasudeva and Anand, 2011). In this way, the continuous access to new, unfamiliar knowledge will facilitate the development of new ideas. This access will also increase the probability that new incoming information is related to existing knowledge base, and therefore provides a more robust setting for learning to take place (Cohen and Levinthal, 1990; Powell et al., 1996). Additionally, there is a higher probability that at least some of the obtained knowledge will lead to a successful innovation outcome as argued by Leiponen and Helfat (2010).

Although Cohen and Levinthal (1990) state that learning is difficult in novel domains, knowledge diversity can increase the absorptive capacity of a firm (Quintana-García and Benavides-Velasco, 2008; Phelps, 2010; Lin, 2011), which is the ability of firms to absorb, learn and use external knowledge (Cohen and Levinthal, 1990). As shown by Powell et al. (1996), firms with a higher level of absorptive capacity learn more from their collaborative activities.

The knowledge-based view of the firm also acknowledges the advantages of having access to a diverse set of knowledge. This perspective focuses on the fit between product domain and the knowledge domain of a firm (Grant, 1997). Most knowledge is subject to economies of scale, i.e. low replication costs of knowledge, and economies of scope, i.e. a specific piece of knowledge can be used for the production of many products (Grant and Baden-Fuller, 2004). Strategic alliances provide access to the relevant knowledge for a specific product without the costs of owning the knowledge (Grant, 1996) and in this way optimize the economies of scope of knowledge.

Both organizational learning and the knowledge-based view acknowledge the benefits of access to a wide variety of knowledge, which will facilitate the creation of new patents in different types of technological domains. Moreover, the risk that existing capabilities are exhausted will be minimized and

prevent that firms only patent in familiar technological domains. Hence, we expect that access to a wide variety of knowledge, i.e. a diverse alliance portfolio, will positively influence firms' technological diversification, i.e. the number of technological fields in which a firm patents. Next, we will elaborate on the effects of the different dimensions of alliance portfolio diversity, and subsequently derive hypotheses.

#### **4.1 Alliance portfolio industry diversity**

Firms can form alliances with partners who are active in different industries. Collaborating with similar partners, i.e. from the same industry, reduces coordination costs and eases the transfer, assimilation and use of knowledge due to the overlap in prior related knowledge (Cohen and Levinthal, 1990, Lui and Ngo, 2005; Luo and Deng, 2009). However, if all alliance partners of a firm are similar, an additional alliance with a similar partner will not yield extra value for the development of innovations (Luo and Deng, 2009). Accessing similar capabilities and knowledge can cause problems of redundancy, in which new combinations of existing knowledge are exhausted (Vasudeva and Anand, 2011). Additionally, if a company only cooperates with similar partners, it is unlikely that it will explore new technological domains.

Collaboration with partners outside the industry of the focal firm reduces this problem by providing new knowledge, capabilities, trends, and practices (Vasudeva and Anand, 2011). This can accordingly be used to make novel associations and linkages with a firm's internal knowledge activities (Cohen and Levinthal, 1990; Lin, 2011). In addition, allying with firms that are already active in a particular industry, market entry to this new unfamiliar industry is facilitated by providing legitimacy (Eisenhardt and Schoonhoven, 1996; Duysters and Lokshin, 2011).

In conclusion, working with partners in the same industry (intra-industry alliances) contributes to patenting in familiar technology fields, while collaborating with partners outside your own industry (inter-industry alliances) facilitates the creation of patents in unfamiliar domains. A portfolio that consists of both intra- and inter-industry alliances, i.e. a diverse set of partners, will increase the variety of technology fields in which a firm patents, i.e. its technological diversification. This leads to the following hypothesis:

*H1: Alliance portfolio industry diversity increases firms' technological diversification.*

#### **4.2 Alliance portfolio functional diversity**

Firms can also form alliances in different stages in the value chain of a product (Rothaermel and Deeds, 2004; Jiang et al., 2010). These different stages require different types of searches for knowledge and therefore the formation of different types of alliances (Rothaermel and Deeds, 2004). In the early stages of product development, the exploration of new combinations of knowledge plays a central role, which advocates the use of R&D alliances (Jiang et al., 2010). These upstream alliances are usually formed with universities and other research institutes (Rothaermel and Deeds, 2006). In later stages, where the focus shifts to the exploitation of the created innovation, firms will employ marketing, manufacturing and distribution alliances (Jiang et al., 2010). These alliances are also called downstream alliances (Hess and Rothaermel, 2011). The above standing studies indicate that exploration alliances are formed with different types of partners than in case of exploitation alliances. For instance, in the pharmaceutical industry, exploration alliances will mostly be formed with biotechnology firms, whereas exploitation alliances are usually formed with large pharmaceutical companies (Rothaermel and Deeds, 2004). Moreover, Chesbrough (2003) states that many firms concentrate on one of the three types of activities, namely funding, generating or commercializing innovations.

According to Rothaermel and Deeds (2004), most firms conduct exploration and exploitation activities simultaneously, because they manage a number of concurrent projects, which are at different stages in the product development process, at the same time. In addition, March (1991) states that finding a balance between exploration and exploitation activities is essential for the continuation of firms. This indicates that firms forming alliances with different functional purposes during the different stages of the value chain have access to a wide variety of external knowledge. This access facilitates the development of new linkages and combinations, which can accordingly increase the number of technological fields in which a firm patents.

Concluding, balancing exploration and exploitation activities can increase the technological competences of firm by simultaneously exploiting familiar technological domains and exploring unfamiliar technological domains. Accordingly, firms can apply for patents in different stages of the value chain, resulting in an increase in the technological diversification of firms. Therefore, the following hypothesis is stated:

*H2: Alliance portfolio functional diversity increases firms' technological diversification.*

### 4.3 Alliance portfolio geographical diversity

Finally, firms can form alliances with companies located in different countries across the world. This dimension becomes increasingly relevant, as technological knowledge is more and more dispersed over the world (Archibugi and Iammarino, 2002; Duysters and Lokshin, 2011). Moreover, Inkpen (1998) argues that international strategic alliances can create unique learning opportunities for firms by providing access to different skills, knowledge bases and organizational cultures. The creation of new knowledge due to the exposure to new contexts is also supported by the organizational learning theory.

Rosenkopf and Almeida (2003) state that many firms still only search locally for new knowledge, while distant contexts offer new insights, and therefore facilitate the recombination of knowledge. They argue that alliances and the mobility of investors are useful mechanisms for firms to conduct a more global search for knowledge. In addition, collaborating with foreign partners can provide access to specialized technological expertise, which is not available locally (Duysters and Lokshin, 2011). Because the knowledge from international partners is less available, it is also more valuable than knowledge acquired from domestic alliances (Zhang et al., 2010).

Hence, we argue that if a firm allies with partners from different regions across the world, it has better access to new and specialized knowledge compared to companies that only cooperate locally. This broader access to knowledge facilitates the development of new ideas and subsequently the creation of unfamiliar patents. Moreover, we expect that these firms are able to patent in a wider variety of technological classes. This leads to the following hypothesis:

*H3: Alliance portfolio geographical diversity increases firms' technological diversification.*

## 5 Methodology

To test the hypotheses, a panel dataset has been constructed containing the alliance portfolios and patent portfolios of 43 pharmaceutical firms for a time period of eight years (1995 – 2002). These firms have been selected from the '2004 EU Industrial R&D Investment Scoreboard' as the top R&D spending pharmaceutical firms.

The pharmaceutical industry has been the focus of many studies in the field of open innovation, because of its high level of inter-firm collaborations (Hagedoorn, 2002). Whereas the existing literature on the effect of alliance portfolio diversity tests its impact on the number of patents, this current study propose the use of an alternative dependent variable, namely technological diversification, which is measured as the diversity of firms' applied patents. Therefore, the focus on pharmaceutical firms allows us to compare our findings with the existing literature.

To construct the alliance portfolios, we used the Thomson SDC Platinum database. This database is based on press releases in which new alliances are announced. For each of the 43 pharmaceutical firms, we downloaded all announcements for the selected years. Next, the downloaded text files were transformed to an Excel-format, after which they were imported and merged in the software program STATA.

Several modifications had to be done to make the dataset usable. The original dataset consisted both of alliance-level variables and firm-level variables. The former were only listed for one of the partners in the alliance and therefore had to be duplicated for the other partner(s). Moreover, some variables were coded as strings, e.g. 'Yes' or 'No'. These variables were recoded in numerical values in order to be able to include them in regression analyses. Moreover, we analyzed whether the names of the companies were consistent and adjusted them if necessary.

Next, we coded the characteristics of each alliance into different categories, which were subsequently used to create the different diversity measures. This coding process will be discussed in more detail in one of the next paragraphs. Subsequently, the number of alliances per category was counted for each of the firms in the dataset. In this way, a firm-level dataset was created, namely the frequency of each category per year was listed for each of the firms. Accordingly, we aggregated the totals of the previous four years to the totals of a focal year, assuming that an alliance between two partners on average lasts five years before it ends. A time-window of five years is a common assumption according to Sampson (2007). The relative size of each category was then calculated as the size of a specific category divided by the total number of alliances of the last five years. These ratios were used to calculate the Blau Index of Variability, which is frequently used to measure diversity. This index will be described in more depth in the next paragraph.

Finally, if a company resulted from a large merger after 1995, it was only included in the sample after its foundation, which makes the dataset slightly unbalanced<sup>1</sup>. In total, the data set contains 294 firm-year observations.

### 5.1 Dependent variable

In line with prior research (Leten et al., 2007; Quintana-García and Benavides-Velasco, 2008), as can also be seen in table 2, we measure technological diversification of firms as the variety of technological classes in which a firm has applied for a patent in a particular year. The patent data is collected from the European Patent Office (EPO). Each granted patent is assigned at least to one of the IPC (International Patent Classification) classes. For our diversification measure, a distinction is made between 625 different 4-digit IPC classes.

Based on this classification, a variation of the Herfindahl index is used to construct the dependent variable, namely the Blau Index of Variability (Blau, 1977). According to Quintana-García and Benavides-Velasco (2008) and Leten et al. (2007), the Blau Index has been widely used to measure the heterogeneity of categorical variables. The Index can be calculated as follows:  $D = 1 - \sum p_i^2$ , where  $D$  is the degree of diversity,  $p$  is the proportion belonging to given category (i.e. IPC class), and  $i$  is the number of total number of categories in which a firm patents. The range of the dependent variable is between 0 and 1, where 0 represents zero technological diversification and 1 indicates a fully balanced patent portfolio in which patents are equally distributed across the classes in which a firm patents.

### 5.2 Independent variables

As argued in this paper, alliance portfolio diversity can be measured in different ways. We focus on three different dimensions, namely alliance portfolio industry diversity, alliance portfolio functional diversity and alliance portfolio geographical diversity. As a first step, the characteristics of each alliance were coded into different categories. Next, we will discuss which categories were used to construct the three diversity measures.

First, *alliance portfolio industry diversity* focuses on the overlap in the four-digit SIC codes of the focus firm and its partner(s) in a particular alliance (Keil et al., 2008). In this way, alliance portfolio industry diversity represents the variety of operational alliances in terms of industry relatedness. An alliance was coded as '0', when the SIC codes were unrelated; as '1', when they shared the same one- or two-digit SIC code indicating a related industry; and finally, as '2', when an alliance was formed between partners with the same three- or four-digit SIC codes referring to an intra-industry alliance.

Second, *alliance portfolio functional diversity* concentrates on the variety of operational alliances in terms of functional activities. While Jiang et al. (2010) code functional activities as R&D, marketing, manufacturing or other type of alliances, we argue that this categorization is too broad. Following the existing literature, we distinguish between explorative and exploitative purposes. The functional activity of an alliance is coded as follows: '1' for R&D alliances, indicating explorative activities, and '2' for manufacturing, marketing and other type of alliances<sup>2</sup>, indicating exploitative activities.

At last, *alliance portfolio geographical diversity* represents the variety of operational alliances in terms of geographical coverage. Geographical diversity was defined as the overlap in the world regions in which the focal firm and its partner(s) were located. Each partner firm was coded based on its location in one of the six categories: '1' for North America, '2' for South America, '3' for Africa, '4' for Europe, '5' for Asia, and '6' for Australia.

Likewise, the Blau Index of Variability was used to construct the three portfolio diversity measures. To clarify, we provide a brief example how we calculated this index for one of these dimensions. In our example, firm A has an alliance portfolio that consists of 20 partners, namely 4 North American, 3 South American, 1 African, 8 European, 2 Asian and 2 Australian partners. By squaring the proportions of each of the six categories, the Blau index is calculated as follows:

$$D = 1 - \sum p_i^2 = 1 - [(4/20)^2 + (3/20)^2 + (1/20)^2 + (8/20)^2 + (2/20)^2 + (2/20)^2] = 0,795.$$

A value close to zero represents a low level of diversity, whereas a higher value indicates that a firm's alliance portfolio is more balanced with equal proportions for each category.

In addition, squared terms of each dimension of alliance portfolio diversity were created. The existing literature that examines the impact of alliance portfolio diversity on the number of patents finds an inverted U-shape relation, indicating that firms face a certain cognitive limit that constrains learning

<sup>1</sup> The following firms resulted from a larger merger after 1995 and were included in the dataset after their foundation (founding year): AstraZeneca (1999), Aventis (1999), Glaxo Smith Kline (2000), Mitsubishi Pharma (1998), Novartis (1996) and Sanofi (2000).

<sup>2</sup> The category 'other type of alliances' includes exploration, funding, supply and (exclusive) licensing agreements.

and the transfer of knowledge (Levitt and March, 1988; Cohen and Levinthal, 1990; Levinthal and March, 1993; Grant, 1996; Grant and Baden-Fuller, 2004). By adding squared terms, we are able to investigate whether the hypothesized relationships are non-linear or marginally increasing rather than linear.

### 5.3 Control variables

Next to the independent variables, a number of control variables have been included to account for other firm-level factors that impact the technological diversification of firms. First, we control for the R&D intensity of firms. Firms with a higher level of expenditures on R&D are expected to face fewer restrictions in the choice of innovation projects and therefore to have a more balanced set of innovation activities. This measure is calculated by dividing the R&D expenditures (in millions of US dollars) by the sales of the firm (in millions of US dollars).

Second, some firms differ have experience in conducting R&D activities than others. This can be seen as the variations in the return on R&D or the efficiency of converting R&D efforts into patents. Hence, we control for these differences by including the patent propensity. This is measured by dividing the number of patent applications that a firm received in particular year by its R&D expenditures in that year.

Third, we control for the alliance experience of firms. Existing literature (e.g. Sivakumar et al., 2011) shows that companies with more experience in managing past alliances have a higher innovation performance. Alliance experience is measured as a logarithm of the number of operational alliances.

In addition, the larger a firm is, the higher its innovation performance (Rothaermel and Deeds, 2004, Luo and Deng, 2009, Sivakumar et al., 2011). Duysters and Lokshin (2011) argue that larger firms have more resources available for the management of alliance portfolios in comparison to smaller firms, which often face financial and managerial constraints (Duysters and Lokshin, 2011). We control for this by including an indicator for firm size, namely a logarithm of the number of employees. The data on R&D expenditures, sales, and employees is gathered from corporate annual reports and financial databases (i.e. Worldscope and Compustat).

Finally, time dummies are included to account for time-varying effects that are related to firms' technological diversification, but are identical for all firms in the sample. These could, for instance, be industry-related or macroeconomic effects. The year 1995, the first year in the sample, is used as the reference category.

### 5.4 Analytical method

For this study, we constructed a panel dataset to test whether alliance portfolio diversity alters the technological diversification of firms. Next, we need to decide how to treat the unobserved individual effects, which are present in panel data. Fixed effects regression assumes that the explanatory variables are related to these unobserved individual effects. Moreover, this method aims to identify differences within groups. The random effects regression, on the other hand, assumes that there is no relation between the explanatory variables and the unobserved individual effects. Because the dataset contains repeated observations for the same groups (i.e. firms), this assumption is not likely to hold. A Hausman test has been conducted to test whether the fixed effects estimators and random effects estimators were systematically different. The test statistic advocates the use of the fixed effects method to estimate our proposed models (Model 8  $X_{15}^2 = 36.56, p = 0.0015$ ). In addition, the fixed effects regression results provide significant evidence of a correlation between the explanatory variables and the unobserved individual effects ( $F = 7.31, p = 0.0000$ ).

## 6 Empirical Results

Table 3 presents the descriptive statistics and correlations. The technological diversification of firms slightly increased over time, as the average value was 0.7882 in 1995 and 0.7939 in 2002. Also the average number of applied patents increased from 55 per year (in 1995) to 90 per year (in 2002). The sample consisted of large firms with on average 28174 employees, annual sales of \$9088796 million and spending \$1133632 million on R&D (in 2002). Additionally, table 3 shows that the alliance portfolios of the selected pharmaceutical firms were quite diverse for each of the dimensions.

Table 3 also provides correlations between the dependent, independent and control variables. In general, the correlations between the independent and control variables are rather low. The correlation between the logarithm of the number of employees and the logarithm of the number of operational alliances is relatively high. This finding indicates that firms that are larger in size also have more alliances, which seems plausible. Moreover, the VIF measures are all below a value of 4 suggesting that

multicollinearity of the variables is not a problem in our analyses. We also tested whether our main independent variables were endogenous, i.e. whether technological diversification also affects the alliance portfolio diversity of firms. However, we did not find evidence of endogeneity for each of the three dimensions<sup>1</sup>.

**Table 3 Descriptive Statistics and Correlations**

Variables	Mean	SD	1	2	3	4	5	6	7
1 Technological Diversification	0.7824	0.1069							
2 Patent Propensity	0.0124	0.0142	0.2520						
3 Log (Employees)	9.2549	1.4366	0.6118	0.0226					
4 Log (Alliances)	2.6779	1.0216	0.4835	0.0139	0.7824				
5 R&D Intensity	0.1777	0.4350	-0.1598	0.0607	-0.3402	0.0109			
6 Industry Diversity	0.4263	0.2067	0.3553	0.0864	0.3812	0.4448	-0.1434		
7 Functional Diversity	0.3705	0.1290	0.3247	-0.0099	0.2961	0.4294	0.1174	0.3356	
8 Geographical Diversity	0.4670	0.1694	0.2472	0.1010	0.2147	0.2631	-0.1019	0.4279	0.4031

The results of the fixed effects regression analyses are provided in table 4. Model 1 is the baseline model by including only the control variables. The number of operational alliances has a positive, significant effect on the technological diversification of firms ( $p < 0.10$ ). For the other control variables we did not find any significant results. The linear terms of industry, functional and geographical diversity are added in Model 2, 4 and 6 respectively. Subsequently, the squared terms were added in model 3, 5 and 7. Finally, we jointly test the effects of the three dimensions of alliance portfolio diversity in model 8.

Hypothesis 1 predicted a positive relation between alliance portfolio industry diversity and technological diversification, which will be analyzed based on the results of model 2 and model 3. Model 2 shows a positive and significant root term for industry diversity ( $p = 0.074$ ), providing support for hypothesis 1. Further analyses were conducted to analyze the existence of a non-linear relationship. The result of a joint F-test of the root and the squared terms in model 3 is insignificant ( $p = 0.1925$ ). Additionally, a more formal ‘utest’ was conducted, developed by Lind and Mehlum (2010). This test evaluates whether the relationship is U-shaped or inverted U-shaped by determining whether the inflection point is between the minimum and the maximum value of the explanatory variable. The results of this test show that the extreme point is outside the interval, indicating that the relation between alliance portfolio industry diversity is linear and positive. Hence, we accept hypothesis 1.

Alliance portfolio functional diversity was also predicted to have a positive impact on technological diversification as stated in hypothesis 2. Model 4 shows a negative coefficient for functional diversity, however it is marginally insignificant ( $p = 0.1052$ ). Subsequently, a squared term is added in model 5. The root and the squared terms are jointly significant ( $p = 0.022$ ). The negative coefficient of the root term and the positive coefficient of the squared term indicate the presence of a U-shaped relation. The ‘utest’ of Lind and Mehlum (2010) provides a test value of 1.39, which is significant at the 10% level ( $p = 0.0828$ ). Concluding, because the findings show a U-shaped relation between alliance portfolio functional diversity and technological diversification, we fail to accept hypothesis 2.

<sup>1</sup> We conducted several Hausman tests in order to investigate whether our three main independent variables were endogenous. Under the null hypothesis, the coefficients from the OLS and the IV regression are similar. The alternative hypothesis states that only the IV estimators are consistent. As an instrument for ‘industry diversity’, we used the other two dimensions (functional and geographical diversity). The approach for the other two dimensions was the same. The results show that industry diversity (Model 2  $X_{13}^2 = 17.98$ ,  $p = 0.1583$ ), functional diversity (Model 4  $X_{13}^2 = 1.33$ ,  $p = 1.0000$ ), and geographical diversity (Model 6  $X_{13}^2 = 1.06$ ,  $p = 1.0000$ ) are not statistically significant, and therefore not endogenous.

**Table 4 Regression Analyses<sup>1</sup>**

	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6	Model 7	Model 8

<sup>1</sup> Significance of the coefficients is indicated by \*(0.10), \*\* (0.05) and \*\*\* (0.01). Standard errors are between the parentheses. All models include firm and year fixed effects.

Hypothesis 3 predicted that alliance portfolio geographical diversity increases firms' technological diversification by providing access to knowledge across the world. The results in model 6 show an insignificant coefficient for the root term of geographical diversity ( $p = 0.150$ ). Adding a squared term in model 7 also provides insignificant results for the root and the squared term of geographical diversity. A joint F-test of the two terms is also insignificant ( $p = 0.3542$ ) as well as the 'utest'. Hence, our results do not provide statistical support for hypothesis 3.

Finally, we estimate the joint effect of the three dimensions of alliance portfolio diversity. Based on the previous findings, we include, next to the root terms of industry, functional and geographical diversity, a squared term for functional diversity in model 8. The joint F-test is highly significant ( $p = 0.0091$ ). This finding shows that alliance portfolio diversity influences the technological diversification of firms. Because we found diverging results for the effects of the different dimensions, we cannot infer anything about the nature of the relationship between both constructs.

When looking at the individual results of the three dimensions in model 8, we observe that their significance levels have changed. Industry diversity has a stronger, positive effect on technological diversification ( $p = 0.016$ ) as well as the U-shaped effect of functional diversity ( $p = 0.040$ ). The relation between geographical diversity and technological diversification remains insignificant ( $p = 0.498$ ). A further discussion of our results and their implications will be provided below.

## 7 Conclusion

While the existing literature has focused on the impact alliance portfolio diversification on technological performance, i.e. the number of patent applications, research examining its impact on the technological diversification of firms, i.e. the variety of patent applications, is lacking. Therefore, the aim of this study was to explore the relationship between alliance portfolio diversity and the technological diversification of firms. Based on the organizational learning theory and the knowledge-based view of the firm, we hypothesized a positive relation by arguing that the access to a wide variety of knowledge would facilitate patenting in diverse set of technological fields. Our empirical analyses focused on the largest firms in the pharmaceutical industry and showed that the relationship between alliance portfolio diversity and technological diversification is more complex than hypothesized. While our findings provide support that alliance portfolio diversity significantly influences firms' technological diversification, the nature of this relationship varies between the three dimensions of alliance portfolio diversity.

First of all, a positive, significant effect is found for alliance portfolio industry diversity, indicating that collaborating with partners from a diverse set of industries facilitates the creation of new linkages and associations (Vasudeva and Anand, 2011), and accordingly provides firms the opportunity to patent in new technological domains. In addition, no evidence was found of the negative effects of high level of industry diversity. This finding suggests that pharmaceutical companies should both form intra- and inter-industry alliances in order to increase their technological diversification.

Second, alliance portfolio functional diversity was found to have a U-shaped effect on technological diversification. This finding implies that pharmaceutical firms with a low or high level of functional diversity in their alliance portfolio have a higher level of technological diversification than firms with a moderate level of diversity. In accordance with the existing literature (e.g. March, 1991; Rothaermel and Deeds, 2004), which states that balancing exploration and exploitation activities benefits the innovation performance of firms, our results show that collaborating on a wide variety of functional purposes increases the variety of technological classes in which a firm patents. On the other hand, pharmaceutical firms that concentrate on forming alliances with a particular purpose, i.e. only explorative or exploitative alliances, are also found to be successful in terms of technological diversification. We conducted some further analyses to examine in which activities these companies specialize. The results show that 21 observations have a fully focused alliance portfolio in terms of functional diversity, of which 18 focus on exploitative alliances and 3 observations focus on explorative alliances. A t-test is conducted to test which approach yields a higher level of technological diversification. However, this test does not provide significant results. Still, we observe that some firms apparently are able to be successful in terms of technological diversification while only conducting exploitative alliances. Because firms increasingly concentrate on a particular type of functional activity, as argued by Chesbrough (2003), some firms might decide to conduct their explorative activities in-house, while collaborating on exploitative activities. This might allow firms to concentrate their alliance activities, while being able to patent in a variety of technological fields. However, this statement

has not been studied so far, and might be an interesting avenue for future research. Overall, if a pharmaceutical company wants to increase its technological diversification, an intermediate level of functional diversity is found to be the least successful.

Third, our study did not find a significant relation between geographical diversity and technological diversification. Although the literature states that knowledge is more and more dispersed over the world (Duysters and Lokshin, 2011), which would advocate the formation of alliances with partners in different world regions to be able to access this information, we did not find support for this statement. This is an interesting result, because this might indicate that the same knowledge is available everywhere (in the pharmaceutical industry) or that the location of an alliance partner does not matter. Future research could examine this finding in more depth in order to analyze whether this insignificant relation also holds in other industries.

The findings of our study contribute to the existing alliance portfolio research by empirically demonstrating that alliance portfolio diversity does not only influences the *size* of firms' patent portfolios (Leten et al., 2007; Guintana-García and Benavides-Velasco, 2008; Phelps, 2010), but also has a substantial impact on the *composition* of the patent portfolio. Accordingly, this can improve the financial and innovation performance of firms (Antonelli and Calderini, 2008; Belderbos et al., 2010; Chen and Chang, 2010). Moreover, the existing research finds an inverted U-shape between alliance portfolio diversity and the size of a technology portfolio, indicating that the effect of alliance portfolio diversity becomes negative after a certain threshold is reached. Our results, on the other hand, do not find negative effects at a high level of diversity and therefore clearly show the benefits of creating of a highly diverse alliance portfolio. This indicates that it is important to distinguish between the effect on the size and the composition firms' patent portfolios.

Furthermore, as advocated by the organizational learning theory and the knowledge-based view of the view (Cohen and Levinthal, 1990; George et al., 2001; Grant, 1996; Lin, 2011), our study acknowledges the importance of being able to access a diverse set of knowledge for the development of *new* knowledge and innovations. As a new contribution to the existing literature, this study shows that access to a variety of knowledge also *broadens* the scope of the knowledge developed by the firm. This indicates that firms can rely on alliance portfolios as a strategic tool to diversify their technological portfolio.

Besides, only recently, studies have started to operationalize alliance portfolio diversity as a multi-dimensional construct, e.g. Jiang et al. (2010). Our results confirm that diversity is not a single dimensional construct by showing that three dimensions of alliance portfolio diversity have a differential impact on the technological diversification of firms. Hence, this study aims to contribute to this new development of analyzing the effects of alliance portfolio diversity in more depth.

Our study also has practical implications. Managers should realize that the decision to enter a particular alliance affects the technological diversification of their firms. Firms could also influence their technological diversification by forming different types of alliances. This is important, because the existing literature indicates that technological diversification increases the innovative and financial capabilities of firms. On the other hand, it is important to notice that although managers have an influence, they face important trade-offs in deciding with whom to form an alliance and for which purpose. The results of this study suggest that it is important for firms to map their alliance portfolio to increase their ability to evaluate the added value of a potential alliance to the portfolio. In this way, managers can analyze how this potential addition changes the diversity of their alliance portfolio, which can accordingly impact the technological diversification of their firm.

For policymakers it is important as well to realize that they can increase the innovative capabilities of their country by stimulating the collaboration within and between industries. For instance, the Dutch government has developed a new policy program in order to become one of the top 5 knowledge economies in the world. To achieve this goal, 9 'top sectors' have been identified, in which governments, companies, university and research institutes agreed to collaborate. However, this program mainly focuses on the collaboration *within* industries, while the results of our research also stress the importance of collaborating *between* industries. This is an issue that needs attention from the Dutch government if they want achieve their goal.

This study knows several limitations. First of all, our empirical analyses concentrated on the pharmaceutical industry. Although the existing alliance portfolio research largely focused on this industry, it might be interesting to examine other industries as well. This will allow us to identify differences and similarities across industries. Furthermore, the 43 largest firms in terms of R&D expenditures were selected. A future study could extend this sample by also including smaller firms,

which would provide a more complete overview of this industry. A third concern is the time frame of eight years, which could be extended in future studies.

Moreover, it might be interesting to further explore the relationship between alliance portfolio diversity, technological diversification and technological performance. Technological diversification could, for instance, act as a moderator or mediator. Secondly, future studies could examine the type of knowledge, i.e. tacit or explicit, that is transferred between the different partners. In this way, we might identify which type of knowledge is most valuable to increase the technological diversification of firms. Finally, although this study combined several theoretical perspectives, a clear theoretical framework in this field of research is missing. Future research should therefore aim to strengthen the theoretical underpinnings of alliance portfolio research.

In sum, while the existing literature focused on the technological performance of firms, this study aimed to fill a gap in the literature by examining the impact of alliance portfolio diversity and firms' technological diversification. Our results showed a significant relationship, however, it is found to be more complex than hypothesized. By making an explicit distinction between different dimensions of alliance portfolio diversity, we showed that alliance portfolio industry diversity, alliance portfolio functional diversity, and alliance portfolio geographical diversity have a differential impact on technological diversification. Jointly, these findings indicate that alliance portfolios can be used as a strategic tool to diversify firms' technological capabilities.

# Research on the Operating Evaluation Index System of Industry Technology Innovation Strategic Alliance

Qin Yuanjian, Lu Hui

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: qyjhb@163.com, luhui751@sohu.com)

**Abstract:** Promote industrial technology innovation strategy alliance construction is one of important national strategic measures. To construct industry technology innovation strategic alliance is a strategy idea for region to transform resources into the development conditions, and also a breakthrough way to develop and restructure industry. This study aims at build an operating evaluation<sup>1</sup> index system for industrial technology innovation strategy alliance. Try to conclude the inadequacies and barriers from the current situation.

**Key words:** Industry technology innovation strategic alliance; Strategy alliance; Evaluation index system; AHP

## 1 Introduction

Promote industrial technology innovation strategy alliance construction, as the important one from series of national strategic measures, which is implemented by the national ministry of science and technology, the ministry of finance, the ministry of education, China development Bank and so on six ministries and commissions in order to carry out the national technical innovation, intensify the combination and promote technology innovation system construction. To construct industry technology innovation strategic alliance is not only a strategy idea for region to take science and technology resources which could transform into the economic and social development, but also a breakthrough way to strengthen industrial core competitiveness, promote the readjustment of the economic structure and development mode. Moreover, it's an effective way to put enterprise technology innovation in main status, promote industry-university-institute innovation and regional innovation system. Since 2009, Hubei province has had started its industry technology innovation strategy alliance construction from experimental units, now there were 21 alliances. Three alliances including Fiber To The Building (FTTx), geographic information system (GIS) and rapeseed processing industry technology innovation alliances are replied as the national experimental alliances by Ministry of Science and Technology. In the preliminary period Hubei province had got many achievements especially on technology innovation, but there are also some operating and managing problems which focus on public strategies and enterprise member's relationship mechanism.

According to the government investigation project of industrial technology innovation strategy alliance development from Hubei province in 2011, this study aims at build an operating evaluation index system for industrial technology innovation strategy alliance. Try to further and comprehensively analyze the related factors in operating and management process, then conclude the inadequacies and barriers from the current situation.

## 2 Literature Review

The concept of strategic alliance was firstly put forward by the CEO of DEC Company J. Hopland and managerialist R. Nigel, after that this idea was concerned greatly by academia and enterprises. Different scholars give different definitions in their own theoretical perspectives; the theories of strategic alliance are gradually more abundant than before. Early theories mainly contain the theory of labor division professionalization, transaction cost, Value Chain and so on. From Adam Smith's theory, the levels of division include enterprises inside division, between enterprises division and industries division. Essentially between enterprises division is the theory basis of strategic alliance. Because of this kind of division, strategic alliance has the effective advantages which aren't had enough by single enterprise or the whole market. Strategy alliance ensures the efficiency mechanism of division and professionalization so that the relationship of division and cooperation could expand and deepen in bigger ranges.

For technology alliance, J. Hopland and R. Nigel though that enterprise alliance is two or more

than two Equivalence economic entities, for a common strategic goal, form together as the shared interests and risks loose network organization, such as primary theory Trust and Konzern, and nowadays Joint Venture Enterprise and Franchisees. As the views of Yoshino and Rangan(1995), two types of cross organization joint rule out of the definition of cross organizations cooperation technology innovation, one is the capital cooperative joint, another is the traditional contract, for example short-term contract, franchise rights, license and interactive license, etc.

Industry technology innovation strategic alliance is a new organization form of technology innovation that is practiced and explored from our industry-university-institute cooperation. Industrial technology innovation strategic alliance is organized by enterprises, universities, scientific research institutions or other organizations to joint development, complementary advantages and shared interests and risks which based on the demand of enterprise development and the all parts common interests, the goal is to improve the industrial technology innovation ability and the binding contract for security. Industry technology innovation strategic alliance essentially is an advanced form of industry-university-institute cooperation, which could satisfy the demands from enterprises, universities and institutes, the capital and research force are mobilized together by every member of the cooperation alliance, and they are stabled by the contracts. It is a kind of entity which is driven under the common value orientation and every part should start from its own role in the cooperation and work hard in order to realize the common value. For the organization mode, most of scholars studying strategic technology alliance structure prefer to divide strategic technology alliance into two parts: equity alliances and non-equity alliances. For the operating mechanism, industry technology innovation strategic alliance is a kind of contractual relationship; the alliance doesn't have the independent legal person status, but current law could standard its behavior completely.

In recent years, there are many researches from the domestic scholars that focus on evaluation of industrial technology innovation strategic alliance. Huang Ziyun (2010) according to the purpose and principles of industry-university-institute innovation alliance, make a value judgment for the direct and indirect economic effect and the development of self competitive ability, then build an alliance evaluation index system. For the operating performance evaluation, Zhang Haijun (2008) build a index system for logistics alliance, it contains inside and outside parts, and cooperation relation part, then use the Fuzzy mathematics method and Benchmarking principle method to get the final evaluatio. Wan Pingnan and Liu Hongxia research the industry alliance performance through considering the environment and organization factors.

### **3 Operating Evaluation Index System for Industrial Technology Innovation Strategic Alliance**

#### **3.1 Design of the evaluation index system**

According to the past literatures, we got some important evaluation factors, then use the key variables to do the questionnaires. In order to constructing industry technology innovation strategy alliance evaluation system, we also use other useful information as the important basis after taking part in the symposium of industry technical innovation strategy alliance in Hubei province. From this symposium we further understand and analysis of the advantages and disadvantages, the present development situation. Then we analyze two parts of the system, the one is about the alliance Operation management, another is about Cooperation relationship. In order to facilitate the weight distribution and evaluation, we analyze the Operation management in 7 parts as the first level factor (F1a): policy environment, marketing environment, investment and finance, alliance purpose, interest distribution, risk prevention and operating ability. Based on the first level factor we further analyze them in 13 factors as the second level factor (F2a). And we also analyze the Cooperation relationship in 5 parts as the first level factor (F2a): adequacy of Communication, coordination degree of Intellectual property rights, the trust degree between members, willing and motivation and suitability of partner selection. Based on them we further analyze in 12 factors as well. In the questionnaire design, we take the Likert scale of five rating index method to get each score.

#### **3.2 Determination of the index weight**

For determining the value of the weight of every evaluation factors, we mainly use the Analytic Hierarchy Process (AHP). Firstly we constructed the first and second level factors pair wise comparison matrixes, which could compare the relative importance between i factor or j factor and the other layer factors as the described way of quantitative relative weight  $a_{ij}$ . The value of  $a_{ij}$  in pair wise comparison matrixes is accorded with Satty's suggestion as following scales:  $a_{ij} = 1$ , i and j have the same relative

importance with the above level factors;  $a_{ij} = 3$ ,  $i$  is little more important than  $j$ ;  $a_{ij} = 5$ ,  $i$  is more important than  $j$ ;  $a_{ij} = 7$ ,  $i$  is really more important than  $j$ ;  $a_{ij} = 9$ ,  $i$  is extremely more important than  $j$ ;  $a_{ij} = 2n$ ,  $n=1,2,3,4$ , the importance of  $i$  and  $j$  are between  $a_{ij} = 2n-1$  and  $a_{ij} = 2n+1$ ;  $a_{ij} = 1/n$ ,  $n=1,2,3 \dots 9$ .

For example, according with the Delphi method, we can firstly get the first level factors pair wise comparison matrixes of the whole operation management (Policy environment  $x_1$ , Marketing environment  $x_2$ , Investment and finance  $x_3$ , Alliance purpose  $x_4$ , Operating ability  $x_5$ , Interest distribution  $x_6$ , Risk prevention  $x_7$ ):

$$\begin{pmatrix} 1 & \frac{1}{2} & \frac{1}{4} & \frac{1}{5} & \frac{1}{8} & \frac{1}{7} & \frac{1}{4} \\ 2 & 1 & \frac{1}{2} & \frac{2}{5} & \frac{1}{4} & \frac{2}{7} & \frac{1}{2} \\ 4 & 2 & 1 & \frac{4}{5} & \frac{1}{2} & \frac{4}{7} & 1 \\ 5 & \frac{5}{2} & \frac{5}{4} & 1 & \frac{5}{8} & \frac{5}{7} & \frac{5}{4} \\ 8 & 4 & 2 & \frac{8}{5} & 1 & \frac{8}{7} & 2 \\ 7 & \frac{7}{2} & \frac{7}{4} & \frac{7}{5} & \frac{7}{8} & 1 & \frac{7}{4} \\ 4 & 2 & 1 & \frac{4}{5} & \frac{1}{2} & \frac{4}{7} & 1 \end{pmatrix}$$

RI=1.32, CR =0.092<0.1, that is through the consistency check.  
Weight vectors are (0.062, 0.065, 0.129, 0.161, 0.258, 0.226, 0.129)

After we get the first level factor weight values, then we can confirm the relative second level factor weight. Because the second level pair wise comparison matrixes of marketing environment is  $\begin{bmatrix} 1 & 1 \\ 0.5 & 0.5 \end{bmatrix}$ , the degree of competition and the degree of demand in marketing environment have same weight values: 0.5, 0.5. By parity of reasoning, we can definite all weight values of each factors. (See table 1).

### 4 Analysis of the Experimental Result

In the investigation part we focus on the participating Hubei province enterprises of alliances, scientific research institutes and administration organizations as the targets. We distribute 182 questionnaires via alliance secretariat channels. 124 effective questionnaires could be the final statistic data. Hubei enterprises are 78.9% of the total, institutes and administration organizations are 21.1%. Weight values are showed in the parenthesis beside each factor; the final result of this investigation is showed by following table 1; (Keep three-digit number after decimal point):

**Table 1 The Score of Alliance Operation Management and Cooperation Relationship evaluation**

	Total score	The first level factor (F1a/F1b)	Weighted average score	The second level factor (F2a/F2b)	Score
Operation Management	1.839	Policy environment (0.062)	2.725	Degree of policy support (0.5)	2.725
		Marketing environment (0.065)	4.313	Degree of competition (0.5)	3.875
				Degree of demand (0.5)	4.750
		Investment and finance (0.129)	2.125	Investment environment & channel	2.125
		Alliance purpose (0.161)	3.835	Determinacy (0.67)	3.975
				Compatibility (0.33)	3.550
		Interest distribution (0.226)	3.635	Fairness (0.6)	3.975
				Rationality (0.4)	3.125
		Risk prevention (0.129)	1.585	Systematize risk prevention (0.56)	1.750
				Executive force of risk control(0.44)	1.375
Operating ability (0.258)	3.451	Appropriate structure (0.18)	3.765		
		Rationality of operating (0.27)	3.500		
		Implementation of administration (0.55)	3.325		

Cooperation Relationship	4.080	Adequacy of Communication (0.286)	3.596	Communication quality (0.57)	3.250
				Degree of information sharing (0.29)	3.995
				Participation of goal setting (0.14)	4.175
		Coordination degree of Intellectual property rights (0.190)	3.940	The distribution of IPR(0.67)	3.800
				The maintenance of IPR (0.33)	4.225
		The trust degree between members (0.381)	4.220	Participate cooperation process (0.44)	4.500
				Share scientific and technological achievements (0.56)	4.000
		Willing and motivation (0.095)	4.875	Willing and motivation	4.875
		Suitability of partner selection (0.048)	3.716	Enterprises complementary (0.14)	3.365
				Enterprises similarity (0.14)	3.675
				Reputation of enterprises (0.29)	4.225
				Ability of enterprise (0.43)	3.500

According to the above comprehensive evaluation scores, Hubei province industrial technology innovation strategic alliance operation administration just get the total score 1.839, the lower parts mainly focus on policy support (2.725), investment and financing mechanism (2.125) and risk prevention (1.585). Therefore, we can find that union or enterprise members of alliances aren't satisfied with the current alliance operation. From the actual interview of these enterprises, we think that three aspects cause the fact: the government financial support is insufficient, alliance operating budget is hard to rise, administration organization service is difficult to implement; in the primary period of alliance operation, it lacks of risk prevention mechanism. From the point of view of the cooperation relationships, Hubei province industrial technology innovation strategic alliance overall cooperation is in a good condition, in the scores of cooperation relationships index, most of scientific research institutions gave the higher scores generally (4.750), enterprises gave the lower scores (3.902) than others.

## 5 Conclusions

From two aspects of the operation management and cooperation relationship, the operation evaluation system can deeply reveals industry technology innovation alliance. The former part is the evaluation function and effect of operation factors and the latter one is the measure of the relationship development situation between participating subjects. The evaluation result provides the beneficial reference for government in the alliance operation when they exercise their rights and responsibilities, make specific strategy or measures and analyze the situations.

Through establishing the industrial technology innovation strategic alliance index system and the empirical research in Hubei province experimental alliance, we find out the current problems of them. Mainly focus on the government policy support is inadequate, financial support insufficiency, the alliance operation investment financing is difficult to occur, and lack of risk prevention mechanism and enterprise cooperation relations. For these reasons, alliance development need further guidance and implement of finance support, constructing a stable investment system and coordination support system and standard enter and exit mechanism of alliance enterprises. Promote great effect and development of industrial technology innovation strategy alliance.

**Abstract:** This paper follows upon a request for process oriented research that investigates incubation via an understanding of management practices and interactions. Going beyond other studies, this paper assesses affiliation with eight elements that underpin the commercialisation of tenant businesses, as recognized by Patton et al. The rationale behind this model is that intangible elements are the true contributors of value for tenants. By means of a multiple case study we conclude that, despite that the intended values are generally of importance, the articulation of the model is cumbersome and therefore not very useful to comprehend the incubation process. We divide their elements into three categories: 1) elements that respondents identify with, 2) elements that respondents do not identify with, and 3) elements that are cumbersome. To unpack the cumbersome elements we suggest alternative formulations, being an on-going tailor-made management advice and assistance and support with funding.

**Key words:** Incubation process; Unpacking incubation elements; Management practices

### 1 Introduction

Business Incubators (BIs) guide starting entrepreneurs through their development process and thereby constitute a strong instrument to promote innovation, entrepreneurship and economic growth<sup>[2, 11, 15, 21]</sup>. Because only few starting ventures make it through their early stages of development, the need to increase their population became a focus point for policy makers<sup>[6, 10, 21]</sup>, inducing a substantial increase in public and private spending on BIs<sup>[38, 41]</sup>. This led to a vast increase of the population of BIs, to an estimated worldwide population of 7.000 nowadays<sup>[34]</sup>.

BIs support new technology-based firms<sup>[3]</sup>, -denoted as tenants, for co-location often is prerequisite [6]-, that consist of entrepreneurial individuals or teams in the process of setting up their business<sup>[42]</sup>. Due to their technological backgrounds they often have limited experience of business and its context<sup>[37]</sup>. They lack the competencies and knowledge required to operate a business, such as knowledge about marketing, accounting, financial and human resources<sup>[10, 41, 47]</sup>. To overcome these liabilities, BI support services try to make tenants aware of their inexperience, facilitate their ability to acquire appropriate knowledge and help to integrate this knowledge into the business context<sup>[37]</sup>.

Rice<sup>[41]</sup> points to the importance of the relationship between the incubator manager and tenants and concludes that BI manager's skills in determining the timing and frequency of business support is crucial to the business development process<sup>[41, 52]</sup>. Each tenant is likely to require a different mix of support components, for individual needs will vary from tenant to tenant depending on the configuration of factors such as their experience base<sup>[22]</sup>. In dealing with these needs BI management helps, for instance via coaching<sup>[36]</sup> and co-productive management support<sup>[41]</sup>, to accelerate the learning curve, and thereby the development/innovation process<sup>[10]</sup>.

Altogether, this line of research is based upon the notion that intangible elements in the incubation process are the real contributions a BI makes<sup>[11, 21, 36]</sup>. It is therefore of concern that the extensive body of BI research up until now has focused upon the outcomes of the process, like income generated, jobs created and survival rates of tenants, rather than on these intangible elements<sup>[21, 33, 36]</sup>. On the basis of their 2004(b) review Hackett and Dilts<sup>[21]</sup> argue that there simply is too little evidence about BI managers' practices and how they contribute to tenant development<sup>[6, 21, 24, 36, 38, 41, 42]</sup>. Such an understanding is necessary to develop the capabilities of BI management, thereby raising quality and the industries' standards in management, policy and practice<sup>[23]</sup>. Hence, there is a need for process oriented research that investigates incubation via an understanding of management practices<sup>[6, 21, 23, 24, 36, 41, 42]</sup>.

Using this as a starting point, Patton et al.<sup>[36]</sup> tried to extend the literature on the contents of the incubation process, by searching for elements that underpin the commercialization of tenant businesses [36]. In doing so, emphasis was put on the relationships that form in the incubation process, for instance between the manager and tenants. Their results, based upon a single case study, constitute a model of eight elements that underpin the incubation process<sup>[36]</sup>. This model seems promising for it captures intangible elements that have not been distinguished as such before, like *developing commercialisation*

*skills in new business teams*. Nonetheless, some explanations of these elements remain unclear.

This paper contributes to the literature by means of a multiple case study and assesses whether the elements found by Patton et al. <sup>[36]</sup> are identifiable in other BIs. Besides testing the affiliation of BI managers and tenants with these elements, we also try to unpack the management practices that underlie these elements, for Patton et al.'s <sup>[36]</sup> descriptions remain a bit vague.

The paper is organized as follows: In section 2 the underlying theoretical constructs are clarified by means of a literature review. Section 3 describes the methodologies used to collect and analyse information. Section 4 presents the findings. Finally, section 5 presents the conclusion. Opportunities for future research are discussed within this section as well.

## 2 Literature Review

Although researchers have not reached consensus upon a single definition for BIs <sup>[6, 21]</sup>, commonalities can be found within the literature that give an insight into the concept and its content <sup>[40]</sup>. In the BI context incubating refers to a 'controlled' environment wherein tenants are nurtured/hatched <sup>[2, 38]</sup>. A BI is the producer of business assistance programs that are meant to create value and learning opportunities for tenants, within this 'controlled' environment <sup>[41]</sup>.

Scholars <sup>[6, 8, 10, 21, 25, 36, 41]</sup> recognize four components of assistance that generally are provided by BIs: 1) *infrastructural support*: available office space which can be rented under favourable conditions <sup>[6]</sup>; 2) *shared overhead resources* such as reception, parking space, availability of meeting rooms <sup>[10]</sup>; 3) Knowledge based *business support services*: such as coaching, training, attracting finance and business plan writing support <sup>[10]</sup>, and 4) *networking possibilities*: an internal network of likeminded tenants and an the BI's external network of professionals <sup>[25, 42]</sup>.

In their 2009 publication, Patton et al. <sup>[36]</sup> tried to extend the literature on the content of the incubation process, by searching for elements that underpin the successful commercialization of tenants' businesses <sup>[36]</sup>. This line of research originates in Campbell et al.'s 1985 publication <sup>[11]</sup>, which introduced a model containing four added values a BI offers to tenants. This model suggests that BIs deliver added value through the provision of intangible elements, such as *diagnosing and evaluating tenant needs* and *access to an expert network*, rather than through infrastructural support <sup>[11, 36]</sup>. Patton et al. <sup>[36]</sup> build on this line of research, by taking contributions into account that follow from relationships that form within a BI, as between BI managers and tenants; among tenants; and between tenants and the external network <sup>[36]</sup>.

The research they conducted was a single case study based on the high-tech BI of the University of Southampton, UK. Their findings resulted in a model of eight elements that underpin the commercialization of tenant businesses throughout the incubation process (Table 1) <sup>[36]</sup>. Because the explanations by Patton et al. are not always clear they will be elaborated considering additions by other researchers as well. The elements will be discussed subsequently.

**Table 1 Elements that Underpin the Incubation Process** <sup>[36]</sup>

1	A quality 'pipeline'
2	Picking winners
3	Monitoring and evaluating progress
4	Developing commercialisation skills in new business teams
5	Creating synergies within the internal support network
6	Building and maintaining an effective external support network
7	Access to appropriate funding streams
8	Managed exit

### 2.1 A quality 'pipeline'

Reasoning behind a quality 'pipeline' within a BI <sup>[36]</sup> is that a steady flow of new tenants has a positive effect on the goings of the BI. For it focuses the attention of current tenants on their own work, thereby pushing the pace of their commercialization agenda so that chances of finding technologies with clear market potential increase <sup>[36]</sup>.

Furthermore, a steady flow of new tenants also has a positive effect on the interest and enthusiasm of

the external network. The primary reason why the professionals in the external network are sharing their experience with the BI is their eagerness for promising and exciting business proposals<sup>[36,40]</sup>. A steady flow of such proposals will keep these professionals interested to be involved. In Patton et al.'s research participants acknowledged that the flow of new firms into the incubator was rather slow<sup>[36]</sup>.

## 2.2 Picking winners

Picking winners comprises the selection of high potential tenants only, whose ideas have a high potential for commercial application, growth or market success<sup>[2, 21, 36]</sup>. The selection of tenants and the associated entry criteria are an essential element in the incubation process<sup>[3, 10]</sup>. Literature on BI selection assumes that there are many potential tenants to choose from, creating the challenge of attracting a sufficient number of 'winning' applicants<sup>[3]</sup>. The reasoning behind the value of this element is that by selecting high-potentials, time and resources are devoted to the right initiatives, rather than to less promising business plans/entrepreneurs. Ideal candidates are likely to be judged on criteria such as technology focus, innovative products, high growth potential<sup>[3, 10]</sup>, characteristics of the tenant's market and his capabilities<sup>[2]</sup>.

## 2.3 Monitoring and evaluating progress

Monitoring and evaluating progress through real time feedback helps to contain downside risk for tenants, by preventing them from making costly and potentially terminal business mistakes<sup>[20]</sup>. This element is further highlighted by Hannon's statement that "*it is the managers ability to communicate, understand problems and resolve any tensions, and at the same time be a good listener and be able to give worthwhile advice, that will make the difference between a successful operation and one that is mediocre*"<sup>[11, 24, p.52]</sup>.

The relationship between the manager and tenant can be reinforced within the processes that monitor and evaluate performance/capabilities<sup>[36]</sup>. Rice<sup>[41]</sup> recognizes three strategies for this to take place: 1) reactive and episodic: the tenant requests counselling effort; 2) proactive and episodic: proactive management involvement on an episodic basis; and 3) continual and proactive: on-going review of developmental needs<sup>[41]</sup>. In Patton et al.'s study monitoring and evaluation was organized through informal interactions with the BI manager, and through formal business review panels<sup>[36]</sup>.

Hackett and Dilts<sup>[21]</sup> consider tenant drop-out during the incubation process to be a non-successful outcome of the process. However, if termination takes place in such a way that losses are minimized, it can also be seen as a useful strategy<sup>[36]</sup>. In the Southampton BI review panels are to weed out tenants that, according to them, are not in the position to achieve their goals<sup>[36]</sup>.

## 2.4 Developing commercialisation skills in new business teams

The following quote highlights the idea behind the next element: "*the problem of getting a bunch of very technical academics turned around and focused towards all the issues involved in starting a business isn't easy, they want to start one, but had no feeling of what starting one meant or was*"<sup>[36, p.627]</sup>. Due to their technological backgrounds tenants often have limited experience of business and its context<sup>[37]</sup>, so they lack competencies and knowledge required to operate a business<sup>[10, 41, 47]</sup>. Hence they might need help with matters such as marketing issues to be able to understand their future customers, or at what price customers would be willing to buy their products<sup>[42]</sup>. To overcome these liabilities BI support services try to make tenants aware of their inexperience, facilitate their ability to acquire appropriate knowledge and help to integrate such knowledge into the business context<sup>[37]</sup>. Hereby managers stimulate tenants to develop their commercialisation skills.

One difficulty within this element is that sometimes tenants fail to see the need for external assistance, and mistake support for interference<sup>[6, 36]</sup>. "*Allowing others to have influence and control over something I had created was difficult but the hardest part was realising how poor I was at the business side of things*"<sup>[36, p.629]</sup>. This quote shows that it can be hard for tenants to come to terms with sharing control<sup>[6]</sup>. Tenants might perceive too much formal intervention as interference, whereas too little involvement questions the value of the BI<sup>[36]</sup>. Managers should be aware of this, and be on their guard for losing balance.

## 2.5 Creating synergies within the internal support network

"*An important aspect of the value-added contributions of a BI is seen in its potential to foster cooperative interactions and synergies between the firms in-house*"<sup>[45, p.486]</sup>. Value is created because tenants, from similar industries and facing similar problems, learn from each other's experiences. Co-location enables this transfer of information, knowledge and experiences among tenants, as well as with the BI manager<sup>[25, 36, 42]</sup>. One task of the management lies in the recognition and deliberate encouragement of possible synergies among them, enabling shared learning<sup>[11, 42]</sup>.

Remarkably, Patton et al. [36] found that, while meeting with like-minded individuals was given as

a main reason for joining a BI in advance, after admission tenants do not endorse the value of internal networking<sup>[36]</sup>. Argumentations such as protecting intellectual property and restrictions in time/opportunities were mentioned to cause this shift in tenants' attitudes. However, the statements made by an external support professional that *'tenants do talk with each other'* and just *'one collaboration could be the catalyst'* indicated that the internal network was still perceived to be of (some) importance<sup>[36]</sup>.

## 2.6 Building and maintaining an effective external support network

Tenants are often in a disadvantageous position when it comes to acquiring resources, because they suffer from a phenomenon which is called 'liability of newness'<sup>[21, 45]</sup>. New ventures lack a track record, therefore they are less trustworthy and have more difficulties with attracting funds/resources<sup>[21, 25]</sup>. Tenants benefit from being associated with the BI<sup>[48]</sup>, and via networking<sup>[10]</sup>, as they experience legitimacy in the marketplace<sup>[10]</sup>. Thereby developing their credibility<sup>[21, 45, 48]</sup>, which in turn has a positive impact on their chances for survival<sup>[10]</sup>.

External BI networks include organisations such as universities, industry contacts and professional service providers like lawyers, accountants, consultants, marketing specialists, etc.<sup>[21]</sup>. Knowledge acquired via this network is of a known/proven value<sup>[25]</sup>, enabling a shortened learning curve<sup>[21]</sup>, at little cost of uncertainty<sup>[26]</sup>. Examples of such knowledge are information on competitors or potential customers<sup>[37]</sup>.

Via external networks, managers can make contributions to technological developments, by brokering between tenants and experts<sup>[41]</sup>. These are contributions that BI managers often cannot make themselves, because they lack a detailed understanding of tenants' technologies<sup>[24]</sup>. *"Therefore, developing and managing a networking infrastructure is a critical function of the BI"*<sup>[41, p.176]</sup>. As external networks enlarge the tenants' opportunities to learn, exploit knowledge, and to obtain access to resources<sup>[25, 42]</sup> and know-how<sup>[5]</sup>. In order for tenants to benefit from the network BI management has to fulfil an essential bridging function between tenants and experts<sup>[8, 24, 48]</sup>.

## 2.7 Access to appropriate funding streams

Attaining an appropriate level of investment is challenging for tenants, because substantial investments are usually required prior to revenue generation<sup>[32]</sup>. Campbell et al.<sup>[11]</sup> stressed the importance of venture capital for BI tenants. A lack of financial resources is one of the main barriers for high-tech SMEs<sup>[10]</sup>. BIs can support both by making tenants investment-ready<sup>[36]</sup>, and by providing contact with early stage investors such as business angels or venture capitalists<sup>[10, 21]</sup>. Next to funding, venture capital investors also play a role in professionalizing tenants, by supervising tenant activities to ensure their own investments<sup>[10]</sup>.

## 2.8 Managed exit

The idea behind a managed exit is to prepare tenants for an independent, self-sustained future<sup>[25, 36]</sup>. After their stay they will continue their operations, and will have to count on their own capabilities. The moment of exit from the BI should be prepared for in order to prevent uncertainty<sup>[36]</sup>. The director in Patton et al.'s research indicated that uncertainty could be reduced by interacting with graduated BI tenants. But there are other ways in which managers can prepare tenants for graduation, for instance help in searching for new residence.

Bruneel et al.<sup>[10]</sup> stress the importance of a timely graduation to guarantee an adequate turnover of tenants. A frequent policy to stimulate tenant graduation is an incremental increase of the rent<sup>[10]</sup>.

Now that Patton et al.'s elements that underpin the commercialization of tenant businesses are familiarized, the following section will explain the methodology as to how these elements are assessed in this research.

## 3 Methodology

*"Case study is a research strategy in which the researcher tries to gain a profound and full insight into one or several objects or processes that are confined in time and space"*<sup>[51, p.178]</sup>. In this research a multiple case study has been performed in which each case has been treated as an independent experiment<sup>[54]</sup>. Following the typology of Thomas<sup>[49]</sup>, the type of case study that describes this research is one in which *key cases* are the subject(s) of the research. The subject(s), meaning the institutions selected to provide information, are BIs. The 'key-ness' of a case manifests itself in its capacity to exemplify the object of inquiry<sup>[49]</sup>, so the BIs in the sample are key cases because they provide examples of what is of importance throughout the incubation process. The related research object, the frame of analysis within which the case is viewed [49], is therefore formulated as *the valuable elements*

that are of importance throughout the incubation process.

The research tries to increase the understanding of a broader issue, rather than focusing on a particular situation, therefore the purpose of this case study is *instrumental*. A second purpose of the research is to be *evaluative*. This type of case study is used to describe an intervention or phenomenon and the real-life context in which it occurred<sup>[4, 54]</sup>.

The next component in Thomas' <sup>[49]</sup> typology relates to the approach of the study. Firstly, this approach is *testing a theory*. This research tries to assess whether the elements in the Patton et al. model<sup>[36]</sup> are of importance in the assessed BIs. The second approach of this research is to *build a theory*, or rather to contribute to the development of theory, in order to unpack components of the incubation process and enhance understanding.

The last component of Thomas' <sup>[49]</sup> typology, process, is configured as a *multiple case study*. Since the cases are being studied concurrently, the process is a *parallel* case study. The process-wise procedure enables parallel collecting of information.

### 3.1 Data collection methods

Information was collected through semi-structured interviews, in which a list of questions (see Appendix) was combined with the flexibility to ask additional questions. Interviews took place in two rounds. The first round targeted questions in general, in the second round we added a focus on specific issues. After the interview, if permission was granted, a survey was sent to tenants. This was done to triangulate the information collected in the interviews.

The interview questions allowed for different response options, such as percentages, numbers or multiple choice answers. Some questions were using Likert scales from 1 to 7, where 1 is strongly disagree with the statement and 7 is strongly agree with the statement. In order for the interviewees to express their views in their own words the respondents could at any time during the interview elaborate upon the topic as they pleased. Besides closed questions there were also a few open-ended questions asked.

The choice for a majority of closed-ended question was made for several reasons, one being that this would ease the repetitiveness of the interview, as well as the comparability of the information that was gathered. Another reason for using closed-ended questions was that addressing all the issues as open questions would be very time consuming.

In order for the interview questions to 'fit' to BI jargon and context, suitable interview questions were sourced from a study performed by the CSES<sup>[12]</sup>. This study was commissioned by the European Commission, aiming to benchmark European BIs. Remarkably none of their respondents was Dutch. Measures for Likert scale questions were mostly sourced from a study by Hughes et al.<sup>[26]</sup>, and were revised to account for context where needed.

Before respondents were approached, a pre-test interview was conducted with a BI director. After this pre-test three questions were deleted and a few minor revisions were made in the formulation of other questions.

### 3.2 Interview protocol and analysis

In the initial protocol interviews were conducted face-to-face at the respondent's worksite. At the start the respondents were given a copy of interview questions so that multiple-choice and Likert-scale questions did not bother the pace of the interview.

Multiple potential respondents expressed a strong preference for the interview to take place per telephone, as for time limitations combined with an expressed "*quantum of research requests*", therefore the decision to deviate from the initial protocol was made. In the second protocol interviews would take place per telephone. For convenience the Likert-scale and some multiple-choice questions were sent and returned by email afterwards. Out of the final set of respondents (Table 2) twelve interviews followed the original protocol, the three remaining interviews were conducted by telephone. One respondent provided information by email solely. The interviews lasted between 45 and 65 minutes. All respondents agreed to be audio-taped. These tapes were used for transcription to enable detailed analysis. The language of the interviews was either Dutch or English, depending on the interviewer.

The final question of the interview asked for permission to approach tenants. If permission was granted the survey was sent to these tenants, either via the BI manager or directly. A total of 48 tenants filled out the survey.

To start the analysis the transcribed interviews were encoded with SPSS. Averages and standard deviations were calculated where appropriate. The answers to the open ended questions as well as the data in the SPSS file were analysed in a qualitative manner. Interpretation of the answers, combined with an interpretation of the documents that were provided by the respondents, provided more in-depth

information. In the end these findings were verified by the answers given in the survey.

### 3.3 Selection of cases

BI managers were interviewed to collect information. These managers were selected on the basis of the characteristics of their BI, rather than on the characteristics of individuals. A prerequisite for the BIs was that their tenants are operating in knowledge intensive industries, such as life sciences, space technology, energy and bio-industries. Table 2 shows the list of BIs that were consulted, divided into the varying BI types as recognized by CSES <sup>[12]</sup>. These types are distinguished to account for variety in the BI population. For practical reasons all respondents are Dutch.

**Table 2 List of Cases**

### 3.4 Validity and reliability concerns

Case studies enable a researcher to study phenomena in a real-life setting, where boundaries between context and phenomena tend to be blurred <sup>[47]</sup>. The natural science model is the most common model to ensure the rigor of case study research <sup>[16]</sup>, as to overcome these blurred boundaries. It divides these boundaries in four criteria: construct validity, internal validity, external validity, and reliability <sup>[16, 54]</sup>.

Construct validity deals with establishing correct operational measures for the concepts being studied <sup>[54]</sup>. In the case of this research it was met by the operationalization of the theoretical concepts, which had partly been performed by CSES <sup>[12]</sup>. Using questions that had been formulated and used for this benchmark study increased the credibility of the research. The same holds for the Likert scale questions, since the formulation of these statements had been developed by Hughes et al. <sup>[26]</sup>. A pre-test interview also strengthened the construct validity.

Another positive contributor to the construct validity is the triangulation of sources. The use of interviews and a survey to collect information enabled us to look at the cases from multiple angles. The fact that not all interviews were conducted following the same protocol has a negative influence on the construct validity of this research.

Internal validity deals with establishing a causal relationship, whereby certain conditions are shown to lead to other conditions, as distinguished from spurious relationships <sup>[54]</sup>. Methods to increase the internal validity of a research are pattern matching, explanation building, and addressing rival explanations or using logic models. Since the interview respondents did not belong to the same BI, different viewpoints on the topics of interest have been expressed. Rival explanations will be discussed in Section 4.

External validity deals with establishing the domain to which a study's findings can be generalized <sup>[54]</sup>. Due to the scope of the research and time constraints the results are based on sixteen interviews, only one interview per BI. Besides that BIs are context specific institutions <sup>[25]</sup>. Therefore the generalizability of the findings of this research does not allow for a statistical generalization <sup>[49]</sup>. Analytical generalization denotes a process that refers to the generalization from empirical observations to theory, rather than a population <sup>[16, 54]</sup>.

Reliability deals with demonstrating that the operations of a study, such as the data collection procedures, can be repeated and then lead to the same results <sup>[54]</sup>. Reliability can be improved by using case study protocol and developing a case study database. For the purpose of this research a case study protocol was developed, but due to respondent preferences we had to deviate from the protocol. This has a negative influence on the reliability. Taping the interviews, using a standardized list of interview questions and converting this response into a transparent encoding enables an easy replication of the research. This is a positive contributor to the reliability of the research.

Now that the methodologies used to collect and analyse information are described, the following section will present the findings of this paper.

#### 4 Findings

Table 3 displays key performance statistics from the CSES benchmark study <sup>[12]</sup>. When comparing their averages and suggested benchmarks with the findings of this research, it shows that the respondents in this study are in accordance with these statistics. Although the number of management staff is relatively high, the sample is deemed to be illustrative for the BI industry on the basis of these scores.

**Table 3 BI Benchmarks and Averages**

	Average from CSES	Benchmark	Average from Sample
Incubator Space	3000 m <sup>2</sup>	2000-4000 m <sup>2</sup>	4735 m <sup>2</sup>
# BI Tenants	27	20-30	25.8
Occupancy Rate	85%	85%	87.6%
Length of Tenancy	35 months	3 years	2.9 years*
# Management Staff	2.3	2	3.4
Ratio BI Staff : Tenants	1:14	1:10-1:20	1:12
Percentage of managers' time advising tenants	39%	50%	38.7%
For-Profit : Non-Profit BIs	2:8	x	3:8

\*One outlier case was excluded here, for some specialist BIs have longer product development lead times <sup>[12]</sup>.

When examining these benchmarks it shows that four out of the five largest BIs in the sample are operating for-profit. So it seems that for-profit BIs have more acreage. This might also influence the slightly higher average BI space in the sample, in comparison to the benchmark.

It is noteworthy that this was the only clear difference between for-profit and non-profit BIs. There were no differences to be found between the BI's objectives, years in business, BI type nor services provided between non- and for-profit BIs.

The most common BI objective is *to contribute to competitiveness and local job creation* <sup>[12]</sup>, respondents in this sample also gave this as an answer. The second most important objective is *to help universities/R&D centres commercialise know-how*, the choice for this is larger in the sample than in the CSES report. Only one respondent mentioned *profit* as an objective, as another one explains: *“I would love to merit tons of money, but reality is different. Incubators will not make profits themselves. We do offer value, by selling knowledge and contributing to the developments of the region, and at the end there are some cents for us left, but no large profits.”*

Besides enabling for checking the information gathered in the BI manager interviews, the survey also enables a ranking of the services that are deemed important by tenants. A list of thirteen services that might be provided by BIs was proposed to tenants (Table 4). When looking at their response, access to a network is valued most, with an average score of 5.5 (where 1=*not important* and 7=*very important*). The second and third most valued services both comprise access to financial resources.

**Table 4 Tenants' service preferences**

Service	Tenant Ranking	Average Tenant Preferences	Percentage of BIs Offering the Service [2]
Networking, e.g. with other entrepreneurs, potential customers	1	5.5	88%
Help with raising bank finance, grants, seed and venture capital	2	4.5	79%
Incubator seed/venture capital fund, business angel network	3	4.4	48%
Mentors, board members and other senior advisers	4	4.3	x
Accounting, legal and other related services	5	4.2	51%
Support business planning and forming a company	5	4.2	86%
Pre-incubation services	6	3.6	68%
Advice on development of new products and services	7	3.5	61%
Market research, sales and marketing	8	3.3	53%
Training to develop business skills	9	2.6	x
Help with exporting and/or partner search abroad	9	2.6	52%
Advice on recruitment of staff and personnel management	10	2.4	39%
Help with e-business and other aspects of ICT	11	2.2	54%

The last column of Table 4 indicates the percentage of BIs that offer this service to tenants, these results were generated by Aerts et al. in a European study surveying 140 BIs <sup>[2]</sup>. This shows that the most valued BI services are indeed provided by the majority of BIs.

In our own sample BIs indicated to be able to provide nearly all of these services, either in-house or via the network, if there was a perceived need to do so. The least offered service in our sample was *giving advice on recruitment of staff and personnel management*, which was still offered by a majority of BIs.

Now the general findings are presented the following sections will present the findings considering the perceived importance of the elements that, according to Patton et al. <sup>[36]</sup>, underpin the incubation process. Herein we reclassify these elements into three categories: 1) elements that respondents identify with, 2) elements that respondents do not identify with, and 3) elements that are cumbersome.

#### 4.1 A quality 'pipeline'

Considering the first element, a quality pipeline, seven of the BI managers indicated that they are content with the current flow of tenants, flow being the entire stream of tenants in the incubation process (inflow, throughput, outflow). One manager explains that *"if I want to help more companies, that costs more. We need some financial stability and therefore we don't want the flow to be too fast."* Four managers indicated that their flow could go faster, one of which said that time was the limiting factor to actually make this work. Overall it seems that having a stable flow is the target, for this enables BI sustainability, but an added value for tenants could be exhibited from this element.

Tenants did not experience a fast flow of tenants coming nor leaving the BI. On top of that they are rather negative towards increasing the flow of new tenants, for they reasoned that the outflow of tenants should depend on the tenants themselves. According to them there is no need for the BI manager to intervene by hurrying/slowing down a tenants' developmental processes for the sake of the BI. On the basis of the above we assign a quality pipeline to the group of cumbersome elements.

#### 4.2 Picking winners

Picking winners requires selection procedures to find tenants with the highest potential [36]. Selection procedures vary per BI. Some BIs solely have intake meetings, mostly between the potential tenant and the director. In other BIs selection is more comprehensive: in five BIs, potential tenants have to present their business plan to a selection committee consisting of representatives from finance, knowledge institutions, large companies, entrepreneurs and innovation experts. In one BI this committees' judgement is decisive, so the manager does not have a say in tenant admission. When external organizations are involved in the selection procedure more selection criteria are considered. However, the BIs that have external organizations in the selection committee have an average admission-percentage of 43%. This is not so different from the total samples' admission-percentage of 43.8%. Thus external selection committees are not necessarily more rigorous.

It varies per BI which criteria are of importance throughout the selection procedure. The criterion that is considered of importance by most BIs is that the *business must have an innovative project*. For specialised BIs it comes as no surprise that tenants should *operate within the BIs' domain*. *Finance must be in place* is not an important selection criterion.

In relation to *picking winners* one of the BI managers made the remark that *"if it were possible to select the best business plans then this BI would no longer need to exist. For the potential of a business plan is always connected to timing and the current economic situation, it is therefore impossible to make a definite judgement to decide which business plan is the best one"*. One contradicting remark is that it is necessary to properly assess tenants before allowing them entrance, for the BI is sponsored with public money. *"This comes with the responsibility to make autonomous and sensible decisions."*

In general, the BIs in this research do practise selection procedures to judge tenants before admission, but they are not judged on being a *winner*. Expressions as *"can the tenant be a showcase for the incubator"* and *"we assess whether these individuals have what it takes to be an entrepreneur"* indicate that potential tenants are selected on the basis of their fit to the BI and their abilities. Potential is certainly considered hereto, but more as to indicate possibilities, rather than to select the 'most successful' entrepreneurs. One manager acknowledged this by saying that *"an incubator gives you the idea to let the entrepreneurs with the highest potential come to us. We will offer them so much services and we will pamper them so much with help and money that they can only be successful. Such an attitude attracts a certain kind of entrepreneurs, one that I don't want here. I prefer the ones that come here and say: I can do this and I will, over the ones that come here to be pampered and want me tell them what to do."*

#### 4.3 Monitoring and evaluating progress

We found that monitoring and evaluating tenant progress is practised, and mostly takes place via informal meetings. The way of management to keep in touch with tenant proceedings mentioned by all respondents was *proactive and episodic*, which comes down to counselling by walking around<sup>[41]</sup>. Formal meetings are less frequent than informal ones, and do not take place in some BIs. Formal meetings take up different forms, such as half-yearly progress reports or interviews, but none of the BIs use review panels involving external parties. So, in contrast to the selection procedure, no external parties are mentioned to consult failure in the incubation process.

Respondents indicated that it is hard to put a time frame to the occurrence of informal and formal meetings, because it varies throughout the incubation process. New tenants need more guidance than tenants that have been working in the BI for two years, so the amount of meetings decreases over time. This confirms a customized way of organizing support.

When asking for the most important management function, the majority of BI managers choose *providing advice and assistance to tenant companies* as meaningful. On average they spend 40.6 % of their time to this task.

Along with this some BI managers participate in setting a clear business agenda for tenants. In a few cases such business plans may include a time schedule as to when specific objectives will have to be accomplished. Independently from involvement in planning, managers indicate that if tenants do not manage to achieve their goals (in time), the majority of BIs will come to a point where the co-operation is ended. Closely connected to this is that a large majority of the managers considers failure of a tenant to be a *part of the process*, rather than a negative event.

#### **4.4 Developing commercialisation skills in new business teams**

The managements' view on the next element, developing commercialization skills in new business teams, is that the managers' role is of mediocre importance. Theoretical reasoning behind this element is that tenants, being technical experts, have limited experience of business and its context<sup>[41, 47]</sup>. BI managers could make contributions here by training/coaching tenants in the process of getting to the market<sup>[10]</sup>. In reaction one BI manager highlights the notion that he is not a teacher, "*I do not have the skills to really teach skills, but I can point to where they should look for, and arrange meetings with professionals.*"

Tenant response on this element varies from "*I can always spar with the manager about new ideas*" up to "*the management is not involved in this, and doesn't need to be.*" This also indicates a customized way of organizing support.

Based on these findings we question the extra value of the element 'developing commercialisation skills in new business teams'. It does make sense that some tenants have limited experience of business and its' context<sup>[37]</sup>, but in that sense support in developing commercialisation skills can be just as valuable for one as support with business planning or personnel recruitment for another. It totally depends upon the particular tenant, his capabilities and needs. Therefore the real value of this element lays in a customization of support, something that follows upon monitoring and evaluating a tenants' needs (over time).

Therefore, from a theoretical notion, it is suggested that Patton et al.'s elements *monitoring and evaluating progress* and *developing commercialisation skills in new business teams* should not be treated as separate elements. Instead, to capture these elements together we suggest that *on-going tailor-made management advice and assistance*, provided that, in order to be able to give tailor-made advice an on-going monitoring and evaluation of progress is required, is a better representation for the intended value of the relationship with the BI manager.

To not lose track of the notions such as that tenants might need support in developing commercialization skills, a checklist can be developed consisting of needs that are of frequent occurrence. For example, one of the interviewed BIs indicated that tenants had to participate in an entrepreneurial assessment in order for the BI manager to estimate their capabilities. Standardizing (and formalizing) such practices can improve and ease the managements' job in tailoring advice and assistance.

#### **4.5 Creating synergies within the internal support network**

The next element, creating synergies within the internal support network, is confirmed to be of importance by all BI managers. Table 5 displays the average management scores for the given statements, where 1=strongly disagree and 7=strongly agree. Table 4, at the beginning of this chapter, already showed that networking in general (both internal and external) is highly valued BI tenants. This contradicts the work of Patton et al. for their tenants were not so positive about internal networking.

It shows that the internal network is frequently used for the exchange of information and experiences,

so tenants do experience shared learning. BI managers also encourage tenants to participate in this kind of networking and to share their own experiences. This endorses the importance of creating synergies within the internal support network.

**Table 5 BI manager networking views and practices**

List of Statements	Average	Standard Deviation
1. Exchange of information and experiences takes place frequently and informally among members of the incubator	6.13	0.99
2. Our tenants experience shared learning with some of the other businesses in the incubator	5.13	1.25
3. I encourage tenants to learn from and share experiences with each other	6.13	0.64
4. Our tenants learn a great deal from the members of the businesses external network	5.63	1.06
5. I encourage tenants to learn from external individuals/organizations	5.75	0.89
6. If a tenant experiences a problem that I cannot help to solve, I mostly bring him in contact with a professional within the network	6.36	0.52
7. If a tenant experiences a problem that I cannot help to solve, I mostly tell him to discover a solution by himself	2.75	1.58
8. Tenants tend to hang on too much to the incubator's network	2.75	1.49

#### 4.6 Building and maintaining an effective external support network

Managers can make contributions to technological developments via external networks, by brokering between tenants and experts<sup>[41]</sup>. BI managers stated that tenants do learn a great deal from the external network, and BI managers encourage acquiring knowledge via this route (see Table 4). When it comes to problem solving tenants are connected to the external network rather than that they are pushed to find a solution for themselves, as one manager stated: *“why on earth would you make them reinvent the wheel themselves?”*

#### 4.7 Access to appropriate funding streams

All BIs indicate to be in contact with multiple organizations, such as business angels, venture capitalists and local institutions, in order to attract finance for tenant investments. Also informal investors are mentioned, *“they are former businessmen that invest amounts between the 100,000 and 600,000 euros. We also have some contacts with larger players, and they say to be interested, but when it comes down to it they back off because they find the projects too small.”* Only one BI in the sample actually takes a share in tenants itself. The survey indicated that access to funding streams and help with making the tenants investment-ready is highly valued by tenants.

Despite the fact that this element is perceived to be valuable, we categorize it in the group of cumbersome elements. This is because actual access to appropriate funding streams takes place via the BIs network, so boundaries between these two elements are blurred, and therefore cumbersome and cluttered. To better capture the value underlying this element we suggest the simple formulation of *support with funding*.

#### 4.8 Managed exit

According to Patton et al. the moment of leaving the BI should be prepared for in order to prevent uncertainty<sup>[36]</sup>. The somewhat hesitant response by the BI managers indicated there was no real concern for this element. Most of the BI managers do not know for how long a tenant will remain in the BI. Only four BIs work with a fixed time of stay for tenants, but indicate to be flexible when tenants have reached these time slots. So the managers find renting for a fixed period of time to be a non-important exit criterion. The only exit criterion that is recognized as influential for leaving the BI is a need for extra (office) space. The majority of managers indicate not to help tenants prepare for leaving the BI.

It also varies per BI what a tenant should have accomplished before being ready for graduation, in most cases this is not strictly specified. The common tendency is that tenants should be able to make the next step as to sustain business, so their business should be viable. But it differs per tenant how this is determined/evaluated. Some achievements that are mentioned as requirements for a tenant to be ready for graduation are for a tenant to have its first customers, or that he made sure his technology is patented.

Now that our findings have been presented and interpreted the following section of the paper will conclude upon our research. Opportunities for future research will be elaborated upon at the end of this section as well.

## 5 Conclusion

Following a request for research that investigates incubation via an understanding of management practices and networking interactions<sup>[21]</sup>, we extend prior research that holds intangible elements to be the foremost contributors to the incubation process<sup>[11, 21, 36]</sup>. As a starting-point for this research we evaluate the model of Patton et al.<sup>[36]</sup>, which consists of eight elements that underpin successful commercialisation of tenant businesses in the incubation process. We complemented these elements by means of a literature review, and then assessed affiliation with these elements by means of a multiple case study, interviewing BI managers and surveying tenants.

The use of the qualitative approach has provided an in-depth understanding of the important elements of the incubation process. Notwithstanding the recognition of- and appreciation for most of the values covered by the elements of the Patton et al. model, we conclude that the model is cumbersome and therefore not very useful to comprehend the incubation process. Based upon our analysis we divide these elements in three categories; 1) elements that respondents affiliate with, 2) elements that respondents do not affiliate with, and 3) elements that are cumbersome.

The elements *creating synergies within the internal support network* and *building and maintaining an effective external support network* are well supported in this research. Managers as well as tenants consider networking, internally and with external parties, to be an important activity for transferring knowledge and experiences into tenant businesses. These networking activities are both facilitated and encouraged by BI management.

The managers in our sample did not really affiliate with *picking winners*. Selection of tenants does take place by means of varying selection procedures, the most comprehensive ones involving external selection committees. But these selection procedures are to select tenants that are a good match to the BI, rather than the ones with the highest potential for business success. One practice worth mentioning is a test that assesses whether the potential tenant has got what it takes to become an entrepreneur.

Another element that was BI managers did not affiliate with is *a managed exit*. This element is not much of concern for the BIs in the sample. Only four BIs work with a fixed time of stay for tenants, but indicated to be flexible when tenants have reached these time slots. It also varies per BI what a tenant should have accomplished before being ready for graduation, and yet still it differs per tenant how this is determined, and some BIs do not even identify with the graduation as such.

The first element that we classify to the third group is *a quality 'pipeline'*, which mainly serves to ensure the sustainability of the BI itself, rather than contributing to the tenants' business. To be fair, the external network was not assessed in this research, so the argument that a steady flow of new proposals will keep these professionals interested and involved might hold. But we do believe that this element is just a cumbersome way of addressing the need for a sufficient occupancy-rate.

*Monitoring and evaluating progress* is appreciated by the managers in the sample. Informal meetings take place regularly, but formal external review panels as Patton et al. describe are not consulted, not even in situations in which a tenant terminates its business. BI managers evaluate such tenant failure as part of the process.

However, monitoring an evaluating does not clearly distinguish itself from *developing commercialisation skills in new business teams*. Both elements are based on the view that BI managers contribute through interactions with tenants, relying on a customized way of offering this support. Therefore we propose to reformulate these two elements into the following one: *on-going tailor-made management advice and assistance*, on the condition that on-going monitoring and evaluation of progress is necessary in order to be able to give tailor-made advice and assistance.

Also *access to appropriate funding streams* is recognized as a cumbersome element. Supporting access to investors is highly valued by all parties involved, but in this formulation it does not clearly distinguish itself from networking. To better capture the value underlying this element we suggest the simple formulation of *support with funding*.

An interesting notion for future research is to develop a checklist of tenant needs that are of frequent occurrence, like the need to develop their commercialization skills. Constructing such a checklist, along with the tests that are to check for such needs, can standardize and thereby unpack some of the learning tendencies throughout the incubation process. It would also be interesting for future research to examine whether dependence on a network, as to acquire knowledge and experiences, might harm the entrepreneurial orientation of tenants. Ambidexterity might be of concern, because tenants develop via experimenting (to establish innovation) but at the same time gather existing knowledge from professionals. The direct returns from the exploitation of existing knowledge are higher, putting the long-term gains out of explorative/entrepreneurial activities at stake.

**Abstract:** The purpose of this paper is to explore the increasingly important economic and business relationship between the People's Republic of China and the countries of Africa. My focus is on how this partnership manifests itself in investments. The research questions are: first, how has the relationship changed over time and second, from an African perspective has this relationship been beneficial? Finally, how has the recent economic downturn affected their partnership? My investigation shows that Chinese investment has been motivated by a desire to access critical resources (oil, bauxite, etc.). Regarding the recent year's trend of international business, process and outcomes of globalization, such as economic, social, cultural, environmental and political has great impact for enterprises or countries to grown internationally. Although the research shows that growth in developed countries is expected to continue to be lower than many developing countries like China and African countries. Reason why strengthening international cooperation or cooperation multi bilateral and partnership between companies of developing countries has a significant importance for the internalization of their activities.

**Key words:** Statistics on the Chinese Presence in Africa; Opportunities and Exploration on Development Right; Challenges and Implications

### 1 Introduction

Since opening up to foreign trade and investment in 1979, China has emerged as a major economic and trade power. China's rapid economic growth has sharply improved Chinese living standards and helped raise hundreds of millions of people out of extreme poverty. China's recent push into Africa is driven by a need to find oil and industrial raw materials to feed its resource-guzzling and the world's fastest growing economy, the second largest economy in the world. China's economy has grown by an average of 9 per cent per annum in the last 25 years and its energy consumption has doubled and outstripped domestic energy production.

Actually, there are three aspects to China's strategies in Africa. First aspect, from 1850 to 1950 related to colonial labor demand called "coolie trade." Coolie trade focused mainly on plantation, mining, and railway construction. At the same time Chinese officials mostly use public diplomacy, including high-powered official visits and a triennial Forum on China-Africa Co-operation (FOCAC), to court and cultivate African elites. Within the last decade, President Hu Jintao has visited 17 African countries. Premier Wen Jiabao and senior officials of the Politburo have also undertaken the safari trip to Africa. Through these deepening engagements, China seeks to build solidarity with African governments and to present itself as a reliable interlocutor between developing countries and the developed West. Secondly from 1960 to 1980 subsequent cold war, Chinese authority pledges large amounts of aid and investments by challenging superpower in order so cement south-south relation, with no political strings attached, except withdrawal of diplomatic relations with Taiwan. The third, China's "going global" strategy, involves the use of aid donations to encourage Chinese companies to internationalize and acquire overseas assets, especially oil assets, it involved co-operation on investment, financial operations, debt relief and cancellation, agricultural, natural resources and energy, infrastructures, education, and multilateral matters.

Nowadays, major Chinese companies have hit roadblocks in well established markets, but Africa's markets are untapped and strategically open. Africa has therefore become a strategic training ground for Chinese companies, through public diplomacy, benign trade terms and large aid and investments deals with no political strings attached except China has gained considerable access to Africa's resources and consumer markets. China now receives 32 per cent of its oil imports from Africa, with Angola overtaking Saudi Arabia as the largest exporter of crude oil to China and major importation of bauxite from Guinea. Although, there is great and plenty optimism about the potential benefits of the new China-Africa co-operation, skepticism also abounds among local groups and the international community.

Most African government officials, embittered by unfavorable aid conditions imposed by the cartel of the Paris Club and the international financial institutions, see China as a reliable, no imperial alternative player that offers and inspires alternative routes to development. They are gratified that their ailing economies are being bolstered by high Chinese demand for their resource exports and by large investments in infrastructure and other critical sectors long neglected by Western donors.

For traditional donors, it is time to engage China as a major player in designing the rules of global economic governance and to review aid conditions to identify what does and does not work for African development in order to continue to remain influential and credible in Africa. As a result: Africa's growth has become increasingly linked to China's. There is a 92% statistical correlation between growth in sub-Saharan Africa and China. In the last few years China is the largest investor in and lender to Africa, as well as the continent's largest trading partner. "Africa's growth is underpinned by China's demand for commodities," says Martyn Davies, CEO of Frontier Advisory and director of the China-Africa Network at the Gordon Institute of Business Science. "This has pulled Africa out of the crisis and poverty. Over the next 10- 15 years, this interdependence will grow." However, there has been intense debate about whether China has been good or bad for Africa. As view, is that Chinese investment is positive for the capital-starved African continent and the growth benefits are starting to trickle down to consumers. The question is How firms ,countries or even continent position themselves and the extent to which they are able to make the most of the growth opportunities will determine who will really grow in the next decade and who will confine themselves to the much smaller market?

## 2 Literature Review

### 2.1 Phases of Engagement

Historical evidence shows that there have been economic and political relationships between China and Africa as far back as 500 years ago and has developed prosperous business partnership. Developing the friendly cooperation with Africa, China has always upheld the principles of "sincerity and friendship, equality and mutual benefit, unity and cooperation, and common development", respecting the sovereignty and will of African countries, and promoting all-dimensional cooperation.

Regarding to that, China and Africa have enjoyed a long-standing friendship. Since the founding of the People's Republic of China, China-Africa relations have developed continuously, as evidenced by a deepening cooperation in political, economic and cultural areas and by the creation of a new type of strategic partnership based on political equality and mutual trust, economic win-win cooperation and cultural exchanges. Over the past 60 years relationship with African countries, China has adhered to the principles that stress sincerity, equality and mutual benefit, solidarity and cooperation development. It has demonstrated respect for the will and choices of African countries, actively encouraged cooperation between Chinese and African businesses, and shown its sincerity in aiding African development. Trade and economic cooperation has achieved remarkable results, having grown in size, scope and areas of cooperation and having yielded benefits to the peoples of both China and Africa. However, this relationship stands as a fine example of south-south cooperation. While China is the largest developing country, Africa is the continent with greatest number of developing countries. China-Africa trade and economic cooperation has not only played a significant role in promoting their respective progress, but has also helped to win the attention and support of the international community to Africa's development. Currently, China is one of Africa's most important trade and economic partners. As the first systematic record of the past and present of China-Africa trade and economic relations, this article aims to promote understanding of this relationship both among the Chinese and Africans and within the international community, and advocate the principle of equality, mutual trust and common development which China has always adhered to in its cooperation with Africa. The report also strives to encourage people from all walks of life who are concerned about African development to increase support to Africa, as the continent pursues sustainable economic and social development.

Between 1978 and 1999, the complementarities between China and Africa came into full play, thus deepening trade and economic relations between the two sides. Together with the rapid growth of bilateral trade, Chinese companies began to contract to engineering projects in Africa, provide Africa with skilled labor, and establish equity and cooperative joint ventures on the continent. At the same time, African businesses started to invest in China. Entering into the twenty-first century, China and Africa expressed their mutual desire to further strengthen their consultations and cooperation. They created the Forum on China-Africa cooperation (FOCAC) and held the first Ministerial Conference under the FOCAC framework in Beijing in October 2000. Under the framework of FOCAC, the Chinese government introduced a host of important measures to facilitate cooperation with Africa, including the eight measures

announced at the Beijing summit. These measures cover a broad spectrum of areas, such as debt relief and zero-tariff treatment, further development assistance, investment promotion, concessional loans, medical care and public health, science and technology, and human resources.

### **2.3 Motives**

In view of the above aid strategy, one may suggest the main motive for Chinese relationship is to gain access to the abundant raw materials that Africa offers. Although this may be a good reason, Alden (2005) states that China's insistence on recognition of its "one China" policy by Africans as another important requirement. Alden (2005) also lists four factors that have shaped China's contemporary African policy: China's need for energy security; new market and investment opportunity; symbolic diplomacy and development; and forging strategic partnerships. According to researcher, the main drivers of the China Africa cooperation are defined by recent statement by Chinese government on two issues. One is on cooperation, "China will continue to strengthen solidarity and cooperation with African countries in the international arena, conduct regular exchange of views, coordinate positions on major international and regional issues and stand for mutual support on major issues concerning state sovereignty, territorial integrity...." The other one is the fact that "The one-China principle is the political foundation for the establishment and development of China's relations with African countries and regional organizations."

From 2000 to 2009, trade and economic cooperation between China and Africa grew rapidly. Yearly statistics show that bilateral trade raise from 10.6 billion USD to 91.07 billion USD. While China's investment in Africa increased from 220 million USD to 1.44 billion USD, Africa's investment in China increased from 280 million USD to 1.31 billion USD.. China's assistance to Africa increased tenfold, with primary focus on such social welfare and capacity building undertakings as poverty alleviation, medical care and public health, education, training and infrastructure. In addition, this period saw expander cooperation in finance, telecommunications, tourism, shipping, environmental protection, and clean energy. African countries partnering with China today are signing with a future world superpower.

In Africa, this Chinese alliance provides strong psychological consequences. It provides economic hope and shows African elites an example of success which they may take as exemplars of their own future.

In somehow, if Chinese investments in key sectors of infrastructure, telecommunication, manufacturing, foods, and textiles radically alter the African continent, the main change will have taken place in African minds. With the recent growth and economic improvement, more Africans students are returning to Africa after studies abroad in order to bring their skills and industry home. With key infrastructure in place, Africa has a future.

## **3 Statistics on the Chinese Presence in Africa**

By the end of the 1990s, Africa's economy had stagnated and in most countries average growth rate had turned negative. Within the last three years, however, most African countries have sustained steady growth, driven by buoyant global demand for oil and industrial raw materials and improvement in domestic supply response. Africa has grown above the world average and faster than Latin America since 2002. Africa's output grew by an estimated 5.5 per cent in 2006 and is projected to grow at 5.9 per cent in 2007, falling marginally to, but still at a high rate of, 5.7 per cent in 2008, according to the OECD and the African Development Bank. The deceleration is attributed to an expected slow-down in South Africa, the largest economy south of the Sahara. Growth in net oil-exporting countries continues to be more robust than in net oil-importers. Nowadays global high demand for oil and industrial raw materials has encouraged foreign direct investments (FDI) in many of Africa's resource-rich countries, particularly from China and India, the fastest growing developing countries.

According to UNCTAD, FDI to Africa grew by 25 per cent to a record \$39 billion in 2006 and went mainly to the extractive sector. FDI flows to developing countries as a whole grew by only 10 per cent to \$368 billion in 2006. The growth rate in FDI to Africa was the second fastest behind the rate of 55 per cent in South-East Europe and the Commonwealth of Independent States, which received \$62 billion in FDI flows. West Asia attracted \$43 billion in FDI inflows, an increase of 23 per cent over the previous year, and was dominated by Turkey and oil-rich Gulf States, while South, East and South Asia experienced 13 per cent increase in FDI flows to US\$187 billion, with China, Hong Kong, Singapore and India as the largest four recipients. China and India have also emerged as new outward investors. FDI flows to Latin America and the Caribbean region fell to US\$99 billion, with Mexico and Brazil as the largest recipients. Most FDI flows to developing countries went to the extractive sector. According UNCTAD, cross-border mergers and acquisitions in the extractive and related service sectors in the first

half of 2006 were three times more than the level in the same half in 2005. Consequently, FDI flows to Africa were uneven, with large concentrations in West, North and Central African regions. Low-income African countries without natural resources were the least attractive to FDI.

### 3.1 Chinese aid and debt relief

China has pledged continuing development assistance and government-backed FDI to African countries. By December 2006, China had given over US\$5.5bn in aid to African countries. At the 2006 Summit of the Forum on China-Africa Co-operation (FOCAC) in Beijing, China pledged to double aid to Africa by 2009 and to give Africa US\$2 billion in preferential buyers' credits over the next three years. China's Export and Import Bank (Eximbank), established in 1994, extended its export buyers credit market to Africa in 2005 and by the end of that year had committed US\$800m concessional loans to cover 55 projects in 22 African countries, according to a recent World Bank study. Chinese aid to Africa has focused on two main areas: infrastructure and human development. Chinese aid provides funding for highly visible and to many minds, important infrastructure projects, which Western donors have long since stopped financing.

Chinese human development assistance has focused on training and the provision of health personnel. Through the African Human Resources Development Fund, China awards scholarships to over 4000 students from 51 African countries to study in China every year. The recently launched China-Africa Inter-Governmental Human Resources Development Plan is part of China's strategy to cultivate African elites through training courses and seminars for middle and high ranking African diplomats and economic and management officials. In the next three years, 15000 African professionals will be trained up while 10 special agricultural technology centers will be created. China also sends Chinese trainers to Africa to give short-term courses, including on malaria prevention and treatment, applied solar energy technology and maize farming. Over the decades, China has sent nearly 15,000 medical workers to Africa and treated 170 million patients on the continent, the Chinese state-run Xinhua News Agency has said. At FOCAC 2006, President Hu also pledged to build 30 hospitals in Africa and provide a 300 million Yuan grant to fight malaria. Recently, China has added sports development to its assistance to Africa, and has sent about 38 coaches to 12 countries, including for the development of table tennis, and provided assistance for the construction of sports facilities, including the building of stadiums in Guinea and Ghana which held the Confederation of African Football Cup of Nations competition in 2008. China exerts no political pressure on African governments for political and economic reforms, although such massive economic and financial assistance cannot avoid having political repercussions. China's only declared condition is the recognition of its "one-China" policy, by which African governments are expected to break off diplomatic relations with Taiwan. One-third of the countries that recognized Taiwan were African, including the regional power South Africa. But in return for development assistance from Beijing, many African countries have severed diplomatic links with Taipei. See Figure 1 trade between China and Africa

Figure 1 Trade between Africa and China

In spite of Taiwan's reported campaign donations to Mandela's African National Congress in 1994, South Africa was compelled to break ties with Taipei in 1998 after Mandela failed to convince Beijing to agree to a dual recognition policy. Other countries including Senegal and Chad have followed South Africa in repudiating Taiwan. 47 of Africa's 53 nations have established diplomatic relations with Beijing, according to the Embassy of the People's Republic of China in the United States. There now remain only a handful of African countries like Sao Tome and Principe that recognize Taiwan, but these are economically and politically insignificant. Even so, China is extending its largesse to these countries to win them over from Taiwan. "China stands ready to establish and develop state-to state relations with countries that have not yet established diplomatic ties with China on the Basis of the one China principle," according to China's Africa Policy paper.

In contrast to other donors, China usually does not offer grants to African countries, but to increase its leverage on borrowing countries, China forgives the debts of borrowers that develop strong political and economic relations with it within an agreed timetable. This is probably what Chinese officials mean in their Africa Policy as being "ready to continue friendly consultation to seek solution to, or reduction of, the debts they [African countries] owe to China." By December 2006, 10.9 billion Yuan (US\$1.4 billion) of debt owed by 31 heavily indebted and least developed African countries had been forgiven, the state-run Xinhua News Agency has reported. It has also been observed that Chinese aid coincides with the award of contracts so that African governments are likely to do fealty when Chinese companies bid for Chinese government funded contracts. A recent report by The Economist suggests that in the next few years, China's growth rate could reach as high as 13% per annum. Industrial output has also increased by almost 50%, creating industrial overproduction in sectors like electronics, textiles and footwear. Rapid expansion has created the need for both import markets for energy and raw materials and export markets for Chinese manufacturers. Chinese companies have discovered opportunities in Africa's vast resources and untapped markets. In the 1990s Sino-African trade grew by nearly 700 per cent, a DFID China study has reported. Since then Sino-African trade has continued to grow at an exponential rate, with China displacing the UK as Africa's third largest trading partner behind the US and France. China accounts for nearly 20 per cent of Africa's total exports and more than half of Africa's exports to Asia.

From 1995 to 2004, Sino-African trade rose from about US\$4bn to US\$28bn. Within a year, trade rose sharply to nearly US\$40bn, more than twice Africa's trade with Japan which stood at US\$18bn for the same year. In 2005, China imported US\$21.1bn worth of goods from Africa while it exported US\$18.7 billion, showing a deficit of US\$2.4bn in its trade with Africa. Chinese officials point to this as indication of its commitment to helping generate surplus revenue to finance African development. But the deficit may largely be explained by China's voracious energy consumption and its emerging dependence on Africa's resources. Apart from a few very resource-rich countries, the majority of African countries have "mounting trade deficits" with China, according to the DFID China report. To ensure secure supplies of resources and export markets China is also keen on negotiating a free trade area with Africa and is already engaged in free trade talks with South Africa. Sino-African trade was expected to reach US\$100bn by 2010.

Chinese exports to Africa are composed mainly of machinery, transport equipment, textiles, apparels, footwear, and other manufactured materials while crude oil and raw materials dominate Africa's exports to China. Figure 2 shows the composition of Africa's exports to China in 2005, while the share of major African exports in Chinese global imports nearly 70 per cent of total African imports were oil (US\$14.6bn), with iron ore (US\$741m), cotton (US\$677m), diamonds (US\$502m) and logs (US\$495m) together making up 11.4 per cent. Angola (US\$6.6bn) was the largest supplier of crude oil. By February 2006, Angola had surpassed Saudi Arabia as China's largest source of crude oil supplies. Other major crude oil exporters to China were Sudan (US\$2.6bn), Congo (US\$2.1bn), Equatorial Guinea (US\$1.4bn) and Libya (US\$0.96). The U.S. Energy Information Authority also suggests that Chinese refineries face capacity problems with the heavier crude oil from the Middle East. While Western powers have succeeded in encircling Latin America, the Middle East, Central Asia and Eastern Europe through a number of regional security arrangements, Africa remains strategically open and China may become even more dependent on African oil.

Figure 2 China's Imports from Africa

### 3.2 Investments

Since the 1980s, China has adopted a "going global" strategy that encourages Chinese companies to invest abroad to guarantee access to advanced technology, foreign exchange, energy and raw materials, and exports markets. The strategy also seeks to encourage Chinese firms to "cut their teeth" in international markets and enhance China's global power status. In Africa, Chinese state-owned and private companies have entered into a number of joint ventures with African national governments, state-owned corporations and private firms. Over 700 registered Chinese companies are reported to be operating in Africa. Beijing is encouraging Chinese companies to acquire and develop strategic oil and gas fields in Africa to mitigate anxiety about secure supplies of energy. It is also encouraging Chinese state-owned companies to source their own raw materials abroad, creating a strategic motivation to invest in Africa's resources. By 2005, the Bank's portfolio had tripled and its commercial operations outstripped those of its counterparts in the US, the UK and Japan. While the largest Chinese operations in Africa are in oil and gas exploration, development and production, there are growing investments in construction and engineering works, telecommunications, textile manufacturing and trading enterprises. At the opening of the 2006 Beijing Summit of the Forum on China-Africa Cooperation, President Hu announced a US\$5bn fund for further investments in Africa.

A significant feature of Chinese investments is that they can be found in countries and in projects considered too risky by Africa's traditional donors and investors. Chinese projects have sprung up in countries like Burundi with significant rebel activities. Conflict-shattered Sierra Leone, Liberia, Rwanda, and the Democratic Republic of Congo have all attracted Chinese investments. So have global pariahs like Sudan and Zimbabwe. The biggest recipients of Chinese investments in Africa have been the largest oil producers on the continent: Nigeria, Angola, Sudan, Equatorial Guinea, South Africa, Libya, Algeria and Guinea.

## 4 Opportunities and Exploration on Development Right

Today business emerge many opportunities and many areas are subjects to potential international joint cooperation between Africa and China. These strategic business opportunities have been described and some of them even explored through the establishment of Sino-African cooperation. To develop the visibility of these opportunities I will highlight especially some sectors.

### 4.1 Oil and gas

Through the three major state-owned Chinese corporations, the China National Petroleum Corporation (CNPC), the Chinese Petroleum and Chemical Corporation (Sinopec) and the China National Offshore Oil Corporation (CNOOC), China has been securing strategic assets and rights for exploration, development and production in Africa's petroleum industry. The three companies, the result of the reorganization of local state-owned companies in 1998, were initially set up to operate a range of local subsidiaries but have all gone international and become giant transnational corporations with vast resources to acquire overseas assets. In 2005, Sinopec and CNPC ranked 23 and 39 respectively among Global Fortune 500 Companies. Chinese oil companies have acquired stakes in 20 African countries. By May 2006, Angola had overtaken Saudi Arabia as the largest exporter of crude oil to China.

By late 2006, the Chinese government and CNPC had sunk US\$4bn into investments, development,

pipeline building and other operations in Sudan. CNPC has acquired a 40 per cent stake in the Greater Nile Petroleum Operating Company to exploit Sudanese oil deposits in the Muglad Basin. In Nigeria, CNOOC has acquired 45 per cent stake in the Alpo field for US\$2.27bn. CNOOC has also acquired 35 per cent of an exploration license for US\$60m. In Gabon, Total-Gabon and Sinopec signed an agreement in 2004 to supply China with one million tons of crude oil a year, making China the third largest consumer of Gabonese crude oil after the US and France.

#### **4.2 Non-oil resource extraction**

The extraction of non-oil resources like metal ores, bauxite essential in the electronics and electrical industries, and timber has also attracted Chinese investments in Africa. Over 60 per cent of Gabon's and a large part of Equatorial Guinea's timber production are purchased by China, which has raised concerns among some quarters as to the sustainability and length of life of this valuable rainforest. China is the world's largest consumer of copper and has invested US\$170 million in the Zambian copper mining sector. The Chambezi copper mine, which was purchased in 1999, is now its largest Chinese mining operation in Africa. China is also increasing its investments in cobalt and copper mines in the Democratic Republic of Congo and is exploring further supply sources from South and Namibia. In February 2008, the state owned Aluminum of China, or Chinalco spent 14bn dollars buying 9 % stake of Rio to disrupt its takeover by BHP. This was the largest amount of Chinese foreign investment. By that time, over last decade (Guinea) has become the largest Aluminum corporation in China with monopolistic power in price setting both down and up stream of them range of product.

#### **4.3 Infrastructure development**

Chinese development aid helps to finance infrastructure projects, including road and railway rehabilitation, hydropower stations, stadiums, hospitals, bridge and schools. In 2005, Chinese companies had been contracted to 722 turn-key projects across Africa. By mid-2006, total China Eximbank concessional and non-concessional loans for infrastructural development in Africa, excluding projects in the petroleum and mining sectors, were US\$12.5bn, the World Bank has reported. Angola, Nigeria, Mozambique, Sudan and Zimbabwe account for over 80 per cent of these loans, and the power sector makes up about 40 per cent of total commitments, followed by "General" or multiple sector commitments (24 per cent), transport (20 per cent), telecom (12 per cent) and water (4 per cent). Concessional loans from the OECD for infrastructural development in Africa amounted to only US\$4bn in 2004, suggesting China may be providing greater support for the development of Africa's infrastructure than are the OECD. According to a Wall Street Journal report, Chinese companies have paved more than 80% of the main roads in Rwanda and almost all Africa. For a continent with poor infrastructure and limited intra-regional trade, such investments constitute a significant development and have the potential to boost trade among African countries.

In Ghana, Sino-Hydro, one of the largest Chinese hydropower engineering firms, has been contracted to build a US\$600m hydropower project financed largely by a Chinese government loan to solve the African country's cyclical power crisis, the Ghana News Agency has reported. Following the visit of President of Guinea and Nigerian in China, both governments reached an agreement with the Chinese government for a loan to part-finance the construction of a railway line.

#### **4.4 Telecommunications**

Africa is one of the fastest growing telecommunications markets in the world. The telecommunications industry in Africa is dominated by Western and South African companies like British Vodafone, France Telecom and South Africa's Vodacom and MTN. Recently, Chinese transnational companies like the Zhong Xing Telecommunication Equipment Company Ltd. (ZTE), China Mobile and the private multinational Huawei have made significant inroads. China Mobile tendered for a \$4m bid for Nasdaq-listed million International, which has subsidiaries in Chad, DRC, Ghana, Mauritius, Senegal, Sierra Leone and Tanzania, while Huawei has introduced telecommunication products at affordable prices to consumers in the entire continent. In Kenya, for example, the price of a fixed line has dropped by 65 per cent after Huawei helped Kenya Telecommunications procure Chinese digital equipment.

### **5 Challenges and Implications**

As we know any business, at any place involves risk taking, also present challenges that have to be overcome anytime. This Principle applies to a Sino-African context especially regarding to a type of venture or cooperation the current research is dealing with. Through China's presence in Africa is driven by economic self-interest, both Africa and its traditional development partners stand to benefit from

Sino-Africa relations. But it also raises major policy challenges for African governments and international donors. Although facts mixed with other geographical, cultural and political considerations that make it more difficult to understand even to establish and to manage.

In practices IJV's are common in the oil, gas and mining sector or industry, even the studies show that  $\frac{3}{4}$  of those cooperation are based on cross border. Chinese government and companies are prepared to invest in high-risk countries, including countries like Burundi with active rebel groups. In many such conflict-affected countries a great proportion of the population is grateful to see new schools, roads, railway lines and stadiums springing up from the debris of war. In post-war Sierra Leone, Chinese aid is financing a range of projects to strengthen the machinery of government and the national security apparatus. A new office block, parliament buildings and a new military headquarters for the government of Sierra Leone have been built with generous support from the Chinese government, while Chinese companies have invested in a sugar plant and a tractor factory, which are providing jobs for the local population. Not every African is singing a lyrical ballad to the Chinese presence, however. Nana Benneh, an African banker who has observed the impact of Chinese operations on his clients' activities in Ghana, South Africa and some other African countries, offered a lachrymal paean: "Chinese exports provide cheaper access to more goods and services. This is good for the well-being of the people; in the long-term this is bad for Africa because it destroys local manufacturing capabilities and competitiveness. At home in Africa, there is growing resentment that cheap Chinese imports are killing local manufacturing possibilities. In Zimbabwe and South Africa, there have been protests against cheap clothing imported from China. Accusations of intellectual property theft by Chinese companies also spread to electrical and other industries.

In a speech at the Royal Institute of International Affairs (Chatham House) in London, President of Ghana and currently Chairman of the African Union, John Kufuor praised the Chinese for their development assistance to Africa but expressed concern about Chinese labor deployment in Africa, which limits opportunities for the transfer of skills and technology. According to researcher, it is estimated that nearly 90 per cent of the labor force employed in Chinese construction projects in Africa are Chinese. The deployment of Chinese labor in Africa reduces the potential positive effects of Chinese investments on household incomes in Africa. This has led to accusations of Chinese predation. There are concerns that because of Chinese aid practices, Western donor governments and the international financial institutions are losing strategic influence in Africa and with it their ability to continue to press for important initiatives on governance, fiscal probity and transparency. China's economic footprint in Africa has caused waves in Western capitals, institutions and the media. The international community's concerns about the Chinese presence in Africa range from preserving normative cosmopolitan ideals such as the protection of human rights, political freedoms and the environment to fears about diminishing Western political and material influence in Africa. As with the local responses, international views are mixed, though there is a preponderance of a negative perception about Chinese activities in Africa.

## 6 Conclusion

The recent Chinese move into Africa is driven by China's desperate need to find oil and industrial raw materials to feed its resource-guzzling and world's fastest growing economy, as well as untapped export markets to address industrial overproduction. China is pursuing strategic commercial targeting in Africa, building a fortress of near monophony in resource-rich countries isolated by the international community and competing out Western governments and companies in countries that were previously comfortable turf for the West. China has leverage over Western competitors because it makes no value demands with its aid and investments and provides generous support for the expansion of Chinese companies into overseas markets, an expansion critical to China's security interests and self-perception as an emerging global power.

The Chinese also have a long-term view of their relations with Africa and readily accept small margins to advance national interests and nurture a potentially large consumer market for the future. Africa has therefore become a strategic training ground for Chinese companies. Chinese presence in Africa is also good public relations for Africa. Chinese activities in Africa are enervating, and generating interest among, otherwise uninterested and disinterested investment communities in the West and may crowd in significant new investments for Africa. Among major stakeholders, China's economic profile in Africa has however produced a "mixed bag" of effects and responses. African government officials are gratified that their ailing economies are being bolstered by high Chinese demand for their resource

exports and large investments in infrastructure and other critical sectors long neglected by Western donors. On the whole, however, the majority of Africans believe China can have a positive or negative influence on Africa's development in the long-run.

(E-mail: hncjzwq@163.com)

**Abstract:** Cooperation of industry, universities and research institutes is the major achievement of educational reform under the new circumstances in China. As a high level of this new model, the strategic alliance of the three parties is the inevitable approach to technological advancement and scientific innovation. It not only integrates all the advantages in environment and resource in universities, enterprise and research institute but also reflects the combination of theory and research with practice and demand. Therefore through the research method of data analysis, this paper investigates in depth the imbalance in academic strength, fund, degree of concern, discipline setting and team construction between local colleges and universities affiliated to central government and ministry. The above mentioned factors are basic causes for the difficulties confronting local universities along their way of cooperation with industry. On this basis this paper proposes a countermeasure which mainly includes the construction of improved academic team motivation mechanism, effective evaluation system and right approach for corporation.

**Key words:** Local universities; Strategic alliance of industry, University and research institute; Structure model; Countermeasures

## 1 Introduction

In terms of the university-industry corporation model in China, Peichu Chen and Meiceng Tu (2007) summarize the corporation model in China into two models from the perspective of corporation alliance construction, namely cooperative research and development, cooperative entity. Recently Gongwen Shi and Yingming Xiang (2011) take the practice model of innovation talent training in Central South University as an example and categorize the corporation model into five types. They are university internal corporation model, enterprise-university corporation model, joint cultivation model, achievement industrialized model and teaching base model.

In terms of the evaluation system of industry, education and academy, Bonaccorsi (1994) put forward to the evaluation index with the core elements of product quantity, research staff numbers and academic achievement numbers. Tomas Hellstrom and Merle Jacob (1999) think that the evaluation system should include fertility, reach and financial success etc. Via the analysis of management process, Zahra and George (2002) thinks the core index should include the numbers of patent, new product from corporation technology, new product in research and development, net profit margin.

However, there are some deficiencies in the present research. Firstly, for the object of study, present researches are based on the investigation on the enterprises in economically developed areas, ministry-affiliated or Project 211 universities and prestigious academic institute. The specific study on the central and western regions, local colleges and medium or small institute are scarce, so is the complete evaluation measurement index system for these areas. Secondly, for the research orientation, present researches mostly emphasize technology and patent transfer more than talent cultivation. They focus the technology support, but ignore intellectual support from the aspects of enterprise management, strategic planning, and risk control by the universalities and research institute. The writer for this paper will compare different universities, search for the bottleneck problems with the local universities' construction of the strategic alliance of industry, education and academy, and suggest some solutions.

## 2 Analyses of the Problems in the Local Universities' Construction of the Strategic Alliance of Industry, University and Research Institute (SALURI)

Now universities administrated by local government account for more than 85% in China. They play increasingly important role for the development of local economy. Thus how to integrate and

coordinate local universities with local economy is worth discussing.

### 2.1 Comparison of SALURI development in different universities

Local universities account for a large proportion in Chinese education system and plays increasingly important role in social development. But they are not granted deserved attention and become disadvantaged in higher education group. On the contrary the central government or ministry affiliated universities take core position in the construction of SALURI owing to resource distribution priority in research strength, fund investment and geographic advantage.

#### 2.1.1 Comparison of scientific research strength

The quantity and quality of researching faculty is the foundation for university’s sustainable development, which symbolize the academic power and play the leading role in the development of SALURI. Universities with faculties of high professional title and level can better interact with industry. They can timely transplant the technological advantage of universities into enterprises to speed technology innovation and facilitate the increase of profit and competitive edge. This research will present the talent advantage of central government and ministry affiliated universities merely by illustrating the university faculty’s professional title.

**Table 1 Faculty Professional Title in Chinese Universities**

	Teaching staff					Staff in research institute
	professor	associate professor	lecturer	teaching assistant	no title	
1. universities affiliated to central government of ministry	41152	59106	62772	8720	3456	20788
including: Ministry of Education	33928	47676	49656	5976	2616	16436
other Ministry	7224	11430	13116	2744	840	4352
2. local universities	85061	262785	374820	166691	42190	11176
including: education department	73849	191380	272398	102037	25197	10050
other department	11212	71405	102422	64654	16993	1126
3. private universities	22339	55334	79346	55688	23667	500

(Source: Ministry of Education Web site statistics)

Table 1 clearly shows that local universities (85061; 262785) are at an advantage compared with central government and ministry affiliated universities (41152; 59106) in terms of professor and associate professor numbers. But it’s due to the large number of local universities. If compared by absolute percentage, the number of professor in each local university is averagely 54, associate professor 167. This figure is far lower than that of 73 central government and ministry affiliated universities (464 and 653 respectively). It shows that the big gap of quality and quantity between local universities and central government and ministry affiliated university is a major factor leading to imbalance of SALURI distribution.

#### 2.1.2 Comparison of fund investment

Due to variation in investment statistics, this research applies the figure for investment in research and development by *National Science and Technology Funds Statistics Bulletin in 2010*. The total fund for R&D in 2010 is 706260 million Yuan, in which 518550 million Yuan is for various enterprises, 118640 million Yuan is for government affiliated research institute, 59730 million Yuan is for universities. The correspondent proportion is enterprise 73.4%, government affiliated research institute 16.8%, and universities 8.5%. This figure shows enterprises’ leading role in technology innovation is increasingly steady with the deepening of innovation system construction. On the other hand the universities in China are divided into two types, central government and ministry affiliated and local government administrated, there is a big difference in obtaining the enterprise sponsored funds. For example, in 2008 central government and ministry affiliated universities obtain 42460 million Yuan as academic funds in which 15450 million Yuan is from enterprises. But the total fund for the large number of local universities is 23900 million Yuan in which 8970 million Yuan is from enterprises. The disparity is very far.

#### 2.1.3 Comparison of geographic distribution

Due to the imbalance of economic development between east and west region in China and the distribution difference in university of various types, central government and ministry affiliated

universities mostly are located in east China, while local universities are mostly located in middle and west part. This results in diversity of difficulty degree in the construction of SALURI. This research uses 2000-2010 CDI (Comprehensive Development Index, including five indexes: economic development, livelihood improvement, social development, ecological construction and technological innovation) to illustrate the influence of regional development variation on R&D funds. This CDI is from China Statistical Society and based on CDI compiling program. Take 2010 as an example, the economic development indexes in the East, Northeast, Central region and West are 73.21%、63.04%、61.33% and 55.54% respectively; livelihood improvement indexes are 73.21%、63.04%、61.33% and 55.54% respectively; social development indexes are 67.32%、68.28%、66.93% and 66.12% respectively; ecological construction indexes are 65.90%、54.52%、57.73% and 55.31% respectively; technological innovation indexes are 38.37%、15.16%、14.72% and 13.54% respectively.

The variation in CDI causes the inclination of R&D fund apparently to development region. *National Science and Technology Funds Statistics Bulletin in 2010* shows that in 2010 there are 6 provinces whose R&D fund is beyond 300 million Yuan. They are Jiangsu, Beijing, Guangdong, Shandong, Zhejiang and Shanghai. Their R&D funds amount to 413650 million Yuan in total, account to 58.6% of the total national fund. 7 provinces whose ratio of R&D to GDP reach or exceed the national average are Beijing, Shanghai, Shaanxi, Jiangsu, Zhejiang and Guangdong. Among them only Shaanxi is located in Mid-west part. The other six provinces are mostly located in east coastal region. East regions have more powerful economy and considerable scientific and technological innovation resources. Mid-west regions are backward owing to historical and geographical reasons. The universities in Mid-west regions, especially local universities have great difficulty in obtaining R&D fund.

## **2.2 Bottleneck problems in the construction of SALURI in local universities**

The cooperation of industry, university and research institute is deeply influenced by social development. The cooperation model experienced the following stages: from formal contract relationship management, technology transfer office, informal technology consulting to today's SALURI promoted by relevant government departments, led by major enterprises, and based on universities. Local universities of large number and wide distribution should become the think-tank and propeller of local economic and social development. But various causes prevent the SALURI from serving local development.

### **2.2.1 Inadequate attention**

Due to different educational philosophy, central government and ministry affiliated universities are more willing to construct SALURI with enterprises to obtain the cutting-edge technological information, meanwhile to strengthen the academic achievement transfer based on market demand, which in turn propel the steady advancement of research level in universities. Although local universities are the main force to serve local economy, the training of application type talents becomes the major task owing to geographical and regional particularity. As a result local universities are mostly confined to daily teaching. They emphasize to impart knowledge and train career skills since these are regarded as major approach to serve local economic development, but neglect that project can promote research and development, that R&D propel application and that application can drive industry. They neglect the following tasks, such as optimizing local development environment by technology transfer, advising enterprise' management and operation, offering reference for government' policy. Moreover they do not assist enterprises to improve core competition and lead local economical and social development which ought to be their main task.

### **2.2.2 Academic team establishment backwardness**

Firstly, academic team in local universities lack core leading figure.

Academic leaders are the original impetus and spiritual pillar of the entire group. The academic leaders in local universities are generally trained by themselves. They lack effective communication with outside and less capable to know the demand of market and enterprises timely. So their corporation of industry, education and academy is somehow passive. The local universities are generally located in middle or west underdeveloped region and unattractive to high level talent. Moreover their personnel recruitment system is not perfectly established, which makes the local universities both unable recruit talent and keep talent.

Secondly, academic team is not stable.

As a group, academic team not only provides basic conditions for the construction of SALURI, but also builds a practice platform for team members. National and international relevant researches show that every university academic team has a life circle, namely integration phrase, growing phrase,

maturity phrase and split phrase.

Integration phrase mainly includes two-way selection of academic and market demand, preliminary construction of team and member identity, association establishment with enterprises etc. Growing phrase follows the preliminary approval of academic achievement by market and enterprises. It means further narrowing down the focus of research orientation and enhancement of the cohesion, coordination of internal contradictions, stabilizing team members to form an institutionalized normalized pattern. Based on the development of growing phrase, maturity phrase comes with more widely accepted academic achievement, rising popularity and credibility, more normalized management. After a period of development comes the split phrase. Some academic rookies grow mature enough to lead new research. The original team is divided into two or more new teams to broaden the overall academic level. This helps SALURI further advance towards multi-disciplinary and high-level direction.

On the whole, there are no essential differences between the life circle of local universities and central government or ministry affiliated universities. However, there's a fluctuation at growing phrase and split phrase.(shown in Figure 1)

Figure 1 Life circle of academic team in local universities

At growing phrase, since local universities lack effective incentives to retain talents, the academic leader may turn to higher-level universities or more developed region after recognized by society. The loss of leaders makes the team exist in name only before maturity. At split phrase, local universities cannot support various disciplines and teams to coexist and develop due to shortage of talent and limited research conditions. Lack of basic personnel and material support makes the new team in malnutrition at early stage and unable to experience market test and gradually disappeared.

To sum up, because of the large economic differences between east and west in China and unequally resource distribution, local universities are at a disadvantage in the construction of SALURI. Meanwhile local universities' inadequate attention, the backwardness of discipline setting and academic team nurturing cause the low competitiveness and ineffectiveness of SALURI in serving local economy development. Therefore, local universities need not only adjust their policy on talent recruitment and team stabilization but also accurately grasp market opportunity and understand enterprises' demand so as to determine discipline setting orientation and make correct choice in SALURI approach.

### 3 Countermeasures for the Construction of SALURI of Local Universities

Although local universities are of great number and wide distribution in China, they fall behind the central government or ministry affiliated universities in many aspects. To avoid being marginalized in the construction of SALURI, local universities should give more consideration to SALURI and make use of such advantages as local status and familiarity with local situation. They should gradually transfer the management mechanism from merely teaching oriented goal to teaching and research paralleling. In this way the alliance will promote enterprise which in turn activates research, development and teaching.

#### 3.1 Establishing academic team incentive system

Local universities should incorporate the construction of academic team into university project system and allot special funds for award and sponsor the team. Based on detailed demonstration of its research plan and financial status, universities should grant special funds for its development and enforce its construction from the following three aspects.

Firstly, local universities should support academic team members to participate in national and

international academic and technological exchange. They can take various measures to send selected outstanding talent into famous universities, research institute or prestigious enterprises to study or research. In these ways they can establish exchange mechanism with national or international experts and scholars to continuously increase research ability.

Secondly, local universities should strengthen the cultivating and sponsoring academic leaders and create advantageous research and living environment. Meanwhile, on the basis of academic development task and local enterprise demand they should combine self-cultivation with external introduction by recruiting academic leaders both at home and abroad. All these efforts aim to forming a middle aged or young academic team with professional advantages, disciplines complement and high innovation ability.

In the team the leader regularly assess the team members under the leader centralized responsibility system. Out of the team the local universities is responsible for assembling the corporation party and external experts assess the academic leader’s performance and organization capacity periodically.

Thirdly, local universities should establish favorable management mechanism for academic team development, in which the boundary between colleges and disciplines are broken and a cross-college and cross-discipline research platform is built. In this way teachers of different major and level can supplement and unite for team development. Salary, allowance and bonus for research and innovation should be bound and allotted in accordance with labor and contribution within the team. With the maturity and more achievement commercialized and market-oriented management model and stock system reform should be introduced and tried out. A self-improvement mechanism is gradually formed by accumulating experience.

**3.2 Constructing effective SALURI evaluation system**

An effective evaluation system is the criterion to quantify the performance of SALURI. It provides importance guidance for studying the advantages and disadvantages in corporation and makes the future plan. The previous research on the SALURI evaluation system in China put more emphasis on the corporation effect and made overall assessment by regarding the provider—universities and research institutes and the demand side—enterprises as a whole. There was no special evaluation system for assessing the research, teaching, talent cultivation, etc in the universities. The lack of utility evaluation offers no help to the improvement of universities mechanism. Therefore it is especially important to establish a set of evaluation system especially for universities.

In order to evaluate the performance of SALURI from the perspective of local universities, this paper first makes a comprehensive study on the researches both at home and abroad. Considering that local universities pay equal attention to teaching and researches with a close contact to local economic development, this paper constructed a evaluation model by mainly choosing seven indexes, namely academic team building (x1) , technological achievement (x2) , students cultivation (x3) , resources utilization (x4) , coordinate distribution (x5) , contact with local enterprises (x6) , and others (x7) .

$$y=f(x_i), \quad i=1, 2, 3, \dots, 7$$

Each index entails a relevant index system (shown in table 2).

**Table 2 Matrix of SALURI evaluation index for local universities**

evaluation index	evaluation items	evaluation index	evaluation items
	1.whether academic team members’ structure rationalization is promoted		
	2.whetehr the team leader has outstanding achievement		1.utilizaiton efficiency of universities lab
team building: X <sub>1</sub>	3.whether the team’s popularity is increased	resources utilization: X <sub>4</sub>	2.utilization frequency of equipment and software
	4.whether the cohesion of the team is enhanced		3.integration of cross-discipline and cross-college talent
	5.whether the development of the team is steady		
	1.quantility of high quality academic papers		1.transparency of profit distribution
technological achievement: X <sub>2</sub>	2.number of corporative research project by universities and enterprises	coordinate distribution: X <sub>5</sub>	2.information exchange and disclosure in corporation
	3.patent number of technological achievement		3. incentive and constraint in corporation
	4.number of technology transfer		
			1.whether deepen the relationship with local economy

	1.number of students participating in the researches		2.whether participate in local policy making
students cultivation: $X_3$	2.number of academic achievement by students	contact with local enterprises: $X_6$	3.whether establish corporation with the local enterprises
	3. employment acceptance of students		4.whether participate in local economy management
	4.students' ability to adapt to society		5.whether provide technological support for local enterprises

evaluation index: 1.2.3.4.5., in  $X_1, X_6$ : 1=no, 5=great help; in  $X_2, X_3, X_4, X_5$ : 1=no, 5=comparatively good

In the evaluation process, local universities should combine internal self-evaluation with external evaluation. Internal evaluation group is composed of academic team leader, member and research and teaching department. External evaluation team includes the representatives from local government, enterprises and people of various social levels. The evaluation result should be objective and impartial enough to serve as a reliable reference for correct judgment of the effect and benefit of local university in SALURI.

### 3.3 Choosing right SALURI cooperation approach

Firstly SALURI is a full range of long term close corporation between universities, enterprises and research institutes based on the common strategic benefit. It fundamentally solves the problems in short-term loose and single SALURI cooperation. Secondly, SALURI is generally constructed on the basis of line of industry. It has an extensive and intensive corporation with the feature of creativity and integrity which can greatly promote the technological development in the industry. Local universities should actively take advantage of SALURI and consider individual characteristics and regional economic development features to develop cooperative way with specific target. (shown in Figure 2)

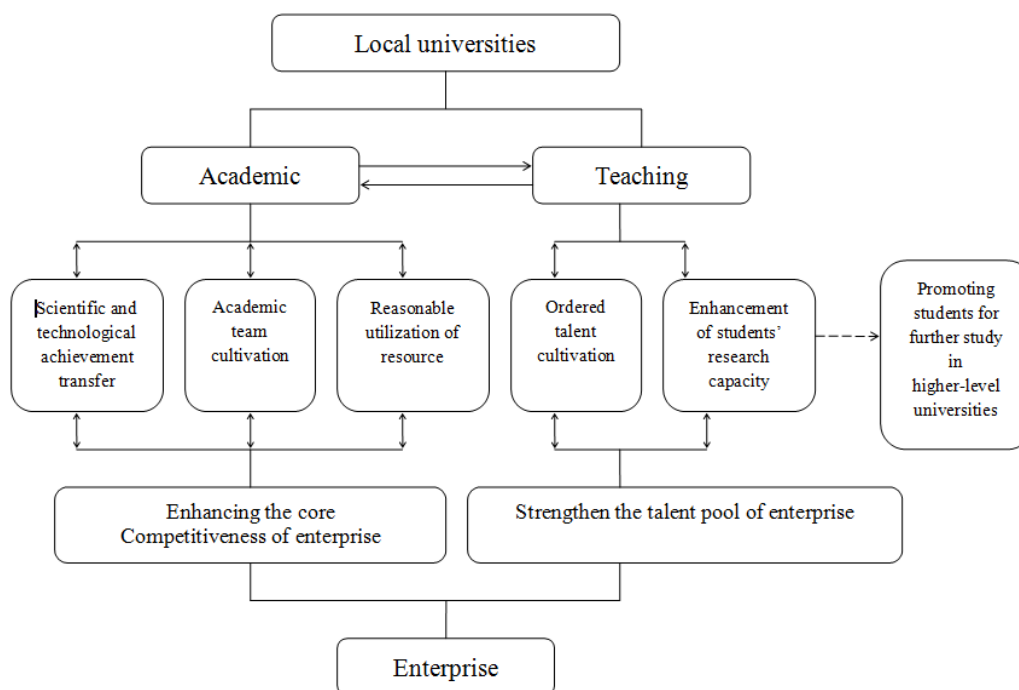

Figure 2 SALURI cooperative approach for local universities

On the whole, in the construction of SALURI, local universities should fully embody the concept of paralleling teaching and academic research. In terms of academic research, scientific and technological achievement transfer, academic team cultivation and internal reasonable utilization of resource should be given full importance. The academic achievement should conform to the practical local economic development and help the enterprise enhance the core competitiveness. Based on the benefit sharing principle of SALURI, local universities should invest the earning profit from the enterprise on teaching and academic research to promote the teaching and academic strength. In terms of teaching, local universities should make use of the local advantages, know timely the enterprise

need and cultivate ordered talent capable of management and technology skills. In the teaching process, local universities should give due consideration to students' academic ability with the goal of further study in higher level universities.

For the discipline setting characteristics in local universities and the defect of single corporation way of SALURI (namely technological achievement transfer) at present, this paper suggests a SALURI corporation notion which involves the equal emphasis of knowledge and technology transfer, joint effort of technological institute and business school. (shown in Figure 3)

**Figure 3 Local universities SALURI approach**

Because technological institutes have obvious advantage in technology and engineering field, they should continue the direction of their technological transfer. However in the construction of SALURI, on the premise of risk pooling universities should not simply regard themselves as the technology provider and neglect to consult the management of enterprises. Business schools have rich theoretical knowledge of operation and management; they lack opportunities to put these theories into practice. Therefore the combination of knowledge and technology transfer can not only conform to the original intention of converting advantage into profit, but also provide guidance for enterprise operation and management. It ought to be the best choice for a win-win approach for the corporation between enterprises and universities.

#### 4 Conclusion

With the rapid development of social economy, as the senior form of corporation between industry, education and research, SALURI is both the future development trend and inevitable choice for universities, enterprises and research institutes to sharing benefit and risks. Universities' role cannot be underestimated. Local universities with wide distribution and large number are important component in the construction of SALURI. Although the central government and ministry affiliated universities have an edge in funds, academic strength, team building, discipline setting and so on, local universities can also play their unique role in economic development. If local universities make best use of their familiarity with local situation, pay equal attention to research and teaching, shake off the yoke of single focus on teaching and take serving local economic development as core task, they will surely become the essential component in SALURI in China.

## Relationship Networks and China's Increasing Presence in Brazil – Looking at Entrepreneurship and Cooperation

Bandeira de Melo, S.A., Stefani, M.T., Dourado, J.R.S., Guevara, A.J.H.  
Pontificia Universidade Catolica de São Paulo, São Paulo, Brazil  
(E-mail: y.p.kamminga@vu.nl)

**Abstract:** The study of interpersonal relationship networks belongs to a long and extensive multidisciplinary academic research field. Although the subject is not a new one, there has been an increase in the interest of the role of social networks in the business world. This article discusses a kind of network very peculiar to Chinese communities' way of life: the *Guanxi*. Ever more emigrating to countries of occidental culture, the Chinese bring with them their way of being and doing business to which the *Guanxi* is a significant cultural trait. Knowing this type of relationship increases the possibilities of success for those who intend to do business with the Chinese, both in Brazil and in China. The article encompasses a theoretical framework, exposing Chinese and Occidental theories about relationship networks, allowing a broad understanding of how *Guanxi* works. Interviews and the relevant analysis of their contents complement the exploratory and qualitative research.

**Key words:** Network; *Guanxi*; Entrepreneurship; Cooperation; Trust

### 1 Introduction

Regarding the international macroeconomic scenario, China already plays an influential role in markets such as Europe, Africa and Americas, which will be further increased in the next decades. In Latin America, China is one of the most important trade partners of countries like Brazil, Chile, Argentina and Peru, among others. Establishing, developing and maintaining commercial and investments long term links with the Chinese people is very important to achieve economic growth in a globalized and competitive market.

The table below shows the growth of Chinese Foreign Direct Investment<sup>[1]</sup> – FDI in Brazil since 2004, providing an insight of the relationship's strength between the two countries:

**Table 1 China Foreign Direct Investment (FDI) in Brazil US\$ millions**

Year	Value	% growth
2004	6.43	
2005	15.09	135%
2006	10.09	-33%
2007	51.13	407%
2008	22.38	-56%
2009	116.27	420%
2010	487.46	319%

Source: 2010–Statistical Bulletin of China's Outward Foreign Direct Investment

Site: Posted in 2011-09-16 - Access in 04/25/2012

The amounts illustrated are the official data provided by the Ministry of Commerce People's Republic of China but, it is believed that the actual figures are much higher. Whereas the Chinese State-Owned Enterprise also sends resources from bases in other countries, data on Chinese FDI flows are distorted and underestimated.<sup>[2]</sup>

Many investments are made by Chinese investors already living in Brazil, besides investments made through the Huey, a kind of an investment consortium congregating private Chinese investors made outside the national or international financial systems. (SHENG, 2008<sup>[3]</sup>).

A report from the Brazil – China Business Council (Conselho Empresarial Brasil China – CEBC<sup>[4]</sup>) gives the information that billions of dollars in Chinese investments in Brazil are already confirmed in almost all Brazilian States, such as Bahia, Goias, Minas Gerais e São Paulo (CEBC, 2011, p.41).

China started the current cycle of economic expansion and the resulting increase of international relationship in the 1980's, following a new phase of economic opening and reformation inaugurated by

Deng Xiao Ping: These reforms caused a wave of foreign companies establishing operations in China and, at the same time, of Chinese companies establishing them abroad. The process generated an increase in the complexity of relationships, both from a commercial and a personal point of view, leading people and companies - in China and elsewhere - to study and understand the culture of countries and people with whom they would be establishing a new relationship.

Providing useful information about Chinese culture to Brazilian entrepreneurs to facilitate their business relationship with the Chinese will certainly increase their possibilities of achieving success in business endeavors in China. At the end of the day, other elements besides the economic are of fundamental importance in establishing long standing relationships.

Data from the Brazilian Ministry of Industry and Commerce (Ministério da Indústria Desenvolvimento e Comércio Exterior <sup>[5]</sup>) reveal that 24,908 Brazilian companies imported from China (51% of importing companies) and 2,643 Brazilian companies (12% of exporting companies) exported goods to China in 2011, showing how the commercial relationship between the two countries is thriving...

This article aims to generate awareness for the need to develop efforts to achieve mutual understanding and adaptation between cultures that are so different. Establishing a structured and conscious process to understand the Chinese culture is a critical factor to Brazilians entrepreneurs' success, especially considering the great differences between the two cultures. That process goes through recognizing that the Chinese culture is the result of more than 5,000 years of continuous written and lived history, built upon the organization of peasant communities.

The Republic of China was proclaimed in 1911 and brought more difficulties to Chinese people that in turn started a civil war. In the years that followed, the conflict between nationalists and communists, coupled with the Japanese invasion, lead many Chinese to immigrate to other countries in search for a better life.

Since 1949, when the Popular Republic of China was proclaimed, there has been a process of persecution of political opponents, especially members of middle income families, deemed as incompatible with the communist regime (VÉRAS, 2009, p. 187 <sup>[6]</sup>). That political persecution led many Chinese families to abandon and leave behind their goods and assets and flee the country, from Hong Kong or Taiwan.

Chinese society is constituted by many networks or webs. Threatened by hunger and starvation, mutual cooperation and collective spirit became the nation's founding values, also guaranteeing individual life and privacy. That specific way of relationship has been maintained by Chinese until today. It has been the main instrument used by those that need to flee the country and establish themselves abroad, most of the times in adverse conditions.

The objective of this article is to study the Chinese style of relationship – called Guanxi – as a determinant factor for immigrants that came to Brazil from 1940 on to achieve success in their private and professional ventures.

## 2 Theoretical Framework

Network: a word in fashion nowadays. It seems to explain almost everything related to human beings. But, at the end of the day, what is a network? There are many definitions, among which one common element is highlighted: it is the most ancient way of human beings relate to each other, so say the Chinese.

The study of interpersonal relationship networks has a long-term tradition in academic research, encompassing various disciplines like sociology, anthropology, organizational behavior and management. Although it is not a new issue, there is a growing interest in acknowledging the role of social networks related to business and other economic activities. Non-institutionalized business networks related to ethnical groups have been reducing international trade barriers and facilitating transnational flow of information and knowledge (GROSSMAN, 2010<sup>[7]</sup>). This article discusses the role and importance of interpersonal relationships – mutual assistance and reciprocity networks – as a driving force and guide of social and entrepreneurial actions in China and abroad.

BARNES (1987<sup>[8]</sup>) defined network as a structure of interpersonal concrete relationships that bond some individuals to others. All starts at family level: the first network to which someone belongs. After that, during the course of each individual's life, other relationships are established with various independent networks at the same time, with different objectives, indicating that networks have different functions and varying degrees of influence over each individual's life.

PINTO E JUNQUEIRA<sup>[9]</sup> maintain that:

“The existence of a network depends on a multiple and complex reality where acknowledging the other individual and the definition of common goals make possible the development of a social fabric.

That means that the social network is established from the interaction between individuals". (PINTO e JUNQUEIRA, 2009, p. 1.092).

Multiple and complex realities are a hint for the difficulties embedded in the task of understanding how networks work: networks are a changing context constantly adapting to new circumstances and events that occur at the same time. Concerning the operation of networks, CASTELLS (1999<sup>[10]</sup>) states that networks, as open structures, have unlimited capacity for expansion integrating new ties, provided that they share the same communication code such as values or performance goals.

MELUCCI (1999)<sup>[11]</sup> proposes an approach on networks' operations stating that networks, most of the time, are invisible, informal, tacit structures. They permeate all moments of social life but, they are virtually hidden from sight – they are the set of "hidden connections", an "underwater structure". Playing a fundamental role in one's life, people have many circles of relationships although they actually do not know how many of those circles exist or how to identify them. Usually people only see the network when they need it. (COSTA *et alli*, 2003)<sup>[12]</sup>.

Functions within the network are only performed through individuals' actions that are considered as social actions. According to WEBER, these are "actions oriented by other people's behavior" (WEBER, 2004<sup>[13]</sup>). That is, the social action occurs when individuals consider it meaningful to them and they behave accordingly to the group's expectations.

KRACKHARDT & HANSON (1993<sup>[14]</sup>) classify networks in trust networks, professional networks and communication networks. Trust networks are those that share "politically sensitive information" and are limited to a certain number of persons. They derive their major strength from trust and reciprocity.

Other important aspect considered by GRANOVETTER<sup>[15]</sup> is the notion of strength between the ties that link individuals to the network. The strength of a tie can be classified as strong, weak or absent, depending upon a combination of the amount of time, the emotional intensity, the intimacy (mutual confiding) and the reciprocal services which characterize the tie:

Most intuitive notions of the 'strength' of an interpersonal tie should be satisfied by the following definition: the strength of a tie is a (probably linear) combination of the amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services which characterize the tie. Each of these is somewhat independent of the other, though the set is obviously highly intracorrelated. Discussion of operational measures of and weights attaching to each of the four elements is postponed to future empirical studies. It is sufficient for the present purpose if most of us can agree, on a rough intuitive basis, whether a given tie is strong, weak, or absent. (GRANOVETTER, 1973, p1361)

To understand networks' operation usually one gets a snapshot of a network and interprets the relationship between ties. That results in a limited comprehension of the network related to a specific moment. However, it is useful to analyze how individuals behave in relation to the network, as the network plays a fundamental role especially at crucial moments in life.

## 2.1 Chinese network

Chinese people have a specific type of social relationship network, the *Guanxi*. Although it cannot be directly classified as a network in the way the term is defined in the Occidental world, it has a series of elements that can characterize that relationship as a network, as described below:

BELL (2000<sup>[16]</sup>) avoids the word network by advocating that *Guanxi* is a concept based on interpersonal connections encompassing "elements of both sharing and exchange. In the absence of the appropriate model, however, such processes are usually represented as exchange relations". He also shows that *Guanxi* network is a web of relationships that begins within family life and is expanded to other relationships established throughout a persons' life cycle.

Those interpersonal relationships have an important role in the Chinese system having its origin in Confucianism. In that system individual responsibilities are based on five important relationships: boss and subordinate, husband and wife, father and son, between brothers and between friends. SELIGMAN (1999<sup>[17]</sup>) suggests considering an imaginary circle around every Chinese. People around them will fall in one of two categories: inside or outside the circle. Inside the circle are relatives, neighbors, classmates, co-workers and those introduced by members of those groups. Some kind of *Guanxi* (relationship network) will be developed with individuals inside the circle and there will be some sort of commitment to them. Those outside the circle are unknown and there are not any obligations toward them. GROSSMAN (2010<sup>[7]</sup>) refers the following text presumably written by a Chinese scholar describing the system as a pattern of concentric circles expanding from the family as its core and having social connections as rays:

The whole ethnic Chinese network consists of numerous such circles. A Chinese businessman would seek a business partner from the nearest circle. The circle will expand as the business expands

(PENG, 2000, p.232 apud GROSSMAN, 2010).

In order to understand the intricate relationship process of *Guanxi*, it is necessary to comprehend the way it was structured over time.

Most of China population is still in rural areas even after the huge economic growth and industrialization of the latest decades, significantly working in agricultural or related activities<sup>1</sup>. Due to a less than favorable geographical environment, Chinese people always faced the challenge of sowing and harvesting food in enough quantity to cope with natural disasters, social calamities and to guarantee the survival of an ever increasing population using the same extension of land.

Although enduring dire constraints and a life marked by scarcity, HAIUA and BAKER (2008 [18]) show the contentment and tolerance existing even among the poorest Chinese communities. They say that behavior is based on the fundamental idea of being “connected”. A Chinese is never encouraged to think or act in an individualist fashion and is never treated as an isolated element. While Occidentals seem to be guided by the proposition “all are born equal”, Chinese believe that “all are born connected”. That belief means that everyone is always part of a network or social fabric. The referred authors conclude affirming that Chinese society is built by many nets and webs.

Reinforced by Confucianism the concept was enlarged to encompass loyalty to the country (e.g., government), respect for and obedience to teachers and superiors (e.g., parents and elder relatives). That mental conditioning leads to a strong sense of belonging and patriotism and fosters a behavior aimed at sharing. Those elements contribute to contentment. A person that is only preoccupied with his/her own accomplishments is constantly deemed “aggressive” and “selfish” instead of ambitious. In Chinese such individual is described as a “little self” or “xiaowo” but, if considered within the group he or she belongs is described as a “big self” or “daowo” (HAIUA and BAKER, 2008).

That environment marked by incessant struggle to survive was the cradle of *Guanxi*, as support from family was in many times not enough and an extension beyond family ties was requested from other village dwellers, co-workers or kinship clan. The Chinese methodology of coordinating the extension of support actions beyond the family cell is denominated *Guanxi* (BELL, 2000<sup>[16]</sup>).

*Guanxi* thus is related to the way Chinese act and establish rules aiming at enhancing support and maintaining cooperation commitments beyond family borders. It's a complex network system with millenary historical roots that in some moments was also used to oppose the State defending interests of the group, family or clan. Chinese peasant's survival, being it understood in physical, economic or social sense, always was underpinned by cooperation ties among individuals, especially family and community members. The system functioned even during the worst period of communist rule before the beginning of economic reforms in 1978. Nowadays *Guanxi* is used in various activities and still exerts its influence on Chinese individuals and their descendants' culture, both in business and family or personal relationships.

According to BELL (2000<sup>[16]</sup>) there are five *gang*<sup>2</sup> in Confucian logic that significantly influence the application of standards of behavior, each of them having an archetypal manifestation within domestic family. Those five cardinal relationships are called *wulun*. They are not “connections”. Structuring interpersonal relationships based on family *gang* is far apart from the instrumentalism that underpins the Occidental notion of “connections”. To say that *Guanxi* is not an instrumental relation (in its appropriate cultural expression) does not imply that *Guanxi* is not useful. Quite the opposite, *Guanxi* is worth much more than connections. In almost all cultures there is a *wu-lun* equivalent that guides relationship within the family. A special feature of Confucian thought is that *wu-lun* and its rules of conduct surpass the family group reaching all other forms of ethical relationship. As *wu-lun* rules are followed by other collectivities, family limits become surrounded by a large family-like structure of duty and responsibility. *Guanxi* is the term that expresses that mechanism (BELL, 2000).

Although occidental scholars consider reciprocity as fundamental for networks, BELL<sup>[16]</sup> uses it with reservations as it is not only a monetary exchange, but an element of group relationship's dynamic. Group is defined as a set of individuals with legitimate claims (denominated *fen*) for the sharing of certain resources. That sharing is done by means of *li* that can be translated as protocol, ritual or virtuous way of doing. The author claims that the performance of the whole group becomes effective, ordained and harmonic as a natural consequence of every person's actions based on the protocol (*li*) related to each one and to all. As a result of that appropriate way of acting contributions (*liwu*) happen accordingly

<sup>1</sup> According with 2010 CIA data urban China population is 47% of total population: <https://www.cia.gov/library/publications/the-world-factbook/geos/ch.html>, access in 07/19/2012.

<sup>2</sup> *Gang* is the term used to define the closest relationships : the ties between father and son, emperor and official, and husband and wife” (BELL, 2000 p.133)

to social position and relationships' hierarchy. Principles of balanced reciprocity are not compatible with this code of conduct. Therefore BELL distinguishes reciprocity notion explaining that "sharing contributions" or *zhanguang* means:

"[...] the sharing of (relative) good fortune. Hence the benefit to be gained from *liwu* is not reciprocal *liwu* but the possibility of *zhanguang*, a nonritual, nonroutine share under unpredictable circumstances (that may not ever arise)" (BELL, p. 135). The reason I argue against the term "reciprocity" in reference to the *liwu-zhanguang* relation is that reciprocity directs our attention to things, not to relations, as though *zhanguang* were the benefit to be gained from *liwu*. (BELL, 2000, p. 137)

In this way, BELL (2000) explains that strength and security of *Guanxi* for its members is the assurance that they can count on other members the moment it is needed. Participating in a network is a moral obligation that has to be complied with and not discussed. Chinese civilization cemented this value overtime and it is embedded in the relationships that are established.

In a further development of *Guanxi* concept, it can be said that it is an important informal relationship agreement between individuals that can be extended to business world and the set of relationships between companies and Chinese institutions. It implies social reciprocity and is based upon mutual feelings (*ganqing*) between two or more persons aiming at cultivating friendship and searching for personal benefits at the same time. In order to understand this concept more precisely it is necessary to point out to four essential terms concerning a broader concept of *Guanxi*: social relationships (*guanxi*), emotions (*ganqing*), favors (*renqing*) and face (*mianzi*) (NITSCH and DIEBEL, 2010<sup>[19]</sup>). *Guanxi* is established based on mutual trust. For the Chinese any important trust relationship between agents in the national economy is basically an issue of informal social relationships.

According to LUO YADONG<sup>[20]</sup> from Miami University the word *Guanxi* points to a kind of support through connections in order to guarantee favors in personal relationships. The term also expresses an elaborate and diffuse relationships' network which is cultivated by Chinese members' efforts and creativity. It has a code of ethics, it encompasses implicit mutual obligations, guarantees and understandings and it also rules Chinese individuals' actions regarding social relationships and long-term dealings (LUO, 2000<sup>[20]</sup>). The trust factor – *xinyon* in Chinese – plays a major role in building *Guanxi* relationship. Business is made with trustworthy individuals and there are no formal agreements or written rules. Those are applied if the business partner is not a family member or an element of the trust network.

SHENG (2008<sup>[3]</sup>) in his article about the experience of Chinese entrepreneurs in Brazil and the financial models based on relationships, relies on JACOBS (1979) to assert that, in the business scenarios, the stronger the *Guanxi* relationships, the greater are the chances for executives to reach their goals. If multiples *Guanxi* are interacting, these chances are also multiplied. JACOBS states (1979, p.262<sup>[21]</sup>) that:

Multi-stranded *Guanxi* bases increase the opportunities for social interaction. They also increase the feelings of commonality between the parties and make it easier for *ganqing* [appreciation] to occur. Multi-based *Guanxi* are closer and more consolidated and thus more resistant to deterioration than single-stranded *Guanxi*. Shared feelings make trust development easier.

According to SHENG (2008<sup>[3]</sup>) *Guanxi* has been viewed as one of the variables that explains success in development and growth of small and medium-size firms in China which, since economic reforms of 1978, have contributed to keep China's high rates of development and economic growth (GDP per capita medium annual increase of 8,1% ).

SHENG (2008<sup>[3]</sup>) explains that one of the success factors is that *Guanxi* through informal financing relieved lack of capital problems of Chinese small and mid-cap companies. Various *Guanxi* based financing models are used. Nevertheless is important to highlight that *Guanxi* can also be used in illegal transactions, bribe and cronyism. In this somber side of *Guanxi*, ways are found to circumvent the law, favoring members of society without merit considerations and encouraging the concession of favors at the expense of society. *Guanxi* network can be built wherever in the world to act in good or bad manner.

Differently from Occidental networking *Guanxi* involves other dimensions of social beings in building relationships. It takes time, living together and setting up trustful connections. It can be said that it represents some net worth. Building that network and counting on it can be a decisive factor for business as "doing business" is also making relationships. WEIDENBAUM and HUGHES (1996<sup>[22]</sup>) illustrate the issue with the example of relationship between ultramarine Chinese where, if any network member does not comply with ethical commitments his or her name is inscribed on the black list. This is much worse than being sued because the entire Chinese network will avoid doing business with the guilty member. On the other hand, transnational networks, for example, dealing with a specific foreign market can also contribute to consumer products' producers finding adequate distributors, assemblers, components' suppliers as well as helping investors to find joint-venture partnerships.

Networks create a circle of mandatory bonds and mutual help that can last for the whole life due to long-term return expectations. In his book *The Spirit of Chinese Capitalism*, REDDING (1993<sup>[23]</sup>) states:

Cooperation through personalistic networking appears not to have changed at all in structure or process, but simply in the identifying of appropriate members. *Guanxi* is as essential as it ever was. (Redding, 1993, p.236)

According to FERNANDEZ and LIU (2010<sup>[24]</sup>) *Guanxi* could be represented by a model of concentric circles: the core is formed by the family; the next layer is constituted by friends, coworkers and classmates. The external circle is made up by connections with precedent circles, i.e., by *Guanxi* of *Guanxi*. In the family circle loyalty and trust are fundamental elements and reciprocity is not mandatory. Reciprocity is stronger in the second circle – friends, coworkers and classmates – but not necessarily immediate. Favors' reciprocity will come in an appropriate occasion. In the external circle – *Guanxi* derived of inner circles – reciprocity is expected and as a general rule immediately. The strength that binds *Guanxi* together is the threat of exclusion. (FERNANDEZ and LIU, 2010).

### 3 Data and Methodology

#### 3.1 Historical background

It's important to present a brief timeline of Chinese immigrants coming to Brazil, in order to point out that there were various immigration flows having different characteristics and specific contexts.

The first records of Chinese immigration to Brazil go back to King Dom João VI in the beginning of Nineteenth century, when Portuguese Chancellor Count of Linhares designed a plan to bring Chinese to Brazil in order to satisfy the king's wishes of transforming Brazil in a tea supplier. It is believed that circa 300 Chinese came to Brazil at that time bringing tea seeds. (CHANG-SHENG<sup>[25]</sup>). Tea cultivation failed and Chinese immigration was only considered again as an alternative to slave labor by the occasion of slave abolition.

From then few Chinese came to Brazil to work in farms but, not in significant number (CARVALHO, 2009<sup>[26]</sup>).

The second Chinese immigration wave took place from 1870 to 1883. CERVO (2011<sup>[27]</sup>) highlights that should be stressed the establishing of diplomatic relations with China as part of Brazilian efforts to expand foreign policy:

Establishing regular diplomatic relations with China by treaty of October 3, 1881. A diplomatic mission to China was defined in 1879 and was led by Eduardo Callado e Artur Silveira da Mota had as initial objective to promote a Chinese immigration flow to meet the requirements of farmers suffering from growing shortage of slave labor force and from insufficiency of European immigration. (CERVO, 2011, p. 147<sup>[27]</sup>).

Although there was an open communication channel between Brazil and China, Chinese immigration flow to Brazil was not big. The last official attempt of Companhia do Comércio e Imigração Chinesa to bring Chinese immigrants to Brazil took place in 1883 (CARVALHO, 2009, p.131<sup>[26]</sup>). In 1900, a Chinese group arriving in São Paulo already came with working agreements with farmers as a result of Qing government – the last dynasty – actions to curb abuses against Chinese immigrants.

The major flow of Chinese immigration to Brazil occurred in the period from 1949 on, after the Communist Revolution of Mao Tse Tung and foundation of Popular Republic of China which led to a Chinese Diaspora in search of better opportunities in other countries including Brazil. This article is focused on Chinese immigrants coming to Brazil after 1950.

#### 3.2 Methodology

This article was written based on results of an exploratory research qualitative method with a case study, in which Chinese immigrants living in Brazil were interviewed (YIN, 2003<sup>[28]</sup>). YIN describes case study as “an empirical research that investigates a contemporaneous event in its real life context”. YIN also considers being valid a specific case study in the following situation:

“One rational form for a single case is when it represents the critical case in testing a well-formulated theory. The theory has specified a clear set of propositions as well as the circumstances within which the propositions are believed to be true”. (YIN, 2003, p. 40<sup>[28]</sup>)

The method consisted in performing a correlation between *Guanxi* and networks' theoretical fundamentals in order to identify the theoretical elements that are present in interviewees' experience. The content analysis method was used to analyze interview's content. That method is defined by BARDIN (2008<sup>[29]</sup>) as a set of communication's analysis techniques. According to LAKATOS and MARCONI

(1999 [30]) content’s analysis technique allows the content analysis of books, magazines, newspapers, speeches and personal documents as journals, interviews among others.

**3.3 Sample**

It is very difficult to gain access to Chinese individuals especially the elders and when the main purpose is to talk about their personal lives. For this article, Chinese individuals that came to Brazil after 1950 and are still living in the country were interviewed. Interviewees were selected based on referrals from other Chinese living in Brazil already connected to one of the authors. That was an example of a practical application of *Guanxi* as access to interviewees and their detailed narratives only was possible because of bonds of trust existing between some of them and one of the authors.

Nine persons were interviewed during six sessions. Nine interviewees represent a small portion of about 200 thousand Chinese living in Brazil. Nevertheless they have characteristics that make them significantly representative of the whole community: they come from different regions of China with specific local costumes and diverse dialects and their families have different professional occupations working in the industrial sector, commerce and services as well as performing religious and martial arts practices. All of them are members or co-founders of institutions whose objective is fostering business interchange and additionally preserving Chinese deeply rooted cultural heritage.

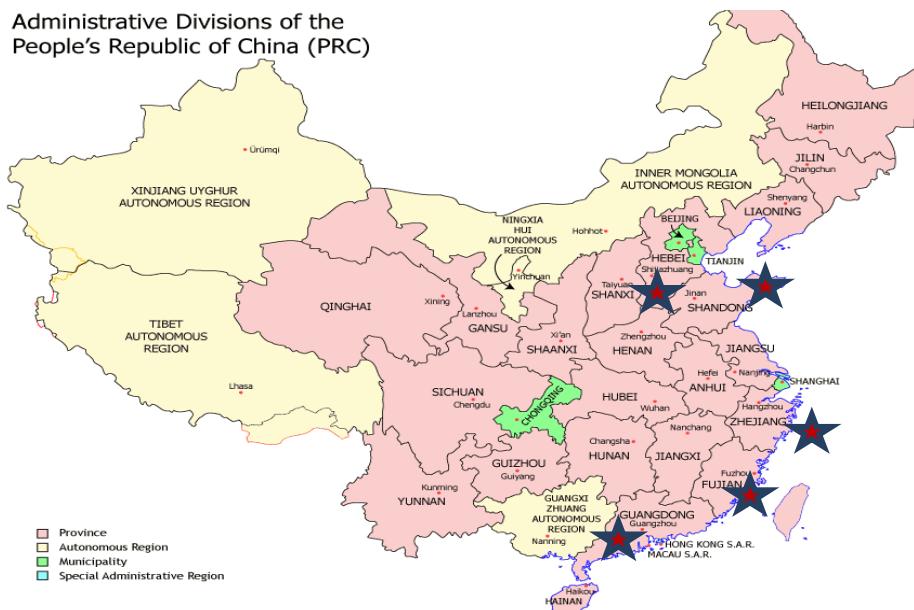

A brief script was elaborated for the interviews but, used only as a guide not disclosed to the interviewees that were free to talk following their emerging memories. Nevertheless, interviews were conducted to achieve the main target: obtaining details of their journey to Brazil, the development of their professional path after arriving in the country and the role played by *Guanxi* in these two very important aspects of Chinese immigrants’ life.

All interviews began with a “narrative generating issue” (FLICK, 2002, p. 110 [31]) in order to facilitate establishing a dialogue. The interviews were recorded and further transcribed. They were made in Portuguese with the possible participation of a son, daughter or a friend to help with the language only when necessary, as all interviewees have been living in Brazil for more than 20 years and are able to communicate in Portuguese in spite of some difficulties with the formal language.

The transcripts were analyzed after categorization of the answers in order to facilitate analysis and to make possible the presentation of the main points revealed by the interviews. Results are shown in the following section.

**4 The Interviews**

Interviewees came from various provinces of Popular Republic of China - Zhejiang, Hebei, Fujian, Guangdong e Shandong – scattered along Chinese east coast as showed in the following map:

**Figure 1 Administrative Division of the People's Republic of China**

Another aspect observed was the reason to emigrate often related to the difficulties of living in China - a very poor country in where the situation became more difficult after Japanese invasion in 1931 and political persecution during the regime installed by Mao Tse Tung in 1949. The exceptions in this case are made for two interviewees that came during the Cultural Revolution initiated in 1966.

The situation is described by some interviewees:

*Because things were very bad; in the middle of a war how you can sow or harvest? It was impossible; there was war every year; people running out, in caves, to save themselves (Interviewee 4)*

*At that time China was an underdeveloped country, feudalist, one war after another; thus it was a practically finished (devastated) country, made poor; so, leaving it was a dream of thousands of Chinese that wished to leave the country” (Interviewee 3).*

All interviewees came from big families of farmers or merchants. That situation is made clear by interviewee number 1:

*...at that time, as it was a small plot of land, a lot of people were relatives or friends, then, you know, one gives reference to the other and so on, and many people went to France, or go to the Netherlands. Then, today in France there are more than 20 thousand fellow citizens there, in the Netherlands there are more than 10 thousand, in Italy 20 thousand, and in Spain more than 80 thousand. So adding up there are a total of 200 thousand people or more from my town outside China, outside my town, and there are 200 thousand people in my town, that is, half its population is outside China” (Interviewee 1)*

All interviewees had important family ties with Chinese that had already immigrated to Brazil. They were helped with transportation (air or ship tickets, documents, passport, visa), with food and lodging in Hong Kong (exit door from China) and also with their reception when arriving at Brazil, hosting the newcomers and helping to get the first occupation. All had support from their families and their connections in Brazil, exception made for one interviewee whose parent had already immigrated to the United States and promoted the son's trip to Brazil as a step to a further meeting with his father in the United States. This interviewee had support from a Chinese middleman in Brazil paid by his father but, as he was charmed by Brazil, he decided to definitely establish himself in the country.

*During revolution and war you didn't have documents; you had to use connections, referrals as well as advice and orientation from other people.*

*He needed money and he didn't have it. After hours the church mate called, gave him an envelope, he opened that envelope and there was the Money his family needed to pay for the tickets to come. Then they came to the border that had to be crossed, there were acquainted people there, on both sides, which brought him and the customs' officers pretended not to see them and the whole family could pass (Interviewee 4)*

Another deposition clearly shows that when a Chinese immigrant succeeds, he or she brings other family members to Brazil:

*... My grandfather came, after that my father came, after came my brother and then came me and my mother. Then, for instance, I marry X; X starts to bring her family here; my brother married my sister-in-law and she already wanted to bring her mother, her brother, so, I mean, family starts to grow and grow. Thus, friend always brings friend, relative brings relative and in this way they grow stronger, creating even more roots. (Interviewee 3).*

*They are like ants, all, one goes out and calls for the others. One comes here, sees that there is hope and goes back there, searching. Chinese maybe have that, what you called, a culture of one calling for the other, helping. When my aunt came here there was already another Chinese.... (Interviewee 5).*

Even having a profession in China, many Chinese immigrants started from scratch a new career in Brazil taking lower paid jobs and doing whatever was available at the moment. They worked at pastry shops, they walked through the streets selling lace handcraft, and they made small slippers and ornaments for Christmas' decoration at home. Taking an immigrant couple as an example, he an engineer who came to work as a draftsman at an automobile wheel industry and she, a university professor, who became an English private teacher being paid below her qualification. But they still manufactured Christmas ornaments to increase family income. Two priests welcomed by Brazilian Catholic Church were the exceptions.

*Here, when I was nine, ten years old, I was already working to help my parents; my elder brothers were also working and studying. For that reason my eldest brother is already gone. There are four left and we had to survive and we worked almost all the time besides school, the spare time was used to make slippers.*

*At that time there were many pastry shops that needed people to do the job. When Chinese came they didn't speak Portuguese, wages were very low, we worked too much, that's because it was a low*

*paid job, workers were not registered and pastry shops' owners needed people. As they couldn't hire Brazilians they hired fellow citizens. And then, fellow citizens started his life that way. (Interviewee 7).*

Reports show family union and support together with community and Catholic Church support as leveraging their capacity to cope with difficulties.

*My uncles left (Honk Kong) and came to Brazil. They said to my father: "look, if you want to come here, you can come because we are here and it's much better than Hong Kong". Then my father said: "OK..., but how can we go to Brazil?"*

*Money came, brothers sold things, pooled and gave money and he bought a one way ticket for the entire family. He hasn't got the money for the return tickets"*

*My father came here and first thing was overwhelming difficulty, the only relatives they had were my uncles that lived here" (Interviewee 4).*

*That means, they are people that came in a dire situation and they helped one another survived and followed different paths...*

*... In each ship came 10, 15 families... each family that came was backup, supported and they sought one another and Church was the best place for that task. At that time people convened at the church with that feelings, with no intentions, no one was thinking of getting rich, no one thinking about ideology, everybody was seeking for support.*

*When people go outside their mother land the safest thing is getting support, I don't know if you understand, if you went through this. (Interviewee 4).*

*When you are an outsider, that means, you don't have a network or connections, and then it really becomes more difficult. You want to succeed, is evident; you got the means, of course. The temple is a good place, you go to pray together, talk about Buddhism; you go to the association to talk about the relation Brazil-China, you want to contribute with it, yes, but I want to say something: it is always proved by actions and not by your behavior (Interviewee 3).*

The speech of Interviewee 3 makes clear that is not enough going to church or to the association to establish a network connection. It is necessary to act in a way that proves your good nature and that gains other members' trust. That aspect is clear in the following observation from the same Interviewee:

*Trust is not bought, one has to conquer it, and then always through your actions and behavior you will prove that you are a person of good nature, that you are a trustworthy person. So, usually people talk: "Chinese are suspicious..." but, once you are trusted you can get everything, I think that's the way it happens. (Interviewee 3).*

Two were the immigrants' main sources of financial resources: hard work combined with minimal consumption and loans provided by their fellow citizens to start commercial ventures.

*They do that kind of consortium... it's not a kind of consortium, I have to use a more precise word, it's a pyramid scheme. Everybody pools some money, 24 installments. If each one gives 1,000 Reais it adds up to 24,000 Reais. 24,000 are enough to support something. And then the group gives this 24,000. First month it goes to me, second month to you, and so on and so forth.*

*[HUEI] Everybody used and everybody needed. It works even today. If one needs he does a HUEI with his partner. Today I need capital, let's say 100,000 Reais and I don't have those 100,000. So, I know S..., I know you, I know another person and then I organize the consortium.*

*... It's Always that: if one needs money, consortium. (Interviewee 7).*

*... Those that came from Shanghai don't use it much but, the peasant, the Taiwanese, use very much. That's very common: if you need money, you go to the consortium. (Interviewee 1).*

Another example of community support is shown by the statement of two interviewees; priests that, at a point in time, needed to build a church and sought support from Chinese immigrants, of which only 30% were catholic:

*In the mean time I had found that land plot but, without money, how to do it? And then, one day, I thought: "How can we make all this?" So, I thought of collecting money from the community and start doing it.*

*... At the time that would cost 68 million of Cruzeiros. [The priests requested a monthly installment to the donors]. Paid in installments, every month I went there to collect a little. At the end of two years I had got 113 million. With 68 million [they paid the land plot] and the rest went to the construction.*

*...money came from [Chinese] community. Back inside there is list, that list shows the contribution of the benefactors. (Interviewees 8 and 9).*

In spite of initial activities, badly paid and characterized by intense workload, all of them in some way achieved a stable financial situation. All of them developed commercial or industrial activities becoming successful entrepreneurs, exception made to a couple that was able to perform the same

activities they made in China. Although supported by the Brazilian Catholic Church, the priests had the initiative of structuring the Chinese Church in Brazil that was successful with the support of the community in spite of difficulties.

An example of entrepreneurship is given by the father of interviewee 1 that came to Brazil to build a factory to his uncle. He worked for him during one year after which he decided to quit because he perceived that he would not be able to bring his family in the short-term. He then started a new import and export venture supported by a friend (a rich Chinese immigrant) that lent him the money. He had come up with new opportunity in a different sector while working in his uncle business.

*He quit and needed to bring his family but, he already brought lace, tablecloth and china from China that than came as luggage. And then the rich man says to him. "OK, I trust you because I know you are competent. I will not lend you 2,000 but, I'll lend you 10,000, therefore you can buy your merchandise and everything but, I have a share. 10% are mine. So, my dad made the calculations and saw it worked. He bought the merchandise and his uncle bundled the goods and sort of make importing official. At the same time he started to deal with ... [other business] and was able to export. And then he began to work like this.*

Other example of Chinese entrepreneurship is shown by interviewee 3 depositions that went through ups and downs ever coming back to business:

*[After a period when the entire family sold Chinese lace on the streets...]. And then things evolved and [his father] bought the first [store] for my mother, after that my big brother bought another one, and then I also bought, and then my kid brother bought. So, we bought four stores in the same mall selling almost equal things. From there, long after I had made money from the store I set up a company and I bought things at auctions, I made a lot of money. I was young, thirty and something. (Interviewee 3)*

After losing everything in a business setback he came back to business:

*And then, you know, and then I lost and came back selling on the streets not anymore Chinese lace but, selling perfumes, watches on the streets, so I got some money selling on the streets for 6 months and set up a company [electronic products], I started to import several products and now I'm importing machines [heavy equipment]. (Interviewee 3).*

Besides the material success achieved by the interviewees, they also had defined as their main target educating their children allowing them to enroll in the best universities. As a result, all their children graduated in excellent universities. Some depositions that reinforce the importance of education are shown below:

*As they came with nothing, most of them came with nothing; they gave education to their children: "you have to study". And then in the decades of 1950 and 1960, maybe 1965, you looked at the newspapers, looking for the college qualifying tests, and the best ranked students were all Chinese.*

*... Everybody has to qualify for USP, the parents said, as they didn't have money. "You go studying day and night and you will pass the qualifying test for USP because I can't pay for a private college and you, to have a future, will have to study". And they, the boys and girls studied day and night and in all areas, you can go there and see, the first three ranked students are all Chinese". (Interviewee 3).*

*... Precisely because Chinese families know how to value, during difficulties, everybody, it doesn't matter if he is a Christian or not, but she comes in a very difficult situation and here she can find abundance. Look, you have to study, you have to learn, you see, this is a wonderful country and there are children graduating from GV. Here in Getulio Vargas, in the 80's, from 100 students 50 were Orientals... That is Chinese blood. The best school, the best school. Everybody has to go to the best school. (Interviewee 4).*

Chinese in Brazil performed also other activities that were always connected with social functions like cultural and social centers and the church. Some of the interviewees and their descendants founded those institutions and others preside or have presided Brazil-China chambers of commerce. Presently there are more than 30 chambers of commerce founded by Chinese coming from various regions and that convened to get mutual support. Chambers are not subsidized and don't have ties with the government of Popular Republic of China. They are private initiatives aiming at fostering commercial, social and cultural interchange between immigrants and the regions they came from.

*There is always a cultural Chinese center and people go there when they come and are searching for business opportunities, a palace to live, where they can...*

*[the center] used to help those that first came. They all went to that cultural center (interviewee 1).*

*In truth those associations exist also to meeting people of the town, talking about the land, to remember and relieve nostalgia; one help each other, It's a sort of mutual help among the fellow citizens only. That's the reason for more than 40 associations. But, there is the Chinese Association of Brazil that*

*coordinates all those regional associations” (Interviewee 3).*

Finally, the most important aspect, the issue of networking among Chinese appears in various depositions making clear that being connected is essential and fundamental in their lives.

*...”Because they come from my land and so they come already connected; they are already part of the network” (interviewee 3).*

One of the interviewees clearly states the importance of trust in building strong connections and generating a new network tie, as already mentioned in “Theoretical Framework”:

*In China they always say: trust is not bought; trust is conquered. So you can see through various jobs and acts; you can see if a person deserves your trust or not.*

...

*And then the guy gives credit to you. They see that you don't have money and they have that cooperative spirit, for the sake of fellow citizenship, for the sake of the Chinese outside China. There were few Chinese here, you see, and when we saw a Chinese that still spoke Chinese we thought: He is like me; it looks like a friend, a relative. Immediately. Because it was very rare a Chinese meet another Chinese here in Sao Paulo. That is a kind of solidarity feeling to a fellow citizenship, because they have the same nationality. And then to talk on behalf of China becomes easier. Once trust is thus established it is spread to the whole family.(interviewee 3).*

There are two additional key elements for *Guanxi* operation: informality and the discipline of wrongful conduct by other network members:

*Ah, they don't fail. Because if you fail you lose your credit, you lose trust, you see... And then there has never been a contract, a sole note is valid. They gave you X, you keep the note, an informal notation. All is trust; all is a matter of trust.*

*So people that, for instance, did bad things, to someone, or some guy that is doing evil; those associations together can call him to see if anything can be done against those elements wrongdoings. And so it's a network, an association that defends Chinese community life's interests, but not only that, it also maintains the culture and the good customs of Chinese life. (Interviewee 3).*

## 5 Results

At the beginning, Chinese interviewed were reluctant. As one of them said, they are suspicious. After understanding the objective of the interviews, many felt at ease and ended telling many touching details of their lives. There was not any attempt to romanticize or circumvent difficult situations of life they had to tackle.

The interviewed Chinese showed some difficulty in understanding why to study *Guanxi*, as for them “being connected” seems to be a fundamental aspect of “living in the world”. The existential issue and the role of network in their lives seem to be something inherent to life and not mentally elaborated. Relationship network seems to be considered a natural element of their lives. They ALWAYS can count on other people willing to help them at difficult moments. And they will do the same to help people needing their help. As far as family and close friends are concerned – the core of *Guanxi* concentric circles – that is a moral obligation (part of Chinese basic values) regulated by Confucianism.

Confucianism considers the family as the logical starting point of moral development (FERREIRA, 1968<sup>[32]</sup>). This important feature of Eastern Culture makes working in family easier as all the members are united to achieve a common goal, that is, to obtain financial stability. The interviewees do not show any kind of consumerism pressure from the children or their parents, all of them aiming at the same objective.

*Guanxi* is fundamental for people to set their professional activities in the market. Individuals help one another in getting a job and they do not care starting from the bottom, as they believe in the strength of their work and in discipline to achieve their goals.

*Guanxi* is established even when there is not a direct referral. There were two situations where a bond was created by the single fact that the individuals were Chinese and both were living in a new country. Help was offered without solicitation but, only after a probation period of daily interaction and the assertion that both parties were trustworthy. Even if help was not accepted, a bond was created and it can be activated in the future, if necessary.

This survey was motivated by the interest in knowing how Chinese immigrants were supported in Brazil by their networks and in how those networks worked. All the interviews revealed an entrepreneurial spirit and all individuals got over suffering, financial duress and the pain inherent to the situation of leaving their country. They arrived in a new and unknown land and were able to build their

careers and/or enterprises with results far beyond those that could have been imagined and no sign of regret or self-pity for the dire initial situations was perceived during the interviews.

*Guanxi* is not an entrepreneurial catalyst but, it was detected that it is a valuable instrument for those who want to start a new business, providing some facilities as prioritizing supplies, providing longer term credit and referral or appraisal to other businessmen. By means of *Guanxi* a series of complex commercial transactions could happen, notwithstanding the bureaucratic hurdles usually in place in a country like Brazil, waiving written agreements, formal guarantees, banking loans and many other conditions that an immigrant in the same situation of the researched Chinese could not cope with.

It is possible to understand the significant value of networks but, besides that, how they are established in all instances of life. For Brazilians doing business in China or with Chinese coming to Brazil it seems to be of paramount importance acknowledge that business for the Chinese are first of all relations. Relations to endure must be based on trustworthy “acts and attitudes” which take time to be proven credit worthy and longstanding. That is a very different custom from the Occidental short-term oriented, legalistic and formal tradition.

Investing in longstanding and mutual advantageous relationships between companies and entrepreneurs both Brazilian and Chinese assumes acknowledging those aspects which are determinant nevertheless intangible.

Since the last decade a growing number of Chinese companies has been establishing in Brazil. In the same way, an increasing number of Brazilian companies have been doing business with China. The crescent Chinese insertion in global markets and specifically in Brazilian market make even more important to understand Chinese approaching to business relationships. That understanding is fundamental to establish advantageous and longstanding business relationships.

Since the global economic crisis of 2008, China has been aiding economies in difficulties, including Latin America and Brazil. This is the key to explain the big resilience of that region so far. A Chinese slowdown can bring big difficulties to Brazilian entrepreneurs. Knowing how to establish trustworthy relationships based on mutual cooperation can be the key success factor to maintain Chinese and Brazilian companies dealing in harmony in the long run.

## Research on Management Mode of the Scientific and Technological Innovation Platform

Zhou Yanmei

School of Economics, Huazhong University of Science and Technology, Wuhan, P.R.China, 430074

(E-mail: zhouyanmeimay@yahoo.com.cn.)

**Abstract:** The existing research on scientific and technological innovation platform paid little attention to the influences of the game of the government, enterprises, universities and research institutes who construct it. This paper aims to study the management mode of the government-led scientific and technological innovation platform. At first the management characteristics and status are analyzed. Then the existing problems and causes are revealed. At last recommendations to optimize management mode of platform are proposed. Five suggestions are given to optimize the management mode.

**Key words:** Scientific and technological innovation platform; Management mode; Game; Optimization; Common technology

### 1 Introduction

Scientific and technological innovation platform (hereinafter referred to as innovation platform) emerges as innovation vector to solve the common technology needs of the industries. It is an important component of national innovation system and the element support system to serve the social scientific and technological progress and technological innovation. It will meet the common technologies needs of enterprises to some extent and can play an important role to enhance the competitiveness of national or regional industries. It will play a major role in promoting the development of the regional pillar industries.

Research joint venture (RJV) in Europe and the United States is a form of innovation platform as we concerned which is constructed by the government, universities, research institutes and enterprises (Y Caloghirou, S Ioannides, N S. Vonortas, 2003) collaborative R&D organizations. But most RJV are constructed by the enterprises, the related studies also focused on the form of R&D organization, which is only one type of RJV. Less attention was paid to the government-led innovation platform. The rise in building innovation platforms in China was from the 90s of last century, (mostly government-led), theory began to pay attention in recent years. There were the following two aspects about research on the management mode of innovation platform. First, it was to explore the ways of construction and organizational model of innovation platform based on common technology of industry from point of view of participants. Secondly, it was to design operating systems of platforms with multiple views. Although the theoretical study on the innovation platforms gradually increases, there is rare study on the influences of the management and development of the innovation platform caused by the game of the participants because of a late start. It's still lagged behind the practice of innovation platforms. This paper reveals the existing problems of innovation platforms based on in-depth analysis of the current status of the management model. Policy recommendations are provided for standardized management and it's helpful for construction and development of the innovation platforms in China.

### 2 Status, Problems and Causes of Innovation Platform Management Mode

There are diversified forms of organization about innovation platforms, but overall, 'government-enterprise-university-research institution' innovation platforms are a large proportion in all innovation platforms. Co-management by multiple management bodies is the main mode of these innovation platforms (figure 1). The contents about management are different with the main parties to manage. And there are differences in management style, too. Such management mode has its advantages, but there are coordination issues.

**Figure 1 The management structure of the innovation platform**

**2.1 Management status of the innovation platform management mode**

There are multiple management bodies on one innovation platform, the contents of the management are different. The management styles are different because of different management bodies.

**2.1.1 The management contents and ways of the government**

The government’s main role is to organize and communicate with investors, invest in the platform and create policy environment about the management of innovation platform, such as making the overall strategic plan for the development of innovation platform, designing the annual plan and budget for building innovation platform; managing application and approval, monitoring and inspecting the process of building, evaluating internal management system of innovation platform, coordinating between the leading construction unit with other participants and so on.

The management way of government is as follows. First, the platform is regarded as a public institution, but it is operated as an enterprise. On one hand, public services should be delivered by the innovation platform, on the other hand, it’s promoted to establish the market mechanism gradually and is asked to have the ability of self-survival and development. Second, policy environment is provided mostly by science and technology management department. From the practical point of view, the existing policies and regulations about establishing the innovation platform are more confined to science and technology management department. Third, the innovation platform is managed by many government departments. There is hardly cooperation about innovation platforms because of the diversification management of the government.

**2.1.2 The management contents and ways of the enterprise**

Enterprise is the main investor for the building of an innovation platform. Capital management is enterprises’ main job during the construction period of the innovation platform. After the completion of the innovation platform the major management task is the allocation of resources, convergence management of market operation and R&D, transformation of scientific and technological achievements. The way of an enterprise to manage depends on the company's position in the innovation platform. If the innovation platform is affiliated to the enterprise, the innovation platform will be integrated into the overall development of business plans, and the operators of the innovation platform will be selected, the performance of innovation platform will be monitored, revenue will be accessed and so on. Otherwise, there is a relatively loose contact between the innovation platform and companies. The purpose of the company is the access to common industrial technology.

**2.1.3 The management contents and ways of universities and research institutes**

There are two main aspects with management of universities and research institutes in innovation platform. One is to manage the inputs of the objects, such as asset management, including the shared use of research and development equipment, transfer and utilization of patents, technology, methods, information and other intangible assets. The second is to manage people who are delegated by universities and research institutes. It’s needed to determine standards for selecting talents, ways for personnel station, incentive and allocation mechanism.

The way to manage is relatively simple about universities and research institutes in innovation management platform. They are mainly involved in council decision-making, coordination with the government about development issues of innovation platform, management of intangible assets and tangible assets, assigned the management team to innovation platform and so on.

**2.2 Problems and causes with management in the innovation platform**

**Figure 2 The management problems of the innovation platform**

**2.2.1 Problems and causes about coordination**

First, the objectives and orientations of multi-management bodies are uncoordinated. As a leader in innovation platform construction, the government tends to make innovation platform provide common

technologies for the industry. Although universities and research institutes are public services, they continue to explore the marketization road under the present conditions of market economy and hope to get more market opportunities and project resources by innovation platform. Enterprises mainly ask for technical support. It can be seen that the objectives and orientations of the three are different. The difference would be reflected in the management mode of the innovation platforms (such as the location, business structure, incentive mechanism and the the distribution of benefits of the innovation platform, etc.). Thus the lack of coordinated management is on innovation platform.

Secondly, the government's multi-management is difficult to coordinate. Construction and development of the innovation platforms is in need of cooperation of financial, planning, land and resource ,fire and building departments. In recent years the innovation platforms developed rapidly. If the management of the government was not in place, it's likely to produce negative phenomenon which is not conducive to the development of scientific and technological progress as well as to the innovation platform, such as repeated construction, vicious competition, and waste of resources.

Again, company affiliated by innovation platform conflicts with other companies in the industry. It should be noticed that there is hidden problems when the innovation platform is affiliated to the dominant firm of the industry. The profitability nature of enterprises contradicts the nature of public service of the innovation platform. In the market economy, the business goal is to maximize profits. In order to achieve this goal it appears fierce competition among enterprises within the industry. Although innovation platform affiliated to company is asked to provide the public technical, technical disclosure of the business and technology fair use issues will inevitably be worried by other companies.

#### 2.2.2. Problems and causes about financial support

Financial support for innovation platform is difficult to meet the needs. Financial funds are invested in the projects of the innovation platform. But the project income is insufficient to cover the research costs. It affected the normal operation and sustainable development of innovation platforms. And R&D in projects is difficult to take into account the sharing of common and forward-looking technology. It is not conducive to industrial generic technology innovation.

#### 2.2.3. Problems and causes about obtaining stable income

There are three reasons for the innovation platform to obtain a bad stable income. First, the personnel structure of the innovation platform is irrational. As the management mode has not really been established, there still exists the phenomenon that technical personnel are valued and management talents were ignored in the personnel structure. It will influence the business development and overall operation. Secondly, the business model is difficult for the innovation platform to get stable income. Compared to enterprises who produce and sell products continuously and can get more stable income, research and development is fundamental survival for innovation platform, while the R&D activities are often based on the project and are non-continuous breakpoints state, and received income is not stable, so the development is hard and not smooth. Again, it is the dilemma to make R&D the main business to operate for innovation platform. The innovation platform is essentially a common technology research and development institutions with the public nature. But also it is given an arduous task to get the hematopoietic system by enterprise operation. It is beyond reality, because the public nature determines the inherent problems of unstable income for the innovation platform.

### 3 Ideas and Policy Recommendations to Optimize Innovation Platform Management Mode

Previous studies stated clear that promotion of the common technologies was impacted not only by market failures, but also by organizational failure. From the analysis of this article it can also be seen that inter-organization failure constrains to promote the development of common technologies. That means that it will make loss because of different objectives of the management bodies building the innovation platform. How to supply the generic technology effectively? That is the problem to be solved with the management mode.

#### 3.1 To establish mechanisms of loose management and free development

We propose that the government and the universities and research institutes should be concerned about the long-term development of the innovation platforms. Specific management functions of the government and the universities and research institutes should be weakened, and functions with supervision, performance appraisal and other services should be strengthened. The focus is on designing and making use of management system of the innovation platform. The innovation platform is operated

as an enterprise. So the management of the innovation platform is directly responsible to the council, rather than a particular administration body or a subordinate unit.

### **3.2 To establish mechanisms of recruitment and incentives of the core staff**

The main risks of the innovation platform are financial risk and reputation risk, and the government takes the main responsibility of the risk as an investor. From the sources of risks, the government is not the party to arise risk unless there is improper risk control; the universities and research institutes as parties to build the innovation platform, they will not take the initiative to create risks because of constraints of responsibility and moral. The risks are most likely to take place in the innovation platform itself. It's from the not due diligence team leader. To sum up, the key to improve management mode is the platform leader. The core is to manage the leader with a scientific and effective way. The scientific decision-making way is needed on mechanism of appointment and incentives.

### **3.3 To establish mechanisms of multiple coordination**

First, the relevant government departments perform their duties based on division of labor. The aim is to form a joint force to develop the innovation platform. It's needed to break down the situation of departmental isolation and low efficiency. It's to make plans and manage with a unified method with existing resources. The innovation platforms should be managed, directed and guided to the healthy development road with rational distribution of government resources,.

Second, the common technology must benefit the industrial enterprises fairly. The relevant rules about developing and using the common technology must be made. The aim is to benefit the majority of enterprises, rather than being a tool for monopolies for certain corporate.

Again, it is needed to establish coordination mechanisms between the innovation platforms. The purpose is to integrate the distributed innovation platform resources and make them share with the innovation platforms in order to set up better docking for the innovation platforms and the enterprises.

### **3.4 financial supports for the innovation platforms should be divided into two stages**

At the operational level, according to the principle of "best configuration of limited financial resources" it's suggested that the government change the way to support the innovation platforms in the constructing stage as primarily (or only means) practice in the past. The method is to adjust the policy orientation. It's to support the innovation platforms with fund from "start-up money" to "development fund". At the start-up stage, the government invests part of the capital into the innovation platform. If the innovation platform was in good working order after two to three years, the government invests will invest more capital into it.

### **3.5 Try to implement the "one platform, two systems" model**

It's suggested that two level institutions should be set up in the innovation platform. The first level is the administrative agent (registered at civil affairs bureau). It's still in the nature of the administrative units. The main task is to construct and operate the innovation platform. The second level is the enterprise institution (registered at bureau of industry and commerce). It is a subordinate enterprises founded by the innovation platform as a public platform. The main task is to construct and operate the venture platform (or transformation of platform). But two platforms are relatively independent, and the enterprise has independent legal person qualification and property rights.

## **4 Conclusion**

There are multiple management bodies on the innovation platform, and the contents of the management bodies are different. The management ways are also not the same with many management bodies. There are some problems with management modes. Such as coordination problem, insufficient financial support for the innovation platform, bad profitability functions and so on. It is needed to establish mechanisms of loose management and free development, to establish mechanisms of recruitment and incentives of core staff, to establish mechanisms of multiple coordination, to divide financial support for the innovation platform into two stages and try to implement the "one platform, two systems" model and so on.

# Collaborative Innovation Ensues Innovation Through Pastiche

Harry Fulgencio

Leiden Institute of Advance Computer Science, Leiden University, Leiden, the Netherlands  
(Email: [harry.fulgencio@gmail.com](mailto:harry.fulgencio@gmail.com))

**Abstract:** One of the means to address societal challenges in the European Union is through social innovation programs and through increased call for collaboration amongst public and private entities. This paper presents a theory that innovation through *pastiche* is an unacknowledged trend in the field of collaborative innovation. As suggested by the researcher, Living Labs are “a human-technology interaction innovation entity utilizing a mix of methods, tools and principles drawn from known disciplines (design, science, etc.), set in a real environment and in a locale/societal scale” for the purpose of social innovation and finding business opportunities. The researcher analyzed related publications of articles within 2005 – 2011 and analysis were made as a practice and not per Living Lab. The researcher concluded that collaborative innovation as observed in the Living Lab, results to a pastiche of best methods working together towards innovation with a collaborative consensus among multiple founding actors.

**Key words:** Collaborative innovation; Innovation through pastiche; Pastiche method; Living Lab

## 1 Introduction

Firms are now collaboratively innovating<sup>[1]</sup>, globally networking and public-private partnerships are becoming crucial elements in companies' innovation processes and in addressing environmental and societal challenges through user involvement and co-creation<sup>[2]</sup>. Societal challenges are considered to be “wicked problems”<sup>[3]</sup> arising from the social realm and needs to be addressed through social innovation. Social Innovation (SI) is “the process of inventing, securing support for, and implementing novel solutions to social needs and problems”<sup>[4]</sup>. Social Innovations then are “new ideas that meet unmet needs”<sup>[5]</sup>. Governments around the world now support SI through collaboration, e.g. Social Innovation Europe<sup>1</sup> (SIE – supported by European Commission) sponsors and presents the different initiatives of 32 countries; USA has the Office of Social Innovation and Civic Participation<sup>2</sup> (SICP) aimed at sponsoring and developing community solutions and new models of partnership; UK's Big Society Capital (BSC)<sup>3</sup> aims at “developing a strong, diverse and sustainable social investment market” enabling organizations to tackle social issues through social investment; and a more futuristic program by the European Commission's *Europe 2020 - Innovation Union Lab*, setting a goal for “more jobs, improved lives, better society”<sup>4</sup> with thirty action points to address. There are also initiatives by non-government organizations in cooperation with private firms such as China Social Innovation Foundation, The Young Foundation, Social Innovation China (SIC)<sup>5</sup> for meet up with entrepreneurs similar to TeD Talks which has different segments. What the trend suggests is that Social Innovation as well as inspirational platforms for innovation is regarded to be a collaborative endeavor, whereby the norm of top-down is supplemented with a bottom-up approach in the hope of mobilizing everybody.

*“The Bottomline is clear: Solutions to America's challenges are being developed every day at the grass roots - and government shouldn't be supplanting those efforts, it should be supporting those efforts.”*

~ President Barack Obama, 30th June 2009<sup>22</sup>

The researcher focused on the study was to elicit the methods used in a collaborative social innovation project. Methods are defined as procedures for data collection, evaluation or experimentation, idea elicitation and techniques utilized during the planning or execution of the project. The setting is the practice called “Living Lab” (LL). It was given preference due to the close affiliation and reputation in engaging a specific locale/society or a group of users or consumers, whereas compared to other innovation projects LL are more considered to be open to public.<sup>[6: 7]</sup> Innovation projects that are LLs were analyzed for

stakeholders or partners involved in the project and the methods used. The results presented are part of a broader research regarding the Living Lab phenomenon previously studied by the researcher.

## 2 Literature Background

The discussion below presents collaborative innovation and its role in advancing societal issues, a discussion of mix of methods approach or innovation through pastiche method towards innovation, and comparing this to the LL setting. In a separate article by the researcher, Living Lab was defined as “a human-technology interaction innovation entity utilizing a mix of methods, tools and principles drawn from known disciplines (design, science, etc.) and set in a real environment and in a locale/societal scale. In addition, Living Lab operates in a “multi-” mode that is evident in its multi-stakeholder, and multi-discipline nature which eventually leads to a multi-method approach, and is often implemented multi-culturally for internationally collaborated Living project. The phenomenon is within the context of innovation and has multiple applications. Performing a keyword Google search on July 2012 for the keywords “mixed-method innovation” results to four links; while “pastiche method innovation” yields no result. However, a working article by Robert Porter Lynch entitled *Architecture of Collaborative Innovation* states that “Innovation” is a “fragmented pastiche of methods, allusions, processes, frameworks, tools, and techniques.” His observations resonated strongly with the researcher’s point of view; but whereas Lynch describes the situation, the researcher provides data to prove that Collaborative Innovation results to pastiche method for innovation

The manifestation of multiple stakeholders collaborating for innovation and usage of different methods during the LL project execution will be elaborated on this paper. With this in mind, discussion about collaborative innovation and social innovation requires some elaboration. Collaborative innovation is enabled by the lowered cost for doing collaborative research and development<sup>[8]</sup>, and growth of network relationships among businesses. Collaborative Innovation with customers is increasingly essential for development of new products and services<sup>9</sup>. The term Collaborative Innovation is a common lingo in businesses but there is little research highlighting this in the field of Social Innovation which is a paradox, because it is pretty much the norm in dealing with societal challenges. Christensen, et al.<sup>[10]</sup> suggest supporting catalytic innovations, defined as “low-cost and simple but useful services for people whom traditional social sector organizations ignore” for a progressive society. Social innovation has been increasingly shorthand for the approach public-private partnership (PPP) and adds more to it by transforming public services by tapping people in the private sector, especially social entrepreneurs<sup>1</sup>. The continuing paradigm shift has also influenced the firms to do collaborative innovation with customers.<sup>[9; 11]</sup>

Initiated projects engaging on a specific locale users has chosen the “Living Lab” concept as a means for social innovation in rural areas<sup>[12]</sup> to serve social needs in a sustainable manner<sup>[12]</sup>. Arguably there is no denying that Living Lab tries to tackle societal issues collaboratively, however researchers produced few research describing methods used in operating a collaborative innovation in the field of social innovation. Literature regarding the principle of mixed method research approach is suggested to have a “methodological pluralism or eclecticism, resulting to a superior research as oppose to mono-method research.”<sup>[13]</sup> Pastiche method for innovation as a metaphor representing the varied carefully amalgamated methods used in an innovation project, to avoid confusion the mixed-method approach was not used as the term has strong links to research but lacks the affiliation with innovation. The researcher will try to explain that collaborative innovation thrives due to the openness to assimilate other forms of methods or “innovation through pastiche” and one example for this study is the Living Lab.

## 3 Data and Methodology

Data was mainly drawn from articles through comprehensive search on scholarly works engines. The qualitative nature of the data gathering was helped by qualitative analysis of Strauss and Corbin<sup>[14; 15]</sup>. The articles are a rich source of data for the study as it elicits all the methods used to carry out the project. The researcher evaluated relevant scholarly publications and conference material between the years 2005 to 2011. Published articles included scientific journals, IT journal, conference paper proceedings, and books. The articles were gathered on November 2011 to December 2011 and resulted to 268 articles, using ACM, EBSCO, Google scholar, IEEE Digital Explore Library, Mendeley, Piccarta,

---

<sup>1</sup>The Economist, 12 August, 2010; Social innovation: Let's hear those ideas; <http://www.economist.com/node/16789766>

Sage Journals, Science Direct, Springerlink, Taylor and Francis and Web of Knowledge. The search has been exhaustive and was representative of the publications. The keywords used were “living lab approach, living lab, living labs, living laboratories, and living laboratory”. Methods are defined as procedures for data collection, evaluation or experimentation, idea elicitation and methods utilized during the project operation and execution.

**3.1 Data Analysis**

The methods that were used hand-in-hand are: principles from grounded theory approach as explained by<sup>[14]</sup>, and qualitative data analysis <sup>[16]</sup>. Grounded Theory is defined as theory derived from data systematically gathered and analyzed through the research process. Techniques, such as open coding, memoing, axial coding, theoretical sampling and others were used to come up with a sound analysis of the phenomenon. Memoing is defined as the process of the researcher recording analysis, thoughts, interpretations, questions and directions for further data collection. Coding is done by identifying the most important keywords with in the paragraph or block of data. It can be done in vivo (informants/interviewees words), or in concept (the researchers own interpretation). In generating concepts, questions such as who?, why?, how?, why this way? and when?, were asked while looking at the data<sup>15</sup>.

**4 Results**

The discussion of the results will be in two parts one for the general results from the 64 LL which were defined with the aid of the 107 articles combined together with the interpretations of the eight interviews.

**4.1 Utilized methods/techniques**

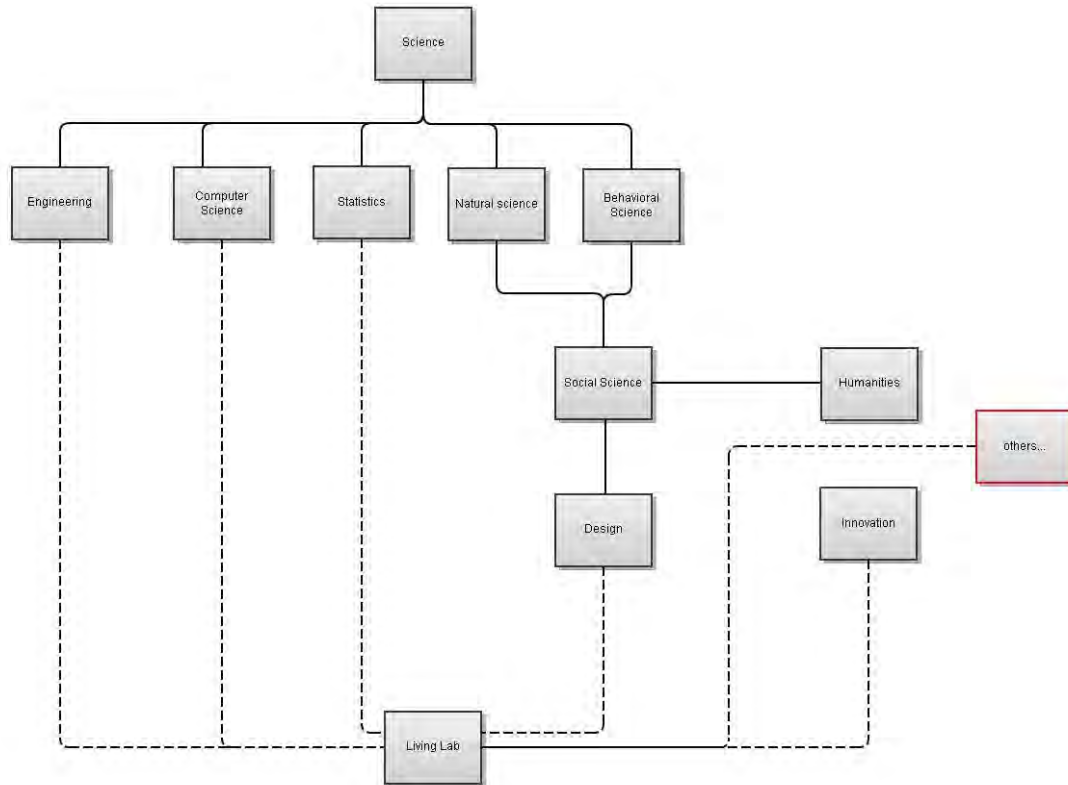

Based on the data Living Lab as a practice utilized the 62 methods (shown in Figure 1) *e.g.* action research, agile method software development, analogies, anticipation analysis, association techniques, basic design, etc. It spans across different disciplines which would represent the LL practice. Under the 62 methods, thirteen different frameworks (but categorized as one) or method were created and applied by other LLs. The same trend has been observed by the participants of the interview. Interview participants expressed some methods working together with the project framework/method being deployed.

**Figure 1 Methods from Varied Disciplines**

Methods	
Action Research	Idea cards
Agile method software development	Interview
Analogies	Market Research
Anticipation Analysis	Media blitz
Association techniques	Narratives
Basic Design	Observation
Blog	Participatory design
Brainstorming	Persona
Branding	Problem Definition
Card sorting	Procedure/Process redesign
Census	Project management
Clustering	Prototype
Co-creation	Qualitative research
Contextualized Model/Scheme/Framework - 13	Questionnaire
Data Gathering	Scenario
Design-oriented research	Self Documenting Methods
Diaries	Seminars

Domestication framework	Service Oriented Architecture
Electronic data collection	Software Development
Empirical Setting	Storyboards
Ethnographic Methods	Survey
Experience Application Research	Systematic Pluralism
Experience Sampling Method	Test methods
Experimentation	Trend Analysis
Extreme programming sessions	Unified Modeling Methodology
Feedback	Use Case
Field Study	Use Case Driven
Focus Group	User-centered design methods
Human computer reaction	Visual Mind Map
Workshops	Visual narratives

**4.2 Traced methods/techniques**

These methods were traced to be from various disciplines from Behavioral Science, Design, ICT, Management, Marketing, Patent, Scientific, Social Science, and Statistics as depicted in Figure 2. Although there is an unsettled debate as to what constitutes whether LL is a method or a concept, there is a consensus about the importance of users' role in a LL project. The researcher wants to add in the discourse that LL is a concept which utilizes the "art of pastiche" as shown in the data. These characteristics can be one of the tacit factors that make LL appealing to researchers and innovation firms.

**Figure 2 Origin of Methods Drawn by Living Lab Practitioners**

As the Living Lab concept grows in its applications, it is the researcher's opinion that the number of discipline method will grow as well, which is a sign that innovation through pastiche is the way forward in collaborative innovation. Having said this, the data also suggests that collaborative innovation in the LL setting is evidenced by the number of partners involved or expected to be involved. The founding partners are normally composed of university and affiliate research firm, government, and private firm, and the public: University acting as host organization of the project in cooperation an affiliate research organization that provides researchers who act as facilitator; European Commission, national government or local government for funding and co-innovation on public policy and local development; private firms that provide technology expertise, products or services which is being tested, and monetary investments; and crucial to this partnership is the group of users, or consumers, to whom ideas will be sourced and validated, and hopefully trigger researchers for inspirations and discoveries with the feedback and behavior of users or consumers.

The diversity of used methods and the flexibility of the practitioners to incorporate different methods can be attributed to the partners or actors involved in establishing the projects. Reflected in Figure 3, most of the LL projects had a minimum of four actors from different classifications: university, users, private - profit and nonprofit oriented and active participation and funding from government. Actors from across different disciplines and interested parties are incorporated during the establishment of the innovation project.

**Figure 3 Living Lab Actors**

### 4.3 Social Innovation in Europe

The data suggests that most of the Living Lab activities are concentrated in Europe; a result of the national and European level sponsorship and encouragement of innovation. Possible usage of technology, open data or information technology and future opportunities in societal issues are seen as key in solving the current EU challenges. However encouragement and sponsorship has been expanded to a more concrete measurement by the European Commission: Horizon 2020 endorsement of an Innovation Union Lab which is job creation<sup>1</sup> and focuses on societal challenges facing EU society<sup>2</sup>, *e.g.* health, clean energy and transport. Scaling up of the innovation efforts can be supported by the proposition of the researcher that on the different innovation projects innovation method from different disciplines and sectors should be encouraged to have a dialogue and increased interaction as these results into a more inspiring and can possibly trigger unexpected innovation. Whereas ICT innovation clusters and business incubators emphasize profit goals, social innovation projects such as LL has it as an underlying goal but has high emphasis on public co-creation of solution enabled by the close interaction of different partners for social issues and it is achieved by the rich perspective and methods that is put into action during the project execution.

## 5 Conclusion

The researcher observed the phenomenon of “innovation through pastiche” by studying the LL concept. Living Lab researchers and practitioners create a neutral environment for collaborative innovation. Proof of success of the LL collaborative innovation is still in question and can be a focus of future researchers but what is visible is the growing practice and research interest evidenced by the number of previously executed and ongoing projects such as Stanford’s Living Lab<sup>3</sup> promoting sustainable food, and the upcoming University of Leiden’s The Hague Living Lab<sup>4</sup> for peace and justice. The focus of the research concept is quite varied and challenging such as eHealth - aging well, ambient assisted living; rural inclusion and development; cross border trading; public eServices; and others. Challenges that require small scale projects for developing solutions, by putting users/consumers in the center of the social innovation projects with the support of different parties. The scaling of solution testing then enables the project to be performed in a societal scale.

Different parties mean different perspectives, manners of execution and means of execution of a project; and so the main focus of this paper to suggest that Innovation through pastiche is an observable trend in the LL practice and should be fostered. The diversity of methods coming together to form a specific innovation project is a tricky proposition but the convergence<sup>[17]</sup> of practices and methods from different fields and disciplines have been observed in media organizations<sup>[18]</sup>, learning<sup>[19]</sup> and increasingly in social innovation. Although social innovation can be done by social entrepreneurs, performing it collaboratively is a more structured alternative to making sense of the social challenges that Europe and the rest of the world is facing.

In summary the researcher was able to provide a basic understanding on the trend of pastiche in the form of utilized method of research concept through Living Labs. For further research, innovation through pastiche for social innovation can be a win-win situation, as it empowers each of the founding actors of the project and allows an exchange of ideas. However, further research is needed not on the perspective of an entire practice but on the micro-level (per collaborative project) specializing on social innovation for profit or non-profit. Articles are a rich source of data but additional interviews can be performed to get more data as well as participating in an ongoing project. The current research only provides an optimistic perspective of the pastiche method in collaborative projects, but does not discuss the dark side of a collaborative organization such as Living Labs as well as the method of “pastiche” in collaborative projects. Elaborate research on the different categories of social issues that can be performed collaboratively and the mechanics involved in executing the project will further develop the knowledge regarding mix of methods approach. The manifestation and increased call for collaboration and dialogue between different parties can also be researched with a focus on the “collaborative culture” in the field of emerging ICT innovations for social innovation. Collaborative innovation in the setting of social innovation is fast becoming a culture rather than an isolated case of tackling social issues; it can be

# Motivations and Risks Analysis of University-Industry-Research Collaboration in China

Karine Caroline Rakotomalala

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail:rcarolinek@live.fr)

**Abstract:** This paper finds the University-Industry Cooperation as a strategic significance in terms of the cultivation of engineers at different levels, scientific research, knowledge innovation and industrial requirements. Our recommendations focus on Chinese University skills development, on the mutuality in the collaboration and on the general factors of success. The findings will help both academies and industries to define their needs and further understand all the advantages offered by a U-I partnership.

**Key words:** University-Industry research collaboration; Innovation; Research & Development; Strategic Alliance

## 1 Introduction

Since China opened its doors to the World, Chinese Government tries to improve the global economy by using innovation ideas and new technologies. Chinese High Education researches pay more attention on knowledge creation and technology development. On the other hand, Chinese Industries manage their profitability, growth and sustainability by using innovation strategies to face International competitors<sup>[1]</sup>. This study defines the motivations and risks that push or inhibit these two entities to start collaborating together on Research and Development. We will first define the term of innovation and give a brief overview of the situation in China. Subsequently, we observe the advantages and risks of this alliance from each side opinion. Finally, we are going to propose some ideas to improve the University-Industry collaboration strategy methods in China.

## 2 Definition of University-Industry (U-I) partnership

### 2.1 Literature review of innovation

Rogers and Shoemaker (1971) defined innovation as any ideas, products or process perceived as new by the public. According to Classic, Neoclassic and Keynes's economy theories, technical progress is an external factor that disturbs equilibrium in the economy growth and which influence the market. Modern Economists like Favre-Bonte (2007), affirms that innovation depends on the organization competence and capacity to conduct Technological progress on the current economic growth. Favre-Bonte talks about Technical innovation, commercial innovation, organizational innovation, financial innovation and social innovation in the organization. New theories pay more attention to innovative ideas and activities that can influence the economy growth<sup>[2]</sup>.

### 2.2 Overview of Innovation in China

The Chinese Government developing strategy focuses on becoming an "innovation oriented country" by warning the public and promotes an internal independent innovation<sup>[1]</sup>. China already did great improvements on industry growth and amelioration of the engineering education quality. Chinese want to seek leapfrog development in key areas, make breakthroughs in key technologies and conduct basic research with the long-term perspective<sup>[3]</sup>. Chinese Government plays a leading role in this innovation development to help the Chinese Companies, Inventors, researchers, Research institutions and Universities to educate. Chinese Government allocated f20.6 billion USD for technology research which represents 1.4 percent of China's GDP. In addition, China has the world's largest technician workforce (35 million), 1.42 million R&D researchers, and over 25 million University students all supported by the Government for innovation research projects<sup>[4]</sup>.

## 3 Motivations and Risks to Collaborate

### 3.1 Motivations to collaborate

#### 3.1.1 Reasons for the firm

Strategic alliances help to improve competitive objectives as decreasing production costs, improving productivity, improving quality and reinforcing innovation (Garrette and Dussauge, 1995). Many reasons push firms to collaborate with Universities that works in the same field. First of all, U-I Alliance helps firms to fulfill the gap between their future needs and their current capacities in

innovation. Firms access to rich intellectual resources, new researches, new techniques, new technologies, innovative processes and potential products during this strategic association. Indeed, Universities bring new ideas, knowledge, strategies, concepts and an external point of view to the Company which can improve their competitive advantages and grow. It is a fact, this collaboration stimulate companies' internal Research and Development program for better productivity, quality products, standard living in the working environment and more efficient methods.

Then, firms can save some researches expenses through this collaboration because Universities experts and lab space are cheaper in the market. Agriculture, biotechnology, chemistry, computer science, engineering, biotechnology and medicine are most likely areas to benefit commercially from this collaboration. Indeed, Universities researches mainly focus on medical technologies (45%), products (75.6%) and chemical process (45.4%). These sectors financial investment on R&D are the most expensive ones, consequently a U-I collaboration bring an important advantage to them<sup>[5]</sup>.

Employees' skills increase during this co-creativity experience by sharing knowledge with the University and generating new sources of growth. Wuhan University of Technology received \$110 million of research funds and earned \$300 million revenue from Hi-Tech commercialization at their scientific Park in 2011.

In addition, firms can improve their innovation system in basic research, gain more industrial practice and reinforce their prestige by participating on journal articles production with the University. The public, industry and economy can access to the firm's Research and Development information through their fundamental researches which can result to patent. Finally, firms better maintain a close relationship with Universities that can provide competent graduated students for future recruitment.

### 3.1.2 Reasons for the University

Universities need large financial support to buy expensive equipment and material for their research, so they should to work with firms willing to sponsor them. University-Industry brings important advantages to the University which also benefit of cheaper research assistant from the firms. For example, Wuhan University of Technology in China has obtained nearly RMB 3 billion of funding from government and industrial sectors for high-tech research and development, and has made a lot of innovative and important technological achievements.

Additionally, University-Industry collaboration increases the reputation in the public's mind and attracts further students who desire learning in an esteemed School. For example University of Birmingham (United Kingdom) is a prestigious University that collaborates with worldwide famous Industry partners as Ernst & Young, Hermes, Deloitte, Worship Company of International Bankers. Likewise, the numbers of quality article journals are a reference for the University success and reputation. Universities can get patent and license from the commercialization of their academic researches.

U-I collaboration does only use the University's skills for commercial use but it is also an opportunity for the students to get practical experience. Indeed, students are rich of theoretical knowledge, but they need real experience to complete their competency. Indeed, Students have the opportunity to center their research topic on this precise case, they learn to set goals and gain experience along the R&D process. In stride, the research team composed by students and teachers become a reliable source of information and knowledge to discuss and confirm theories according to a concrete case study. And finally, Universities have the advantage to offer job opportunities for students in specific field and Companies<sup>[5]</sup>.

## 3.2 Risks and barriers

Nowadays organizations are not considered anymore as "machines with human elements" but as a "social systems where multiple groups with conflicting interest coexist" (Coombs; Saviotti, and Walsh 1987). This quote expresses that even inside an organization each unit has his own objectives and values<sup>[6]</sup>. Consequently, risks of conflicts between the organization and an external collaborator are even more probable.

### 3.2.1 Risks and barriers for the Universities

Universities face risks of their research teams' organization because of lack of experience and communication. Universities lack of marketing, technical and negotiation skills can be a liability for them to attract Industries. They also have to follow the firms' corporate and scientific norms all along their research which might limit their researches. Indeed, if the researches don't bring enough benefits Universities will lose time, money, their reputation and the Industry's trust. Universities

should pay attention of unrealistic expectation from the Industry regarding the technology and financial fund that they received. Poor rewards for University researchers might demotivate students to take part of future collaboration.

### 3.2.2 Risks and barriers for the Firms

The industries wish to maximize their benefit by developing their production to satisfy the society's needs and keep a private knowledge base to have a strong competitive advantage. On the other hand, Universities mission is to cultivate students' knowledge to share knowledge with the society through publication, notoriety of the researchers and critics of the other research centers. So there might be a moral risk for the firm if the University doesn't respect the Industry copyright by publishing private information in its articles.

Additionally, some firms are unfamiliar with the collaboration program and see some management risk due to the organization between the different teams and cooperation risk that will affect them. Firms are restrained to collaborate because of profit risks and time risks.

And finally, Industries think that Universities lack of experience and knowledge about the market cannot help them to solve their innovation problems. According to these firms, Universities have a lack of market knowledge and they don't share the same vision <sup>[6]</sup>.

## 4 High Performance Requirement

### 4.1 Development of skills

In order to convince more local and International Industries to invest in this collaboration, Chinese Universities should deliver more innovation-oriented students. Universities need to encourage the students to adopt a problem solving approach, organize more student group work, develop their statistical thinking, and implement systems for proper feedback. Academic courses should adopt a project-oriented teaching, experimental learning and curriculum development. Chinese Universities should ameliorate their training scheme offered to the students and improve learning requirements to develop their knowledge and creative abilities <sup>[6]</sup>. Universities should regularly update their knowledge thank to case studies, researches, theories, and training. In fact, Students should attend to Industry training every year with report production to improve their technical experience and research about the interested field. This kind of training can improve more students' skills and help all of them to increase their contacts in the field and improve their chance of employment after their graduation.

In addition, students have to be familiar with foreign firms by knowing how to communicate with them (methods and languages). Large knowledge of the innovation field with quality comprehension and practical abilities are important requirements that Industries want from the students. So in order to reach this goal, students have to develop their practical abilities through exchange with foreign Schools, by doing training in firms in local Companies and abroad which improve their understanding of the market's need <sup>[7]</sup>.

Universities should provide quality professional for China's industrial sectors. Teachers in Universities should have years of work experience in the field like retired engineers and industry expert as advisors. Universities can develop programs to send some teachers abroad during a specific time to gain international working experience. Domestic and foreign firms in the country or abroad should work with Universities as partners of research. Long-distance advisors that can communicate with Chinese students through video-chat and emails can help them to obtain international specifications to judge their research products.

Universities should encourage informal relationship, social networks and regular communication with the Industry through website to update the knowledge transfer. Academic program should help the students to develop their communication skills. Without a doubt, students have to know how to define each role and responsibility in the team.

### 4.2 Mutual transfer innovation knowledge

At the beginning of the collaboration, contract should stipulate data ownership, mutual agreed objectives and interest in any product developed. Copyright and privacy agreements are vital to avoid conflicts between the two parts and to keep an excellent University-Industry relationship. They should agree on which information should stay private in the firm, about the special access to critical department, and research on core technology should only being done by their own employees. Conduct systemic researches on system, mechanism, rules, regulations, modes, methods, operational approaches and procedure. Universities cannot have a fundamental role in developing new process and product;

only the marketing and production department should be responsible for this part. The Marketing Department can share some knowledge from experience about market and customer tastes to the students for their training and market analysis. So Innovation knowledge transferred for the students basic researches should focus in productivity, knowledge innovation and industrial upgrade with respect of property rights.

Industries can give a delay of 6 months to the University before publishing the articles that they previously checked. During this time the Industry can get a patent and protect their intellectual property and let the University to share the information with the public. Each part should recognize research contributions from the other part through gratification. To control the Universities information in each article, Industries should do a joint research and enjoying more prestige in the same time.

Industries have to provide high quality staff to join the research project in order to lead the team, share vision and reach the firm's aims. Industry should give equality of power to each member of the research team for an equal contribution.

### 4.3 Apply universal success methods

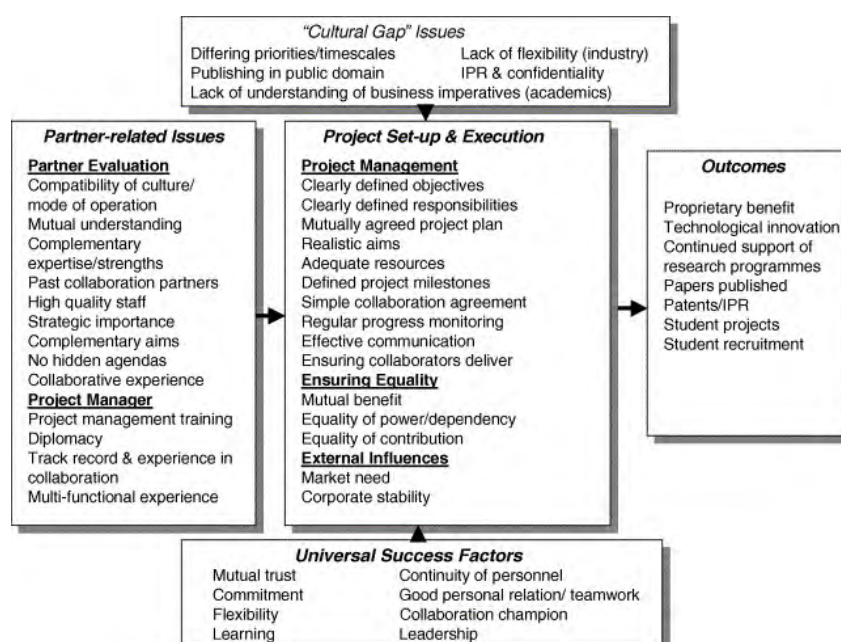

Figure 1 Management "Success" Factors Identified from the Literature

As shown in the previous scheme, all the requirements for a successful U-I collaboration are an efficient partner evaluation, the project manager skills, the project management quality, the sense of equality in the relationship and some external influences.

In addition, Government should support skill development, knowledge production and transfer between Universities and Industries. Indeed, the Chinese Government should reward Industry's financial investment to encourage them to collaborate together [8]. The Chinese Ministry of Education could arrange internship program to match Industries' needs with Universities' needs of research projects. Chinese Government better co-sponsoring a part of the research projects to support the Industries investment. In order to strengthen the University-Industry cooperation in China, both parts have to think about long-term and short-term win-win interests.

From this perspective, Universities better promote the importance and advantages to collaborate with them in order to attract them. Universities should send some convincing Representatives to travel abroad and promote the University's research faculty to potential industry sponsors R.

In the other hand, Industries should accept risks and try a University-Industry program during a short period by specifying terms of confidentiality. Build basic understanding and capabilities in teams.

Finally, Government should develop creative culture by offering a new lifestyle to the Chinese population who is becoming more and more intelligent about products and new technologies. Government, Universities and Industries should analyze future needs in employees from science and technology sector to promote education field.

## 5 Conclusion

University-Industry-Research collaboration is an efficient strategy to form talents training system and technological innovation. This collaboration attracts Universities for the financial support of Academic innovation research projects, and Industries the transfer technology to the commercial environment. Firms face the most risks but gain the most benefits from this less expensive R&D strategy. On the other hand, Universities have to match their skills with the Industries needs to attract more and more sponsors for their research project.

Managers know that today, the best strategy is not only based on the price, quality and delivery but the firm should be speed, flexible and innovative. In this new knowledge economy, link between public and private R&D could improve quality, quantity and speed of technology diffusion in economy.

The Chinese developing strategy focuses on becoming an “innovation oriented country” by warning the public and promotes an internal independent innovation. China already had great improvements on industry growth and amelioration of the engineering education quality. China will continue its reform and opening-up policy for a long-term to grow its economy, innovation independence. China is more and more open to International cooperation demonstrated by the application of International rules and practices. Indeed, Knowledge production is becoming a vital requirement for an innovative nation.

## Industry-University-Research Institute Strategic Alliance Model: Classification Standard and Selection Strategy\*

Jin Haihe, Liang Jian

School of Public Administration, Inner Mongolia University, Hohhot, P.R.China,010070

(E-mail: haihejin@163.com, jianliang@ieee.org)

**Abstract:** The Industry-University-Research Institute Strategic Alliance (IUR) has played an important role during the construction of an innovation-oriented country. Because the IUR model directly affects IUR's organizational form, operating mechanism, structure stability and the mode of benefit distribution, it is a necessity to attach great importance to the selection of IUR models. Nevertheless, owing to a lack of unified classification standards and effective selection strategies, it is in the predicament to select an appropriate IUR model. To solve these problems, this paper firstly points out that the IUR model, from an economic perspective, is in nature a model of innovation resource allocation. And then, it analyzes the innovation resources of IUR and superior resources of each innovative partner. After that, as it puts forward, the principle of IUR's innovation resource allocation should realize the effective combination of innovative partners. Based on this principle, this paper presents the "innovation stage-cooperation level" classification standard and "monopoly degree-technology readiness level" selection strategy.

**Key words:** Industry-university-research institute strategic alliance; Industrial technological innovation; Model; Classification standard; Selection strategy

### 1 Introduction

With the acceleration of global economic integration, international competition is increasingly fierce, technological complexity is considerably rising, and the risk of innovation is dramatically increased. To gain a competitive edge, China is actively building an innovation-oriented country. China has laid down related industrial planning and made supporting policy to enhance the innovation capability of Chinese enterprises. At the same time, China's scientific and technological resources have been gathered for a long time in universities and research institutes. Therefore, the government, the business circle, the academia and research community attach importance to the great resource potential to promote the development of Chinese enterprises<sup>[1]</sup>. As an organizational model of collaborative innovation, IUR becomes the focus of attention<sup>[2]</sup>. IUR refers to a long-term maintaining, stable, mutually beneficial, symbiotic collaborative relationship between academia and industry, and it is a cooperation model to achieve a all-win interaction among enterprises, universities and research institutes. It is a system with enterprises as the main body, guided by market and featured by combination of all the superior resources of innovative partners to create the innovation chain. With explicit purpose and strong organizational support, IUR can enhance the capability of independent innovation and improve core competitiveness. In many research fields of IUR, the model of IUR has impact on the organizational form, operating mechanism, organizational stability and the mode of benefit distribution, which directly affects the success of the collaborative innovation. Therefore, it has always been the focus of all IUR's collaboration partners. Many institutions and scholars have researched on the classification, comparison and selection of IUR models.

OECD gives seven models of university-industry collaboration: general research support, informal research collaboration, contractual research, knowledge transfer and training schemes, collaborative research with government support, research consortia and cooperative research centre. Atlan (1987) divides the ways of university-industry interaction into: general R&D funding, collaborative R&D, R&D center, university- industry R&D alliance, industrial co-ordination unit in the university, business incubator and science park<sup>[3]</sup>. Bollon & Robert (1994) lists several ways of university-industry cooperation: scientists introduce new ideas and technologies to students, college students work in laboratory of enterprises, enterprises use the experimental facilities that university temporarily not using, scholars go to industry and make the report; enterprises provide university with a variety of devices and equipment<sup>[4]</sup>. Morasch (1995), from the economic perspective of transaction cost, analyze the selection

---

\* This paper is supported by the Soft Science Research Projects of Science and Technology Department of Inner Mongolia Autonomous Region of China (Research on Industry-University-Research Institute Strategic Alliances and Related Operating Mechanism: A Case Study of Inner Mongolia Autonomous Region)

problem of the collaborative innovation model<sup>[5]</sup>. From the perspective of knowledge management and strategic management, Carayannis (2000) analyzes the collaborative innovation model between government, industry and university<sup>[6]</sup>. Chinese scholars such as Wang Xue-yuan (2005), in accordance with the organizational forms, divide IUR model into co-building research institution, project-based alliances and co-building business entity<sup>[7]</sup>. According to the role of the partners play, Li Yan-yan and Ye Bing (2004) divide IUR models into four categories: government-oriented type, business-oriented type, universities-oriented type, and all-partners-oriented type<sup>[8]</sup>.

Through the analysis above, it is obvious that these researches simply conclude the model of IUR according to various classification standards. Their differences lie only in appellation, but they are essentially repetitive, telling the same or similar thing. Due to lack of unified classification standards and the effective selection strategy, there are many difficulties in selecting the appropriate IUR model. This paper attempts to put forward unified classification standards and come up with effective selection strategies of IUR models.

## 2 Economic Perspectives on IUR

The scarcity of resources is the foundation and precondition of all economic analysis<sup>[9]</sup>. Economic efficiency requires efficient resource allocation and greater output with the limited resources<sup>[10]</sup>. As a form of collaborative innovation, IUR aims at a reasonable configuration of knowledge, technology, funding, manpower, information and other resources and obtaining maximum output. Its operation process can be regarded as a special kind of production activities. From this point, the selection of IUR model, in essence, is the choice of the resource allocation model. In order to allocate resources efficiently, we need to analyze innovation resources of IUR and make clear the superior resources endowed by each innovative partner.

### 2.1 Innovation resources of IUR

Innovation resources are the production factors inputting throughout the collaborative innovation process. To accurately define the main innovative resource of IUR and analyze its role in collaborative innovation is the premise of efficiently allocate innovative resources. After in-depth analysis, this paper puts forward nine categories of innovative resources input by IUR.

**Table 1 Main Innovation Resources of IUR**

Resources	Description
Knowledge	The starting point of innovation, such as explicit knowledge, implicit knowledge.
Technology	Operation methods and skills, such as technical patents, engineering technology
Funding	Mainly comes from enterprises, venture funds, universities, government etc.
Policy resources	Mainly refers to the policy support, financial support, the tax rate relief etc.
Material resources	R&D facilities, equipment and instruments, production base, and ancillary facilities.
Market resources	Insight of the market capacity, market development, sales channels.
Information	The ability to discover, store, identified information of other innovation resources.
Manpower	The staff engaged in knowledge creation, R&D, industrialization, and management.
Contract	Formal and informal contracts signed by innovative partners.

### 2.2 Innovative partners of IUR

The innovative partners of IUR refer to enterprises, universities, research institutes, governments and intermediaries who input innovative resources for profit. These partners are directly or indirectly involved in collaborative innovation activities. Analysis of the superior resources of each partner has great significance in choosing cooperative partners of complementary resources.

Industry, primary, secondary and tertiary industries included, refers to the competitive enterprises whose goal is to gain profits. Enterprises generally have a lot of money. With keen insight and quick response to market needs, enterprises can improve the relevance of research and development of the alliance and help to realize the economic value of the result as soon as possible.

Universities and research institutes are the output of scientific knowledge, personnel training, with some research capacity, such as colleges, universities, public or private research institutes. It masters the latest technology and research frontier. With libraries, research centers, advanced laboratory equipments

and highly qualified researchers, universities have great R&D potential.

Governments, through industrial plans and technology development strategy, makes supportive policies to actively guide the direction of the IUR and enhance the independent innovation capability and technological level of domestic enterprises.

The five different types of partners above, with their respective strategies and respective superior resources (table 2), ally with some complementary partners forming the IUR.

**Table 2 Main Superior Resources of Innovative Partners**

Partners	Main Superior Resources
Industry	Funding, market, material, manpower, technology
University	Knowledge, technology, manpower, material, funding
Research institute	Technology, Knowledge, material, manpower, funding
Government	Policy, funding, information, contract
Intermediary	Information, funding, contract

**2.3 Principles of IUR’s innovation resource allocation**

The innovation resource allocation of IUR is a process where within the context of collaborative innovation. A innovative partner, with some superior resources, cooperates with others possessing with complementary resources to form a collaborative innovation system. This reallocation of resources for the whole innovation system is a pareto improvement. The motivation to involve in the collaborative innovation is that partners attempt to gain more benefits by inputting their limited innovative resources. Its overall purpose of IUR is to rationalize innovative resources to maximize the output with limited innovative resources. Therefore, resource allocation principle of IUR is the effective combination of innovative partners. We believes that the IUR model reflects the combination of innovative partners. So this paper studies deeply the classification standard and selection strategy of IUR models.

**3 “Innovation Stage-Cooperation Level” Classification Standard**

The value orientation, superior resources, and the purpose of joining alliance are various according to different types of partners from enterprises, universities, research institutes, governments to intermediaries. Therefore, the IUR models are various. To choose an all-win model is the key to the success of IUR. This paper presents “innovation stage-cooperation level” classification standard, which classifies the models of IUR from two dimensions: innovation stage and cooperation level. The innovation stage refers to the process that knowledge and technology are gradually transformed into product prototype. From the upstream to the downstream of the innovation chain, it can be divided into three stages: fundamental research, application research and technical development. The cooperation level refers to the degree of close collaboration, which is divided into “primary”, “intermediate” and “advanced”. By referring to other scholars’ research on the model of collaborative innovation, the classification of IUR models was shown in Figure 1.

Cooperation Level	Advanced	Joint Research Institute	Business Incubator Joint Business Entity	Joint Business Entity Business Incubator
	Intermediate	Joint Key Laboratory	Joint Engineering Research Centre	Joint Technology Development Centre
	Primary	Entrusted Research Entrusted Training Cooperative Education	Entrusted Research Patent Licensing Cooperative Education	Patent Licensing Entrusted Training Cooperative Education
		Fundamental Research	Application Research	Technical Development

**Figure 1 The Classification of IUR Models**

The “innovation stage-cooperation level” classification standard can apply to all kinds of IUR models. Using this classification standard, characteristics of each model will be visually shown, which greatly facilitates the comparison and selection of IUR models. As for models which are not included in Figure 1, after analyzing their innovation stage and cooperation level, this classification standard will still work.

#### 4 “Monopoly Degree-Technology Readiness Level” Selection Strategy

The IUR models, which reflect the cooperative model of innovative partners, are the result of multiple factors. Innovative partners, with different resource endowments, different negotiating capital and different interest demands, require different models. The main aim of the each partner is all to maximize the benefits of its innovation resources. Therefore, the higher a partner presents its monopoly degree in innovation resource, the more advantages it will gain in negotiations. In a word, high-level alliance obtains more benefits. At the same time, the more mature the technology is, the more importance the alliance should be given to the development and application of technology, and the downstream model of the innovation phase is adopted.

Referring to Figure 1, the “monopoly degree-technology readiness level” selection strategy of alliance models can be summarized as follows.

Strategy A: The higher degree of monopoly the innovative partners possess, the more advanced forms of cooperation should be adopted. Only by so doing can the partners maximize the benefits of the innovation inputs. On the contrary, the more primary model should be adopted. (See Figure 2)

Strategy B: Less proficient collaborative innovation should adopt the upstream of cooperation in the innovation phase. In so doing, the partners could share the cost and risk of R&D and promote the exchange of knowledge and technology. On the contrary, the downstream of cooperation in the innovation phase should be adopted. (See Figure 3)

Figure 2 Strategy A

Figure 3 Strategy B

#### 5 Conclusion

The IUR model is essentially a model of innovation resource allocation. By analyzing the nine innovation resources of IUR, and exploring respective superior resources of five innovative partners, a theoretical basis will be founded to effectively allocate innovation resources of IUR and select appropriate IUR models for innovative partners.

The innovation stage-cooperation level classification standard provides a unified classification standard. It combines the characteristics of existing standards and overcomes the limitation caused by simple classification rules, such as limited models, generalized or ambiguous definitions etc. It is a flexible classification standard according to which it classifies IUR models by two dimensions: innovation stage and cooperation level. In general, the innovation stage-cooperation level classification standard could apply to most IUR models when their innovation stage and cooperation level are analyzed. Therefore, this classification standard can cover most IUR models and visually display each model’s features, which makes it convenient to make a comparison of IUR models.

The monopoly degree-technology readiness level selection strategy is effective. Innovative partners could evaluate relative monopoly degrees of their innovation resources through investigation, and then select the corresponding cooperation level by using Strategy A. Generally speaking, the higher the cooperation level is, the more values of scarce innovation resources could be realized. In doing this, it is beneficial to maximize the innovation resource’s benefits of each partner. After that, innovative partners could collectively evaluate the technology readiness level and decide the reasonable innovation stage of their cooperation by using Strategy B. Taking into account both Strategy A and Strategy B, innovative

partners are able to select IUR models accurately.

# Creating Shared Value Through Strategic Corporate Social Responsibility

Mark Anthony Camilleri

University of Edinburgh Business School

(Email: m.a.camilleri@sms.ed.ac.uk, 1markcamilleri@googlemail.com)

**Abstract:** The Literature review about corporate social responsibility (CSR) suggests that there are organizational benefits to be gained from unintentional discretionary expenditure in laudable behavior. With this in mind, the methodology integrates insights from the stakeholder's theory and the resource-based views to sharpen the strategic base for CSR investment. Quantitative research techniques have been used to discover how the hospitality business organizations are creating shared value for themselves and for society. Correlation and Regression analysis tested the relationship between Strategic CSR (in terms of the organizational benefits) against the firms' commitment, behavior and resources devoted to CSR. From the findings a research a model is derived to determine the synergistic value creation for businesses and society.

**Key words:** Corporate social responsibility; Shared value; Strategic CSR

## 1 Introduction

Businesses' way of thinking has changed dramatically since Levitt, (1958) and Friedman (1962, 1970) held that the companies' only responsibility is to maximize their owners' and shareholders' wealth. Corporate social responsibility (CSR) has developed during the latter part of 20th Century as the recognition of all stakeholders, rather than just shareholders being the legitimate concern for the business, see Freeman (1984). CSR has been described as a rather vague concept of moral good or normative behavior; see Frederick (1986), Carroll (1979, 1991, 2004). An all embracing definition was given by Moon et al. (2009), 'CSR is about beyond-compliance contributions of companies to social, environmental and ethical concerns'. Whilst retaining the comprehensive aspects, Carroll (1979) suggested a relativistic measure of 'the economic, legal, ethical and discretionary expectations that society has of organizations, at a given point of time'. With an entrepreneurial stance, Drucker (1984) characterized it as a way of tackling 'social problem(s)' to engender positive 'economic benefit(s)' to ensure 'well paid jobs, and ... wealth'. Porter and Kramer (2006) recognized that 'CSR can be much more than a cost, a constraint, or a charitable deed'. Apparently they perceived CSR, 'as a source of opportunity, innovation, and competitive advantage'. There have been diverse theoretical perspectives surrounding the notion of CSR. McWilliams et al. (2006) emphasized that CSR research requires a multi-disciplinary approach. They describe it as a '...fertile ground for theory development and empirical analysis'.

This paper maintains that laudable CSR initiatives can be re-conceived strategically to confer competitive advantage. The business case for CSR focuses on building adaptive approaches and directing resources towards the perceived demands of stakeholders. Stakeholder demands are viewed less as constraints on the organization, but more as challenging opportunities which can be leveraged for the benefit of the firm. This paper looks at different aspects of strategic CSR, as it makes specific reference to responsible human resources management, sustainable environmental practices, marketplace and community policies which can create shared value for the business and the society. This paper addresses a knowledge gap in literature as it reports the effects of strategic CSR engagement among the Maltese hospitality enterprises.

## 2 Aims and Objectives

Although there is an extensive list of publications surrounding tourism enterprises and sustainability (e.g. Graci, 2009; Dodds and Kuehnel, 2010; Graci and Dodds, 2009; Merwe and Wöcke, 2007; Ayuso, 2006, 2007 and Kasim, 2006) this area of study may seem relatively under-researched particularly when considering relevant research which links hospitality enterprises and responsible entrepreneurship practices. It is the intention of this study to show that the hospitality businesses may stand to gain from their social and environmentally-responsible behavior. This research project was built on the foundation of the following research questions:

- What are the current insights and perceptions of responsible entrepreneurship among the owner-managers of the hospitality enterprises?

- Are the hospitality enterprises actively engaging in CSR (social and environmental) practices?
- What is their business case for CSR (in terms of CSR's costs and benefits)?

### 3 Literature Review

#### Conceptual Framework

Several enterprises are putting their values into a written code of conduct, a statement of good business practice or even a set of simple rules which articulate the company's vision, values, responsibilities and ambitions (Ingenhoff and Fuhrer, 2010). Defining and communicating the company values will help businesses and their employees to remain true to what they believe in and will help to build their reputation. The mission statement and vision of the company ought to be communicated to the stakeholders and the community at large. Employees like to work for and with others who share their values, so organizational commitment for CSR may help to attract quality employees, customers, suppliers and investors who approve of the business' principles (Davies and Crane, 2010). It is imperative that the company values will in effect mirror the enterprises' business ethos, and its context. This leads to the first hypothesis:

**Hypothesis 1: There is a positive correlation between strategic CSR benefits and organizational commitment.**

Generally, some of the socially and environmentally responsible initiatives most commonly recognized among businesses are: skill development and training activities for employees (Bohdanowicz and Zientara, 2009), safeguarding the employees' health and safety (Maignan and Ralston, 2002 and Fombrun, 2005), positive involvement within the local community, support of cultural activities, the environmental protection (Ayuso, 2006) as well as sponsorships and donations to charitable institutions (Carroll, 1979; Mohr et al., 2001) among others. The long-term success of any business and its ability as an effective entrepreneur often relies on the competencies and motivation of employees (see Zeitz et al., 2009). Employees represent one out of many other stakeholders addressing the company with demand (Turker, 2009). Arguably, businesses present social security by offering safe employment positions and good innovative working practices, as evidenced by Ozcelik et al. (2008). Seitanidi (2009) demonstrated that employers need to build good internal partnerships with their employees. The businesses themselves will benefit from employee involvement, in terms of generation of ideas, commitment and loyalty. This was shown by Mc Shane and Cunningham (2011); Kim et al. (2010) and Turker (2009). Environmental performance often makes financial sense for the organization itself (Gjolberg, 2009 and Muller and Kolk, 2009). Energy efficiency, waste minimization, pollution prevention and recycling can potentially result in significant cost-savings for any firm (Tudor et al., 2008; Williamson et al., 2006) as well as enhancing the firm's reputation and standing (Fombrun, 1996; Lewis, 2001). The organizational behavior to green policies translates to added value and mutual benefits for the business and the environment (see Holcomb et al., 2007; Lee and Park, 2009; Chiang and Hung, 2010).

The way enterprises operate within the market is a vital indicator of how they have integrated social and environmental concerns into their mainstream organizational structure and decision making processes. Good positive relations with stakeholders will leverage the value chain of any organization, (Jones et al., 2006; Bhattacharya et al., 2009). Social networking is always a very basic requirement in business. A firm's business policies are continuously evaluated by suppliers, customers, competitors and the local community. Marketplace policies are devised to trigger customer satisfaction and enhance the quality of the service (Walsh and Mitchell, 2010). Marketplace policies can often lay down the essential criteria of how to select prospective business partners. They can possibly favor and support local suppliers (Porter and Kramer, 2006; Jenkins, 2006). In order to maintain good business relations, there should be some procedures laid down (e.g. the paying the bills on time). Appropriate marketplace behavior increases the reputation of the firm, resulting in stronger partnerships with suppliers (Spence and Bourlakis, 2009), more efficiency and better mutual understanding (Carroll, 1991, 1999; Porter and Kramer, 2006, 2011; Young and Tilley, 2006). Several managers have realized that there is further potential for more firms to get involved in societal and community activities (Scholtens, 2009; Rettab and Ben Brik, 2008). For instance, there is scope in supporting social cases, environmental causes, heritage protection, philanthropic activities as well as cultural and sport related initiatives (Carroll and Shabana, 2010 and Du et al., 2010). It is in the businesses' interest to keep an open dialogue with the community on adverse, controversial or sensitive issues (Merwe and Wöcke, 2007; Ayuso, 2006). The community policies are considered essential and an integral part for responsible entrepreneurship (Fuller and Tian, 2006; and Nelson, 2006). The enterprises' community engagement may possibly add value to

the enterprise itself. This leads to next hypothesis:

**Hypothesis 2: There is a positive correlation between organizational behavior and strategic CSR benefits.**

The Resource Based View (RBV) theory suggests that resources of the firm affects its activities and growth (Penrose 1959), profits (Wernerfelt 1984) and the level of sustained competitive advantage (Barney 1991). Firms may be potentially constrained by a lack of resources. Younger firms may often lack experience and therefore tend to rely on informal management systems and training practices (Cardon and Stevens 2004). Liability of smallness implies problems in competing for labor with larger organizations and recruiting and training employees (Aldrich and Auster 1986). This condition distinguishes them from their larger counterparts and requires some very different management approaches. O'Cass and Weerawardena (2009) held that resource poverty hinders the adequate performance of certain activities such as appropriate training of new employees. In addition, the small firms may also have difficulties in pursuing new approaches to successful personnel management, due to their lack of information about the recent HRM developments in other companies (Bacon et al. 1996). Bird et al. (2006) found that the availability of discretionary resources drives management's interest to finance CSR activities. Perhaps, that's why large firms show greater corporate financial performance and corporate social performance (CSR engagement). Macher and Richman (2008) argued that the transaction cost economics show that CSR is not cost-free. CSR often requires substantial resources, including time. Financial and human resources are required to identify the relevant stakeholder groups; negotiating with representatives of such groups, and monitoring their satisfaction (Orlitzky and Swanson, 2008; King, 2007). This leads to the next two hypotheses:

**Hypothesis 3: There is a positive correlation between organizational resources and Strategic CSR benefits.**

**Hypothesis 4: The organizations' commitment, behavior, its available resources, as well as its societal relationships will lead to strategic CSR benefits.**

The literature review suggests that the most strategic CSR occurs when a company adds a social dimension to its value proposition (Porter and Kramer, 2011). The authors held that the solution for strategic CSR lies in the principle of 'shared value'. Other recent value creation propositions include; 'value in business' (Lindgreen et al. 2012); 'value creation through social strategy' (Husted et al. 2012) and 'The Stakeholder Approach to Maximizing Business and Social Value' (Bhattacharya et al., 2012).

**Hypothesis 5: The organizational behavior and commitment, its slack resources and its optimal organizational performance will lead towards creating shared value in business and society; leading to stronger societal and regulatory relationships.**

Arguably, the rationale for doing good by doing well may be triggered from the firms' availability of slack resources. Orlitzky et al. (2003) have supported the view of reverse causality from financial performance to organizational behavior for CSR. In good economic times, the high levels of financial performance may provide the slack resources which are duly required to successfully engage in CSR (Ullmann, 1985). Carroll (1979) held that CSR often represents an area of relatively high managerial discretion. The availability of excess funds will determine whether there is the 'initiation and maintenance of voluntary social and environmental policies' (McGuire et al 1988). For instance, if the organization has gone through a period of consistent satisfying results, with good corporate financial performance, the executives may exhibit a sense of obligation to give something back to the community (Economist, 2006). On the other hand, if the firm has recently experienced low profits and has scarcer resources at its disposal, then the firm may not engage itself in CSR activities and investments. This leads to the last hypothesis.

**Hypothesis 6: Strategic CSR's financial performance outcome is a precursor of organizational behavior (for CSR).**

## 4 The Method

The research fieldwork was carried out in Malta, the smallest country of the European Union. The main reason for choosing this country for the data collection purposes was that the quantitative study had targeted all the hotel owner-managers of the licensed accommodation establishments across the Maltese islands. A web-survey questionnaire has been administered between October, 2010 and January, 2011. The hospitality enterprises which were chosen to take part in this research project included hotels ranging from 1 star to the 5 star categories (comprising guest houses and hostels). The survey questionnaires were distributed by email to all the ninety two licensed hotels. Subsequently, the completed surveys were personally collected. There was a total seventy-two (72) out of ninety two (92)

valid responses (which represented 78% of the total population) from all the accommodation establishments in Malta, as featured in Table 1. Evidently, there was insufficient response among the lower rated/classified hotels, possibly indicating that they were not seeing the business case in CSR engagement, or they had lower CSR credentials and / or awareness.

**Table 1 Online Survey Response Rate**

Hotel Category	N	Population	Total %
5 Star Hotels	13	14	92.86
1-4 Star Hotels	59	78	75.64
<b>Overall Total Response</b>	<b>72</b>	<b>92</b>	<b>78.26</b>

The objective of targeting the designated profile of owner-managers was to gain an insight into their ability to make evaluative judgments in taking strategic decisions in their enterprise. The owner-managers were required to indicate their level of agreement with the survey questionnaires' statements. In the main, the responses were coded using the Likert Scaling mechanism (except for the variables, 'HR department' and 'Stakeholders requesting data about CSR' - which were measured by dummies). There were different scales for the variables; 'CSR expenditure', 'period of CSR engagement' and 'enterprise future intentions', as reported in Appendix 1. For all the other variables, the values ranged from 1 (strongly disagree) to 5 (strongly agree) with 3 signaling indecision. A list of all the variables which were used in the survey instrument is illustrated in Table 2.

**Table 2 The Variables Used in The Survey Instrument**

<b>Socio-demographic Variables</b> 'Gender', 'Age', 'Role', 'Level of Education', 'Industry Experience', 'Organization Size', 'HR Department'.
<b>Organizational Commitment</b> 'Mission Statement', 'CSR Ethos', 'Period of CSR Engagement', 'CSR Future Intentions', 'Staff dedicated to CSR', 'Money devoted to CSR', 'CSR Expenditure Scale'
<b>Organizational Behavior</b> 'Training Employees', 'Consulting Employees', 'Health and Safety', 'Work-life balance for Employees' 'Environment Conservation', 'Waste Minimization', 'Pollution Prevention', 'Environmental Protection', 'Sustainable Transport', 'Procurement Policy', 'Supplier Relations', 'Customer Relations', 'Community Dialogue', 'Community Support'.
<b>Strategic CSR (benefits)</b> 'Employee Loyalty', 'Employee Morale', 'Job Satisfaction', 'Less Staff Turnover', 'Attracting Quality Employees'. 'Maximize Efficiency', 'Investor confidence', 'Brand Image', 'Customer Loyalty', 'Reputation', 'Competitive Advantage', 'Increase Sales', 'Increase Market Share', 'Enhance Marketplace Relations'.
<b>Creating Shared Value (benefits)</b> 'Legal Compliance', 'Third Party Pressure', 'Ethical and Philanthropic Reasons', 'Community Relations', 'Lower Criticism from the Public', 'Minimize Regulatory Relations'
<b>Organizational Resources (costs)</b> 'Financial Resources', 'Human Resources', 'Time', 'Training and Awareness', 'Economic Short-terms'.

The gathered data was subsequently transformed into a suitable form for analysis, using what is commonly referred to as data reduction techniques (Blaikie, 2010). Data reduction aimed to achieve the desired reliability, timely and accurate assessment of the findings, in an inductive perspective. The dataset was in Excel format and imported into SPSS. Initially, exploratory data analysis (EDA) and descriptive statistics were carried out to examine categorical data. Subsequently, there was correlation analysis of the main variables by using Spearman's rank correlation coefficient ( $\rho$ ). Principal component analysis and regression analysis were carried out in accordance with the previously set hypotheses. An effort was made to ensure that the data met the statistical significance requirements.

## 5 Analysis and Results

Descriptive statistics are presented for each and every variable in Appendix 1. Reliability and appropriate validity tests have been carried out in the analytical process. Cronbach's alpha was 0.85, indicating an acceptable level of reliability across all variables. The hotel owner-managers were requested to indicate their level of agreement with the given statements which reflected their attitudes and perceptions about responsible behavioral practices. In the process, they also clarified the benefits and costs of strategic CSR.

### Correlations

Spearman's rank correlation coefficient indicated that there were some interesting positive and significant relationships between the constructed variables. The correlations matrices are featured in appendix 2. In general, the hypothesized correlations were significant as they were close to zero, and predominantly they did not exceed 0.05. The significance levels were not surprising, given the sample size. The results from the first hypothesis regarding a positive relationship between organizational commitment and strategic CSR has revealed positive correlation coefficients, particularly between 'financial resources devoted to CSR' and 'attracting quality employees' ( $\rho=0.708$ ). Another substantial correlation has been registered between 'period of CSR engagement' and 'attracting quality employees' ( $\rho=0.700$ ); 'increasing sales' ( $\rho=0.635$ ). There was a moderate relationship between 'period of CSR engagement' and 'improving market share' ( $\rho=0.488$ ). Similarly, there was covariance between 'CSR expenditure' and an 'increase in sales' ( $\rho=0.505$ ) and market share improvement ( $\rho=0.572$ ). A moderate relationship has been found between 'staff dedicated to CSR' and 'increasing sales' ( $\rho=0.434$ ) and 'improvement in market share' ( $\rho=0.459$ ). The covariance in the second hypothesis has reached the highest levels between organizational behavior and strategic CSR where it has already been stated that the highest correlation coefficient of ( $\rho=0.948$ ) indicated a substantial relationship between 'competitive advantage' and 'procurement policies'. Additionally, very high correlation coefficients were registered between 'competitive advantage' and the organizational behavior's variables entitled, 'sustainable transportation option' ( $\rho=0.908$ ), 'energy and water conservation' ( $\rho=0.861$ ) and 'community support' ( $\rho=0.844$ ). As anticipated, there were strong relationships between 'attracting quality employees' (Strategic CSR variable) with 'community support' ( $\rho=0.799$ ) and 'environmental protection' ( $\rho=0.747$ ).

It was anticipated that the third hypothetical relationship between the firm's organizational resources (costs) and strategic CSR would be characterized by negative relationships. For instance, the relationship between the constraint variable entitled, 'lack of money' was inversely related to 'attracting quality employees' ( $\rho=-0.871$ ), 'competitive advantage' ( $\rho=-0.705$ ), 'increasing sales' ( $\rho=-0.629$ ), 'discretionary spending in ethical and philanthropic causes' ( $\rho=-0.611$ ) and 'market share' ( $\rho=-0.547$ ). Similarly, there were negative correlation coefficients between 'lack of staff' and 'attracting quality employees' ( $\rho=-0.462$ ) and also in 'discretionary spending in ethical and philanthropic causes', ( $\rho=-0.425$ ). Nonetheless there were some substantial to moderate positive relationships, particularly between 'economic short-terms' and 'increasing market share' ( $\rho=0.435$ ), 'competitive advantage' ( $\rho=0.435$ ) and 'minimize regulatory problems' ( $\rho=0.421$ ) and 'discretionary spending in ethical and philanthropic causes' ( $\rho=0.380$ ).

### Data reduction

The Principal Component Analysis (PCA) has been purposely chosen to obtain a factor solution of a smaller set of salient variables, from a much larger dataset (Hair et al., 1998). Moreover, this

approach was considered appropriate as there were variables exhibiting an underlying structure as they seemed to share close similarities. Therefore, PCA had identified the patterns within the dataset. Evidently, the underlying similarities (and differences) were highlighted in each and every component. In the process, the data has been compressed, as it was reduced in a number of dimensions without much loss of information. The rationale for the data reduction was to have in place the factor components for the subsequent multivariate regression analysis. From SPSS; the principal component analysis has produced a table which illustrates the amount of variance in the original variables (with their respective initial eigenvalues) which were accounted for by each component. There was also a percentage of variance column which indicated the ratio expressed as a percentage of the variance (accounted for by each component to the total variance in all of the variables). The sum of the eigenvalues equaled the number of components. Only principal components with eigenvalues greater than 1 were extracted. The factors accounted ranged between 64–85% of the variance before rotation. A summary of the results is given here, but the complete results from the factor analysis are reported in full in Appendix 3. Table 3 illustrates the number of extracted components from the original number of variables and presents the resulting cumulative percentage of variance for the group of variables (and also reports the related ‘loss of information’).

**Table 3 Data Reduction Through Principal Component Analysis**

Original Number of Variables		Cumulative Percentage of Variance %	Loss of Information %	Components Extracted
Org. Commitment	7	76	24	3
Org. Behavior	14	76	24	4
Org. Resources	5	85	15	3
Strategic CSR1	8	72	28	3
Strategic CSR2	6	75	25	3
CSV	6	64	36	2

Table 3 features the number of extracted components. The rotated component matrix was easier to interpret than the unrotated matrix, as the rotation maintained the cumulative percentage of variation explained by the extracted components. This variation is more evenly spread over the components. A brief description of the extracted factor component, together with their eigenvalue and their respective percentage of variance is provided hereunder in Table 4

**Table 4 The Extracted Factor Components**

Org. Behavior	Eigenvalue	Var.	Alpha
		Explained %	0.831
Innovative Environmental Practices	6.747	48.193	
Human Resources Policies	1.545	11.039	
Training and Development	1.247	8.909	
Marketplace Policies	1.055	7.534	(KMO 0.854)
Org. Resources	Eigenvalue	Var.	Alpha
		Explained %	0.823
Money	2.001	40.014	
Time	1.204	24.076	
Economic Short-terms	1.026	20.512	(KMO 0.510)
SCSR1: Firm's Performance	Eigenvalue	Var.	Alpha
		Explained %	0.901
Financial Performance	3.306	41.319	
Market Standing	1.879	16.631	
Reputation	1.114	13.928	(KMO 0.688)
SCSR2: HR & Operations MGT	Eigenvalue	Var.	Alpha
		Explained %	0.891
Employee Motivation	1.879	31.31	
Effective HRM	1.463	24.389	

Operational Efficiency and Cost Saving	1.162	19.365	(KMO 0.535)
<b>CSV: Societal Relations</b>	<b>Eigenvalue</b>	<b>Var.</b>	<b>Alpha</b>
		<b>Explained %</b>	<b>0.765</b>
Community Relations	2.651	44.191	
Regulatory Relations	1.173	19.553	(KMO 0.628)

The reliability measure was computed using Cronbach's Alpha. The Kaiser Meyer Olkin which measures the sampling adequacy was acceptable, in some cases it was well above the 0.5 benchmark (Field, 2005). The components were labeled following a cross-examination of the variables, which reflected the properties of the data contained within each and every component, particularly those variables with the higher loadings. Typically, the variables with the highest correlation scores had mostly contributed towards the make up of the respective factor component. The underlying scope of clustering the variables by using component analysis was to reduce the data and make it more adaptable for regression analysis.

#### **Multivariate regression analysis**

This section explains some of the relationships between the key variables by using the regression analysis. A stepwise procedure was purposely carried out to select the relevant predictive variables in the regression models. The number of potential explanatory variables was reduced and the regression model resulted in significant values. The *p*-value was less than the 0.05 benchmark and there were adequate F-ratios and adjusted Spearman's rho; which meant that the reported models were explained by variance. More importantly, the insignificant variables were excluded without appreciably increasing the residual sum of squares. The regression models produced the regression coefficients which represented the strength and significance of the relationships, as shown in Appendix 4. Moreover, the control variables, namely 'organization size' and 'HR department' were also entered into the equations.

#### **Strategic CSR benefits and organizational commitment**

One of the outcomes of the first hypothesis (H1) indicated that there was a positive and significant relationship between the firm's organizational commitment and financial performance (adj  $r^2=0.680$ ). This relationship was highly significant at ( $p < 0.01$ ). It transpired that the 'financial performance' is dependent on the firm's 'Size' (t-value = 4.626), 'CSR intentions' (t-value = 3.627), and 'staff dedicated to CSR' (t-value = 3.007). The following equation describes the relationship between financial performance and organizational commitment.

#### **Regression equation 1.**

H1: 'Financial Performance' =  $\beta_0 + \beta_1$  'Size' +  $\beta_2$  'CSR Intentions' +  $\beta_3$  'Staff devoted to CSR' +  $\epsilon$ .

There was a positive and significant relationship between effective HRM and the firm's organizational commitment (adj  $r^2=0.481$ ) at a 99% confidence level. Again, the stepwise procedure has excluded the insignificant variables from the model. When testing for this hypothetical relationship, it transpired that the firms' human resources management is dependent on the 'HR Department' (t-value = 5.174) and with 'staff devoted to CSR' (t-value = 2.841). This result indicated that the presence of an 'HR department' has positive effects on 'human resources management'. Interestingly, it also emerged that there are HRM benefits if there are staff within the firm who are specifically dedicated on CSR duties and responsibilities. The following equation describes the relationship between effective human resource management and organizational commitment.

#### **Regression equation 2.**

H1: 'Effective Human Resource Management' =  $\beta_0 + \beta_1$  'HR Dept' +  $\beta_2$  'Staff devoted to CSR' +  $\epsilon$ .

The results suggest that there is scope for organizational commitment in CSR strategy. The findings indicate that the firms (particularly the larger ones), should encourage their staff to involve themselves in CSR practices. This is consonant with the literature review. Jenkins (2009:31) proposed that the operationalisation (for CSR) may be performed from a change agent, i.e. a business champion. Alternatively the coordination of CSR activities may be delegated to a team of employees with the support of their senior managers. Grey and Smeltzer (1989) have referred to champions as individuals within the organization who pioneer new products or concepts, who are given the freedom to try out these ideas. Moreover, the empirical results which emerged from this study suggest that there were positive and significant relationships between operational efficiency and cost savings and the firm's organizational commitment (adj  $r^2=0.259$ ). The findings indicate highly significant relationships (where  $p < 0.001$ ). It emerged that the firms' 'operational efficiency' is dependent on 'CSR intentions' (t-value

= 5.043). The following equation describes the relationship between effective operational efficiency and organizational commitment.

**Regression equation 3.**

$$H1: \text{'Operational Efficiency'} = \beta_0 + \beta_1 \text{'CSR intentions'} + \varepsilon.$$

As management becomes more efficient in using and allocating resources within the organization, the firm enhances its internal operational efficiencies. Efficiencies often translate into savings (Holliday et al., 2002). Cost and risk reduction may be considered as a form of balancing interests among the social, environmental and economic concerns. Interestingly, some studies under this approach have also identified a relationship which suggests that there is an optimal level of environmental and social performance beyond which the corporation incurs unnecessary costs and reductions in profitability (Salzmann et al., 2005).

**Strategic CSR benefits and organizational behavior**

The findings from the second hypothesis (H2) yielded a positive and significant relationship between financial performance and the firm's organizational behavior (adj  $r^2 = 0.676$ ). The measurement of significance with organizational behavior indicated a confidence level of 95% (where  $p < 0.05$ ). The 'financial performance' is significantly and strongly correlated to 'organizational size' (t-value = 2.660), 'innovative environmental practices' (t-value = 4.096); and 'training' (t-value = -2.015). As expected, 'HR Training' had a significant and negative effect on financial performance. The following equation describes the relationship between Financial Performance and Organizational Behavior.

**Regression equation 4.**

$$H2: \text{'Financial Performance'} = \beta_0 + \beta_1 \text{'Size'} + \beta_2 \text{'Innovative Environmental Policies'} + \beta_3 \text{'HR Training'} + \varepsilon.$$

This model has confirmed that the owner-managers thought that their hotel guests were valuing the innovative environmental practices. This finding reflects the academic literature in this area of research (Ayuso, 2006). Customers are willing to pay more for products and services from socially and environmentally responsible companies (see Laroche et al., 2001). This may be also attributed to the firms' communicating their sustainability initiatives to their different stakeholder groups. There was a positive and significant relationship between effective HRM and the firm's organizational behavior (adj  $r^2 = 0.488$ ). The 'effective HRM' was significant (where  $p < 0.05$ ) and strongly correlated to 'HR dept' (t-value = 2.601), 'innovative environmental practices' (t-value = 2.664); and 'marketplace policies' (t-value = 2.347). The following equation describes the relationship between effective operational efficiency and organizational commitment between Effective Human Resource Management and Organizational Behavior.

**Regression equation 5.**

$$H2: \text{'Effective Human Resource Management'} = \beta_0 + \beta_1 \text{'HR Dept'} + \beta_2 \text{'Innovative Environmental Policies'} + \beta_3 \text{'Marketplace Policies'} + \varepsilon.$$

As expected, the presence of an 'HR department' has a significant and positive affect on 'effective HRM'. Curiously, the significance of the variables 'innovative environmental practices' and 'marketplace policies' in the model may suggest that there are many HRM benefits as a result of CSR behavior. The results indicate that the employees are committed to their hotels' sustainable environmental practices and marketplace policies. The staff's involvement in CSR engagement can lead to boost their morale, job satisfaction and loyalty to their firm. In Freeman's stakeholder model (1984, 2004) employees represent one of many other stakeholders groups addressing the company with their own demands. There are positive and significant relationships between the firm's organizational behavior and operational efficiency and cost savings with an adj  $r^2 = 0.326$ . The 'operational efficiency' is equally correlated to 'organizational size' (t-value = 3.636), and 'HR policies' (t-value = 3.635). The following equation describes the relationship between Organizational Behavior and Operational Efficiency and Cost Savings

**Regression equation 6.**

$$H2: \text{Operational Efficiency} = \beta_0 + \beta_1 \text{'Size'} + \beta_2 \text{'HR Policies'} + \varepsilon.$$

How businesses respond to the expressions of ethics and morality in markets may be triggered by a desire to avoid unnecessary costs. The different demands of stakeholders may present potential threats to the business organization. Therefore, this cost and risk reduction perspective of the CSR business case provides a plausible explanation of why businesses may try to mitigate and alleviate the threats through a threshold level of satisfactory social and environmental performance.

**Strategic CSR benefits and organizational resources**

The results from the third hypothesis (H3) have produced a positive and significant relationship

(where  $p < 0.05$ ) between financial performance against the firm's organizational resources (adj  $r^2 = 0.634$ ). With a correspondingly high t-value of 10.026, 'organizational size' has emerged as very significant in modeling the relationship between organizational resources and financial performance. Moreover, the stepwise procedure has picked up the predictor variable 'economic short-terms constraint' (t-value = 2.162). The significant t value of 'an economic short term suggests that the organizations are not investing in their long term capital investment (which comprises discretionary expenditure in CSR). Of course, this may result in more liquidity and financial resources in the short-run. The following equation describes the relationship between Organizational Resources and Financial Performance.

**Regression equation 7.**

$$H3: \text{'Financial Performance'} = \beta_0 + \beta_1 \text{'Size'} + \beta_2 \text{'Short-terms'} + \epsilon.$$

The available slack resources theory (Waddock and Graves, 1997) also assumes a trade-off view of CSR and financial performance, by suggesting that when organizations are enjoying superior performance, they are able to dedicate additional resources to CSR activities. The implication here is that the firms might perceive CSR as an additional cost and thus they can only afford to pursue these activities when they are not in a situation where they need to minimize costs. A positive and significant relationship has emerged between effective HRM and organizational resources (adj  $r^2 = 0.458$ ). In this case, the measurement of significance has indicated a confidence level of 95% (where  $p < 0.05$ ). The relationship between 'Effective HRM' and 'HR dept' was strongly correlated ( $t = 3.337$ ) and negatively correlated to 'Financial Resources' (t-value = -2.202). The following equation describes the relationship between Organizational Resources and Effective Human Resource Management:

**Regression equation 8.**

$$H3: \text{'Effective HRM'} = \beta_0 + \beta_1 \text{'HR Dept'} + \beta_2 \text{'<Financial Resources>'} + \epsilon.$$

The literature review in this field suggests that the organization's internal resources and skills are an important mediator between social performance and financial performance. Advocates of this internal resources theory claim that CSR policies increase managerial competencies. CSR helps to develop better skills and abilities to adapt to changes in the challenging business environment. Appropriate knowledge of the social and environmental performance is becoming indispensable in the hospitality industry (Tsai et al., 2010). The internal skills perspective is substantiated empirically to some extent, in this study. The findings have indicated a positive and significant relationship (where  $p < 0.05$ ) between operational efficiency and cost savings and the firms' resources (adj  $r^2 = 0.213$ ), where 'size' (with a t-value of 4.176) and 'HR department' (t-value = -2.201) were the predicting variables. Surprisingly, the presence of an HR department was significant where it emerged that it has negatively affected operational efficiency. The following equation describes the relationship between Organizational Resources and Operational Efficiency and Cost Savings.

**Regression equation 9.**

$$H3: \text{'Operational Efficiency'} = \beta_0 + \beta_1 \text{'Size'} + \beta_2 \text{'<HR Dept>'} + \epsilon.$$

**Does CSR engagement bring economic value?**

The next model attempts to explain the causal mechanisms which may determine financial performance. This time, a myriad of variables (and factor components) have been taken into account, in order to come up with a plausible 'causal path' (Granger, 1980). Therefore, 'organizational commitment', 'organizational behavior', 'organizational resources', the 'societal engagement' components, 'Size' and 'HR Department' were inserted in the regression model. Again, a stepwise entry procedure ensured the selection of the significant predictor variables which exhibited the highest bivariate correlation with 'financial performance' (and excluded other insignificant variables). This fourth hypothetical model (H4) has yielded a strong correlation coefficient (adj  $r^2 = 0.769$ ). This relationship was significant (where  $p < 0.05$  level). According to this model; the 'financial performance' is preceded by 'size', 'community relations', 'innovative environmental practices' and 'regulatory relations'. The following equation features the antecedents for 'Financial Performance'.

**Regression equation 10**

$$H4: \text{'Financial Performance'} = \beta_0 + \beta_1 \text{'Size'} + \beta_2 \text{'Community Relations'} + \beta_3 \text{'Innovative Environmental Policies'} + \beta_4 \text{'Regulatory Relations'} + \epsilon.$$

It transpired that the financial performance is dependent on its 'size' with a t-value = 2.535, 'societal relations' (t-value = 5.764), 'innovative environmental practices' (t-value = 3.388) and 'regulatory relations' (t-value = 2.347). Interestingly, the organizations' ability to build stakeholder relationships has resulted as a precursor for the organizations' financial performance. Such empirical studies were carried out in the past to investigate the relationship between CSR (corporate social performance or corporate citizenship) and financial performance. Previous empirical results have ranged

from negative relation (Wright and Ferris, 1997), to no relation at all (Mc Williams et al., 2000), to showing a positive relation (Orlitzky et al., 2012; Waddock and Graves, 1997).

#### **What creates shared value?**

The fifth hypothetical model features the societal relations (CSV1) as the dependent variable. The model has produced a strong correlation coefficient (adj  $r^2 = 0.645$ ) which was statistically significant ( $p < 0.05$ ). The independent variables which have significantly explained a large portion of this variation consisted of the organizations' 'financial performance' (were  $t = 7.206$ ), 'financial resources' ( $t = 5.117$ ), 'training' ( $t = -3.720$ ), 'marketplace policies' ( $t = -2.878$ ) and 'time resources' ( $t = 2.457$ ). Interestingly, the organizational behavior explanatory variables have resulted in a negative effect on societal relations. The reason for this is that businesses may devote their slack resources on training their staff and on marketing and promotion activities rather than strengthening the ties with the community around the business. This finding indicates that businesses tend to look after their customers and suppliers first. The following equation describes the causal model for societal relations.

#### **Regression equation 11.**

H5: 'Societal Relations' =  $\beta_0 + \beta_1$ 'Financial Performance' +  $\beta_2$ 'Financial Resources' +  $\beta_3$ '<Training>' +  $\beta_4$ '<Marketplace Policies>' +  $\beta_5$ 'Time' +  $\varepsilon$ .

There was also a positive and significant relationship when regulatory relations (CSV2) was the response variable. In this case, there was a moderate correlation coefficient with an adj.  $r^2 = 0.423$  at a highly significant level ( $p < 0.001$ ). This second H5 model shows that the 'regulatory relations' are dependent on the 'organization size' ( $t = 7.138$ ). It transpires that the larger firms tend to build closer relationships with the government and its agencies. This finding was also reflected in the literature review (see Albareda et al., 2004). The following equation features the stepwise regression equation for regulatory relations

#### **Regression Equation 12.**

H5: 'Regulatory Relations' =  $\beta_0 + \beta_1$  'Size' +  $\varepsilon$ .

#### **Does doing well, lead to doing good?**

So far the findings indicated that organizational commitment, behavior, their slack resources and size are the causal determinants. Therefore they are the temporal antecedents of financial performance. Curiously, there are many theoretical arguments in literature which suggest that financial performance can be the precursor of organizational behavior (for CSR). The rationale for reverse causation may be triggered from the firms' availability of slack resources. Orlitzky et al. (2003) have supported this view of reverse causality from financial performance to CSR (they used the notion Corporate Citizenship). Similarly, Waddock and Graves (1997) found that Corporate Social Performance (CSP) depends on financial performance, and that the sign of the relationship was positive. The sixth hypothetical relationships between the 4 organizational behavioral components against 'financial performance' have been tested using regression analysis' stepwise procedure. There was a strong correlation coefficient (adj  $r^2 = 0.603$ ) and it was highly significant (where  $p < 0.001$ ) between 'innovative environmental practices' (dependent variable) and 'financial performance' ( $t = 10.291$ ). This strong relationship suggests that when an organization achieves sound financial results it tends to invest in innovative environmental practices, such as 'energy and water conservation', it may engage in 'environmental protection' measures, 'waste minimization' and the like (see Dodds and Kuehnel, 2010; Graci and Dodds, 2009; Merwe and Wöcke, 2007). The following regression equation describes the causal model where Financial Performance is the antecedent of Organizational Behavior:

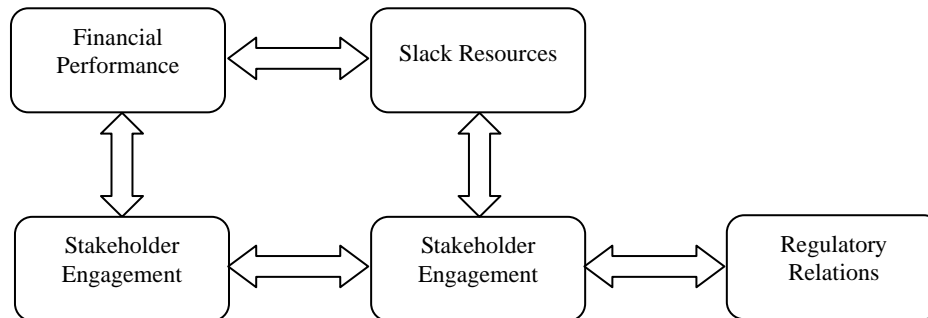

#### **Regression equation 13.**

H6: 'Innovative Environmental Behavior' =  $\beta_0 + \beta_1$  'Financial Performance' +  $\varepsilon$ .

In good economic times, the high levels of 'financial performance' may provide the slack resources which are required to successfully engage in CSR (refer to Ullmann, 1985). The availability of excess funds will determine whether there is the 'initiation and maintenance of voluntary social and environmental policies' (McGuire et al., 1988). If the firm has experienced low profits and has scarcer resources at its disposal, then the firm may not engage itself in CSR activities and investments. On the other hand, if the organization has gone through a period of consistent satisfying results with good financial performance, businesses may exhibit a sense of obligation to give something back to the community (economist, 2006). The relationships between 'financial performance' as a predictor variable against the other behavioral outcome variables (namely, 'HR policies'; 'Training' and 'Market relations') did not yield any positive and significant relationships. In this case, the findings suggest that successful financial performance, does not necessarily translate in significant improvements in the businesses' human resources and marketplace policies; such as training and development of staff, better customer

services and fruitful relationships with suppliers and the people they do business with.

An extensive literature review about business models has confirmed that responsible behavior can be used as a strategic tool for value creation (see Orlitzky et al. 2012; Husted et al. 2012). A conceptual model may lead towards achieving a competitive advantage of the firm, if the model is sufficiently differentiated (see Teece, 2010). Following the sound empirical findings in this thesis; a model representing the 'creation of shared value' is being proposed and is depicted hereunder:

**Figure 1** 'Creating Shared Value' Model (Compiled by the Author)

According to the stakeholder theory, there are win-win outcomes when businesses connect with their stakeholders. Firms create simultaneous, pluralistic definitions of value whilst targeting their multitude of stakeholders. In a similar vein, the resource based view (RBV) theory suggests that resources of the firm affects its activities and growth (Penrose 1959), profits (Wernerfelt 1984) and the level of sustained competitive advantage (Barney 1991). Significant areas of study which are gathered under this business case approach of CSR include: 'sustainable local enterprise networks' (Elkington, 1998); 'value based networks' (Wheeler et al. 2003); 'positive synergy' or the 'virtuous circles' (Pava and Krausz, 1996; Preston and O'Bannon, 1997; Stanwick and Stanwick, 1998); 'societal learning' (Brown and Ashman, 1998); 'creating shared value' (Porter and Kramer, 2006, 2011; EU, 2011); 'value in business' (Lindgreen et al. 2012); 'value creation through social strategy' (Husted et al. 2012) and 'the stakeholder approach to maximizing business and social value' (Bhattacharya et al., 2012). The fundamental motivation of such approaches is the view that creating connections between stakeholders will open up unseen opportunities for value creation.

## 6 Discussion and Conclusions

The quantitative analysis revealed that CSR engagement translates to better organizational performance. It has been reported that there is more to CSR behavior than boosting the employee morale and increasing employees' job satisfaction. The hotel enterprises indicated that they are engaging themselves in innovative environmental practices, as they realized that there are cost saving opportunities for them. It has been demonstrated that CSR engagement improves the financial performance of the business. The socially responsible behavior coupled with the environmental performance often elicits greater customer and employee loyalty, as it simultaneously improves the existing societal relationships, including the regulatory ones. The discretionary spending in CSR whether it is driven from a strategic intent or from 'posturing behavior', often results in improved relationships with internal and external stakeholders.

In the main, the informants have indicated that strategic corporate social responsibility yields substantial benefits to the firm itself as it supports the core business activities. This research found that the firm's financial performance is dependent on the firm's organizational behavior for CSR engagement. Interestingly, it also emerged that the financial performance is also dependent on the firm's size and with its capability to forge good community and regulatory relationships. This quantitative study suggests that CSR (when manifested as environmental behavior) is dependent on the firm's financial performance and vice-versa. Both relationships  $CSR \rightarrow FP$  and  $FP \rightarrow CSR$  were strong and significant, when tested statistically. Therefore, this study has shown that CSR behavior causes financial performance and in turn financial performance causes CSR behavior. This finding also supports the slack resources theory. When there are available resources (financial and time resources) the businesses have greater freedom to spend in discretionary activities. Firms may choose to invest their slack resources on strategic CSR, at the same time they will be 'doing good by doing well'.

## Research on Synergistic Innovation Mechanism of Industry Technology Innovation Strategic Alliance: A Case Study of FTTx\*

Zhang Hong, Qin Yuanjian, Guo Chen

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: zhanghong1971@yahoo.com.cn, qyjhb@163.com)

**Abstract:** With the increased development of international industrial competition and growing demand of technology innovation, innovation strategic has trended to become kinds of systems of cooperation or alliance in regional industries. This thesis tries to research the synergistic innovation mechanism from the view of knowledge transfer and the case analysis of FTTx industrial technology innovation strategic alliance of Hubei province. To point out the innovation process and mechanism principles of alliance can help to know further about operating management of innovation activities.

**Key words:** Synergistic innovation; Industry technology innovation strategic alliance; Knowledge transfer; Innovation mechanism; Conceptual model

### 1 Introduction

At present, industrial technology innovation strategic alliance construction in China has made great achievements: each regional alliance improved integrated innovation with industrial technology innovation chain, and it promoted their industrial core competitiveness; At the same time, each alliance held national or provincial science and technology projects, developed common key technology research and development, the technology innovation mechanisms promoted the foundation and share of alliance platforms or bases and they also affect optimal allocation of the innovation elements; The alliances focused on exploring their own characteristics and different operation mode that can strengthen themselves cooperation. Innovation alliances in the national innovation system play a great role in industrial technology innovation. Most importantly they cannot neglect the efficacy from synergistic innovation mechanism.

The concept of synergy has already appeared in last century from the theory of economic management, now it gradually spreads into innovation research and synergistic innovation plays an important role in this field. The earliest synergy research is from Ansoff when he studied enterprise diversification.<sup>[1]</sup> In 1971 the German researcher Haken discussed the systematology, then he thought if each subsystem of the whole system could have the characteristics of intercoordination, cooperation, synchronous joint and collective behavior, then it will get the "1+1>2" synergistic effect. The definition of synergy is: different subsystems will structure a kind of function architecture with the macro level time and space. In self-organizing theory synergy was thought as a tool which could realize self-organizing; it emphasizes the interaction between system and function that will have the structural effect.<sup>[2]</sup> In addition American, Japanese and other scholars also discussed and put forward coordination mechanism and the synergy management.

For synergistic innovation, nowadays the third generation of technology innovation theory said that technology innovation needs stronger support as the background which could build a great environment for it. So the views are focused on the internal or external factors of innovation interaction which includes institution, support system and so on, as Feedy proved in empirical way that the institution and innovation have interaction between them. B·A·Lundvall in national innovation system theory said that, industry, university and research institute which are the foundation factors are the core of national innovation system. For the factors of innovation organization, the scholars have common ideas.<sup>[3]</sup> Xiong Li and Sun Youxia (2011) separated the present ideas into two parts, which are internal innovation and external innovation, according to the different realizing approaches. The external innovation is also separated into transverse and longitudinal parts. According to the comprehensive research most of scholars thought the main factors of synergistic innovation include technology, marketing, university, enterprise, research institute and so on. The support factors, such as government, also help and take part in operating process.<sup>[4]</sup>

For the mechanism of industry technology strategic alliance, it is a kind of contract relationship, the alliance is not a legal person, but nowadays laws or rules could restrict its behaviors. Though the

\* From the project: Soft Science Project of Science and Technology Agency of Hubei Province 20112s0129

guidance from series of contracts, alliance can ensure the operation of investment systems, interest distribution systems and so on. He Yubing (2012) constructs industry-university-institute cooperation system from thinking of levels of strategy, knowledge and organization, by this way it was analyzed the internal cooperation and all-win processes.<sup>[5]</sup>

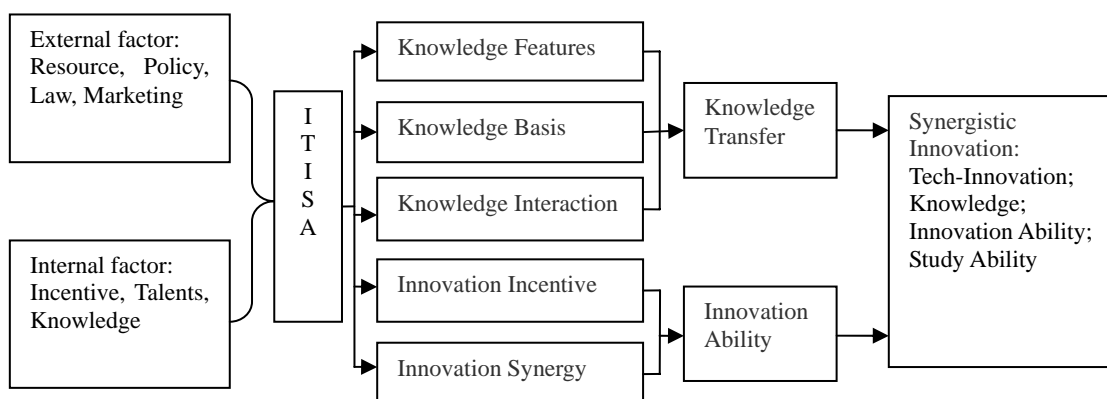

Industrial Technological Innovation Strategic Alliances not only acquire new knowledge by knowledge transfer, but also obtain synergistic innovation effect by the interactions among research universities, research institutes and enterprise knowledge subsystem. Knowledge transfer mentioned above is the premise and foundation of synergistic innovation, which promotes knowledge transfer in return. Process of synergistic innovation accompanies knowledge transfer. They interact with each other, creating conditions for generation and update of the core competencies of the organization. Around the knowledge transfer theory perspective, this paper further constructs the industry technical alliance of synergistic innovation mechanism.

## 2 Synergistic Innovation Mechanism of Innovation strategic alliance

Synergistic innovation in industrial technology innovation strategic alliances can be influenced by various factors, including science, technology, economy, society, policy and the interest of cooperators. We establish the industrial technology innovation strategic alliances mechanism in combine with the current situation of Hubei province and the existing theories foundation. The model divides all the factors which determine and influence synergistic innovation into two parts-internal and external ones, emphasizing that synergistic innovation is the result of both the internal and external factors and showing the dynamical complexity of the synergistic innovation process. The improvement of university and research institutes and core competencies of the organization in the alliances depends on the improvement of performance of synergistic innovation between them. Both of them enhance their technical and learning abilities, expand the knowledge base, strengthen sustainable innovation, and promote the formation and development of core competencies in the end.

The following Figure (see Figure1) shows the synergistic innovation mechanism of industrial technology innovation strategic alliances. The performance of synergistic innovation is influenced by the following factors:

- (1) Knowledge storage of university, research institutes and enterprises, which is prior knowledge;
- (2) Interact knowledge transfer ability of university, research institutes and enterprises, including acquisition and transmission ability;
- (3) Features of knowledge, which is mainly the complexity of knowledge;
- (4) Creation impetus of university, research institutes and enterprises, mainly considering the rational allocation of the alliances etc;
- (5) Innovation ability of university, research institutes and enterprises, mainly referring to the quality of employees etc;
- (6) Synergistic status of university, research institutes and enterprises, mainly concerning the synergistic status of cultures, targets, employees and management in the alliances;

**Figure 1 Industry Technology Innovation Strategic Alliance Synergistic Innovation Mechanism**  
 (Notes: ITISA is the abbreviations expression of Industry Technology Innovation Strategic Alliance.)

According to the analysis above, it can be proved that the knowledge complementarities is the

condition of forming synergistic innovation and produces obvious performance in the alliances, which improves the abilities of technical innovation and knowledge accumulation, shortens the innovation cycle time, and then gains competitive advantage.

### **3 The Case study: FTTx Industry Technology Innovation Strategic Alliance**

#### **3.1 Brief Introduction of FTTx Industry Technology Innovation Strategic Alliance**

Before 2008, the gap of FTTx (Fiber to the Building) industry is huge between China and other foreign countries. Back then, the FTTx coverage in developed countries is from 20% to 40%, while it is less than 2%; there is a large proportion of FFTH (Fiber to the Home) in developed countries, while among the only 2% in China, there is a small proportion of relatively larger commercial FFTH application mode. At present, we have 1.1 billion telephone subscribers and 0.45 billion internet users. As an important component of a new generation of information technology, the rapid development of FTTx and WBN (Wide Band Network) which is centralized by FTTx, will drive the development of a strategic emerging industry which is of a scale of one trillion RMB. Therefore, a national alliance was formed---FTTx industrial technology innovation strategic alliances, which includes 12 core members---Wuhan Research Institute, China Academy of Telecommunication Research, China Telecom, China Mobile, China Unicom, Huawei Technologies, ZTE, PTIC, and Balefire communication etc, and 30 peripheral members. It is the first alliance in China committed to popularize WBN, develop the "triple play" and promote the construction of technology innovation chain of broadband industry.

Since the establishment of the alliance, its members cooperate actively, strive for innovation and do a lot of works to perfect the industry standardization, achieving good results:

(1) Its members supported the standardization of the alliance by implementation traction and technology diffusion. To be specific, on the basis of "Coalition Agreement" and "Alliance Cooperation Management Approach", the members carried out a great number of innovative collaboration activities, for example, together with WTD, HUST, Wuhan Light-science and Technology company researched and developed key optoelectronic devices to lower the cost of optical fiber access devices, trying to make it to 20% by 2012; YOFC and Balefire communication together researched and developed new optical fibers (such as UBIF) and supporting optical fiber perform suitable for FTTx; together with Balefire communication, China Academy of Telecommunication Research etc., YOFC researched and developed new optical fibers (such as feeder cable, optical distribution cable, and GJXH etc.); they also started a series of cooperative innovation activities in the respect of integration of broadband fiber access and wireless technology.

(2) Its members worked in cooperation with each other to get international standard in the field of FTTX, leading the development of domestic industry; they formulated a series of national and industrial standards, promoting the standardization in FTTx in China thoroughly.

(3) The alliance co-held FTTx development strategy meeting with China Institute of Communications every year since its establishment; the "FTTX technology and standard workshop" co-held with China Institute of Communications systematically trained over 2000 FTTx research staff, providing a firm talent resource foundation for standardization of FTTx in China.

The excellent results closely related to the base work and the internal mechanism of the alliance. On the one hand, based on the alliance agreements, the alliance provides for the objectives and tasks of the member units of the standardization work and provides the basis for the work and system support. Specifically, when the alliance is established, the agreements units confirm:"continuously improve our standard system of the FTTx, ensure the interconnection of the independent intellectual property rights FTTx solutions, collaborative research and improve the standard system of the FTTx, before 2010 it completed the study work of the FTTx national institute of standards. Industry and information technology ministry of telecommunications research institute, as the main focal points, complete the study work of the FTTx national institute of standards before 2010."

#### **3.2 Enlightenments of FTTx Alliance**

FTTx Industry technology innovation strategic alliance, from the beginning of set up to now, has made the good progress and achievement, synergistic innovative experience is worth to learn from it:

(1) Megamerger of alliance members. 12 core members and more than 30 peripheral members of the alliance have included, for domestic, the most innovative and influence research, manufacturing companies and telecom companies in the Devices, optoelectronic devices, fiber optic cable and other areas of the optical access system, Alliance members represent the highest level of the corresponding areas of innovation within. The lead unit of the alliance that is the Union Fiber Home Technologies

Group is a conversion from the enterprise by the Wuhan Institute of Posts and Telecommunications Group, is considered the birthplace of the Chinese optical communications industry, According to statistics, in China's communication network, 2.5 km out of 9 km fiber optic cable is developed by the Wuhan Institute of Posts and Telecommunications, and 3-5 km from its technical support corporate. The Alliance is a veritable "Megamerger". In 2010, the main business of Alliance member companies total revenue of more than 1.5 trillion RMB, accounting for more than 90 percent of the owners of information and communication business revenue.

(2) Complement each other's advantages among members. For each company's own technical secrets, their core competitiveness, through the differentiation advantages of technological innovation, utilization of resources, and the alliance carried out joint research projects to achieve the same purpose, and share knowledge and technology, and made full use of resources. In addition, in order to strengthen the co-operation of the project members, on the one hand, the alliance start the project enlists that is Member units of the Ministry of Industry and Telecommunications Research Institute, China Unicom, China Mobile and other feedback nearly 10 project proposals, on the other hand, according to the demand for industrial development, alliance members jointly apply for the National Science and Technology project. Dividing work, complementing each other in project cooperation, and get the "1+1>2" achievement at last.

(3) Regulating the alliance cooperation system based on the internal mechanism. The internal mechanism of alliance is "one line" and "standard link", "one line" means the standard work that strive to get the international standard discourse; "Standard link" means to strengthen cooperation innovation, through the upstream and downstream of the industry chain close communication; to accurate positioning demand, through project promotion. In the project cooperation process, the alliance gets the agreement as a foundation. To specify the members of different stages of objectives and tasks of standardization work in agreements, and to regulate the members' responsibility and obligation which effectively provide strategic basis and system support for alliance operation.

#### 4 Conclusion

FTTx alliance is one of 36 industry technology innovation strategic alliances experimental units which are replied by the ministry of science and technology. These years it has made the good progress and achievement, especially on synergistic innovation. This thesis tries to research the synergistic innovation mechanism from the view of knowledge transfer and the case analysis of alliance. Compared with enterprise independent innovation, shared knowledge base in synergistic innovation makes the enterprises meet complex problems and source of knowledge they haven't met before, in this way, making economic effect increased to a new level significantly and core competencies of organization enhanced.

# Building a Collaborative Innovation Strategic Alliance and Exploring New Modes for Industry-University-Institute Cooperation: Take Wuhan University of Technology, P. R. China as an example

Gao Guowei

Wuhan University of Technology, Wuhan, P.R. China, 430070

( E-mail:gaoguowei1978@163.com )

**Abstract:** The industry-university-institute cooperation cannot play the due role in boosting innovation unless it is launched in an effective mode in this paper, profound studies and analyses have been conducted on the practice, effect and experience of the new industry-university-institute cooperation mode on the basis of the exploration and practice of “The Strategic Cooperation Alliance on the Research of Glass Technology” and “Green Transport Alliance” of Wuhan University of Technology, China, which gives full play to the strengths of education and technology, and puts forward the thinking of building a collaborative innovation strategic alliance on the principle of mutual benefit in terms of industry leading, government leadership, mechanism innovation, project actuation and platform support, providing a beneficial reference to universities in terms of industry-university-institute cooperation.

**Key words:** Collaborative innovation; Strategic alliance; Industry-university-institute cooperation; New mode

## 1 Introduction

To carry out the spirit of the important speech made by State President Hu Jintao at the 100-Year Anniversary Celebration of Tsinghua University, on May 2012, the Ministry of Education of China launched the “University and College Innovation Capability Improvement Plan” (i.e. the “Plan 2011”). The direct carrier to implement the Plan 2011 is to build a collaborative innovation strategic alliance, to innovate the organization mode of industry-university-institute cooperation, to solve problems in the building of technological innovation system, and to boost the building of an innovative country.

Due to the dispersion, repetition and inefficiency in innovation power of China for a long time, personnel training and scientific research are divorced from economic and social development, and the major gap between China and the developed countries is the deficiency of innovation.

According to the global experience in the industry-university-institute cooperation, to cope with the rapid changes of technology and market, cooperative innovation has become the main measure that European, American and Japanese universities and colleges, research institutes and enterprise are adopting to deal with the uncertainty of innovative technology and market. Relying on colleges and universities, collaborating with research institutes, industry enterprises, local government and the international community to form the whole collaborative innovation and to solve the national demands and important scientific problems is not only an effective way to promote national innovation, but also proved by many domestic and foreign cooperative innovation practice. In the 1990s, the policy makers in USA began to encourage universities cooperate with enterprises in technological development, and tried to use a series of plan (such as “a national center plan to promote the development of manufacturing industry science”, “human genome atlas plan”, etc) to strengthen the innovation ability of synergy between universities and enterprises conditions<sup>[1-2]</sup>. For scientific research and technology development, the United States has always been pursued free policy. 60s was the golden age when government was in charge of science and technology development, and gradually formed the science and technology system at current United States whose main body is scientific research institution of the university. The following is the scientific research system structure sheet (table 1).<sup>[3]</sup>

**Table 1 U.S. Science System Structure**  
(Expenditure Ratio in 1992)

	University	National Laboratory	National Research Center of the Entrusted Management	Enterprise	Nonprofit Research Institutions
basic research	50.9	11.1	11.1	18.5	8.5
application research	13.1	11.8	2.7	67.5	4.9

Technological innovations are raising new innovative requirements for the combination methods of technological innovation elements, and need to be improved continuously in practice on the basis of national conditions<sup>[4]</sup>.

Only in the effective mode can the industry-university-institute cooperation be important to promote innovation<sup>[5]</sup>. Wuhan University of Technology regards serving regional and industrial economy as its duty, and positively explores the new industry-university-institute collaborative innovation cooperation mode.

Building a collaborative innovation strategic alliance should focus on the reform of the mechanism system and on promoting the integration development inside and outside colleges and universities. Establishing cooperative innovation mode strives to solve the inharmony between the innovation chain and innovation management. In 2006, the university built, together with Shahe, Hebei, China, a high level generic technological innovation service platform—the Glass Technology Research Institute (Research & Development Center), absorbed enterprises and made up a “Glass Technology Research Strategic Cooperation Alliance”. In 2012, the university held the hands of 21 universities and colleges, scientific research institutes and large enterprises at home, building the “Industry-university-institute Collaborative Innovation Alliance of Green Transport Technology” (Called “Green Transport Alliance” for short). The Green Transport Alliance has been crowned with success in boosting the close linkage among education, science and technology, and economy.

## **2 Building a Collaborative Innovation Strategic Alliance**

Wuhan University of Technology and Shahe Municipal Government of Hebei Province entered into the “Glass Technology Research Strategic Cooperation Alliance” with local enterprises by building a high level generic technological innovation service platform, i.e. Glass Technology Research Institute. This is a form of collaborative innovation that the university has made in the exploration of cooperative mechanism centering on the improvement in the training of outstanding talents, technological innovation, and the great demands in the building material industry, as well as serving the development of regional economy. The alliance gives full play to the characteristics of material disciplines and the talent advantage of university. On this basis, it focuses on the urgent need of transformation and upgrading of the characteristic glass industry of Shahe City.

The “Green Transport Alliance” built under the leadership of China - Wuhan University of Technology establishes the collaborative innovation target system based on the “Green Development” in close accordance with the major strategic demands on green transport, which involves establishing green transport discipline and the direction of key technical breakthrough, training and gathering innovative talents supporting green transport, improving industry culture and policies, and building an industry-university-institute collaborative innovation support platform. A new collaborative innovation system and mechanism has been built based on mutual benefit. This brand-new alliance organization has realized comprehensive collaboration and profound integration by the traditional industry ties and the core value of green development, as well as the combination and unification among “segment management”, “plan and market”, and “science, education and economy”.

## **3 Fruitful Results from the New Mode**

Through years of exploration, the new industry-university-institute cooperation mode built jointly by Wuhan University of Technology and Shahe City in Hebei Province has achieved remarkable results in serving local economy, enterprise development, talent support, and the development of university in itself.

### **3.1 Enhancing local economic development**

Shahe Glass Technology Research Institute in Hebei Province has directly provided fast and effective services in the transformation and upgrading of the glass industry in terms of technology, talent, equipment and brand closely specific to the bottlenecks and technical difficulties in the development of the glass industry of Shahe City. Since 2005, the Glass Technology Research Institute has extended assistance in succession in the development of Glass Industry Development Plan of Shahe City and 2011-2020 Regional Economic Development Plan, etc., helped to bring about the successive operation of a number of high-tech quality float glass production lines in Shahe City, pushed the upgrading and transformation of the glass industry, and helped to increase the industrial benefits substantially. In 2011, Shahe realized the annual output 0.12 billion weight cases, with production value RMB 21 billion, and

paid taxes RMB 600 million about 20 times more than that in 2005.

### **3.2 Enhancing the technological innovation capability of the industry**

Shahe Glass Technology Research Institute has successively helped Shahe Yingxin Glass Group Co., Ltd., Jinhongyang Company, Chirun Special Glass Industrial Park introduce a number of high-tech projects, which enriched the types of glass products, extended the industrial chain, and enhanced the development momentum of glass enterprises. In 2011, the production capacity of quality float glass increased from 9% in 2005 to 85% of total output of glass all over Shahe City. The rate of further processing of glass rose from 25% to 32%.

### **3.3 Extending talent and intellectual supports in the locality**

Wuhan University of Technology provided all-round talent guarantee to Shahe City via Shahe Glass Technology Research Institute according to the actual needs of key areas and weak links of the talent training and the development of Shahe City, Hebei Province of China. (1) Provide 3,860 person-times of post training totally to the glass industry of Shahe City by the direct training, special training, and irregular seminars, and training the party and government management personnel and executives of key enterprises of Shahe City about specialized and business knowledge, enhancing and developing their insights and management capabilities in the economic and social development. (2) Carry out the joint education, building a modern distance education study center and a continuing education correspondence coaching center in Shahe City and training local technical personnel in Shahe City. (3) Provide on-the-job service. A youth teacher each year will be designed to take a temporary post in a government department or an enterprise of Shahe City and to give guidance and have a physical training.

### **3.4 Boosting the development of the universities**

The university has undertaken diversified projects of the glass industry of Shahe City since 2005. Multiple scientific research results have been transformed and put into production. The university built a “Graduate Scientific Research Innovation Base” and an “Outstanding Engineer Training Base” in Shahe City. The university will assign a number of teachers and students each year to the Glass Technology Research Institute, where they will take part in the research and development by the good practicing and experimental conditions, and the pilot base. It will help to improve students’ innovation capability as well as teachers’ practical ability. In the process of serving local economic and social development, a number of research results, technologies and talents go out of the university to enterprises, helping to enhance the university’s capability in the scientific research and development and in the transformation of scientific results, as well as the reputation of the university greatly.

The “Green Transport Alliance” has just been put into operation at present. It is believed that it will make positive contributions to the transformation of the development mode of China’s transport industry, as well as the strategic adjustment of economic structure.

## **4 The New Mode’s Benefits**

### **4.1 The foundation of the new mode**

The glass industry, which is a characteristic industry of Shahe City, Hebei Province of China, contributes 20% of the total plate glass to China. But the glass industry of Shahe City is faced with the reality in urgent need of upgrading. The transportation industry of China starves for the building of low-carbon transportation system and the green development of the transportation industry. Wuhan University of Technology has resource advantages in the area of traditional materials, new materials new energy resources and equipment manufacturing and has obtained a series of achievements. The 21 members of the “Green Transport Alliance” have gathered multiple national key disciplines, research platforms, talents and other innovation resources in direct relation to the transportation industry, and have been extending supports to talent training and technological innovation in the transportation area. The glass industry of Shahe City, the technical demand of China’s transportation industry and the characteristic advantageous disciplines of Wuhan University of Technology are highly coincident, thus having laid a solid foundation for the establishment of the new industry-university-institute cooperation mode.

### **4.2 Government leadership in the new mode**

Shahe Municipal Government in Hebei Province, China attaches great importance to the building and development of Shahe Glass Technology Research Institute. Mayor of Shahe Municipal Government assumes the office of director of the Research Institute Management Committee to coordinate, plan and push concerning work on the whole. The municipal government invested over

RMB 70 million in building the Glass Technology Research Institute, purchased the domestic best and the world advanced scientific research equipment, and offered favorable policies in the land, funds, and talent introduction, etc., thus playing a critical role in the establishment of the industry-university-institute cooperation mode. The “Green Transport Alliance” is subject to the management of the council under the Ministry of Transport of P.R.C., the Ministry of Education and the Ministry of Science and Technology, deals with issues relating to the long-term, overall and strategic development of green transportation industry, establishes the main direction of attack and key tasks of the alliance in different periods, and gives instructions and supports to the collaborative innovations of the alliance.

#### **4.3 The core of the new mode**

The “Green Transport Alliance” has built a collaborative innovation system and mechanism based on mutual benefits, an inner motivation mechanism centering on market adjustment (Including a brand-new collaborative technological innovation mechanism, an innovative talent training mechanism and a talent management mechanism), and a cooperation exchange mechanism based on overall opening. The alliance is fully open inside and outside, and has realized all-round communication, resource sharing, risk sharing, combination of brainstorm, and collaborative innovation. Shahe Glass Technology Research Institute has established a “three-four-three” cooperation and development pattern in the operation, i.e. “three promotion mechanisms” (i.e. input, plan and policy), “four supporting systems” (i.e. first-class technology, talent, equipment, and brand), and “three cooperation modes (i.e. pushing independent operation of consulting, decision-making and executive institutes, building a glass technology alliance to push collaborative innovation, and building a technology application demonstration zone).

#### **4.4 The key point of the new mode**

Shahe Glass Technology Research Institute in Hebei Province regards the basic research on the application of glass, and technical transformation as the main direction of attack, and researches and develops, on the leading edge of glass material science, the key production technology and new types of glass, new energy based glass technology, production process and equipment and automation emulation techniques, key energy saving and emission reduction techniques of the glass industry and technique assessment, and product defect quick diagnosis and analysis. The “Green Transport Alliance” regards the three scientific areas (i.e. green water transport, green land transportation, and green navigation) and key technologies as the main directions of attack, carries out project cooperation, and strives to make technological breakthrough centering on major fundamental, prospective and strategic issues in relation to green transportation.

#### **4.5 The guarantee of the new mode**

The Glass Technology Research Institute as a high-level generic technological innovation service platform jointly built up by China - Wuhan University of Technology and Shahe City in Hebei supports the industry-university-institute cooperation of the “Glass Technology Research Strategic Cooperation Alliance” comprised of the university, local government and enterprises. The “Green Transport Alliance” is to build a world first-class technological innovation platform, including a collaborative innovation platform for the major basic research and major basic research on the application, a collaborative innovation platform for the major key generic technology research and development, and a collaborative innovation platform for the transformation of major scientific and technological achievements. It is to build a world first-class innovative talent training experimental site, a green transportation-oriented comprehensive culture and policy research platform, and a strategic consulting platform to ensure the continuous effective operation of the alliance.”

## **5 Conclusion**

Wuhan University of Technology, China, has worked out a new mode of industry-university-institute cooperation by organizing the “Glass Technology Research Strategic Cooperation Alliance” and the “Green Transport Alliance”, by reforming and innovating talent training mode and mechanism and research organization mode, and by establishing major research and application platform based on multidisciplinary, team collaboration and technology integration, thus having achieved favorable economic and social effects, boosted the short-term, loose and single cooperation to transform into the long-term, close and systematic industry-university-research cooperation. Thanks to the new cooperation mode, there could be a win-win situation between various parties; and such a mode can be used for reference by other universities and colleges for purpose of

industry-university-institute cooperation.

## Industry-University-Research Teaching Mode of Real Right Law Course\*

Ma Hui, Gao Jie

School of Arts and Law, Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: luomafaxue@163.com, gaojie\_2008wh@163.com)

**Abstract:** Industry-University-Research teaching mode is not only beneficial to improve students' practical ability, but also for scientific research to serve the society better. Literature research method and investigation method are used in this paper. This article takes the connotation of Industry-University-Research teaching mode as the breakthrough point, and put forward the specific ways and methods of Industry-University-Research teaching mode of real right law, and analyzes the practical significance of the teaching mode. The results reveal that the Industry-University-Research teaching mode is the development direction of the real right law teaching activities.

**Key words:** Real right law course; Industry- University-Research; Teaching mode; Literature research method; Investigation method

### 1 Introduction

Industry-University-Research teaching mode is derived from "Cooperative Education", which was presented by Herman Schneider in University of Cincinnati in 1906, and the theoretical study of a climax was appeared in the 1980s. The main contribution includes: "Actions to strengthen university-industry cooperation" written by Duncan Davies (Duncan Davies, 1983), and "Industry-Government-University cooperation to establish CIM education in the USA" written by G. Koves. (G. Koves, 1990) In recent years, the research on combination of Industry- University-Research is more refined. "Triangular spiral theory" is put forward by Loet Leydesdorff and Henry Etzkowitz. (Loet Leydesdorff, Henry Etzkowitz, 2001) In china, the combination of Industry- University-Research began in the "enterprise-university-institute united project", which is organized by Ministry of Foreign Economics and Trade, Ministry of Education and Chinese Sciences Academy. After 20 years of hard work, the study of the combination of Industry- University-Research gradually forms the system, the relevant works springs up.

For many years, worldwide scholars have developed a lot of Industry-University-Research teaching modes. At present, the Industry-University-Research teaching modes mainly include Two-Way Education System, Sandwich Education, Warwick Model, etc. But it is of few studies about the Industry- University-Research teaching mode of real right law. This paper put forward teaching mode of real right law course based on Industry- University-Research.

### 2 The Connotation of Industry-University-Research Teaching Mode of Real Right Law Course

Industry-University-Research teaching mode of real right law course is the mode of higher education, which is centered by cultivating students' comprehensive qualities and professional qualities, and effectively uses the different education resources and environments of universities, legal practice units and law research institutions, and organically combines school education and legal practice activities together.

"Industry" mainly refers to legal practice unit, and it mainly includes the courts and procuratorates, law firms, legal service center, etc. It is the unit that is able to turn real right law theory into practice. "Industry" is the key link of Industry-University-Research teaching mode. This link not only enhances the students' practical ability and employment competitiveness, but also increases the economic efficiency, for theoretical innovation and application to lay corporeal foundation. "University" is the real right law teaching activity in school, that is, the process of teacher to teach students about the basic principle. It is the basic link of Industry-University-Research teaching mode. This link provides the essential real right law basic rules to practice. "Research" is a law research organization, which explores the theory of real right law rules, studies on the latest problem of this subject. Subject to make the

---

\* This paper is supported by Teaching Reform and Research Project of Wuhan University of Technology in 2012 and Humanities and Social Sciences Research Project of Hubei Provincial Department of Education in 2013.

students participates in the whole process of scientific research, cultivates the students' creativity and promotes the development of the real right law theory. It is the important guarantee of Industry-University-Research teaching mode.

Figure 1 The Relationship among Industry, University and Research

### 3 The Ways and Methods of Industry-University-Research Teaching Mode of Real Right Law Course

#### 3.1 Diversified teaching means

About the teaching mode of real right law course, China learns from civil law countries' practice, and it is centered by teaching basic theories and pays attention to the cultivation of principle rules and academic thinking patterns. But the traditional teaching mode can not adapt to the demands of the society for talents, at the same meanwhile, to accord with the requirements of integration of industry, university and research, universities must reform the teaching means.

##### 3.1.1 Case teaching method

Case teaching method began in legal precedent method, which was founded by Christopher Langdell, dean of school of law of Harvard University in 1870s. It is a teaching activity that the students use their legal knowledge to analyze a case and decide how to deal with it. Real right law teaching usually has two kinds of forms: Firstly, the analysis form. The teacher introduces basic concepts and rules of real right law, then lists typical cases and analyzes them with the basic principles. Secondly, the discussion form. The teacher assigns the representative cases before the lecture, and encourages students to access information and exchange ideas to discuss the case, and explore real right law theory from the case.

Case teaching method can solve the tedious problem of traditional teaching mode, make the teachers' role from "lecturer" to "guide". It can improve students' ability to solve practical problems with real right law theory, and to arouse students' the spirit of inquiry and the spirit of innovation.

##### 3.1.2 Teaching method of simulated court

Teaching method of simulated court appeared in Britain in the 14th century. At first, it was used in the four famous lawyer college (Gray's Inn, Lincoln's Inn, The Inner Temple and The Middle Temple) of Britain. They used this method to investigate students' professional ability, and decided who can become the member of the British lawyer association. Teaching method of simulated court is that the teacher selects classic real right law cases, and at the premise of analyzing the cases, he let students perform the trail process by playing roles and debating.

Simulated court is that students reproduce the true court proceedings, "They regard themselves as parties or participants of the case, analyze the case from their own positions, and strive for the best results of the case for themselves. The debate issues may be fictional, but the simulated court is of good training significance."(Yin Chao, 2007) But, it should be noted that in the process of teaching, it can't be entirely confined to the "script", and makes role playing as "performance". Teachers can appropriately manufacture "emergency", and arouse students' reasoning ability, emergency ability and expression ability. Simulated court is a kind of heuristic teaching method, which places students in the case of the situation to analyze the case, and turn the theory into the practice ability.

##### 3.1.3 Clinical legal education

Clinical legal education began in the United States in the 1960s. In 2000, China introduced the mode under the Ford Foundation sponsored. China offers "legal clinic learning" course in more than 10 universities to improve students' professional skills, for example, People's University of China and Peking University. Medical school with the clinical medical treatment to cultivate doctor, and clinical legal education reference this pattern, make university alone or with other organizations to set up legal

clinics. In general, legal clinics are the legal education places with legal aid function, like Law Service Center. Clinical legal education enables students to contact the true real right case, talking face to face with the parties and under the guidance of teachers to deal with real right problems. This method makes the students to understand the real right law provisions and principles better, and improves the students' professional ability.

Clinical legal education makes real right law theory, real right law provisions associate with professional skills, and guides the students to think about the problem from the perspectives of legal practice. This method builds bridge between abstract theory and the practice for students, and cultivates students' legal analysis ability and legal skills. "To be more meaningfully study law, can't isolate from society, and just satisfied in legal theory or legal philosophy discussion." Madhava Menon said. (Madhava Menon, 2002)Clinical legal education breaks the barriers between teaching and practice in the traditional legal education, and builds the bridge between legal education and social reality.

**3.2 Exam system of real right law course**

The effect of exam system on teaching achievement should not be ignored. But at present, China's exam system of real right law course is out of date, and most universities only use the final papers as evaluation standard for students learning results. This approach not only cannot reflect the students' real level, but also deviate from the teaching goal of "industry, university and research integration". Therefore, establishing scientific exam system of real right law course is especially important.

First of all, change "disposable exam" to "penetrating examination", and abandon the disadvantages of traditional test. Teachers should increase the proportion of grades at ordinary time, and make a comprehensive and fair evaluation about students' theory master ability, practice ability, language ability, documents writing ability and the unity cooperation ability. Secondly, teachers should adopting diversified forms in examination. For example, increasing the oral exam link, teachers ask students to impromptu analyze the real right law cases, which is carefully chosen, to investigate strain capacity, legal skills and language ability of the students. Finally, we must pay attention to the National Judicial Examination's influence on the real right law teaching, avoid pursue reform and deviate from the practice, and do harm to students' employment. In short, the scientific exam system of real right law course can firm theoretical basis, stimulate innovation consciousness, cultivate talented person, and effectively make use of the advantages of Industry- University-Research teaching mode.

**3.3 Practical places in campus and training base outside**

Practice can improve people's working ability. The sampling survey of 20000 persons proves this point.

**Table 1 The Main Way to Obtain Working Skills**

Working Skills	Theoretical Study	Practice	Post Training	Other Ways
The Ability of Analyzing and Solving Problems	7.8%	75.6%	16.1%	0.5%
Operation Ability	3.7%	77.1%	18.4%	0.8%
Communication Ability	0.7%	85.2%	3.6%	10.5%
Independent Working Ability	3.6%	88.6%	6.8%	1.0%
Cooperation Ability	3.5%	88.6%	3.4%	4.5%

So practical teaching must be emphasized, and Industry-University-Research teaching mode must be used. In order to meet the requirements, using school resources is the most convenient measure. Therefore, it is imperative to construct practical places in campus, we can take the following measures: Firstly, the construction of simulated court. Let the students to play all kinds of litigation roles and participate in the lawsuit activity in simulated court. It's the comprehensive exercise of ability to using real right law. Secondly, set up legal aid organization in university, for example Law Service Center which is management by school. Law Service Center is not only a social welfare organization, but also a practice agency. It can help students to be familiar with the theory of real right law, use the real right law provisions more smoothly with the true real right case, and make the legal aid welfare activity combing with the teaching, scientific research, and social practice closely together. Legal aid organization not only makes students have the opportunity to practice, but also promotes the reform of teaching mode about real right law course. Thirdly, the construction of scientific research base in the university. With the scientific research base for the platform, making students participate in the research of latest

problems about real right law, cultivating students' innovation ability, and promoting the development of the theory of real right law. The campus practice base has the characteristics of systematic and diversity, makes the "Industry", "University", "Research" closely linked, improves the students' quality and enhances professional skills.

For comprehensive talent training, and making students have a solid theoretical foundation and strong practice ability, only on campus practice base is difficult to meet the requirements of Industry-University-Research teaching mode, it needs to expand outside school training base, and establish the cooperation relations among schools, courts, procuratorates and law firms. This method can be optimized to personnel training mode, and solve the problems such as dull teaching content, single teaching means, and weak links in practice. Outside school training base provides students with the real work environment, and in this environment it conducts post practice and implements the industry standard. It can improve students' comprehensive quality, help students to adapt to the needs of social development, and conform to the goal of Industry- University-Research teaching mode.

### **3.4 Information platform of Industry-University-Research**

The key of successful Industry-University-Research teaching mode is founding a connecting point among schools, scientific research units and legal practice units. Accessibility of information can help us seize the connection. So, establishing information platform of Industry- University-Research is especially important for us. It effectively removes obstacles of information exchange among subjects, realizes perfect combination among teaching, scientific research and employment, and makes for the optimization of resource allocation.

Information platform of Industry-University-Research is managed together by universities, scientific research institutions and legal practice units. Practice units should release information in the information center, which is about operation and frontier problems of real right law. Universities and scientific research units saw this news can timely communicate with the practice unit, and explore the methods to solve those problems. Schools can master the requests of employees enterprises and control the latest cases of real right disputes through the information platform, thus to adjust the teaching content and structure, and grasp the direction of scientific research. At the same time, universities and scientific research units can release the latest research results in time through the information center, improve transfer ratio of research achievement, and promote combing theory with practice about real right law.

### **3.5 The system of "double teacher"**

The system of "double teacher" is used first in the master's professional graduate education in China, for the purpose of training of high-quality practical talents. It is a teaching theory of combining theory with practice. The author considers that it can be applied in legal talents training mode universally. In terms of real right law course, a student is common guided by theory tutor and practice tutor. The theory tutors are the teachers of school, they teach principles of real right law, focus on the cultivation of the students' theory attainment, explore frontier problems of real right law, and guide students to do scientific research activities. Practice work unit personnel as practice tutors, their main task is to guide the students to improve their professional quality, and cultivate the students' ability about analysis of case details and application of law, so as to make the students adapt to the future work as soon as possible.

The system of double teacher comprehensively shares campus and social resources, absorbs fresh blood of outside school to join the tutor team, set theory and practice training in a body, and highlights advantages of tutor group. The traditional close-end teaching model is transcended by this diverse training mode. Real right law course is guided by theory tutor and practice tutor, and they cooperate with each other to help students to cognize the theory deeply, enhance their professional quality, inspire their potential ability, and shorten the process of student success. The system of "double teacher" makes students apply frontier theoretical results to analysis of real cases effectively, so as to realize the combination of Industry- University-Research. This method can better adapt to society for the high level talents' demands.

## **4 Significance of Industry-University-Research Teaching Mode**

### **4.1 Improving the students' comprehensive quality**

The Industry-University-Research teaching mode breaks through disadvantage of the traditional closed cultivation mode of real right law course, and establishes relationship among universities, scientific research units and society. This model creates favorable environment for talent growth. Its

main characteristic is to use personnel training advantage of schools, practice units and scientific research units. The school education environment which mainly imparts knowledge is combined with production environment which is gain practical experience in the process of cultivation of students. Therefore, Industry-University-Research teaching mode of real right law course can improve students' comprehensive quality and professional skills. It takes the social demand as a guide, makes full use of the diversified teaching resources and teaching environment, and makes the lectures, research and practice together. It can not only make students' cognition of the basic theory of real right law, but also tap their potential, enhance the practice ability, and shaping a high level of comprehensive talent.

#### **4.2 Raising the level of teaching and scientific research**

Industry-University-Research teaching mode brings a closer relationship among the schools, scientific research units and practice units. Teachers can extract teaching materials from the latest real cases of real right law, adjust teaching structure, update teaching contents, and make teaching activities combine with practice. Discussing legal application problems in class can stimulate the students' practice ability and innovation ability. At the same time, scientific research units can also find new application problems of real right law from case agents and trials, force scientific research items, conducts research exploration work, and form research results of real right law which have application value.

#### **4.3 Promoting the transformation of scientific research achievements to practical application**

Real right law is an applied course, but restricted by the traditional teaching mode, a lot of advanced theoretical research results have been idle. Industry-University-Research teaching mode makes information circulating, and provides a platform for transformation from the theory to the practice. Practice units can quickly get the latest theoretical research data of real right law through cooperating with schools, find problems in the case processing and perfect the analysis ideas by taking advantage of the superiority in talented personnel of school, and to ensure that the results are fairness and justice. The application of Industry- University-Research teaching mode of real right law course is beneficial to academic research joint track with practical operation, realizing complementary advantages of university and practice unit, and promoting scientific research achievements transform to practice.

## **5 Conclusion**

The application of Industry-University-Research teaching mode of real right law course can improve students' comprehensive quality, promote theoretical innovation of real right law, and improve transformation efficiency research achievements. And a new mechanism of cooperation will be established among universities, scientific research units and practice units. Industry-University-Research teaching mode is a continuous developing issue, so we need to take the law of social development and the interests of all parties into consideration, continuously adjust and perfect the cooperation mechanism. Then put the achievement into the practice of real right law teaching to optimize the teaching effect.

# Research on the Brand Communication Media and Channels of Mobile Internet Age

Zhou Liang

Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail: 13802882230@139.com)

**Abstract:** A research mainly focused on the development of media in the Mobile Internet Age. The research discusses the evolution of the traditional media, application of mobile Internet media and the development prospect. We consider the structural changes happen in the brand communication channels in the certain age. We make comparisons with characters of brand communication media and channels considering the rapid development of Internet technology in longitudinal and latitudinal way. Suggestions about the innovations of the brand communication channels are drawn to be a reference for the operators to promote the management level of their brand communication.

**Key words:** Mobile Internet; Brand Communication; Media; Channel

## 1 Introduction

Mobile Internet defines as a network that users could access to the Internet with their cell phones, PDAs or some other choices of mobile terminals. Users can enjoy in the public Internet Services at any moment. On the coming of the Mobile Internet Age, the transmission techniques are comprehensively developed and such a kind of progress influences the conditions of the original transmission ecology. In the applications of the novel techniques, media competition and convergence springing up, diversifies the media Channels.

We are in an age that Virtual reality contacts and exchanges are in unprecedented prosperity. In this era, facing to the trend and small demand, brand communication should be in further research, ignorance in none of these aspects, is it possible to grasp the balance of the brand communication stance. The current brand spread is already entered the mobile Internet communication environment, and there is little experience on dealing with problems in the era, for such phenomenon has never occurs before. Brand spread needs the communication to be more diversified, more media-oriented, since these factors result in great changes of brand communication demanding characteristics: the brand communication process of interactivity and humanized factors mobility, to promote the brand communication. The research made comparisons of the various media characters and analyzed the respective advantages of applications with such media in brand communications, and then suggestion of some methods and orientations to the coming development in brand communications.

## 2 Media Development in the Mobile Internet Age

With the rapid co-development of Digital and Network technology, the original transmission ecology has been influenced tremendously by the booming in mobile Internet. As of December 2009, the approximate number of netizens in China is 484 million, according to statistics. The penetration rate of Internet increases as a rate of 28.9%.

The netizens population with cell phones increases by 120 million per year, reaching 233 million. Smart phones and mobile terminals dominate the media equipment markets. Users who surf on Internet using cell phones have become new growth point of Internet users in China. Under certain circumstance, traditional public media and mobile Internet media present the tendency of convergence. According to the Report of development in China Digital publishing industry 2007-2008 by China Institute of Publishing Science, 37 newspaper groups, more than 300 newspaper presses all around the nation produce digital newspapers on the Internet with the digital newspaper technology. The whole newspaper industry in China has produced about 1500 kinds of digital newspapers for cell phones, covering divergent fields, as of the end of 2008.

Large media groups own their websites. Taking Xinhua News Press as an example, they proposed to expand their business to the multimedia news platforms for a bigger audience population in *Working Scheme for 2008-2015 of Xinhua Press*. They established Xinhua Network, Xinhua Mobile News, Mobile TV, ODTV (Outdoor Television) and IPTV and so forth, the transmission of those content in which are mostly rely on the Xinhua Network and Mobile News platforms. Also we know that the broadcast and television media groups are more and more tend to focus their attentions on the trends of

multiple transmissions of their media content. A typical example is CCTV, which spread their business to CNTV, Mobile TV, IPTV, and some other mobile digital TV programs. During the Olympic Games 2008 in Beijing, the CNTV platform achieve the coverage of 200 million netizens, programs broadcasting to the mobile users 510 billion times, on 80 thousand screens, with 50 thousand buses, in 30 cities.

In the future, with the universal 3G business carried out, Mobile Internet will be applied to every possible aspect of the social industry and daily life. The users and business scale will achieve explosive growth in such condition. Morgan Stanley published their research in December, 2009. It shows that the speed of mobile Internet development has surpassed the speed that based on desktop access. Within 5 years, users with mobile terminals will become the majority of the Internet users. 3G Technology, SNS, Online Video, IP telephone and mobile equipment are five major supports that can represent the development of the mobile Internet. The future of mobile Internet development will rely on the key factors such as users centered, with voices, data and multimedia services on the open networks. Consumers will be active in the interactions on the mobile Internet more frequently with more hours spent on at the same time. Such a tendency will lead to that the mobile Internet centered media technology is gradually clear.

From all above, the mobile Internet media will be the main stream in the transmission markets as the bellwether compete with the other media technology.

### 3 Selections of Brand Communication Media in Mobile Internet Age

The convergence that occurs among media in the Mobile Internet Age enables the consumers to be active in their preference of access to the Internet. Choices of terminals are the results decided with a combination of physical characters of the media, practical operation preference and mode of thoughts by the users. Commonly, three types of media will cater to most appetites of consumers. News preferred people are tend to real-time information and portable devices. Then the cell phones and netbooks will be their first choice, while people at home will enjoy in high definition TV programs with Digital TV terminals. Digital newspapers will satisfy the Deep Thinking requirement that comes from the special group of people. Cell phones and laptops will more consider the individual demands from the different users.

In the mobile Internet based age, broadcast, TV, newspapers, magazines and even outdoor multimedia will achieve their transformation and convergence with the new styles of media, accomplishing their multiple media business. Compared with the traditional media, media on mobile Internet have gained higher speed to eliminate time delay in real-time transmissions, and have changed the size of the equipment and ways of interactions into active methods. Therefore, differentiations among those media, like broadcast, TV, Newspapers, will be mainly concentrated on the contents they received and preference or trust in the media style that coming from the willingness of users. (See in Table 1)

**Table 1 Characters of the Contents from Different Media**

characters	TV	Broadcast	Newspaper	Magazine	Outdoor	Network	Cell phones
Authoritative	√		√	√		reprinted	reprinted
Entertainment	√					√	√
Notification		√			√		
Size					√		√

As is mentioned above, the technology enables the media with real-time transmissions. That is to say, authority of the media but immediacy of information now in the Mobile Internet Age is the primary problem. People can only accept limited information every day. It's enormous cost for common people to identify information from different news sources, thus the selection standards are important to the consumers. As to the authority of the media, it is more likely to have the traditional opinion in minds; that is, like the newspaper and TV news with convincible reality in news reports, the contents from four major news media on the new platform in this age tend to be leader power of the opinions. Consequently, when setting up brand communication to the public, we should pay more attentions to such media types

to establish brand image with advantages in guidance of brand incipient communications.

To those entertainment contents, we recommend to choose video media. Video can compound sounds, pictures, words with useful information to strengthen their brand with creative carrying capacity, which will satisfy those pursues in the brand communication. What's more, Video requires only images in minds, accepted by most of the perceptive of the consumers. That makes it entertainment. As to the brand communication, they are searching for creative and perceptual characters, which are available mainly on the video media. Moreover, some other media brands with little fame could make use of the creative carrying capacity and comprehensive acceptance of videos to root their brand communication among the consumers in the incipient period.

To those notified content, outdoor media or broadcast will suit for the transmission better. In the Mobile Internet Age, outdoor media will thrive for its more reliable technology. Outdoor media in the Mobile Internet Age act as the signs of the metropolitans highlight the prosperity of the cities. Except for the billboards and signs at the bus stops, mobile Internet raises the popularity of mobile TV screens. As is to the limitation of the outdoor media, broadcast appears as a supplement of other media types with its audio information. Under certain circumstance, audiences have no other choices but the audio type, with a contact named "instantaneous style". Because of the "tough" feature people get information from audio and outdoor media, those audiences usually pay little attentions on this. The outdoor media and broadcast therefore match for the use of simple advertising messages, like something outside the cars or the buses, which means people can hardly peruse from those words. We classified such media as types for low-level concerned products, and usually for the purpose of notifications or promotion in sales.

Brand communication of high-level concerned products needs newspapers or other network media as their advertising platforms. Consumers will always search for these messages and take times in realizing those products. Thus, when coming to such brand communication, words and graphs for detail expressions are necessary to promote the recognition to the brand and products from the consumers. Usually, we choose to transfer abundant information on the media platforms like the newspapers or magazines. We try to attract consumers for these messages but push them to the consumers.

## **4 Brand Communication Channels in Mobile Internet Age**

The arrival of mobile Internet age brings the enormous changes of communication pattern, and channels of communication present diversified trend. Commercial value and influence of the channels is no less than the content, and thus the development of channels turns to be the focus for mobile operators to compete.

### **4.1 Innovative application of traditional and new channels**

The mobile Internet has had a great impact on traditional communication channels, the arrival rate and the amount of advertisements of traditional channels such as newspapers, radio and television are reducing gradually. The mutual integration of mobile Internet and traditional media changes the total portfolio of medium. Developed mobile Internet media will serve as the core communication platform and other traditional media as a supporting role in the communication system. The innovative application of traditional and new channels mainly reflects in the following aspects.

#### **(1) The innovative application of print media**

With the development of mobile Internet, print media is facing many challenges, including the growth of online media, the rise of electronic media, the competition among peers, the change of audience reading habits, the impact of the economic boom and the rapid technological innovation. Aiming at these problems, in order to broaden communication channels and facilitate communication, print media should get innovative applications. First, innovation is the application of new technologies. With two-dimensional code technology, the two-dimensional code on the newspapers / magazines is scanned with a phone, and then coupons, news clips, questionnaires and pictures will be automatically downloaded, thus paper resources are turned into mobile information resources. Print media is no longer just printed. Based on the application of this technology, the interaction between print media and audience will greatly enhanced. Meanwhile, the mobile Internet should strengthen the content and integrate resources. Integrate internal and external resources, combine with network and make use of mobile technology to expand the application scope of print media and enhance the core value.

#### **(2) The innovative application of television / radio media**

The innovative application of television and radio media includes two aspects. For the hard advertisement aspect, determine the type of audience through a terminal monitoring, and then make an immediate feedback and put in appropriate hard advertisements. This use provides put more mobility for

the put-in of TV / radio and reduce the errors in the prediction period. For example, put the right ad through the high-frequency vocabulary by web search and then further filter information according to the results of the survey feedback, which makes communication more accurate, more extensive and more successful. In software aspect, strengthen soft-depth cooperation with the related programs and carry out soft implant, such as game vote and finale vote by mobile Internet to strengthen the interaction of the program.

(3) The innovative application of the Internet media

Internet information can be automatically downloaded to users' mobile phones through their settings, including life information like train schedules and online video on the computer which hasn't been finished by the audience. The download information will include advertisements, which break Internet advertising away from the computer and expand the coverage. At the same time, the Internet will combine with television, radio, newspapers and other communication channels, integrating new channels, such as network television, and electronic magazines. In the Mobile Internet Age, this integration will be more frequent, the innovative application of network media will get a wider range, and communication channels will be more diverse.

(4) The innovative application of outdoor media

Monitor mobile phone information covered by outdoor LED with terminal technologies in order to analyze the population category and automatically put the related business advertising for this crowd of population. Connect all LEDs in the entire city through technology and automatically identify the appropriate points to put. Then the outdoor media will break the regional limitations and advertising coverage is broader and more accurate.

#### **4.2 The integration of mobile operators' own brand communication channels**

Rapid market expansion of the mobile operators must rely on a broad and efficient system of marketing channels, along with the increased market competition in the mobile communication business and the enrichment of mobile communication services, construction and management of marketing channel system for mobile operators are developing to adapt to market changes, presenting changing trends from extensive and dispersed one into a uniform, standard, fine planning, close coordination and more focused management.

At present, the channel system of mobile operator includes the following two types: master channels mean the core channels which operators directly control and directly get involved from property rights perspective, including self-built business hall channel, self-service stores, major customers services, customer service hotline and operator websites. Social distribution channels refer to the sales-type channels in addition to operator self-built channels expanded with the use of social resources from the level of cooperation, which is an important complement of the operator's core channels. That includes the business hall of the social agents, cooperation brand stores, franchised stores, authorized sale points, retail points directly supplying standard cards and so on.

During the Mobile Internet Age there are still some prominent defects in the channel system of the mobile operators, such as coverage is too concentrated, channel means is too single, the existing channels isn't able to reflect the value of customer service better, and more market user information can't be obtained. With the development of mobile Internet, there will be more brand business to be launched, the existing channels is obviously not suitable or even will restrict the flow of 3G products and development of 3G services. Existing channels of the mobile operators rely only on the master channel and cannot ensure a dominant position in the competition. As a result, mobile operators must integrate its own channels and supplement it with the cooperation of social channels to strengthen marketing service function of the channels and enhance the comprehensive level of service. The integration of mobile channels is recommended to start from the following aspects.

Firstly, transform and upgrade mobile operators' own channels. Transform and upgrade of its own channels will help carry out the implementation of the overall marketing strategy downward, help enhance the businesses brand image, and help serve and retain the final user and help to new business timely.

Secondly, enhance the proportion of social channels and strengthen cooperation. The marketing of t3G products in the Mobile Internet Age make the market share become the goal for operators to compete for. At present, the first batch of TD depth customized mobile phones of China Mobile is in the product maturity period, and more than 2,000 Mobile business halls will sell it, which is associated over 1200 social channels.

Thirdly, introduce into e-commerce channels. At present, some operators have begun to try to

introduce into this new e-commerce sales model. China Mobile launched the first 3G network card online sales on Dangdang.com. Beijing Telecom has also announced cooperation with Joyo, Dangdang and Taobao for the sale of 3G network cards on these sites.

## 5 Conclusion

From the above analysis, we can conclude that a huge change has taken place in the brand communication media and channels with the rapid development of Internet technology. Targeted optimization and integration of media and channels of brand communication will play a significant role in the future development of China's mobile operators.

## Research on Industry-University-Research Institute Strategic Alliances (IUR) Benefit-sharing Mechanisms\*

Yan Jin, Jin Haihe

School of Public Administration, Inner Mongolia University, Hohhot, P. R. China, 010070

(E-mail: yanjin\_1987@163.com, haihejin@163.com)

**Abstract:** The research of Industry-University-Research institute strategic alliances benefit-sharing mechanisms is in purpose of achieving the tripartite interests of enterprises, universities and research institutions. It can be confirmed the benefit sharing is an important goal for research strategic alliances. Benefit-sharing mechanism is more important of IUR. As the IUR parties are obtaining their respective interests, we must deal with several aspects of IUR including capitals distribution, approaches allocation, trust mechanism and so on. The final target is to establish a reasonable benefit-sharing mechanisms so that to stabilize the strategic alliances. This research will use and demonstrate method in strategic alliances to the distribution of benefits, and it aims to help each party to explore a common way for profit sharing in the end.

**Key words:** Industry-University-Research (IUR); Strategic Alliances; Benefit-sharing Mechanisms; Qualitative analysis

### 1 Introduction

With the rapid development of the information age, Chinese economy is growing to a deeper level in a wider area. This new age has provided new opportunities for Chinese economic development; however, it also faces severe challenges. At present, most enterprises' own technological innovation capability is not strong; it has a considerable gap with the developed countries. Also, there are low level products, weak competitiveness, and lack of independent intellectual property rights. In order to adapt the new technology age, IUR should use the advantages of the research cooperation, joint development, and the independent intellectual property rights to improve the core competitiveness of enterprises.

The traditional theory of strategic alliances consists of two or more enterprises achieve the strategic objectives of resource sharing risk or cost-sharing, complementary advantages and expanding markets. Each of them has equity to participate or make other agreement to form a loose organization of cooperation and competition. This is a narrow understanding of the strategic alliance, while generally speaking; strategic alliances members are also including universities, research institutions and government departments (Adams, 2002). The IUR strategic alliance cooperate with forms of organization which is based on knowledge - technology - the exchange of information as the main way of new combination mode. It will become an effective way of solving technology and economic integration so that it will guide economic development as well. IUR strategic alliances cooperates both universities and research institutes in order to the further extension of the industrialization and commercialization process, and the fundamental character. So far, the need for academia research on the strategic alliance in research development and research strategic alliances, feasibility, and their development prospects; the problems in the economies in transition IUR strategic alliances; proposed by IUR strategic alliance system. Other suggestions such as mechanisms, concepts, patterns and other aspects of the proposals and ideas are waiting to be proposed. IUR strategic alliance benefit-sharing mechanism are rare, therefore there is few information, so I would like to conduct further analysis of this issue, and thus to contribute to research and development of IUR strategic alliance benefit-sharing mechanisms.

### 2 The Problems of IUR Strategic Alliances Benefit-Sharing Mechanisms

The benefit of IUR alliance is depending on a mutual alliance and coordination of enterprises, universities and research institutes, as a whole created new income. The starting point of the benefit-sharing is solution to the interests of fair and reasonable distribution issues, including to determine who is the main interests of the creation of the coalition parties contribute to the growth in interest size, in order to achieve a common goal for sharing the benefits. Under the market economy

---

\* This paper is supported by the Soft Science Research Projects of Science and Technology Department of Inner Mongolia Autonomous Region of China (Research on Industry-University-Research Institute Strategic Alliances and Related Operating Mechanism: A Case Study of Inner Mongolia Autonomous Region)

conditions, the distribution of benefits is the driving force to promote research alliances and maintain healthy functioning of IUR ties.

**Table 1 Rank of IUR Cooperative Level in 2006**

Country	Cooperative level	Rank
America	5.6	1
Switzerland	5.6	2
Sweden	5.6	3
Japan	4.9	14
China	4.1	25

From Table 1 we can see America, Switzerland, and Sweden are the top 3 in IUR cooperative level. China only ranks 25. The IUR development in China is not as strong as others. In order to push the development of Chinese IUR, we should study how to establish benefit-sharing mechanisms effectively, and begin with the distribution of benefit issues.

### **2.1 Unreasonable capital risk**

Universities and research institutions do not have the direct financial capacity and strength of self-transformation. In IUR, the enterprises as the mainstay in most cases offer the funds and universities or research institution provide the talents and equipments because of technical support function. Thanks to such differences, universities and research institutes are usually the safe parties in capital risk aspect. However, enterprises almost have to bear the risk of financing difficulties, and the uncertain investment returns brought by the cooperative process. When the enterprises are facing enormous pressure to bear such a high risk will inevitably prohibitive for many high-tech achievements, or they are only willing to bear part of the risk in the cooperation, and hope to pass on some of the risk to other risks investors. The unreasonable capital risk will not only dampen the enthusiasm of the cooperative, but also will lead to financial bottlenecks in the process of cooperation.

### **2.2 Unfair benefits distribution mechanism**

Under normal circumstances, enterprise, university, research institution cooperation will be the distribution of benefits that have their own expectations, but in order to ensure the smooth cooperation, parties should to make an agreement on the details of the distribution about benefits. However, due to the three partners' differences for industries, systems, fields and point of views, it is often difficult to coordinate and it is easy to result in contradictions. The difficulties are: Firstly, scientific research transfer pricing is difficult to confirm. Various stakeholders have different ways to determine the price, enterprises are mainly based on the potential benefits, and academic institutions are mainly based on technical research and development costs price. Secondly, there exists the outcome of the ownership on intellectual property issues. Conflict of interest demands of all parties, organizations and poor cooperation in a short time, low degree of cooperation and exchange are important factors that lead to disputes. Thirdly, the distribution of benefits problem. Build entities, universities and research institutes were put into a certain proportion of funds, manpower or equipment to work together to build a model of the joint R & D base. If the IUR lack of the unified standard, the outcome will get mess in the end.

### **2.3 Inadequate trust mechanisms**

Members of the research in the strategic alliance, especially those of enterprises, their reputation and spirit of cooperation are the key factors to affect the IUR formed and well-run. They are also addressed as a key issue of benefit-sharing mechanisms. The spirit of cooperation is part of corporate culture, but most of the enterprises have not been a good corporate culture. Also, there is more lack of internal cooperation than external. If only enterprises just concern tangible profits simply, so that the purpose of IUR will not to achieve win-win situation, but to use more economical way to learn the key technology of others. This collaborative environment will be a serious impediment to the development of domestic research cooperation. When each party in IUR chooses the partners, they will show some preferences, norms and standards, and each other has a strong dependence. When a party in the research strategic alliance formed on certain types of partners, the understanding may be to strengthen and enlarge, concrete is divided into two extremes: the unlimited confidence and infinite trust. Either of them is not good for parties to get the right information.

### **2.4 The tendency of opportunism behavior**

The so-called opportunistic behavior is not only the pursuit of personal interests to maximize the economic man in the transaction process, and through improper means to seek their own interests. The new institutional economics emphasizes human behavior has a tendency to opportunism. Cooperative

performance for all stakeholders shows a resourceful, opportunistic to reap greater benefits for their own behavioral tendencies. In cooperation, each party knows others less just surface information, thus one can not use the others' disadvantages to do the opportunistic behavior. In this field, it is hard to prove a breach of contract that resulting in opportunistic behavior is difficult to be confirmed in court. Hurt by opportunists often reluctant to resort to the judicial process, the way of sanctions against opportunistic behavior is more limited.

### **3 The Analysis of Problems to Benefits Distribution of the IUR Strategic Alliance**

#### **3.1 Imperfect agreement of IUR alliance benefits distribution**

Because of the limited rationality of stakeholder cooperation that may arise in opportunistic behavior can not in the cooperation to be fully anticipated. When parties signed a research cooperation contract without fully information about each other, thus clear the rights and obligations of the contract are often incomplete. So, if one party begins with opportunistic behavior, such as capital withdrawing, others have nothing to against In addition, parties have less alliance awareness, lack of efficient technology management system and the spirit of cooperation, the concept of risk prevention. It is extremely unfavorable to meet the IUR risks and challenges in day-to-day cooperation. Thirdly, research cooperation projects of IUR on the property and post-distribution of the proceeds failed to clear in the contract, resulting in cooperation in the late disruption difficult, thus affecting the entire development, strategic alliances initial and final overall.

#### **3.2 Lack of laws and regulations to guide**

At present, the legislation still no specific legislation for the research, the existing legal provisions and more dispersed in the technological innovation legislation, despite the technological innovation legislation has formed a certain system, but there are still many problems. Firstly, legislation does not systematic in technological innovation. There is no special 'Technology Innovation Act'. At the same time, technological innovation related to the field of urgent legal regulation has no legal basis, such as venture capital, basic research, and science and technology investment. Secondly, the existing technology law operability is not strong to implement, inspect and supervise. Chinese legislation is basically the product of planned economy, which is too principled, obscure and general so that lack of legally restraint. Again, law enforcement is not perfect in recently. Many of Chinese judicial and law enforcement officers know little about the scientific and technological knowledge or technological innovation, they are lack of specialized technology legal talents. These aspects will directly affect the IUR does efficient cooperation.

#### **3.3 Lack of intermediary services**

Intermediary service system refers to the institutions of scientific and technological achievements that play a role as a bridge between supply and demand side in scientific and technological achievements. Intermediary and professional services firms are important parts in technological innovation and industrial development. In recent years, Chinese scientific and technological achievements intermediary services from scratch to a certain development still have some problems, such as large multi-functional single institution is not perfect, information services in a timely manner or lack of accuracy. There are few special intermediary service organizations to offer the related service so that the information exchange platform is hard to build. Because of the information can not be offered integrity for each party, it often leads to different views in post-production of research. At last, the result will delay or hinder the cooperation project.

#### **3.4 The asymmetry information**

Segmentation of the management system, universities, research institutions and enterprises still has barriers of cooperation - a crisis of confidence. At present, cooperation between universities, research institutions and enterprises are mostly the way of project cooperation which have short-term, temporary features. These features influence the flow and exchange on parties mutual and the long-term, stable and institutionalized community of interests' establishment. Yet to truly get rid of the institutional barriers between universities, research institutions and enterprises, cooperation is still stuck at a relatively low level, real research strategic alliance to establish still have time. Thanks to the barriers, the mutual trust between the members of the research strategic alliance is often difficult to form in the conditions of lack of an effective signal to indicate information screening so that avoid moral hazard considerations. Ideas differences, differences in value orientation, risk preference differences or behavioral style differences may lead to a series of factors that affect the real cooperation then become "trust threshold".

## 4 Conclusions

Benefit-sharing mechanisms of IUR strategy alliance is based on enterprises, universities and research institutions as the core, it has integrated research elements and resources from each parties of the strategic alliance, and used modern means of science and technology, unified and coordinated to distribute the benefits orderly. In order to satisfy each participate parties' benefits and reduce the intensification of contradictions due to the uneven distribution of benefits. Rationalization of benefit-sharing mechanism is better to resolve the parties' contradictions, which makes all parties in the interests of the drive, to achieve the fundamental purpose of the research cooperation to "win-win".

### 4.1 Strengthen risk awareness and alliances awareness

Science and technology systems should strengthen universities, research institution's alliances consciousness. Around the needs of the market economy, in order to achieve scientific and technological resources to optimize the allocation, and get the research institutions reenter the market. Government uses market allocation of resources to build the related operating mechanism and organizational models, which comply with the law of market economy operation. For striving to take up their place in the high-tech fields, universities and research institutions should take the initiative to strengthen contacts and cooperation with enterprises, and compound their respective scientific and technological advantages, personnel, academic advantage, industrial advantage to overall advantage of pro-competitive, when based on technology transfer, joint research, seminars, personnel exchanges, technology services, etc.

### 4.2 Benefits and risks sharing mechanism

"Joint development, complementary advantages, benefit-sharing, risk sharing" is the general principles of the research the distribution of benefits. The long cycle of major industrial and technological innovation activities require the research parties have steady cooperation credit, as well as get what they want the protection of the interests. At this time, contract should be applied. Each parties establishes the benefits and risks of long-term cooperation mechanism of IUR on a voluntary basis, Intellectual property as a central link to solve the mechanism of distribution of benefits issues, around all aspects of the creation, application and protection of intellectual property rights, define the responsibilities, the right and the benefits. The key for IUR is to form a "community of interests" to be self-running. At this stage, we should gradually establish the responsibility system by the research risks in strategic alliances, to achieve a hierarchical decomposition of the risk liability in a phased manner. For example, Japanese government set an intermediary service called high-technology market, which is promoting the research achievements shift to enterprise and letting the achievements industrialization. This action cuts the risk and makes the cooperation more stable.

### 4.3 Improve the trust system

Effective communication is an important means of building trust between alliance members; we should establish a formal mechanism for information exchange in order to share internal knowledge and external market information. Also, pay attention to the informal exchange and communication between the alliance officers. Interpersonal communication between the alliance to improve the efficiency of cooperation, and resolve cultural differences and barriers between the different members so that the principles and methods of doing things can be acceptable to all parties, and to lay a cultural foundation for the establishment of mutual trust and a good atmosphere to create. Finally, strengthening the information networks establishment to interactive platform for the coalition parties to provide information, promote the exchange of information to universities, research institutions and enterprises.

### 4.4 Stressed that the government functions

To strengthen the IUR strategy alliance, government should shift its focus to the macro-control to create conditions and environment for the strategic alliances. Formulating of laws and regulations to provide policy guidance and services, and research to develop and organize the implementation of protection of intellectual property policy and industrial policy. Such as the specialized agencies or organizations' function are coordinate the research cooperation process. Both of them are aiming at developing and improving the laws and regulations of the policy. What's more, the government makes strong strategic alliances with production-related theoretical research and policy analysis to develop strategic alliances and research supporting fiscal, financial, risk and investment, and research market laws and management approach encourage policy measures, particularly intellectual property laws and regulations. The NSF of America is a good example of China to study. It is not only stress the local government's guide and coordinate function, but also provides the key topics to universities.

In addition, this essay has further clarified and strengthened the important role of strategic alliances in IUR benefit-sharing mechanisms, and raised objective and systematic research strategic alliance

benefit-sharing mechanism to provide a good performance guarantee for IUR strategy alliance. But this paper has larger proportion of qualitative analysis, quantitative analysis has been lacking through my writing process. At the same time, due to restrictions on the level of professional academic research on certain issues is not enough in-depth and comprehensive, I am looking forward to discuss further with other academic peers in the future.

**Abstract:** During the *post-crisis* era, Chinese enterprises participate in overseas merges actively. For the potential risks in the processes of the overseas mergers and acquisitions, it is a crucial problem to promote the mergers' abilities for the domestic enterprises. Based on the common principle of core competence theory, this paper illustrates that building, extending and refreshing core competence are always the direction in the course of overseas mergers, and proposed a concept model for the overseas mergers and acquisitions strategy in the background of *post-crisis* era.

**Key words:** Model; Mergers and Acquisitions; Core competence; The post-crisis era

### 1 Introduction

The post-crisis era refers to a more stable state after the crisis easing. This steady state is a relative term since the fundamental cause of the crisis has still been existing. There are still many uncertainties in the world economy and it is a coexisting state of a detente with the crisis. Affected by the subprime crisis, financial tsunami happened, national consumer confidence dropped and the market expectation became sluggish all over the world.

The number of the global mergers and acquisitions (M&A) activities has been drastically reduced since 2008 under financial crisis, which runs directly counter to China. Ministry of Commerce of the People's Republic of China encouraged internal qualified companies to implement vigorously "going out" strategy in 2010 and actively carried out foreign investment and multinational management. The government would reform deeply the foreign investment management system, promote foreign investment facilitation and support internal companies to go abroad to participate in international economic cooperation and competition<sup>[1]</sup>.

Counter-cyclical cross-border mergers and acquisitions is in accordance with China's "going out" strategy, which is the important attempt to cultivate multinational corporations commensurate with the economic power and maintain industrial security<sup>[2]</sup>. Chinese enterprises have been carried out lots of cross-border mergers and acquisitions since 2008 and the following table (Table 1) is the notable example in May 2011.

### 2 Overseas M&A Risk Analysis in the Post-crisis Era

The number of M&A is very large<sup>[3]</sup>. But the statistics analyzed by McKinsey & Company show that about 67 percent of China's overseas acquisitions is unsuccessful over the past two decades. Then is it an opportunity or risk for the development of Chinese enterprises through the strategy of overseas mergers and acquisitions during post-crisis era? In general, the causes of the failure of cross-border M&A have four categories: (1) the country's political and policy barriers where the target company exists; (2) the inappropriate timing of M&A; (3) the lack of experience of cross-border M&A; (4) the unsuccessful integration of M&A.

The chief factor to guard against trade protectionism of the host country of the target company should be noticed by Chinese enterprises in the process of overseas M&A. But it is more important to increase their ability to prevent and reduce the rate of failure of M&A caused by the latter three reasons<sup>[4]</sup>. How to realize the success of M&A is the important problem and maybe the means that the enterprises make it round the fostering and enhancing of core competence during the process of M&A is the good choice.

### 3 Model of Overseas M&A Strategy Driven by the Core Competence

Overseas mergers and acquisitions is the strategic behavior to achieve business development for many enterprises, and it also a good method to get the international competitive power. To get the success of M&A, enterprises should do overseas M&A based on achieving and enhancing the core

competence. According to the process of cultivating the core competence: the identification of the core competence, the attainment, the shift and the integration of the core elements, the enhancement of the core competence, we could divide the process of M&A into five stages: the preparing period, the negotiating period, the trading period, the integrating period and the consolidating period. As the following figure shows (Figure 1). It can be seen that every stage of M&A are in accordance with every stage of attaining and upgrading of the core competence. That is, the whole mergers and acquisitions' process should go along around the core competence.

**Table 1 the Transaction Size of Various Industries in China M&A Market in May 2011**

Industry	Number	Number disclosed	M&A Amount disclosed (US \$M)	Average M&A Amount (US \$M)
Energy and Mining	14	11	3863.33	351.21
Chain Operations	3	3	1176.69	392.23

(Data from www.ChinaVenture.com.cn)

### 3.1 M&A Preparing Period

Cross-border M&A is a complex process, which involves cost assessment, valuation, financing, contracting, implementation of the transaction, integration and other aspects, many enterprises without internal professionals should hire some experts from outside to help the M&A companies analyze and operate the whole process to evade risk. After analyzing the external environment and internal conditions, M&A companies should investigate and collect the target companies' information to carry out the valuation, so that provide a scientific basis for financial feasibility analysis, M&A risk controlling and determining payment cost. The valuation is not only for the target company, but also for M&A company itself and composite company<sup>[5-6]</sup>. Estimating the range of payment cost and the value added caused by M&A are also necessary.

### 3.2 M&A negotiating and trading period

Enterprises must carefully adjust their capital structure according to the result of analyzing and negotiating of target companies, choose a suitable means of financing to get funds M&A need, and then determine the payment range and method. As a result, M&A trading is put into action. M&A must hire some relevant legal advisers to ensure M&A transaction effectively.

### 3.3 M&A integrating period

M&A completion among enterprises can only show it has finished property transactions in the legal sense, which doesn't mean various elements of resources have been reconfigured. The objective of

M&A is not only obtaining the property rights of the target companies but also acquiring, building, strengthening and expanding the core competence. The integration of M&A is the key successful factor for the composite company. Implementation of an integrated strategy must continuously adjust according to the specific circumstance of the two sides. How to integrate is also requested to design in prior planning and arrangements of M&A.

Figure 1 Model of M&A Strategy Driven by the Core Competence

In general, M&A integration must be carried out from six aspects: strategic integration, the integration of skills and knowledge, integration of human resources, organizational integration, systems integration and cultural integration.

(1) Strategic integration. Strategic integration after M&A is the adjustment of the enterprise's developing direction. It may decide the future of corporate positioning. The company's development strategy after M&A should be made according to the direction of corporate development and the environment in the future. The strategic integration includes of the integration of the strategic decision-making body and the integration of the strategic objectives, the strategic measures, the strategic steps of each subsystem. It requests the target company should enter the strategic frame of M&A company so that the asset use and business extension of the target company could obey to the overall strategy objective and other correlated arrangement of M&A company.

(2) Integration of skills and knowledge. Core competence is the cluster of skills or knowledge, there are three types of skills transfer in M&A: the transfer of general management skills, the sharing of operational resources and the transfer of functional skills.

(3) Integration of human resources. First of all, M&A company should maintain the relative stability of human resources. On the one hand, human resource policies of M&A company must be passed to employees, which could guide them to come into a new vision system to get the organizational cohesion rapidly. On the other hand, managers in the human resources department and related departments should communicate timely with staff to obtain the understanding and support of the staffs. Second is to focus on retention and integration of key personnel. The key personnel have the characteristics of strategic assets. Whether retain the key personnel or not is the successful determinant of M&A in a sense.

(4) Organizational integration. Organizational integration is to make the necessary adjustments or

reconstruction in the organizational structure and management system after M&A in order to achieve the organizational synergies. M&A integration process is the timing of the process reengineering to counteract the rigid core of the organization. M&A companies could establish a positive organizational mechanisms to encourage various business units to pursue their association and overcome the difficulties of inherent coordination and communication<sup>[7]</sup>.

(5) Management System Integration. Management System Integration after M&A is mainly reflected in the integration of management systems. Both sides should achieve a unified criterion and complementary advantages, and result management synergies in research and development, production, marketing, finance, personnel and other functions.

(6) Cultural integration. Cultural integration related to the values of both sides, business philosophy, behavior standard and work style, with indoctrinating and transplanting from superior culture to inferior culture. Different cultures have different organizational adaptability so that the difficulty of integration is different and a pertinent strategy should be adopted in line with local conditions. Cultural integration is the key factor in mergers and acquisitions strategy and long-term operating performances. It is also the final successful sign of mergers and acquisitions.

Cultivation, strengthen and transplantation of the core competence is a short-term process of development, its' process of accessing and enhancing is dynamical and infinite loop<sup>[8]</sup>. The business organization must be innovative to obtain long-term development<sup>[9]</sup>.

### 3.4 M&A consolidating period

In this period the core competence will be enhanced and upgraded. After passing M&A integrating period smoothly, the M&A process has been made initial success at the organizational level. But at the strategic level, it is uncertain that there is significant market effect in the core competence. Therefore, the consolidation of M&A is the necessary extension of building and enhancing the core competence. It is necessary in this stage not only to develop and establish core products in various business, but also to realize interaction development and virtuous circle between M&A and core competence in the strategy.

## 4 Conclusion

Successful M&A can bring a huge positive effect, and M&A in failure can allow enterprises to pay a painful price reversely. Chinese companies need seriously consider overseas M&A risks and have a clear understanding to take appropriate mode. From the perspective of the core competence, a clear and viable model of mergers and acquisitions has been established in this paper. This one is just like the mode of "Total Quality Management", and it emphasizes the enterprises should penetrate the building, nurturing, strengthening and enhancing of the core competence into the whole process of M&A on the base of careful evaluation itself.

## **Analysis on Management Culture Mode and Selection over Large-scale Enterprise Groups\***

Cao Yanrong

School of Art&Law, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: cloris\_cao@163.com)

**Abstract:** With further economic globalization, fiercer market competition, and the enterprise paying more attention to the soft management today, strengthening the research of enterprise management culture, setting up the business enterprise management culture and implementing cultural management is the strategic choice of large enterprise group in China to change the development mode and raise the level of management, and it is also an advanced topic that needs to be solved to promote the soft power of large enterprise group culture. For large enterprise group management culture mode, there is no authoritative result in academic field. In this paper, the author puts forward some models of the large enterprise group management culture by using system theory and comparison analysis, and summarizes the development paths of the group management culture through the analysis and comparison, and it is concluded that the highest level of the selection and construction of management culture model is humanistic innovative management culture mode.

**Key words:** large enterprise groups; Management culture; Humanistic innovative; Game theory

### **1 Introduction**

More than 30 years, the enterprise culture has been defined from different angles by the scholars domestic and overseas, and it also has been known by many entrepreneurs and managers. However, there's very little research on enterprise management culture. Enterprise management culture actually is using the enterprise culture in management, it is the management method, management features and management standard which carry and perform the enterprise culture, it is the management style and management behavior generated by effectively conducted enterprise culture through the management activities, it is the important performance of enterprise culture. There's very little conclusion on how to choose the enterprise management culture mode both in China and overseas, therefore this paper will do some analysis on this topic.

### **2 Some Modes of Large Enterprise Group Management Culture**

From the enterprise managers' ways of thinking and behavior, we think there are four modes of large enterprise group management culture:

#### **2.1 Experience adherence type**

Experience adherence type, is based on empirical thinking, paying a lot attention to the traditional management experience, adhering the existing knowledge, reacting slowly on the outside environment changes, behaving more conservative, pursuing steadiness, making decisions with experience, with the management value orientation venerating historical traditions, worshiping past experience, paying great attention to the material factors, ignoring human value, stressing rule of man, a lot of freedom in management, and with the goal of management making money, and stable.

#### **2.2 System control type**

The system control type management culture mode, is based on scientific thinking, paying a lot attention to the system construction, believing in scientific rules, holding the mature management system, perfecting management system, emphasizing the uniformity of members' thoughts and behaviors, achieving the strict top-down management by increasing the management level, detailing the management rules and establishing management process, pursuing the best quality effect and avoiding business risks. The management value orientation is venerating authority, worshiping authority, obeying disciplines and commands, controlling the behavior of people, stressing the rule of law, disliking changes, reacting slowly to the market, and the management goal is to be stable and profitable.

#### **2.3 Entrepreneurs guide type**

Entrepreneurs guide type management culture mode, is based on the entrepreneurs' thinking, paying great attention to the concept of innovation, using entrepreneurs' idea for leading the

---

\* This paper is supported by Innovation Fund of the Ministry of Education 2010.(2010-YB-21)

development direction of enterprises, forming a management culture pattern that is “one people gives thoughts, all the others response”, emphasizing the use of entrepreneurship to cast enterprise spirit, expanding cultural influence through the entrepreneurs’ personal charisma, the management value orientation is venerating leader authority, worshiping personal thoughts, relying on entrepreneurs personal thoughts, highly obeying the rules, stressing the rule of man but also stressing the rule of law, and the management goal is to control and be profitable.

#### **2.4 Humanistic innovative type**

Humanistic innovative management culture mode, is based on humanistic thought, paying much attention to the value of the people, giving prominence to the subjective position of human, emphasizing constantly changes of ideas, promoting the management innovation, mechanism innovation, and technological innovation, and guiding the enterprise by scientific outlook on development. Humanistic innovative management culture mode creates a learning organization to construct an enterprise culture of progressive thinking, correctly guiding, highly appreciated by the staffs and all members practice together, strengthens knowledge management, constantly improves the learning ability, innovation and enterprise brand power, uses the innovation spirit to cast the enterprise cultural soul, uses the enterprise culture to build the enterprise’s core competitive ability, and stresses the rule of culture. The management value orientation is venerating the human nature, worshiping the innovation, advocating performance, conducting a humanistic management, respecting subjective position of human, arousing people’s creative potentials, and the management goal is social responsibility, harmony, stability and healthy development.

### **3 Comparison of Large Enterprise Group Management Culture Modes**

The four large enterprise group management culture modes have different characteristics, according to the general rules of the management culture (as shown in table 1).

Experience adherence management culture is characterized by taking the empiricism as the main way of thinking, relying on the experience to make decisions, lacking of strategic thinking, and the vision is limited. From their behavior, they emphasize the material factors, overlook the human factors easily, pay less attention to subjective position and enthusiasm of human, and the management has too much freedom, a typical human-dominated management, depending on the experience of the manager. Their goal is to maintain a high degree of stability, taking profit as the most important task.

Compare with the experience adherence management culture, the system control type make a big progress from thinking mode to behavior pattern. The system control type emphasizes scientific thinking, advocates to think and measure the management problems by scientific spirit and scientific method, in order to get rid of the dependence of past experience, to overcome the defects brought by empirical thinking. They emphasize particularly on construction of system, stress rigid management, control the enterprises by carrying out strict management through power of system, avoid the operation risk and arbitrary management, and it is rule of law. Their goal is to put the profit in the first place, emphasizing solid management and steady operation.

Compare with the system control management culture, the entrepreneurs guide type makes a progress again. It is characterized by taking the entrepreneurs’ thinking as the weapon, making concept changes, venerating leader authority, relying on personal wise, and entrepreneurs’ wisdom is their philosophy weapon in business operation. They emphasize team obedience, stress rule of man, are good at diversified management, and the management goal is to pursue enterprise stability and control operating risk.

Humanistic innovative management culture is by far the most desirable management level, far more advanced than experience adherence type, system control type and entrepreneurs guide type, and it is the management culture form which fits the cultural administrative requirements best. Humanistic innovative management culture is characterized by humanistic thinking. It starts and ends both in people-oriented ways, and it emphasizes improving the relationship between man and man, man and enterprise, man and society, man and nature by integrated development of man, so as to promote the development of the enterprise. It puts emphasis on exerting subjective initiative, venerating human value, keeping continuous innovation and constantly changes by improving the team learning and relying on collective function of the leaders rather than the personal talent, stressing the rule of culture, and their goal is to put the social responsibility, harmony and stability, healthy development at the first place.

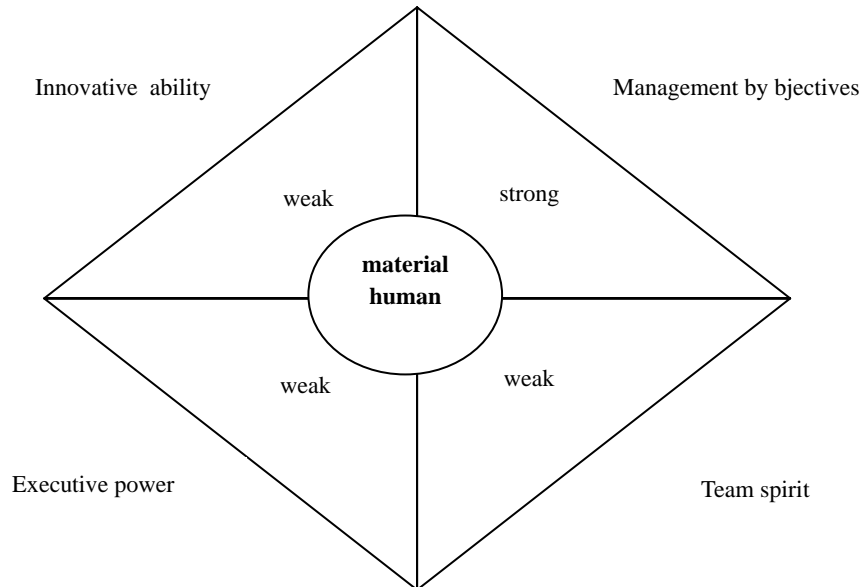

**Table 1 Comparison of four management culture modes**

Character	Type	Experience adherence	System control	Entrepreneurs guide	Humanistic innovative
Content					
Thinking pattern		empiricism	scientism	entrepreneurs	humanistic
Ideas of management		Venerate historical traditions, worship past experience, pay great attention to physical factors	Venerate system construction, worship authority, stress obeying disciplines and commands	Venerate changes of ideas, worship leader authority, rely on individual thoughts	venerate human nature, worship the innovation, construct learning organization
Ways of management		Rule of man, emphasize materials	Rule of law, emphasize system	Rule of man, emphasize obedience	Rule of culture, emphasize culture
Goals of management		Stable and profitable	Profitable and steady	Stable and control	Social responsibility, harmony and stability, healthy development

#### 4 Competitiveness Value Analysis of Large Enterprise Group Management Culture Modes

Currently because large enterprise group management culture modes are different in the way of thinking and behavior patterns, competitive values (as shown in Figure 1, Figure 2, Figure 3, Figure 4 and Figure 5) are also far different, and this can provide reference for large enterprise groups to choose the most appropriate management culture mode.

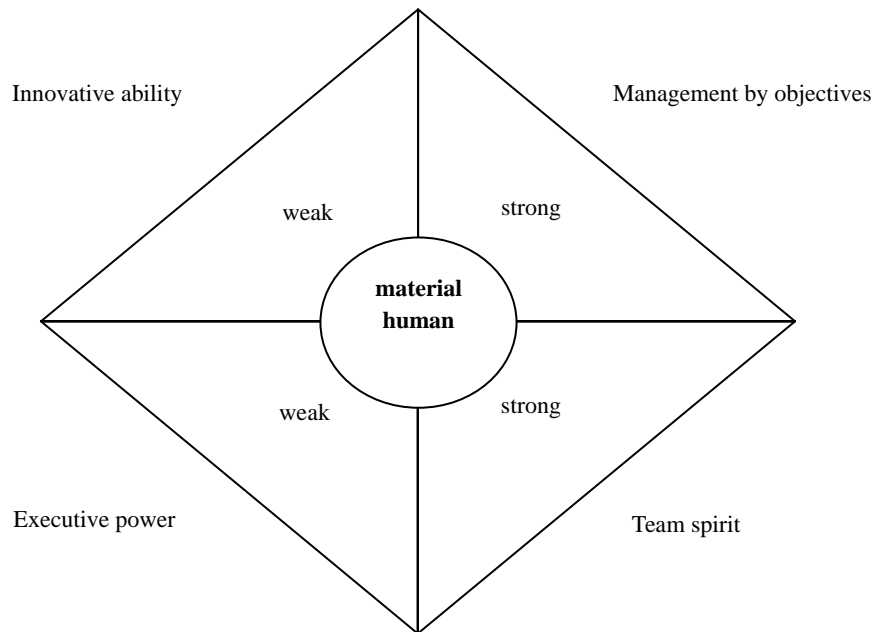

Experience adherence management culture values the function of target, but pays less attention to the team spirit, easily to have some friction in work, the execution is casual, the innovation ability is weak, they stress materials rather than human, and therefore the competitiveness is the lowest. The Giants, the Sanzhu Group and the Asia Enterprise were all of this type and failed in management.

**Figure 1 Competitiveness Value of Experience Adherence Type**

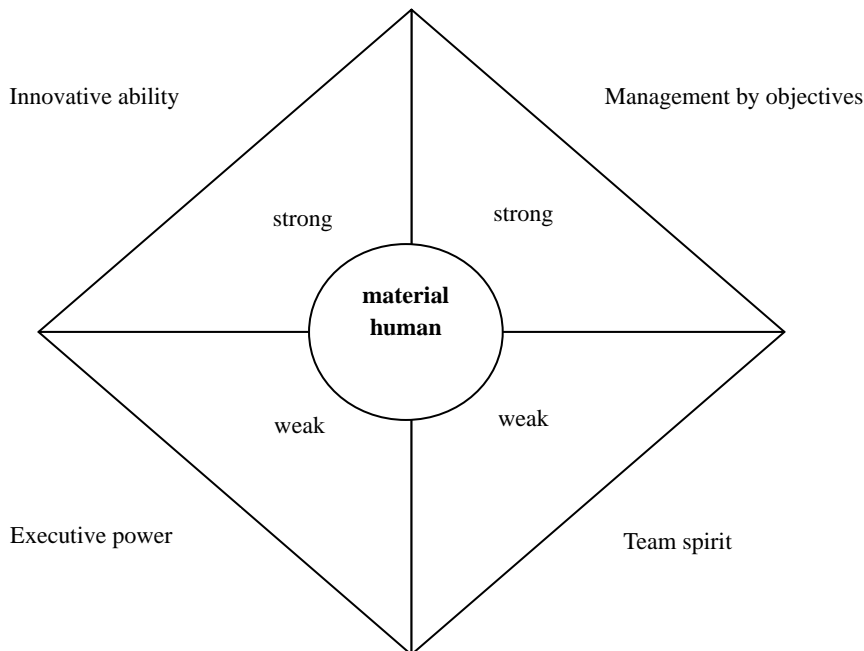

The system control management culture has a strong consciousness of target management and teamwork spirit, but the execution is easily to be bounded, the innovation ability is weak, and it pays

more attention to material rather than human. So the competitive power is also limited. Most of the state-owned enterprises and many of the joint ventures are of this type of mode.

**Figure 2 Competitiveness Value of System Control Type**

Entrepreneurs guide management culture thinks highly of goals, emphasizing the target management, focusing on enterprise innovation, but the team spirit and execution are likely to be fluctuated and not stable. Although it stresses human and has some competitiveness, the enterprise development depends too much on entrepreneurs' personal wisdom. Once there is something wrong with the entrepreneurs' decision, thinking or behavior, the enterprise is in risk. Family enterprise, most private companies, some collective enterprises and some state-owned enterprises are of this type, such as Lenovo Group, BYD Group, Wahaha Group, Shenzhen Sam training company and Huawei etc.

**Figure 3 Competitiveness Value of Entrepreneurs Guide Type**

Humanistic innovative management culture has a good targeted management mechanism,

venerating teamwork, stressing the culture of teamwork, having strong executive powers and innovation abilities, it attaches great importance to human value, and it has highest competitive value. There are a few domestic enterprises have courage to change in the wave of market economy, are good at learning, gradually form a humanistic innovative enterprise culture characteristics, and some of them have grown to benchmarking enterprises in the industry or even in the whole country, such as Dongfeng Automobile Company, Baosteel group, Shanghai Automobile Company and First Automobile Works etc.

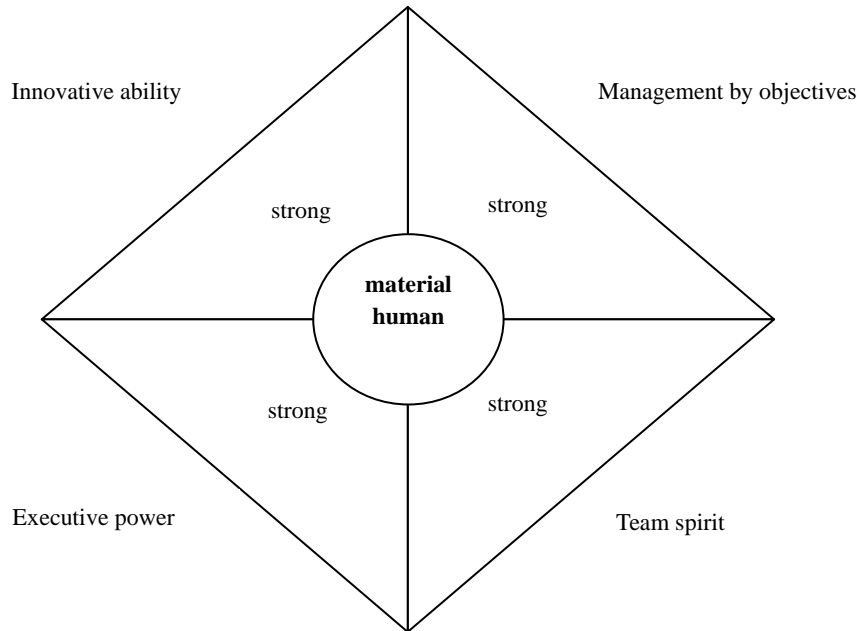

Figure 4 Competitiveness Value of Humanistic Innovative Type

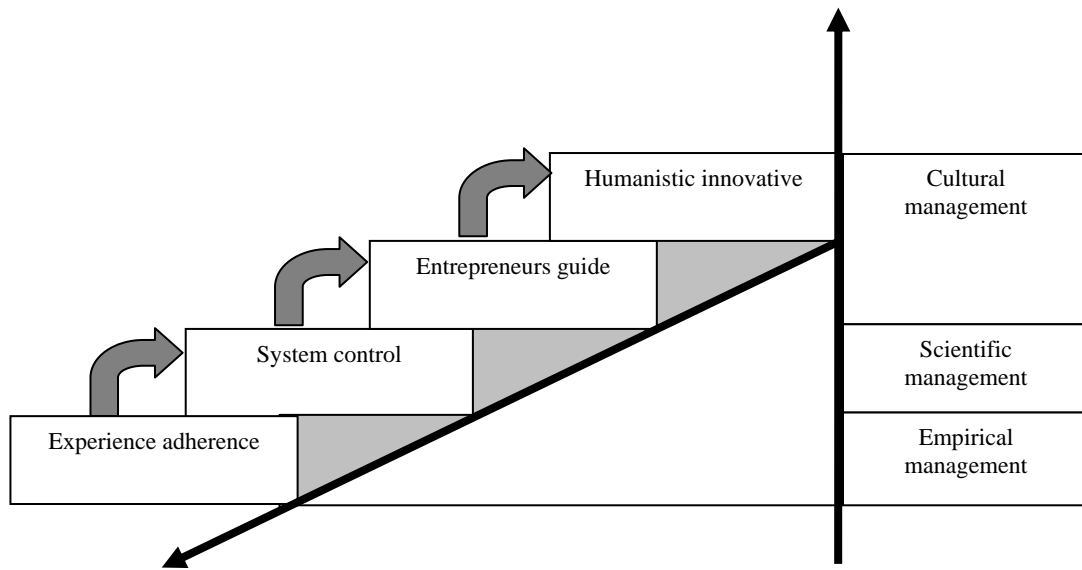

### 5 Selection of Large Enterprise Group Management Culture Modes

From the analysis above, we can see that in the four different enterprise group management culture modes, the humanistic innovative type has the most competition value. It has the best growing prospects of development, the greatest influence on the enterprise development, the largest impact to improve the competitiveness of the enterprises; the next is the entrepreneurs guide type, then is system control type, and the lowest level is experience adherence type. In the circumstance of knowledge-based economy emphasizing cultural management, large enterprise groups should choose humanistic innovative type, and gradually transfer from the other three types to the humanistic innovative management culture mode.

For large enterprise groups, the process of culture management will go through four stages up, which also make the enterprises more and more competitive. As the model in Figure 9, the four stages match along with three stages of the development of management practice too. As the model reveals, nowadays the construction of culture management should evolve from experience adherence or system control types towards humanistic innovation, which meets the needs of culture management. Though entrepreneurs guide type is also the manifestation of culture management, this form of culture management is restricted by individual factors, which makes enterprise develops wholly depending on wise decisions of an individual. This type of culture psychology is far from an optimum cultural ecology of culture management. The optimum cultural ecology is the one that focuses on humanistic innovation.

### 6 Conclusion

To construct the most competitive and energetic enterprise management culture, the enterprise should slip the leash of empiricism adherence and system control, break the culture limitation of entrepreneurs guide and weave the humanism-oriented and team innovation-oriented culture, meeting the demands of scientific development of culture management. If the construction of culture management came to a standstill or failed to step to new stage or level, the ecology and competitiveness of culture management would drop, pulling down the competitiveness of the whole enterprise.

# International Trade among Developed and Developing Countries: New Empirical Analysis

Yu Xuejiao

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail:xuejiao758@sina.com)

**Abstract:** This paper argues that technological innovation and transport infrastructure investments are important factors in bilateral trade, especially for developing countries, through the econometric model. What are proposed by this paper is that geographical and cultural factors are more important for developing economies than developed economies. The econometric model includes value of import, income, population of both countries and seven different dummies. Finally it reaches the conclusion that the investments in technological innovation and in transport infrastructure have shown great influence on the volume of trade.

**Key words:** International trade; Technological innovation; Transport infrastructure; Gravity equation

## 1 Introduction

Traditionally, when estimating a gravity model of trade, it is implicitly assumed that the coefficients of all the explanatory variables are the same for all the trading patterns. Empirically, this requires relaxing the pooling assumption. Throughout a lot of papers, they often neglect some auxiliary conditions because of the restriction of some assumptions.

In this paper we test the pooling assumption in a gravity model augmented with technological innovation and transport infrastructure variables for 62-country samples. The aim is to evaluate the empirical effects of technological innovation, transport infrastructure, cultural and geographical factors on international trade. We find that the significant sign of the explanatory variables depends on the certain characteristics of trading partners. Thus, the samples are divided into two groups of countries according to their level of income labeled developed countries and developing countries. The estimation results show important differences concerning the goodness of fit as well as the significance and magnitude of the variable coefficients. The next section demonstrates data and the estimated equation. The main empirical results are manifested in the following section. Finally, in Section 4 we outline our conclusions.

## 2 Data and Estimated Equation

### 2.1 Construct the regression equation

In order to evaluate the empirical effects of technological innovation, transport infrastructure, cultural and geographical factors in international trade, we use a gravity model (Deardorff, 1995; Anderson and van Wincoop, 2003) augmented with technological variables and a transport infrastructure index. A number of dummies representing geographical and cultural characteristics are also added. The model is expressed in additive form, using a logarithmic transformation. The estimated equation is:

$$\begin{aligned} \ln X_{ij} = & \alpha_0 + \alpha_1 \ln Y_i + \alpha_2 \ln Y_j + \alpha_3 \ln P_i + \alpha_4 \ln P_j + \alpha_5 Adj_{ij} + \alpha_6 Isl + \alpha_7 Land + \alpha_8 CACM + \\ & + \alpha_9 CARIC + \alpha_{10} MERC + \alpha_{11} NAFTA + \alpha_{12} CAN + \alpha_{13} UE + \alpha_{14} \ln Dist_{ij} + \alpha_{15} Lang_j + \\ & + \alpha_{16} ArCq + \alpha_{17} ArCq + \alpha_{18} difArCq + \alpha_{19} \ln f_i + \alpha_{20} \ln f_j + u_{ij} \end{aligned} \quad (1)$$

where  $\ln$  denotes natural logarithms,  $X_{ij}$  denotes the value of exports from country  $i$  to  $j$ ,  $Y_i$  and  $P_i$  refer to income and population in the exporter's market,  $Y_j$  and  $P_j$  refer to income and population in the importer's market,  $Adj_{ij}$  is a dummy that takes a value of 1 when countries share the same border, otherwise, it takes 0.  $Isl$  takes a value of 1 when the exporter or the importer are islands, else takes 0.  $Land$  is a dummy for landlocked countries,  $CACM$  is a dummy that takes a value of 1 when both countries belong to the Central American Common Market,  $CARIC$  is a dummy that takes a value of 1 when both countries belong to the Caribbean Community,  $MERC$  is a dummy that takes a value of 1 when both countries belong to Mercosur,  $NAFTA$  takes a value of 1 only when countries are members of the North American Free Trade Area,  $CAN$  is a dummy representing Andean Nations Community members and  $UE$  takes a value of 1 only when countries are members of the European Union.  $Dist_{ij}$  is

the geographical great circle distance in kilometers between the capitals of country  $i$  and  $j$ .  $Langij$  is a dummy when both countries sharing the same language,  $ArCoi$  and  $ArCoj$  are technological variables measuring technological innovation in the exporter and the importer countries and  $difArCoij$  is the technological gap between trading partners (Filippini and Molini, 2003). This indicator is based on the insight that two countries can be far away from each other not only geographically, but also from a technological perspective.  $Inf_i$  and  $Inf_j$  are infrastructure variables measuring the level of transport infrastructures in the exporter and the importer countries. Finally,  $u_{ij}$  is independently and identically distributed among countries.

**2.2 Obtain the related data**

The model is estimated with data of 62 countries in 1999. First, we perform OLS estimation on the double log specification as given by equation (1). However, since almost 20% of the observations in bilateral trade flows are zero, then a Tobit model is estimated in order to take the missing trade into account.

Data in bilateral exports are obtained from Statistics Canada (2001), income and population variables are from the World Bank’s World Development Indicators (2001). Information about geographical and cultural dummies is from the CIA (2003) and the data for ArCo are obtained from Archibugi and Coco (2002).

In order to understand whether a differential behavior concerning the determinants of trade flows in developed and developing countries exists, we estimate equation (1) by interacting the exogenous variables (except integration dummies) with a dummy (DP)<sup>3</sup> that takes the value of 1 when trading partners are richer than the simple average in our sample. DP takes the value zero when trading partners are poorer than the simple average in our sample. We use the Wald test in order to check whether both exogenous variables and its interaction with the dummies can represent that developed countries present a different coefficient. We reject the null hypothesis of equality of the coefficients in the two sub-samples (developed and developing countries). Table 1 shows our final results.

**Table 1 Multiple Linear Regression Model**

Variable	OLS (1)	OLS (2)	TOBIT (3)
Constant term	-19.36*** (-32.05)	-22.11*** (-28.97)	-48.36*** (-32.6)

Scale Factor	-	-	3.37*** (75.25)
Number of observations	3126	3126	3782

Notes: \*\*\*, \*\*, \*, indicate significance at 1%, 5% and 10%, respectively. T-statistics are in brackets. The dependent variable is the natural logarithm of exports in value (current US\$). Income, population and distance are also in natural logarithms.

### 3 Empirical Results

#### 3.1 Equation via t-test

Model 1 shows the estimation results for equation (1). All the explanatory variables are significant via t-test and show the expected sign, except for UE dummy. However, the magnitude of the income coefficients is lower-than-expected. The adjacency coefficient has the expected positive sign, but it is not noticeable. The landlocked coefficient is negative as expected, indicating that countries without direct access to the sea trade 62% less. The island dummy is negative, as expected. The language dummy coefficient is positive and indicates that countries sharing the same language trade 129% more than those speaking different languages. The European Union dummy coefficient is negative signed and statistically significant. Although this result has been found by other authors (Cyrus, 2002), we believe that the reason may be the presence of heterogeneity in the sample or the existence of zero values. Technological distance ( $difArCo_{ij}$ ) is significant, indicating that countries tend to trade more when they place more emphasis on a technological point of view. The model has a high explanatory power (Adjusted  $R^2 = 78.8\%$ ).

#### 3.2 Equation with iteration dummies included via Wald test

Model 2 presents the results of low income countries as well as high ones, with the inclusion of iteration dummies. The results from the Wald test show that the probability assumption is indeed rejected in bilateral exports and that the estimated parameters are not identical in bilateral relationships. Income variable has a more close relation to developed countries. A 1% increase in own GDP increases exports from developed countries by 0.52% (0.04%+0.48%), while only increases 0.04% when exports are from developing countries. Very similar coefficients are obtained from foreign GDP. This may indicate that the cost and revenue of integration and globalization could be unevenly distributed among the richest and the poorest countries and the former can benefit from this distribution. The coefficients of population variables show positive signs, but show a very low magnitude for developed countries and present a magnitude close to unity for developing countries. This indicates that greater availability of cheap labor force in developing countries can stimulate trade, whereas in

developed countries the transition is over and the trend of population growth is stable. The magnitude of the distance coefficient is lower in developed countries,  $-0.72$  ( $-0.97+0.25$ ), than in developing countries,  $(-0.97)$ . The adjacency dummy coefficient is  $0.45\%$  lower in developed countries and also the language dummy is lower ( $0.53\%$ ) when it comes to the developed. Therefore, results show that trade flows are more sensitive to geographical and cultural variables (adjacency, geographical distance and language) for developing economies than for developed economies. Since developing countries face higher transport costs, higher institutional and informal barriers, and more limited access to market information, they tend to trade more with their neighboring countries. The result that language links have an impact on international trade has also been found before, and the former research has shown that language influences on trade are more significant in China (a developing country) than in the U.S. (a developed country). The estimated coefficients for technological innovation and infrastructure variables are always significant and higher in magnitude for developing countries. Hence, technological innovation and transport infrastructure investments seem a good policy for developing economies.

### 3.3 Equation by Tobit estimation

Finally, Model 3 reports the Tobit estimation of the gravity equation with the interactive terms included. The results show several distinctive features compared to those obtained in Model 2. It is income variables for the exporter and the importer that show a higher magnitude in developed countries ( $1.66$  and  $1.73$  respectively) than in the OLS estimation. Population variables for developed countries now present negative coefficients ( $-0.97$  and  $-1.12$  respectively), indicating that an increase in population hinders the trade. This may be due to an absorption effect. The adjacency dummy has a coefficient for developing countries that is twice than that in Model 2 and also the effect of some integration dummies is amplified (CACM, CARICOM and MERCOSUR). However, the NAFTA and CAN dummies are not significant and the EU dummy is now positive and significant. Geographical distance has a considerably lower effect on trade for developing countries and the coefficient for the interactive variable is positive but not significant, whereas language, technological innovation and transport infrastructure have a higher effect on trade flows, for both developed and developing countries than in Model 2.

## 4 Conclusions

In a conclusion, it is proved that the volume of trade is not only impacted by geographical and cultural aspects but also affected by investment in technological innovation and in transport infrastructure.

With respect to trade, there are still other factors which can influence bilateral trade flow, such as humanitarian aid from developed economies and some good economic policies. This paper only analyses some certain variables by using a gravity equation and verify the hypothesis. Other factors were still worthy to be considered.

2 School of Economics and Management, China University of Geosciences, Wuhan, P.R.China, 430074

(E-mail: wangxc01@163.com)

**Abstract:** Online community has been proved to be a new source of innovation by many scholars. But, innovative activities within online brand community attracted few academic studies. This paper uses netnography to collect data and analyzes by coding based on grounded perspective. 16 key activities are identified to be innovation relative according to their frequency of importance. These activities are involved the three major stages of innovation process, idea generation, developing and testing, and launch and marketing, and the brand community members are most active innovators in idea generation.

**Key words:** Brand Community; Innovative Activity; Netnography; Coding

### 1 Introduction

The phenomenon that customers invent or improve a product for their own consuming is not a new fad just after Web 2.0 appeared. In more than three decades, many scholars had explored it and named it different way.

Toffler defined prosumers as people who produce some of the goods and services entering their own consumption, for example, designing customized clothes. He argued that driven by more leisure time, empowering computers and telecommunications technology, rising service costs, higher education as well as sensitivity for quality and conscious lifestyle, the norm of society shifted from mass consumption to individuation, spotlighting self-actualisation. Hence, consumers as phenomenon of the industrial age were shifting to prosumers in the post-industrial age. Toffler's prosumer thesis was extended by Kotler in 1986 to the context of marketing, stressing individuation, skill-building, and productiveness as relevant marketing themes. Kotler concluded already in the pre-new media age that marketers should look for opportunities to facilitate prosumption activities by creating tools for prosumers to use.

Von Hippel first reported that the central role of innovators can also be users in the 1970s. He defined users as individual consumers or firms that expect to benefit from using a product or a service, while manufacturers often expect to benefit from selling a product or service to their customers. von Hippel noticed the trend of open innovation and distributed innovation, and then introduced the concept of "User centered innovation". This generalized concept includes the phenomenon that manufacturers absorb user innovators' ideas and introduce them into the mass market. In this case, the final innovation is possessed by established manufacturers; however, source of ideas is partially from users. Usually, lead users are more active in the formation of user centered innovation.

Customers' wants and their acquired knowledge through the actual use of products make them an essential external resource for innovation. Some customers are not only knowledgeable but also able to develop their own new products. Such innovative customers can be found in online communities. Such online communities are based upon shared enthusiasm for an issue or an activity and are often virtual meeting places for innovative users to discuss the ideas for product improvement. In "alt. coffee" for example, community members share their ideas and thoughts about how coffee machines and roasters can be improved in order to enjoy the optimal coffee pleasure. At niketalk.com, an online community for devoted basketball players, new basketball shoes are developed by users. The new designs are discussed, evaluated and improved within the community. Members of communities of consumption seem to be particularly suitable for the virtual participation in new product development because of their high product interest and knowledge as well as presence on the Net. Analyzing four different sports communities Franke and Shah showed that on average one third of the community members improve their sports equipment or even design their own products. Moreover, these members are well informed regarding the innovative activities of other community members.

While the role of innovative users in online communities has enjoyed significant development in

---

\* This paper is supported by grants from the National Natural Science Foundation of China under Grant 71072080

the literature, a number of gaps remain. Although some authors have used brand communities as virtual settings for their studies, few authors have explored the user innovation in online “brand” communities as specific contexts, with unique characteristics different both from offline settings and from not-brand-related online communities. The purpose of this article is to address the question of “what are innovative members doing in the user-initiated brand community” by generalizing and classifying the major innovative activities within the brand community, which is the first step to understand the user innovation phenomenon in the specific brand community context.

## 2 Literature Review

### 2.1 Brand community

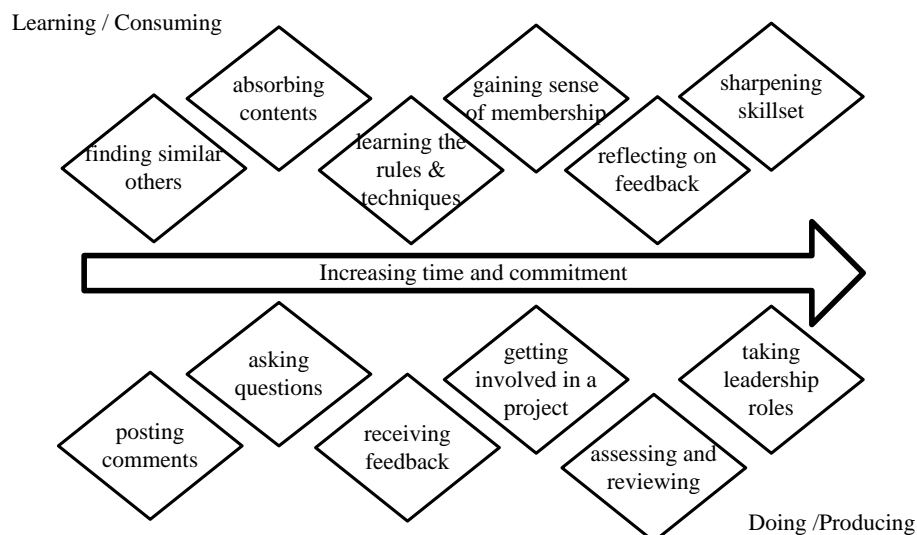

The notion of brand communities was developed by Muniz and O’Guinn as “a specialized, non-geographically bound community, based on a structured set of social relations among admirers of a brand”. Brand communities are complex entities with their own cultures, rituals, traditions, and codes of behavior<sup>[13]</sup>. Members of a brand community derive much of their personal identity from their participation and membership. In other words, in brand communities conversations are centered on a specific brand and usually passionate members are consumers of the brand.

Brand communities differ from other not-brand-related communities because the three distinguishing features, namely consciousness of a kind, rituals and traditions, and sense of obligation to the community and its members. Compared to not-brand-related community, brand community members have a strong interest in the product and in the brand. They usually have extensive product knowledge and engage in product-related discussions; they support each other in solving problems and generating new product ideas. Therefore, brand communities can be a valuable source of innovation.

So far, most researches in this field elaborated on the relationship between membership and brand loyalty, brand identity and so on, which apparently are the traditional downstream realm that brand works, few researchers linked brand community with upstream activities such as technology innovations.

### 2.2 Community innovative activities

Kozinets, Hemetsberger and Schau presented a processual model of community activities, separating learning from doing, and implicitly separate production of information from its consumption. He argued that in a perpetual loop of learning and doing, aspirant members “research” their sites of interest, absorb the rich stores of information and social and collective knowledge. Kozinets believes that this is grassroots informationalism; informationalism enacted at the small-scale level of consumer “hobbies” and “interests.”

**Figure 1 Processual Model of Community Activities**

Source: Kozinets, et al, The Wisdom of Consumer Crowds: Collective Innovation in the Age of Networked Marketing, 2008

Figure 1 depicts this dimly specified progression from lower-value content contribution to higher-value content contribution, the involvement process is based on feedback and self-identification, a combination of affective ideological, social motivation, and educational intellectual commitments.

Later, some consumers assume leadership roles. They provide feedback, critically evaluating, vetting, and challenging. In a constant process of idea contribution, they advise and mentor the more novice members, aggregate similar contributions, and review and challenge current contributions. In these ways, collective creativity develops and produces “content” that exceeds the value that could be provided by single individuals. Eventually, communities may develop hierarchies of expertise, as we observe within many open-source and fan communities.

The wisdom of consumer crowds” is the only work which is accessible for the author that elaborates on “Collective Creative Activity”, which overlaps a lot with the term “virtual community innovative activity”. Although many authors mentioned innovative activities in their research paper such as information seeking, knowledge sharing, problem solving and co-creating, few researches really focus on studying these activities. Most of the community innovative behavior researches focus on motivations and influencing factors of joining, sharing and innovating in community and leave the following questions behind: What are the activities that the community members do most frequently? What are the activities that contribute more to the user innovation? If there are any specific activities that could only be found in brand community? All above questions need to be addressed because it helps managers to get better understanding of brand community innovation and thus develop better approach of co-creation with the loyal customers.

### 3 Methodology

Netnography, or ethnography on the Internet, is a qualitative consumer research methodology that uses the information publicly available in online forums to identify and understand the needs and decision influences of relevant online consumer groups. Of course it could also be used to study the nature and behavior of online consumer groups. Netnography is based primarily upon the observation of textual discourse.

For this study, the netnography divides into four steps: (1) community identification and selection; (2) sampling; (3) screening and coding; (4) interpretation of findings.

#### 3.1 Community selection

Kozinets listed several guidelines for community selection: (1) a more focused and research question relevant segment, topic or group, (2) higher “traffic” of postings, (3) larger numbers of discrete message posters, (4) more detailed or descriptively rich data, and (5) more between-member interactions of the type required by the research question.

According to above principles, an online Mac community called MacIdea is chosen as the study objective. MacIdea is an online forum initiated by several Apple Mac admirers and a technology community called Pcbeta, one of the best forum focused on Windows operation systems in China. This origin brings a “hybrid” character for MacIdea: it has members of technical background which makes it different from other apple forum mainly visited by users who care most about download App software; and it is also different with the forums gathered by Apple developers because the “pure” users and admirers talk about their love to Apple and Jobs makes it a qualified “brand community”. The “hybrid” character ensures MacIdea to be an ideal setting for this research because of its high relevancy with “brand” and “innovation”.

MacIdea shares a 210,000 plus membership with Pcbeta, and over 25,000 respective registered members for its own. The large membership volume guarantees the enough “traffic” of posting.

#### 3.2 Sampling

The heavy traffic load of posting makes the read-all-posting-plan a mission impossible, a sampling method is proved more feasible. A random sampling is used to choose 200 members from a check-in topic which calls newcomers to post and have more than 20000 members followed. That is, to choose 200 numbers from 1-20000 randomly, use one random numbers to match the order number of the floors within that check in topic, and then identify one poster. The next step is to use the poster’s name as keyword to search within the forum with google provided by MacIdea so as to find all his posting messages recorded. In that way, 2246 postings from 200 members were collected and screened.

Another sampling method adopted in this research is theoretical sampling. One of innovative projects discussed under sub forum “Independent Developer”, focused on a video player on Mac was

chosen to ensure “more between-member interactions of the type required by the research question”. 2075 postings were collected from this MplayerX projects discussion.

**3.3 Screening and coding**

Totally 4000 plus postings were read word by word. Data relative to innovation is copied and coded until getting enough messages to achieve theoretical saturation.

The initial coding is based on every message and every message was given several coding, varies from activity form (initiating a topic or just reply); content (advices or bug reporting or etc); commitment (simple or detailed); category (from which sub forum, Mac or iphone).

The second step is to do focusing coding according to the frequency and importance of initial coding.

And the last step is the axial coding. The items generated from focus coding were categorized into groups according to innovation process model.

**4 Findings**

**4.1 Innovative support from community members in MplayerX project**

MplayerX is a video-playing tool developed for Mac. It is compiled on Mplayer, an open source software under Linux. The developer initiated the project individually in 2009, launched the first edition on January, 2010, and its latest edition is available on shelf of App Store for free since March, 2011. The MplayerX forum of MacIdea was opened on June, 2010. From then on, the developer and community members keep on discussing about the project, and the developer got technical, emotional and economic support from the community. And the innovative support can be found in three innovation stages of conception, developing and marketing. The following table lists some of the examples.

**Table 1 Brand Community Support for Innovative Project MplayerX**

support from members	examples
technical support	advices on new function
	advices on new features
	language translation for Chinese edition, and traditional Chinese edition
	aesthetical design
	software developing advices
	new edition testing
	bug reporting
emotional support	comparison analysis with other video players
	rating and comments in APP Store
	acknowledgement for free sharing
economic support	encouragement to insist upgrading
	donate

**4.2 General innovative activities**

MplayerX is a special example of brand community innovation, because the members are aware of their involvement with the project and make innovative contribution deliberately. According to coding from 200 samples, it is found that in most cases members participate in innovative process unconsciously. The sparkle of innovation is hidden under experience telling, skill showing and even complaining. The following activities in Table 2 facilitate innovation directly or indirectly.

In their processual model of community activities, Kozinets, Hemetsberger and Schau separated learning from doing, and implicitly separated production of information from its consumption. In this model, the learning/consuming activities are non-public behaviors that can't be observed by posting screening. For example, lurks on original innovation posts or uses private message to discuss with other members. These activities may also benefit brand community innovations.

**Table 2 Innovative Activities in Brand Community MacIdea**

Innovation stage	Innovative activities
Idea generation	carrying out surveys on consumer behavior
	comparison analysis of consuming experiences among competitors
	describing expectations for product improvement
	description of decisional consideration in purchasing

	introducing or analyzing new technology or new trend
	demanding special product (for example, Chinese edition of software)
	complaints of product or service
Developing and testing	posting original creation
	seeking for help
	giving technical advices
	bug reporting
Launch and marketing	downloading
	posting comments on innovation
	improvement advices
	advices on price and distribution
	tweet and other propagandas

## 5 Conclusions

Totally 16 innovative activities from 3 different stage in innovation process are identified within MacIdea. Compared with other forms of virtual community, brand community is always product focused. The biggest advantage of brand community in innovation is its product information abundance. High density of product related information greatly help to identify customer needs and wants. The second advantage comes from opinion leaders. Brand community is gathered by loyal customers, who are in many cases more sophisticated users and, in other words, more opinion leaders.

The result may vary with other brand's community because Apple products are high involvement ones and a considerable part of Mac users in China are developers or designers, who are supposed more skilled and more likely to innovate. Further research should be carried out to study the brand community in different industry so as to get a more universal conclusion.

# Application of the Grey and Multi-linear Regression Combined Model in Reverse Logistics Predictions

Sun Shusheng, Du Xiang

School of Management, Wuhan University of Science and Technology, Wuhan, P.R.China,430070  
(E-mail:sun1368@126.com, du123xiang@163.com)

**Abstract:** The accurate prediction of the quantity of reverse logistics is useful to the drafting of industrial development plans and the feasibility research of infrastructure. Taking into account the uncertainties of reverse logistics, this paper uses the two single forecast models, the grey GM (1, 1) and the multi-linear regression models, to model the statistics. Using combination forecast theory, the paper makes predictions based on the prediction effectiveness of the combination forecast model. The results reveal that the accuracy of the combination forecast theory is significantly higher than the two single forecast methods, hence proving the feasibility and effectiveness of the former in predicting the demand for reverse logistics.

**Key words:** Reverse logistics; Grey forecasting multiple; Linear regressions; Combination forecast

## 1 Introduction

“Forewarned is forearmed”. Forecast can reveal objective fact, predict the future development trend and regularity, and play a decisive role in the national economy. In today's China's rapid economic development, resource waste, emissions and waste disposal problems that economic development brings become increasingly protruding coming out now. So, more and more scholars come to realize that the reasonable and advanced reverse logistics industry can make the waste recycling process more scientific, promote waste recycling items and reduce the waste of resources in the process of logistics. However, larger reverse logistics often arises from different kinds of waste materials which mixed together and through different locations. Reverse logistics<sup>[1][2]</sup> has dispersity, slow nature and hybridity, and these characteristics determine it provide rarely reliable and known conditions in its predicting, which make it more difficult to predict much higher than planned stronger positive logistics.

For many years, worldwide scholars have developed a lot of prediction models. At present, the traditional logistics demand forecasting methods mainly include multiple regression models, exponential smoothing, neural network and gray system<sup>[3]</sup> etc. owing to the assume condition and applicable scope of single forecast models are limited, a single prediction model's precision is low. Taking into account the uncertainties of reverse logistics, this paper put forward Grey and Multi-linear Regression Models based on effectiveness.

## 2 Uncertainty Analysis of Reverse Logistics

### 2.1 The uncertainties and solution of return reverse logistics

Return reverse logistics include the following: Commercial return produced by the dealer inventory's deal stock or retailers clearing the backlog of shelves, return to repair or upgrade in quality guarantee period, Regulations return produced by unqualified product. The main causes of these uncertainties are unexpected sale conditions and unstable quality. Because of continuity of these uncertainties, use exponential smoothing and grey theory to forecast can effectively reduce the impact of these factors.

### 2.2 The uncertainties and solution in production process and transportation

The following increased uncertainty of reverse logistics: returned goods of by-product in production process, returned goods of damaged products in transportation, return goods due to error record of user's information. These factors relate to management and transport capacity of enterprises. It's difficult to master these factors, hence grey theory which use a small amount of inexact original data row of the system behavior characteristic sequence as prediction basis is an appropriate solution.

### 2.3 The uncertainties and solution of product abandonment

Product abandonment is the main cause of reverse logistics. It is relate to using habit of consumers and life cycle of products. The quantity of product abandonment has direct relation with sales volume, inventory, operating frequency and other relevant datas. regression forecasting analyze phenomenon's trend which is relate to forecast objects base on causal relationships between economic phenomena, then calculate quantity state of forecast objects. Hence regression forecasting method can accurately

forecast the quantity of product abandonment.

**2.4 comprehensive analyses**

In conclusion, there are many factors produce uncertainties of reverse logistics, previous single forecasting method cannot adapt to the complex interference factors. So this paper uses combination forecast model to overcome the limitations of single forecasting methods and accurately predict the quantity of reverse logistics. Thereinto, the grey system GM (1, 1)<sup>[4]</sup> model predict based on historical logistics quantity, it only need a small amount of data and simple calculation. What's more, it has good adaptability with gray system such as reverse logistics. The multi-linear regression models predict based on variables related to predictor variables, it has well complementary with GM (1, 1) model.

**3 Modeling Principle of Individual Forecast**

**3.1 Grey system prediction**

GM (1, 1) is the most popular gray forecasting model, the basic steps are as follows :

Set the raw data sequence as  $x^{(0)}$ ,

$$x^{(0)} = (x^{(0)}(1), x^{(0)}(2), \dots, x^{(0)}(n)) \tag{1}$$

(1) Calculate AGO sequence by accumulation,

$$x^{(1)} = (x^{(1)}(1), x^{(1)}(2), \dots, x^{(1)}(n)), \quad x^{(1)}(1) = x^{(0)}(1); \quad x^{(1)}(k) = \sum_{m=1}^k x^{(0)}(m). \tag{2}$$

(2) set  $z^{(1)}(k)$  as the mean sequence of  $x^{(1)}$

$$z^{(1)}(k) = 0.5x^{(1)}(k) + 0.5x^{(1)}(k-1), \tag{3}$$

$$z^{(1)} = (z^{(1)}(2), z^{(1)}(3), \dots, z^{(1)}(n)), \tag{4}$$

Then the grey differential equation model of GM(1,1) is as follow,

$$x^{(0)}(k) + az^{(1)}(k) = b \tag{5}$$

(3) Construct the equation matrix as follows,

$$y_n = BP, \tag{6}$$

$$y_n = [x^{(0)}(2), x^{(0)}(3), \dots, x^{(0)}(n)]^T,$$

$$B = \begin{bmatrix} -z^{(1)}(2) & 1 \\ -z^{(1)}(3) & 1 \\ \vdots & \vdots \\ -z^{(1)}(n) & 1 \end{bmatrix}, \quad P = \begin{bmatrix} a \\ b \end{bmatrix}.$$

(4) Calculate the parameters sequence,

$$P = \begin{bmatrix} a \\ b \end{bmatrix} = (B^T B)^{-1} B^T y_N \tag{7}$$

(5) The GM(1,1) model is gained by parameters calculation,

$$\hat{x}^{(1)}(k+1) = (x^{(0)}(1) - \frac{b}{a})e^{-ak} + \frac{b}{a}, \tag{8}$$

$$\hat{x}^{(0)}(k+1) = \hat{x}^{(1)}(k+1) - \hat{x}^{(1)}(k) \tag{9}$$

**3.2 Multiple linear regression model**

Set the prediction object y is influenced by  $x_1, x_2, \dots, x_m$ , and its relationship is a linear equation as follow,

$$y = \alpha_0 + \alpha_1x_1 + \alpha_2x_2 + \dots + \alpha_mx_m + \varepsilon \tag{10}$$

If observations  $(y_i, x_{i1}, x_{i2}, \dots, x_{im})$  can be gained, then we can establish the following equation,

$$y_i = \alpha_0 + \alpha_1x_{i1} + \alpha_2x_{i2} + \dots + \alpha_mx_{im} + \varepsilon_i, \quad i = 1, 2, \dots, n, \tag{11}$$

$$\text{Set } Y = (y_1, y_2, \dots, y_n)^T, \varepsilon = (\varepsilon_1, \varepsilon_2, \dots, \varepsilon_n)^T, \alpha = (\alpha_0, \alpha_1, \dots, \alpha_m)^T,$$

$$X = \begin{bmatrix} 1 & x_{11} & x_{12} & \cdots & x_{1m} \\ 1 & x_{21} & x_{22} & \cdots & x_{2m} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & x_{n1} & x_{n2} & \cdots & x_{nm} \end{bmatrix}, \tag{12}$$

$$\text{Then, } Y = X\alpha + \varepsilon, \tag{13}$$

$\alpha$  is unknown parameters,  $Y$  is observations vector,  $X$  is Observations matrix,  $\varepsilon$  is random error vector.

#### 4 Forecast Combination Based on Forecasting Effective Measure

At present, the research of linear combination prediction model<sup>[5]</sup> is based on the criteria that minimize the sum of squared errors. In fact, this criteria and assumption can not reflect the validity of the prediction method perfect, for different index sequences have their own dimension, which can not lead to a direct comparison. Even the same index sequences with same dimension, due to different indicator values over the same period, the same amount sum of error squares can not show the prediction methods equally and effective. The prediction method in this paper use the average of prediction accuracy to reflect its dispersion degree of the mean square error description, the modeling steps are as follows.

Set the time sequence of certain index as  $\{x_t, t = 1, 2, \dots, N, N + 1, \dots, N + T\}$ , the sample interval is  $[1, N]$ , and the prediction interval is  $[N + 1, N + T]$ . If the kind of prediction method is  $m$ , and  $x_{it}$  stands for the fitted value of  $i$ -th method in time  $t$ , then its relative error is

$$e_{it} = \begin{cases} -1, (x_t - x_{it}) / x_t < -1 \\ (x_t - x_{it}) / x_t, -1 \leq (x_t - x_{it}) / x_t \leq 1 \\ 1, (x_t - x_{it}) / x_t > 1 \end{cases} \tag{14}$$

and its prediction accuracy is

$$A_{it} = \begin{cases} 1 - |e_{it}|, 0 \leq |e_{it}| \leq 1 \\ 0, |e_{it}| > 1 \end{cases}. \tag{15}$$

Set  $l_1, l_2, \dots, l_m$  as the weighting factor of individual forecasting methods in the sample interval, then the fitting accuracy of combination model in time  $t$  is,

$$A_t = 1 - |(x_t - \hat{x}_t) / x_t| = 1 - \left| \sum_{i=1}^m l_i e_{it} \right|, t = 1, 2, \dots, N. \tag{16}$$

Thus, combination prediction model on the sample interval can be expressed as the following optimization model

$$\begin{aligned} \max m_1 &= \sum_{t=1}^N Q_t A_t, \\ \text{s.t.} &\begin{cases} A_t = 1 - \left| \sum_{i=1}^m l_i e_{it} \right|, t = 1, 2, \dots, N, \\ \sum_{i=1}^m l_i = 1, l_i \geq 0, i = 1, 2, \dots, m. \end{cases} \end{aligned} \tag{17}$$

In the same way, combination prediction model on the total interval can be expressed as

$$\begin{aligned} \max m_1 &= \alpha \sum_{t=1}^N Q_t A_t + (1-\alpha) \sum_{t=N+1}^{N+T} Q_t A_t, \\ \text{s.t.} &\left\{ \begin{aligned} A_t &= 1 - \left| \sum_{i=1}^m l_i e_{it} \right|, t = 1, 2, \dots, N, N+1, \dots, N+T, \\ \sum_{i=1}^m l_i &= 1, l_i \geq 0, i = 1, 2, \dots, m. \end{aligned} \right. \end{aligned} \tag{18}$$

$0 \leq \alpha \leq 1$ , The greater  $\alpha$  means more emphasis on fitting validity, and the smaller means more emphasis on prediction validity. This model can be solved by linear programming software.

### 5 Examples

Take the prediction of China's scrapped car as the example<sup>[6]</sup>. Table.1 shows the auto production, ownership and end-of-life data of China from 2002 to 2010, production and ownership are the highest correlation with predictor variables, which are set as the foundation of multiple linear regression. (Unit: ten thousands)

**Table 1 Data of China's Auto**

Year \ Category	2002	2003	2004	2005	2006	2007	2008	2009	2010
production	325	444	509	570	728	888	938	1350	1806
ownership	2035	2383	2694	3160	3697	4358	4975	6288	7802
scrap	71	85	93	109	145	175	220	270	292

So the raw data of grey system is  $x^{(0)} = (71, 85, 93, 109, 145, 175, 220, 270, 292)$ , and the prediction equation is  $\hat{x}^{(1)}(k+1) = 396.5505e^{0.1882138k} - 325.5505$ .

Set the ownership of car is  $X_1$ , the production is  $X_2$ , and the end-of-car is  $Y$ , then multiple linear regression model can be obtained by software SPSS,  $Y = 0.1X_1 - 0.233X_2 - 56.538$ .

Weights of grey system prediction  $l_1 = 0.387$ , and weights of multiple linear predict regression is  $l_2 = 0.613$ .

The results and errors of three prediction methods are shown in following table.

**Table 2 Forecasting Results Cross-References**

Year	real value	gray system		multiple linear regression		Combination Model	
		predictive value	error value	predictive value	error value	predictive value	error value
2003	85	82.122	2.878	78.31	6.69	79.785	5.215
2004	93	99.129	-6.129	94.265	-1.265	96.174	-3.147
2005	109	119.658	-10.658	126.652	-17.625	123.945	-14.945
2006	145	144.438	0.562	143.538	1.462	143.886	1.114
2007	175	174.35	0.65	172.358	2.642	173.129	1.871
2008	220	210.456	9.544	222.408	-2.408	217.783	2.217
2009	270	254.041	15.959	257.712	12.288	256.291	13.709
2010	292	306.649	-14.649	302.864	-10.864	304.329	-12.329

From table 2, the squares error sum of grey system prediction is 720.550, while the squares error sum of multiple linear regression is 640.935, and the squares error sum of combination prediction is 610.051.

### 5 Conclusion

By practical analysis the results reveal that the accuracy of the combination forecast theory is

significantly higher than the two single forecast methods. Taking into account the uncertainties of reverse logistics, this method effectively develop features and advantages of two forecasting model, and overcome the shortage of single forecasting model. The results can be used to reverse logistics industry planning and infrastructure construction feasibility study, etc.

# Research on Economic Development Problems of Wuhan City Circle in China from Inclusive Growth Perspective

Zhao Defang, Pan Huiming  
School of Management, Wuhan Textile University, Wuhan, P.R. China, 430070  
(E-mail: zhaofei123169@sina.com, gary5487@126.com)

**Abstract:** Inclusive growth called as “shared growth”, is a kind of value orientation and a new social economy growth way. Its fundamental purpose is to let the people of all the countries and regions enjoy the achievement of economic development, realize the harmonious development of economic society in the process of sustainable development. In this paper, we present an investigation, a collection and analysis of economic data, found the problems of Wuhan city circle economic development are the regional differences among cities, cities’ development level is uneven, Wuhan alone big, illustrate the impacts by the economic problems. Based on the concept of inclusive growth, we give three main insights for making Wuhan metropolitan become mature, excellent and efficient.

**Key words:** Inclusive growth; Regional economy; Wuhan city circle economy; Development problem

## 1 Introduction

The concept of Inclusive growth was first proposed to eliminate poverty and solve the problem of uneven development in Asian developing country in 2007 by the Asian Development Bank. On November 15, 2009, Chinese president Hu Jintao made a speech entitled “Force to Deal with Challenges and Propel Sustainable Development” at the Asia-Pacific Economic Cooperation Organization. In his speech, he emphasized that human should advocate inclusive growth and give overall consideration. On September 16, 2010, Hu Jintao addressed the opening ceremony of the Fifth APEC Ministerial Meeting on human resources development, gave a statement titled “deepen exchanges and cooperation to achieve inclusive growth”, once again emphasized that realize “Inclusive Growth” and solve the social problems in economic development to lay a solid social foundation for advancing trade and investment liberalization and implementing economy long-term development, and that, the fundamental purpose of realizing inclusive growth, is to ensure economic globalization and economic growth benefit all countries and regions, benefit all the population, and realize the coordinated development of economy and society in the process of sustainable development. In the past decades, China's successful growth in economy attracted worldwide attention, but at the same time, accumulated a lot of social problems, regional economy as an epitome of national economy, also accumulated many problems. So at the process of implementing regional economic in china, explore and use “inclusive growth” in order to realize the sustainable development, and construct a new mode economic growth of harmonious society has important meaning.

## 2 Connotation of Inclusive Growth

### 2.1 The ways of realizing inclusive growth is inclusive

The meaning of “inclusive” in modern Chinese dictionary is tolerance, receiving. From social economy development perspective, “inclusive” advocates free, open and fair. Inclusive growth proposes right fairness, opportunity fairness, regular fairness and allocation fairness. Inclusive growth is not only a social and economic development that needs mankind to complete, but also a principle needs all nations to follow.

### 2.2 The ultimate goal of inclusive growth

Inclusive growth dedicates to the fulfillment of fair and reasonable sharing the fruits of economic growth, let the vulnerable groups be protected, so that all people have equal right of various aspects. Globalization closes the economic and cultural exchanges among areas; allocates kinds of resources, production elements in the global scope; enhances economic complementarities, inclusive growth is committed to the whole world economy as the situation of “you have me, I have you”.

### 2.3 The principles of inclusive growth insists

Inclusive growth adhere people-centered development to solve the basic problem of the people's livelihood, and pay attention to social stability, called for strengthening the building of small and medium-sized enterprises and fostering individual capacity in balanced economic growth process, emphasizes investment and trade liberalization, opposes trade and investment protectionism. Liu Meina

believed that “inclusive growth” is seeking the harmonious development of economy and society, implementing economic long-term and overall development. Economic interest allocation should be carried out fair and justly, make economic grows benefit to all citizens as far as possible.<sup>[4]</sup> Zhou Yangmin and others through the study of the growth of India economy think Indian conceal wealth in civilian is the concrete embodiment of “inclusive growth”.<sup>[5]</sup>

### 3 Problems of Wuhan City Circle's Economy Development

#### 3.1 Overview of Wuhan City Circle

Wuhan called as the “nine provinces thoroughfare” is an especially big city in Central China, is the financial center, traffic center and cultural center of Central China. Wuhan city circle is a city community makes Wuhan as the center, with a radius of 100 kilometers, including Wuhan and eight medium-sized city of Huangshi, Ezhou, Xiaogan, Huanggang, Xianning, Qianjiang, Xiantao, Tianmen of china. Its area is about sixty thousand square kilometers, achieves 33% of Hubei province area. Its population occupies 51.6% of Hubei general population.

#### 3.2 Wuhan city circle's economy development problem

The current economy of china is at a high-speed growth but produces various problems; coordinated development has not handled well. Wuhan city circle as a key area of the national strategic planning and implementation, the author through visit investigation and combined with relevant statistical data found that in Wuhan city circle development process, there are also many economic and social problems. Table 1 shows the main social and economic indicators of Wuhan, Huangshi, Huanggang, Ezhou, Xiaogan, Xianning up to 2010 December (The status of Qianjiang, Tianmen and Xiantao are the same as Xiaogan, Xianning, so we did not list).

**Table 1 Main Social and Economic Indicators of The Six Cities in Wuhan Urban City**

	Wuhan	Huangshi	Huanggang	Ezhou	Xiaogan	Xianning
Gross Regional Product GDP (Billion Yuan)	4559.11	352.52	96.00	395.29	155.81	132.20
Deposit Balance of Financial Institutions (Billion Yuan)	10335.17	451.26	151.07	256.64	275.71	156.00
Loan Balance of Financial Institutions (Billion Yuan)	3240.40	219.29	89.27	149.43	158.00	81.43
Total Investment in Fixed Assets (10 Thousand Yuan)	3048.51	232.61	155.76	298.64	120.39	128.50
Total Retail Sales of Social Consumer Goods(10 Thousand Yuan)	2261.99	161.03	57.10	135.05	68.31	57.73
Total Industrial Value (Billion Yuan)	2458.75	481.54	275.73	272.04	388.79	279.34
The Per Capital Public Library (Ce)	1.88	1.18	1.20	0.34	0.40	0.33
Hospital (Ge)	130	29	18	43	28	15

(Source: China Economic Information Network Database)

#### 3.2.1 Unbalanced economy development in Wuhan urban circle

Wuhan as the center and leader of Wuhan urban circle has higher economic development level than other cities. The deposits and loans in financial institutions and industrial total value index data reflect Wuhan achieved gratifying success in industry development and financial scale, but in contrast to other cities' data, as show in table one, we found that the quantity of Wuhan city is more than the sum of other city, which means that Wuhan Metropolitan has polarization effect, shows the condition of intermediate oversized and surrounding minimal.

#### 3.2.2 Discordant infrastructure construction between Wuhan and other cities

City infrastructure is to satisfy the City material production and the needs of the residents, includes energy facilities, supply and drainage facilities, transport facilities, communication facilities,

environmental protection facilities, and disaster prevention facilities. City's development is inseparable from the basic facilities. After our visit, we found that the infrastructure construction was put in very big difference between Wuhan and other cities. The Fixed Assets Investment index also reflects this point.

3.2.3 The educational, cultural, and health resources distribute unreasonably.

The level of education, culture and health is a measure of one area residents' satisfaction, also a main index to evaluate whether the region is livable or not. Hubei province has good educational resource, brings together many domestic colleges. According to the statistical yearbook of Hubei province, there are 95 universities located in Wuhan city circle, further we found there are 78 universities from table one, accounted for 82% of the entire city circle, as shown in figure 1, and according to the Ministry of Education, 7 universities are named as "211 Project" university of Hubei province are all in Wuhan. Therefore, the educational resources, excellent education resources are all concentrate in Wuhan. Come and see the quantity of hospital and public library shown in table one, the situation is the same as the quantity of university, so the distribution of Wuhan city circle in educational, cultural and health resources is extremely lopsided.

Figure 1 University Distribution within Wuhan Metropolitan Circle

3.3 The impacts of the problems exist in Wuhan city circle development

We can see from the database of China economic information network that the development of Wuhan city circle from 2001 to 2010 is just Wuhan's development, from figure 2, we can also see that eight other cities cannot get anymore before all sorts of opportunities, which causes the current development pattern that Wuhan is big along, the developments of the eight cities are lagged seriously. Imbalanced economy and the people's livelihood problem bring about serious adverse effects to Wuhan city circle.

Figure 2 Regions' Total Investment in Fixed Assets

3.3.1 The polarization effect of center city is sharp

Metropolitan area as the second stage of city group makes big city as the core and surrounding small-medium cities participate the division and cooperation of labor, is a phenomenon of integral and regional economic, its reasonable scale layout should be "center city—deputy center city—small and medium city". From each city's Industry Accumulative Value and GDP index, we can see Wuhan was the center of the circle, but there was no second class city. All sorts of capital, technology, labor force

resources in Wuhan cannot get effective diffusion, forms a one-way predatory absorb of the eight cities' resources make himself cannot develop well during his growth process, we can see from figure 2, there was no change in fix assets investment of Wuhan from 2005 to 2010.

### 3.3.2 The income gap between Wuhan and other cities is dwelling

The ultimate aim of economic growth is to benefit from people's life, economic development drives the employment, and high employment rate can enhance income level. But in Wuhan city circle, Wuhan city and other eight cities' economic development differed very far, which result in income gap between the other eight city's residents and Wuhan city's residents, and lead to income structure become imbalance, increase the gap between the rich and the poor.

### 3.3.3 Wuhan city circle's integrated function was inhibited

Wuhan city circle serves as a whole of organic system, the imbalance of economic development and resource allocation coordination agglomeration effect, scale effect are not obvious within the entire metropolitan area; there was also no cost effect because of any reasonable resource integration and industry regulation. The imbalanced internal structure result in the efficiency of the whole city circle is not high and the metropolitan's brand effect has not been played.

## 4 Use Inclusive Growth to Solve Wuhan City Circle's Economy Development Problem

If Wuhan city circle want to be a mature, excellent and efficient economic community and achieve steady and rapid development, it must realize coordinated development among Wuhan, Huangshi, Ezhou, Xiaogan, Huanggang, Xianning, Qianjiang, Xiantao and Tianmen area of china. The most basic meaning of inclusive growth is fair and reasonable sharing the fruits of economic growth, and pay attention to all aspects of people's equal rights. Unreasonable resource distribution has seriously affected the development of Wuhan city circle. Solve the fair problem of the development between the cities is imminent. Inclusive growth has become an important means to realize Wuhan city circle's development.

### 4.1 Clear and perfect regional function to eliminate cities' administrative barriers

Inclusive growth encourages regular fairness. Social economic development has always been mediated by the two hands of market and government. When market regulated function is out of order, government should play a role. Up to now, the internal economy development of Wuhan metropolitan region is extremely lopsided, the whole function of the urban circle also failed, the government should give full play to its function of macroscopical adjusting control, eliminate the policy causes of regional differences. Equal administrative policies conducive to the exchanges and cooperation of regional business and personnel flow in both directions; unified market is conducive to reasonable and effective configuration of resources and elements among regions; perfect standard system is the inspection standard of all sorts of policy implementation results. Policy planning can clarify city's function position, further clarified what the city should develop, what the city should limit, what the city should forbid, and break regional barriers to achieve coordinated development.

### 4.2 Establish reasonable industry structure conducive to urban economic sustainable development

Rational industrial structure is the fundament of regional economy and can keep it developing steadily and rapidly, inclusive growth emphasizes internal coordination. To achieve reasonable industry structure of Wuhan city circle economy development, the first what we should to do is speeding up Wuhan city's industry structure upgrade, expanding tertiary industry rapidly, making cultural tourism industry, science and technology service industry as the key development industry, Wuhan should committed to "Ecological City". Second, improve the capacity of undertaking Wuhan city's industry transfer of the cities around Wuhan, through the establishment of encouraging innovation and entrepreneurship environment, economic environment, legal environment, and public opinion environment to guarantee the stable and healthy industry development. Third, through improving investment and financing platform for small and medium enterprises to encourage and support the development of small and medium-sized enterprises, so as to coordinate industrial scale of the entire area.

### 4.3 perfect city infrastructure construction of the inside circle, pay attention to people's livelihood

Mr. Sun Zhongshan once said, people's livelihood is the livelihood of the social living, is the national life, is people's life. People's livelihood is the fundamental problem that inclusive growth to solve. Wuhan city circle economic coordination development brings about dweller income gap, increased disparity between rich and poor. The first what Wuhan city circle should to do to realize harmonious is to improve the infrastructure construction level, handle people's clothing, food, housing

and travel demand, improve life happiness index; secondly, increase income level of low income area, correct income allocation proportion, by raising income level to consolidate people's happiness satisfaction; finally, cultivate and improve teachers' strength, increase educational inputs, perfect educational equipment, make children have equal access to education in various places.

## 5 Conclusion

The mission of Wuhan urban circle's construction should be to narrow regional differences, to improve the level of cities' infrastructure construction, to strength collaboration between cities, to establish cooperation framework beneficial to share economic outcomes, and solve unreasonable economy situation fundamentally. The approach of using inclusive growth to solve Wuhan city circle's incompatible development is an important way to construct social economy in the future.

**Abstract:** This paper puts forward the countermeasures for achieving the blue management innovation of pale-biotic fossil by using the research methods which approach present questions by researching ancient cases on the basis of the analysis of mass extinction events in biological evolution history, the connotation of the blue, the contents of the blue management innovation of pale-biotic fossil and the present situation and abuse of the pale-biotic fossil management; thinks the blue management innovation of pale-biotic fossil should achieve the goal of continuous increase and sustainable development of the economy, ecology and social comprehensive benefit; had reached the conclusion that “the blue idea” is natural ecological equilibrium, the harmony of human society and the harmonious development between the people and nature.

**Key words:** Blue management innovation; Pale-biotic fossil; Mass extinction events; Blue idea

### 1 Introduction

The fossils of China are rich and varied, may be rated as the first in the world. For the sake of understanding the biological evolution process some hundred millions years ago when the mankind had not appeared, the most reliable evidence is unearthed fossils in strata. These pale-biotic fossil resources have a very important scientific value and ornamental value, an important position increasingly in the research of biological evolution and human existence and development and other aspects. However, as a result of unreasonable exploitation and utilization as well as the lack of protection consciousness of the pale-biotic fossil resources, the destruction phenomenon of the pale-biotic fossil resources is very serious, and has caused the destruction of the ecosystems, the existence of the people as a member of the nature is being also menaced by a great threat<sup>[1]</sup>! For this reason, strategy research of the “blue” management innovation of pale-biotic fossils of China is particularly important

## 2 The Concept of the Pale-biotic Fossil and the Mass Extinction Events in the Evolutionary History of the Organisms

### 2.1 The concept of the pale-biotic fossil

The pale-biotic fossil (Fossil) is the remains of the living things and the traces of the life activities as well as residual organic molecules remained by the formation cause of the living things, those are preserved in the rock stratum in a geologic historic period<sup>[2]</sup>. The ancient and modern biologic circles generally take the Holocene Epoch ( that was ten thousand years ago ) as dividing line, those living things lived Holocene Epoch ago are called after Ancient organisms, but those living things lived since Holocene Epoch are a part of Living organisms.

### 2.2 The mass extinction events in the evolutionary history of the organisms

The American scholar Sepkoski had gathered statistics of various data of marine animal fossils which take the family as unit about 6 hundred million years of The Phanerozoic Era in 1982, identified 5 major extinction events (as Table 1).

**Table 1 Sepkoski (1982) Identified 5 Extinction Events**

Extinction event	Years from mow/Ma	Number of family of extinct marine animal
I Extinction in Later Ordovician Period	439-440	22
II Extinction in Later Devonian Period	360-380	21
III Extinction in Later Permian Period	220-230	50
IV Extinction in Later Triassic Period	175-190	20
V Extinction in Later Cretaceous Period	60-65	15

It can be seen from Table 1, the biotic crisis was the most serious in the Later Permian Period, and 50 families of marine animals have become extinct. In this period; they were almost half of the number

of total families of marine animal at that time. It is more serious if the genus and species as the unit are used for statistics, the genera about 83% of the total number of marine animals and the species about 96% have become extinct, only the species of 4% of the marine animal were continued to Triassic Period. Above vast majority of extinction events in the history of biological evolution was caused by external causes. At present, various animals about 1.40 ~ 1.70 million kinds are living on the earth, disappearing at the speed that a species is extinct per hour. Now many scholars believe: new extinction is an extinction of terrestrial animal groups that the most are extinct, this is caused by new predators. The mankind not only prey the animal group, but also occupy a large number of land which originally belongs to the animal habitat, the ecological competition also causes the animal extinction. Particularly the people are being on the predatory utilizing of the wild animal and plant resources because of commercial trade are important factor to cause the imminence and even extinction of the species.

### **3 The Connotation of the Blue and the Contents of the Blue Management Innovation of Pale-biotic Fossil**

#### **3.1 The connotation of the blue**

“Blue” is a natural culture, “blue” is very pure, usually let the people connect the ocean, sky, water and the universe in mind. The pure “blue” shows a beautiful, calm, rational, serene and vast. “Blue” is a symbol of eternity, means that the equilibrium of nature, the harmony of human society and the harmonious development between the people and nature, these have already become the important sign of modern human civilization. So introduce the adjective "blue" into the management innovation activity of pale-biotic fossil. “Blue” means the ecological equilibrium, the ecology is the relationship and the state of existence among the living things as well as between the living things and environment; the ecological equilibrium is a fundamental condition that the living things maintain normal growth and development, reproduction and procreation, is also the basic conditions for human existence. This paper is generally speaking only all activities to take the history of biological evolution as a guide, to blend the blue idea in the process of the protection, management, scientific research, popular science, reasonable use of the pale-biotic fossils, integrate rational utilization of the pale-biotic fossil resources and thought, action and plan of environmental protection as a whole.

#### **3.2 The contents of the blue management innovation of pale-biotic fossil**

In main research aspect to establish and perfect a comprehensive system of the protection, management, scientific research, popular science, reasonable use of the pale-biotic fossils in China, the innovation begins to be paid attention to and approached by the scholars, but it is closed by the end at present, the research on the comprehensive system of the protection, management, scientific research, popular science, reasonable use of the pale-biotic fossils has not still to be considered by the blue management innovation. This paper thinks the blue management innovation of the pale-biotic fossils has the following three kinds of representative meaning:

The first kind of the meaning: the blue management innovation of the pale-biotic fossils refers from the point of view of fully utilizing the pale-biotic fossils which are a superiority of irreplaceable resources, to take ecological equilibrium, the harmony of human society and the harmonious development between the people and nature as the foundation, to promote the change from the superiority of the resources into market superiority and economic superiority by formulating corresponding blue systems and policies on the basis of < The pale-biotic fossil protection ordinance > in the process of the protection, management, scientific research, popular science, reasonable use of the pale-biotic fossils.

The second kind of the meaning: the blue management innovation of the pale-biotic fossils refers to achieve the sustained growth of regional economic, ecological, social benefits according to the objective requirement of the development of the times and the market competition, by the integrating the resources to build the top superiority. Its essence is to reposition that the resources of the pale-biotic fossils not only need to be protected and utilized, but also need to be developed, is the inevitable choice for sustainable development.

The third kind of the meaning: the content of the blue management innovation of the pale-biotic fossils is very rich, mainly includes the innovation of the blue concept and blue culture, the innovation of talent development and encouragement, the innovation of the regulations and system, the innovation of plan and management etc., i.e. the comprehensive, systemic blue management of all activities. So that achieves the goal to improve the maximization of management efficiency and benefit, continuously strengthen the consciousness of all citizens that voluntarily protect the resources of the pale-biotic

fossils and environment. This is the essential characteristics of the blue management innovation of the pale-biotic fossils.

## **4 The Present Situation and Abuse of the Pale-biotic Fossil Management**

### **4.1 The consciousness to protect the pale-biotic fossils and geological environment is not strong**

According to the investigation, the pale-biotic fossil resources of our country are basically located in poor mountain areas, the economic development of these areas are more backward, on the one hand the government and masses of the locality have very strong desire to be lifted out of poverty and to develop the economy; on the other hand because the basic conditions of the locality are poorer, the information is not quick access, the development channels of economy are not many, thus the economic development strongly depends on the resources, the life and production of the masses maintain close link with natural resources, and then because of being driven by the interest, so illegal stealing and excavating, reselling at a profit and smuggling the fossils frequently happen. Many governments excessively construct the highway in the protection area in the name of the developing of the tourist trade, and so on and so forth. The pale-biotic fossil resources are seriously damaged, thus the specialists loudly appeal to the public: "If the departments concerned don't quickly adopt scientific and effective ways to deal with this situation, the pale-biotic fossil resources of the state will certainly sustain irretrievable serious losses in 5 to 10 years". If it goes on like this, not only the environment and resources are damaged, the existence of the animals and plants is threatened, but also the existence of the mankind as one member of natural world is greatly threatened<sup>[3]</sup>. In which, a very important factor is the consciousness of the whole nation and whole society to protect the pale-biotic fossils and geological environment is not strong, the handling of the relationship between economic development and protection of the pale-biotic fossils and geological environment is not proper.

### **4.2 Only pay attention to scientific research and do not pay attention to education of popular Science**

The policy of reform and open has been putting into effect since 1978, Chinese paleontology gradually get rid of the subordinate position of the strata and the geological services, and open a new phase that Chinese paleontological research begin to take itself as main, move toward the world. But the research of the pale-biotic fossils basically is in the category of natural science for a long time, the education of popular science of the pale-biotic fossils is not paid attention to. Because it is driven by economic interest, the developers always invest the most money into ornamental and entertainment facilities, rather than invest in the construction of related facilities with popular scientific education in both the construction of geological parks and the construction of the museums. At present, almost all the paleontological museum is arranged in accordance with the years or the sequence of the evolution, the sign only indicates the name, place of origin and age, do not relate the specimens with living environment of the specimens or with the mankind and human environment together, do not achieve goal of the education of popular science. It is more important to develop the scientific connotation and the education connotation of the pale-biotic fossil resources while it provides the ornamental and entertainment.

### **4.3 The construction of the laws has serious shortcomings**

The legislation on the protection, management and sustainable development of the pale-biotic fossils in China is not enough, this mainly shows as follows: first, the laws of high administrative levels have wide binding range, but the contents stipulated are in more general terms, have not strong operational characteristics, the laws of low administrative levels have strong operational characteristics, but the binding force is weaker, the binding range is small<sup>[3]</sup>; second, many parts of the present ways of the pale-biotic fossil management of our country are more backward than the practical development under the influence of the legislation tradition, third, there are not clauses on the compensative use in <The Management Way of the Pale-biotic Fossils>, these contents should be regulated by law form, so that ensure the environment and resources which are damaged are compensated, can achieve the economic interests of the state proprietary right; fourth, each part of the law and system is not coordinative and perfect, doesn't form the rule and system.

### **4.4. There are more problems in the administration at many levels that each does things in its own way**

In the management and enforcing the law, form a powerful political system to take the government as the leading factor, all departments including department of the land resources, public security, industrial and commercial etc. respectively put into effect corresponding policies, and each department is in charge of one's own responsibility, manages at one's own level, but the investment is thrown by

many sides. This system is taking more and more important role. Then sometimes the leaderships of many sides happen in the management, someone can manage, but someone can also not manage, and someone manages while there is the interest to it, doesn't manage while there is not the interest to it. The natural protection area of the pale-biotic fossil was established on the basis of the administrative order; it is short of the support and participation of the social masses of the locality, short of the contact with economic development of the locality, short of effective coordination in the protection and development as well as rational use of the resources of the buffer zone, the repelling and conflicting each other among the protection area, communes, the government of the locality are more than the cooperation and coordination etc<sup>[4]</sup>.

## **5 The Countermeasures for Achieving the Blue Management Innovation of Pale-Biotic Fossil**

### **5.1 The blue management sense and blue cultural innovation**

The blue management innovation of the pale-biotic fossils must set up new sense and new culture of correct blue management innovation; this is the prerequisite of the design of the blue management innovation of the pale-biotic fossils. The establishing of new mechanism is not equal to set up new sense. Only do away with old sense, can establish new sense. Only change the sense, can change the mechanism. The blue management innovation of the pale-biotic fossils must set up the sense of the ecological equilibrium as the foundation, the harmony of human society and the harmonious development between the people and nature, set up the sense of constantly creating and encouraging continuous innovation of a cultural atmosphere etc. At the same time these management senses are also the cultural core. The new thought, new sense and new culture of the people are not innate, are the result of the long-term learning, accumulating and shaping, so in order to realize continuous innovation of the sense and culture, the people only insist on continuous learning and are bold in the practice. In the new situation, the most prominent feature of the managers' action of the pale-biotic fossils is innovation, future the important conditions of the managers of the pale-biotic fossils should be the ability of the blue management innovation. The blue culture as a form of sense and spirit force will more and more become the internal dynamic power and fountainhead of the blue management innovation of the pale-biotic fossils.

### **5.2 The innovation of the development and the encouragement of the qualified personnel**

The development and the encouragement of the qualified personnel are the important condition and effective driving force of the success of the blue management innovation of the pale-biotic fossils. Facing the situation of more and more complex blue management innovation of the pale-biotic fossils, still need to develop the ranks of the qualified personnel which have reasonable structure, advanced idea, deep knowledge, and rich professional practical experiments, can bring remarkable results to the management, protection, scientific research, popular science, reasonable use of the pale-biotic fossils; can make the management of the pale-biotic fossils be more scientific. First of all, develop the qualified personnel in the development, on the basis of understanding the demand of the qualified personnel, import the qualified personnel that it is aimed at, pay attention to both the talents who have the achievement and the talents who have the development latent; not only attract the talents from other places and overseas, but also pay attention to the development and use of local talent resources. Next, encourage the qualified personnel in the development, comprehensively use varied encouragement mechanism according to the actual situation, combine the encouragement method with the purpose, change the mode of thinking, truly establish the open encouragement system to suit the characteristics of the blue management innovation of the pale-biotic fossils, the characteristics of the times and the needs of the talents, make the activity of the blue management innovation of the pale-biotic fossils have a continuous development in the complexity of the market competition.

### **5.3 The innovation of the laws, regulations and system**

The blue management innovation of the pale-biotic fossils is huge system engineering, must depend on the laws, regulations and system to standardize the whole process of the management innovation of pale-biotic fossil. After the mankind had summed up the five events of biological extinction and the experience of severe ecological crisis in biological history, had come to realize that the mankind is just one of the many species, it has its own position in the whole ecosystem, but only when it is helpful to the ecological system, will have its own value. For this reason, must abandon the traditional thought that the contemporary people take immediate interests as the center, establish the legislation spirit to respect the ecological nature, change the priority of the "economic benefits" into the

priority of the “ecological interests”. Only respect the ecological nature, adhere to the concept of blue, can achieve the sustainable development. So must have the blue transition In the formulation of laws, regulations, system and other aspects, from blue point of view, establish blue dynamic mechanism, blue operating mechanism, blue development mechanism and blue cultural mechanism etc.

#### **5.4 The management innovation of plan**

The plan is a more comprehensive long-term development plan, the whole work plan on deep thinking, considering and designing of future integral, long-term, basic problems. The protection and management of the pale-biotic fossil resources is established on the basis of a scientific and rational plan, if there is not a scientific and rational plan and design, will is difficult to put into effect effective protection and management. So the working out, examination and approval, execution and supervision of the plan must take the blue idea as the primary principle, thus it not only can make the economic benefits, but also do not damage the fossil resources, simultaneously can reflect the environmental benefit and the social benefit. At present, the guide for working out province-grade protection plan of the pale-biotic fossils in China have been approved, all parts of the country must work out the fossil protection plan of the administrative regions according to the guide. All parts of the country should work out the development blueprint of the pale-biotic fossil resources which harmonizes and unifies with the economic, social, environmental benefits; takes the pale-biotic fossil resources of the administrative regions as the foundation; keeps the unity with the plan strategy of the national economy and social development.

### **6 Conclusion**

From the above researches, come to the conclusion that “the blue idea” is natural ecological equilibrium, the harmony of human society and the harmonious development between the people and nature. At the same time, have pointed out that the blue management innovation of pale-biotic fossil is to take the blue idea as the foundation, actively reform and create the top superiority on the basis of integration of existing resources, produce and apply new conception and new sense, so that achieve maximum dynamic process to improve the management efficiency and management benefit. So the blue management innovation of pale-biotic fossil should consider the problems from the viewpoint of a system and the viewpoint of a whole, its purpose is to achieve continuous growth and sustainable development of economic, ecological, social comprehensive benefits.

This paper researches the work of the management innovation of pale-biotic fossil on the basis of “the blue idea”, but at present the research on “the blue idea” is not still insufficient, the countermeasures and the suggestions on the blue management innovation of pale-biotic fossil are still at the stage of theoretical discussion, are also not all have been tested by the practice, this makes the basic thinking of the research of this paper still be relatively weak, need to increase further the research strength of influence of “the blue idea” on the management innovation of pale-biotic fossil in future, so that provide more favorable thought support for the research of this paper.

# On Construction of Industrial Ecological Culture

Cheng Ping

School of Automation, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: chengping123@whut.edu.cn)

**Abstract:** While pushing forward the rapid development of economy, “Economic Man” is increasingly ruining the relationship between Human and Nature. Due to the Economic Man’s desire for the economic profits, the ecological profit is neglected. In addition, the egoistic nature of Economic Man is in contradiction with the public nature of the ecological profits and violates the principles of sustainable development. Through elaborating the connotation of ecological culture of the industry, this paper deepens and expands the hypothesis of Economic Man, extends conception of “Economic Man” from bounded rational Economic Man to ecological rational Economic Man, and proposes measures of transformation from economic culture to ecological culture so as to motivate the whole industry to achieve the harmonious coexistence between Human and Nature as well as benign interaction between ecological recourses and economic development.

**Key words:** Ecological Culture of the Industry; Bounded Rational Economic Man; Ecological Rational Economic Man; Economic Development

## 1 Introduction

Ecological culture is the product of era. This concept as put forward under the condition that natural resources had depleted, environment had been seriously polluted, and ecological crisis had affect human survival and development. Ecological culture is the prime mover for ecological construction. This idea is manifested in the harmony among the management system, policies regulations, values, ethics, production methods and consumer behavior. It is also shown in the transformation from individual animal the economic to the collective, ecological smart people. Its core is how to influence people's values, behavior mode, make an ecological realm where harmony existed between human and heaven and create a healthy, civilized production and consumption patterns. A major feature of ecological culture is emphasis on the influence that such natural factors as nature law and ecological environment impose on human society. Ecological culture comprises of cognitive culture, institutional culture, state culture and mentality of culture<sup>[1]</sup>. Ecological culture emphasizes on the fact that human beings should develop, promote a kind of way of thinking, decision-making, way of production and way of life that is the harmonious coexistence with nature. Ecological culture is also a cultural form that surpassed previous cultural forms and is the advanced culture that pursues to exist and co-develop with harmony with natural ecosystems.

## 2 Eco-Cultural Implication of Industrial Development

Industrial development originates from the cultural type, and different cultures will form different industrial development direction. In a sense, the pursuit of economic interests depend on the value orientation, on the cultural significance, in particular, depends on people’s attitude towards nature. If people could not make cultural turn, in other words people can not change the understanding of the natural values, and then ecological crisis, brought about by the traditional industrialization could not possibly be fundamentally resolved. Therefore, the ecological crisis is not just an economic problem, but a serious philosophical question, an ethical issues and cultural issues. In other words, with the intensification of worldwide ecological crisis, people have to re-recognize the significance and value of natural ecosystems to human beings and have to reflect on the ancient philosophical proposition-relations between man and nature. The thinking of Western scholars on this issue have divided into two major parties—the shallow ecological school, and deep ecology school<sup>[2]</sup>, as shown in Table 1.

**Table 1 Different Views of Shallow Eco-school and Deep Ecology School**

	The root causes for ecological crisis	The solution ecological crisis
The shallow ecology school	Irrational economic, unreasonable legal systems, development and utilization of natural resources out of control	Ecological movement or the Green Movement under the concept of ecological protection
Deep ecology school	Anthropocentrism (people place “value” and “right” of human above the natural “value” and “rights”, the development is in accordance with the will of the people. people’s interests are achieved through conquering and controlling nature rather than realizing value of human and nature	Idea about caring for nature and the revival of the concept of ecology from value, worldview, values: complement of ecologicalization of technical innovation from the source of production to the production of the whole process

To resolve the existing serious ecological crisis today, it is necessary to make cultural shift, while the center of this cultural shift is to cultivate an ecological culture. Facing ecological crisis, people change view from the shallow ecology, deep ecology to the ecological philosophy. This process is the cultural turn on concept level, and it is a historic leap from traditional culture to the ecological culture.

### 3 Fulfillment of Shift from Limited Rational Economic Man to Eco-rational Economic Man

“Economic man” has two meanings: “Firstly, the goal of an individual’s activities is to enhance their own economic interests. Individuals can’t take into account the interests of others or the society’s of one’s own accord to benefit, unless he is beneficial from above. Secondly, under the condition of a variety of proposals, people choose one which is in their favor, according to costs and benefits”<sup>[3]</sup>, so that he could maximize his interests. Therefore, people who engaged in economic activities, have three characteristics: “self-interested”, “rational behavior”, “the pursuit of maximum of the benefits”.

Based on economic theory, in order to meet human social and economic activities as well as the ideology of “sustainable development”, we must deepen and extend the assumption of economic man, sublimate our pursuit from the material needs to the humanities needs and ecological needs. Economic behavior is based on material needs and aims to promote individual survival and development, “material needs”, reflects the “selfishness” “individual rationality”, “the maximization of individual interests” as its Code of Conduct. Its rationality is limited, that is, the “limited rational economic man” <sup>[4]</sup>. Ecologically rational economic man is based on “human needs” and “ecological needs”, aims to meet the spirit of the individual and integrate into the social relations, its main purpose is to seek the survival and development of mankind as a whole, its code of conduct is shown as “mutual benefit” and “collective rationality” “maximum of the benefits of the group”.

#### 3.1 The difference between “limited rational economic man” and “eco-rational economic man”

Economic Man’s rationality is limited, and its bounded rationality is shown in various forms in terms of environmental issues, the performance of bounded rationality and ecological rationality is different, as shown in Table 2.

**Table 2 “limited Rational Economic Man” and “Ecological Rationality of Economic Man” Comparison**

	Limited rational economic man	Ecological rationality of economic man
Understanding	There is not enough scientific understanding of the environment	Have a full understanding of the environmental issues
Motivation	Opportunity tendency	Take into account the long-term interests, the overall interests, the interests of the community
Behavior	Behavior detrimental to the environment	Consciously constrained environmentally detrimental behavior
Results	Economic growth mode at the expense of damaging the environment	Take into account economic interests and ecological interests

The difference between the two is obvious; the main reason for this distinction has two aspects:

(1) The scarcity of environmental resources and its public nature lead to the bounded rationality of “economic man”

First of all, environmental resources available for human use are scarce, not only the total amount of non-renewable resources are limited, but the regenerative capacity of the environment and self-purification capacity are limited. People are forced to live in a social environment where a variety of resources are scarce and living environment force the “economic man” to weigh the pros and cons in order to maximize their interests, they use what so-called “pre-emptive method” to use of scarce resources without limit, they don't consider the impact of own behavior on the environment, as well as the decrease of the opportunity other microscopic principal have. Secondly, the environmental resources are public resources, they are non-competitive and non-exclusive, everyone can enjoy and enjoyers do not take the initiative to pay, destroyers will not take the initiative to compensate for their damage. It is best for “Economic man” gain maximum benefit with minimum investment in order to pursue their interests. What producers care about is profit, consumer concerns about the effectiveness of personal consumption, and no one will take the initiative to care about the impact of personal conduct on public resources, “economic man” take advantage of environmental resources according to their cost-benefit decision criteria, regardless of the fairness of the choice and the willingness of society as a whole, even if the “tragedy of the commons” is formed, it also has nothing to do with him.

(2) The market failures lead to bounded rationality of “economic man”

The market possesses externality; externalization of environmental cost is an important form of market failure. “Economic man” is under the market economy, the law of value “invisible hand” has a decisive influence on their behavior. The market itself is defective, the specific example is the market can not reasonably evaluate and distribute environmental resources, thus the market price of the goods or services does not reflect or not fully reflect environmental costs, the value of environmental resources can not be reflected in the market. Polluters can use environmental resources for free and they do not need to count the environmental costs of its business activities with the result that environmental costs are not included in the price of goods and services. “Economic man” use free environmental resources as much as possible, regardless of serious pollution to the environment and tremendous damage to natural resources. Therefore, such market failures as the externality and deviation of environmental resources from of value and price are also one of the reasons that lead to “economic man” bounded rationality.

### **3.2 Ways for transition from “Bounded rationality, economic man” to ecological rational economic man**

The above analysis of reasons of economic man’s economic rationality aims to seek ways to shift to ecological rationality:

(1) The dynamic of the ecological rationality--economic man’s self-interest and interests’ tendency

Economic man’s primary characteristic is self-interest, and the pursuits of maximizing their own interests are regarded as a fundamental goal.

First of all, diversification of the interest goals for “economic man” is the basis of the change. Modern economic theory and practice proved that the pursuit of the interests for “economic man” is not just material wealth, but also include social, psychological, sensory, environmental, ecological and other non-material needs. The pursuit tends to diversify interest objects. With the improvement of economy and social civilization, as well as decrease of the proportion of material wealth in the overall goal, growth of the proportion of non material needs, many countries and regions in the world today are both the producers to reduce the environmental costs and consumers to enjoy the landscape and ecological consumption, consciously or unconsciously, as the case of their own pursuit of the interests of the target. This tendency provides people with chances to pursue ecological rationality.

Secondly, the life cycle makes it possible to transit to ecological rationality. Economic activity has continuity and sustainability. This requires the “economic man” considering the immediate and future short-term and long-term while counting interest; they could not only pursue to maximize interests. After counting and weighing, they will understand that in a foreseeable period of time, to maximize the overall interests is the goal he pursues. Considering the maximum of interest, natural life cycle and the time will be taken into account. Some time in the foreseeable future for is regarded as the integration interval of target interest. In this interval seeking for maximum just reflects the ecological rationality.

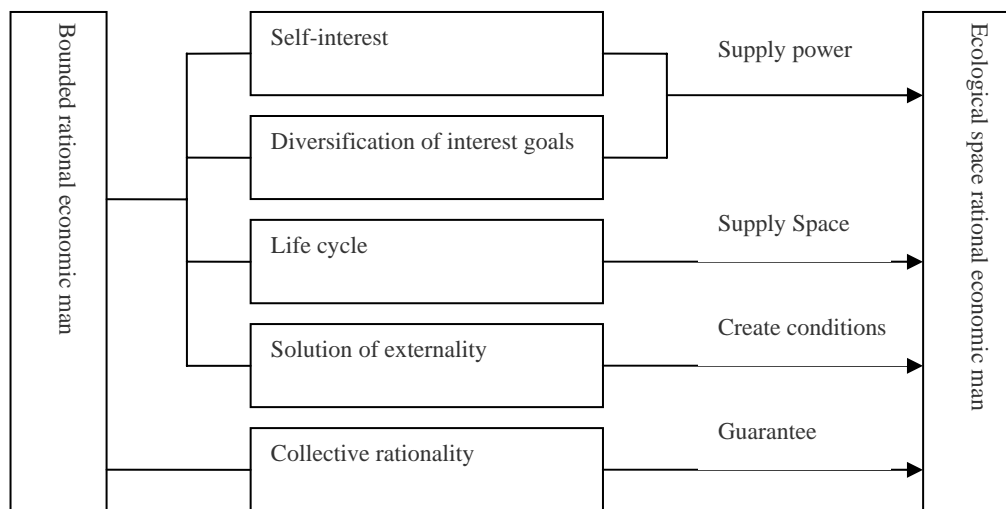

Furthermore, the solution to the problem of externalities creates the conditions for the ecological rationality. Economic activity possesses externality and the negative externality will increase the social costs, resulting in the loss of social welfare. Although these losses may not be related to each other, the socio-economic system acts as whole, producers within the region are always linked to each other in a variety of ways. Besides, they are always in a continuous, repeated game. The game will make them understand: the negative external economic issues will ultimately reduce their own interests, and then led them to find a solution to the negative externalities internalization to minimize losses and maximize the benefits. In addition, producers in the reality often are also consumers, this dual identity also contribute to the solution to external problems. For example, when cutting too much damage ecological environment, as producers they may have short-term interests, but have two losses: First, as a producer its long-term interests will be reduced. Second, as consumers they suffer health problems that environment deterioration causes. Therefore, to solve the problem of externalities is not a purely "external" pressure, but may evolve into producers’ "intrinsic" need power. Thus, the solution to the problem of externalities is the inevitable development of human society, the process to solve the problem of externalities is the process to achieve ecological rationality.

(2) Guarantee of fulfillment of the ecological rationality change—“economic man” collective rationality

Individual rationality refers to awareness and ability of some individual economic agents to pursue maximum of their own interests; collective rationality refers to consciousness and ability that the specific composition which consisted of different individuals, pursues to maximize the benefits of the collective. Collective rationality comes from the repeated game between the economic entity, people and the environment and their learning accumulation mechanisms. Maximizing the collective interests

include the following meaning: not all member who constitute collective could meet maximized interests, in other words, not to meet some of interest maximum, but to ensure that the overall interests of the collective maximize, so there is bound to sacrifice individual in exchange to maximize the overall interests. Secondly, people do not pursue to maximize short-term benefits, but to ensure maximum of the long-term benefits. This requires the development of the collective must be sustainable, short-term and long-term will be unified to seek to maximize the overall interests. Thirdly, to maximize means relying on the integration of collective power of. These also happen to be whole unified way of thinking the ecological rationality present.

The history of development of human civilization is the history where human beings gradually move toward a rational and mature in the process of repeated games between man and the nature. The experience has shown that the higher the degree of civilization of a region, the stronger the collective rationality is. Eco-environmental awareness and behavior depends largely on the collective rationality. If the concept of the collective is to enlarge the entire human race, we can say the collective rationality of human beings will be the guarantee of ecological rationality.

**Figure 1 Ways for Transition from “Bounded Rationality, Economic Man” to Ecological Rational Economic Man**

#### **4 Ways for Transition from Industrial Economic Culture to the Industrial Ecological Culture**

Industrial ecology culture is the main body of ecological civilization, and only do people cultivate an ecological consciousness and make ecological rational economic man play its role, so that the concept of sustainable development could be put into implement and to truly realize the harmonious coexistence between man and nature, ensure human’s sustained permanent development.

##### **4.1 Establishment of harmonious development on the concept level**

On concept level, the industrial ecological culture requires man to recognize the intrinsic value of nature, to abandon the concept of resisting nature, abandon the idea of man dominating nature, establish values of harmonious development between man and nature, promote the ethical spirit of harmonious coexistence with nature, in order to man and nature's common prosperity.

“Economic man” has only social attributes, without biological properties. As his life cycle is limited, rational limited, he can not correctly understand the ecological consequences of economic behavior and does not predict the long-term macroscopic impact of his behavior, thus caused many environmental problems and ecological disaster. “Ecologically rational economic man” is in pursuit of harmony between man and nature, confirms the intrinsic value of the environment and ecology which reflects in the “economic man” conscious behavior. Therefore, in order to impair “ecological rationality” to “economic man”, we should make up for the economic man’s lack of humanity, so that the “economic man” has become a complete human, in this way within limited life cycle, he can escape from the present limitations of interests, local interests, personal interests, their own profit-driven behavior will

be limited to ensure human living environment not be polluted and destructed and people form environmental protection preferences. Only with the “eco-rational economic man” self-awareness, people can transcend the purely narrow view and consciously unify the economic perspective and ecological perspective.

#### **4.2 Increase of intensity of technological innovation on the material aspect**

On the material aspect, mankind will be required to abandon the old natural modes of production and way of life-plundering life, learning the wisdom of nature, to create new forms of technology and new forms of energy, guarantee and co-existed with nature

When dealing with resources, we would prefer say “our ability is limited” rather than call “scarcity of resources”, or resources are “scarce” only in terms of human low utilization efficiency. Therefore, to completely solve the so-called “scarcity”, while practicing strict economy, we should pay full attention to the importance of technological innovation and make great efforts to cultivate the capacity for independent innovation. Whatever resource uses reduction, or product reuse and recycling, the prerequisite and basis is continuous technical progress and change. It can be said that technological innovation is key to transit from the bounded rationality to fully rational change. Technological innovation is not only the guarantee to maintain the industry's own market competitiveness, but also a prerequisite of construction of resource-saving and environment-friendly society.

#### **4.3 On system level settlement of ecological problems safeguarded by system**

On system level people are required to reform and improve the social system and social norms, changing the traditional society which can not consciously protect the environment but damage the environment spontaneously. In accordance with the principle of justice and equality, people establish the new human social community, as well as partner community between man and nature, so that environmental protection institutionalized and legalized. Much importance has been attached to long term micro development of economic society. Under this premise, people strive to solve ecological and environmental problems that may arise in the process of making social development strategies and canceling risk in the initiative stage..

#### **4.4 Advocating of green economy and green consumption on practical level**

Traditional industrial culture is “advocating high consumption, pursuing material comforts”. The value orientation of industrial ecology culture is “thrifty, the pursuit to create”. The green economy emphasizes the people-oriented value and follows the laws of nature to maintain the green environment. It also develops green industries to create industrial chain where resources, environment and products are regenerating, recycling and circulating to fulfill coordination and harmonization of man and nature, economy and society. Green economy can not only promote the social and economic development, but also can improve people’s living standards. The green consumption is asking people to abandon the current way of life and way of production, and change people’s blind obedience to the excessive consumption. It is a new environment-friendly consumption culture and consumption concept. It is win for both economic development and environmental protection and advocates moderate consumption-that is to make use of natural resources, and does not exceed the carrying capacity of ecological environment, especially basic human needs as the standard, opposed to the luxury consumption, do not go beyond their own ‘economic capacity’. Therefore, the green consumer is not only an economical consumption, consumption of common prosperity, also a civilized scientific consumption. Green consumption requires people’s consumption of non-polluting, healthy products, and consumption behavior should save energy, protect the ecological environment.

Ecological rational economic man should have ecological thinking. They should promote economic development through the industrial ecologicalization and environmental awareness, and promote the development of “green industry” and cultivation of “green market”, and ultimately make positive interaction between ecological resources and economic development.

## **5 Conclusion**

Culture of industrial ecology is a social and cultural phenomenon, it is a reflection on one’s own natural values, a transitional culture to an ecological civilization and social culture, an important part of the construction of ecological civilization, it is an advanced culture which promotes the ecological civilization advanced culture, and the cultural foundation for the construction of ecological civilization. Protection of ecological balance, just between man and nature is the lowest critical point of the relationship, the recovery and revival of the ecological balance is the highest state of relationship between man and nature. Therefore, how to create the ecological and cultural industry is indispensable

to fulfill the harmony between man and nature, make benign interaction between ecological resources and economic development and build a harmonious society.

**Abstract:** Based on green supply chain management theory, this paper constructs a concept model of green building supply chain system. Through the analysis of technology diffusion path of the green building supply chain node enterprises, we explored technology diffusion mechanism of a green building supply chain, and analyzed the strategy choice of a green building supply chain technology diffusion in the node enterprise through the symbiotic Game model. In the end, the suggestions of establishing a green building supply chain technology sharing coordination mechanisms was put forward.

**Keywords:** Green building supply chain; Node enterprise; Technology sharing; Coordination mechanism; Game theory

### 1 Introduction

Circular economy and sustainable development is the subject of our current social activities. Green building become an inevitable trend in the construction industry for its low energy consumption, low resource consumption, environmental health and harmony with nature, etc. As a green product, Green building involves the government, developers, contractors, suppliers and consumers during the whole process from design, construction, use and management to the recycling use. Moreover, the green building has obvious externalities due to the additional environmental protection and resource saving property. Therefore, the green building development and use is not a separate subject's behavior, but to all the enterprises from production to consumption chain. How to coordinate the enterprises relationship, improve the production efficiency, which makes the research of cooperation between the member mechanism becomes a basic problem to resolve, it is why this essay focus on the green building developers as the members of supply chain cooperation mechanism. At present, foreign research of partners coordination mechanism mainly focuses on the cooperation between enterprises of the game mechanism and trust mechanism, as well as the support from top management and influence on the cooperation and coordination from cultural integration. and emphasizes on the advanced facilities use for information sharing to improve communication and cooperation. Huang<sup>[1]</sup>from the Adelphi University in US studied three kinds of relationship between vendors and manufacturers based on non cooperative game, cooperative game and Nash negotiation, and put it in application of product publicity business. Robert B, Handfield<sup>[2]</sup> think that in order to reduce supply chain entity cycle time, they should establish cooperation mode based on trust, and proposed the corresponding cooperation model. Research shows that through mutual trust can improve supply chain responsiveness.

The research focuses on the importance of the supply chain coordination in china, based on the game mechanism or the principal-agent theory of the supply chain coordination mechanism and so on, particularly emphasis on supply chain coordination of the distribution of interests. Li Fangyun ,etc<sup>[3]</sup> in her article "based on coordination center of agile supply chain system the research", which mentioned supply chain management and operation way can make use of information economics theory and methods, such as defining trading strategy and rules, makes all members honor commitment, set up under asymmetric information coordination mechanism, etc.Chen Juhong,etc<sup>[4]</sup> design the incentive and coordination mechanism of industry production, supply and marketing of three departments share interests by using the game theory.

### 2 Frame Analysis of the Green Building Supply Chain Systems

#### 2.1 Green building enterprises in supply chain

Through synthesizing Chinese and overseas scholars point of views, we believe that Green Supply Chain is under the guidance of sustainable development Theory, Supply chain management technology, Involving suppliers, manufacturers, distributors, retailers, logistics providers and other enterprises and end users, The goal is to make the enterprise from raw materials procurement, manufacturing,

distribution, transportation, storage, consumption, recycling throughout the supply chain management process to achieve economic development, environmental protection, resource conservation unified chain of the triple objectives. Therefore, the green supply chain is a chain of suppliers, manufacturers, distributors, retailers, logistics providers, consumers and recyclers, suppliers, manufacturers, distributors, retailers, logistics providers, consumers and recyclers can be called different nodes of the green supply chain.

(1)Green suppliers, Refers to the downstream node enterprise to provide green materials and green energy enterprise, The main factors to consider in selecting a supplier are: product quality, price, delivery, volume flexibility, species diversity and environmental friendliness, etc. Positive green suppliers focus on the environment, raise the level to meet the delivery requirements of green, the purpose is to reduce material usage, reduce waste production.

(2)Green manufacturers,Refers to the use of green technology, green production, green manufacturing in the manufacturing process. In the production process, manufacturers need to consider the parts of the manufacturing process input, output and resource consumption and environmental impact of material flow from raw material to the qualified parts of the transformation process and transformation processes, material and energy resource consumption, waster generation, the environmental impact of the situation.

(3)Green distributors, retailers, logistics providers, Refers to the enterprises on the sale of part of an ecological management and sale of the business, through the distribution channel for green products. Selection of brokers, they should pay attention to examine its green image, IT Can be carried out online sales, e-commerce is very environmentally friendly and broad development prospects, Promotions, green distributors on the one hand can choose the most economic and environmental benefits of the way, on the other hand we should vigorously promote the green characteristics of the enterprises and products.

(4)Green Consumer, Means required to buy health green products and services, and as far as possible in the course of environmental protection, resource conservation.With the voices of environmental protection and resource conservation has become increasingly higher and higher, green consumers pay more attention to the use of green products, and certain pressure to the upstream enterprises, also for the downstream business of waste recycling.

(5)Green recyclers, Means recycling waste products, and then processed products back to the upstream node enterprises. Recycling of products through the collection of reusable components, it is divided into the direct reuse of parts and repair, refurbishing, remanufacturing, parts cannibalization and recycling of materials to produce a variety of recycled products. Renewable parts, the parts themselves completely scrapped, but the material is renewable after use. IT Can be the transport of waste products to recycling processing plant processing, and finally the transport of recycled products to the sales site to sell.

As the green supply chain is the Commonwealth of more than one enterprise, its between enterprises of many property, only the dynamic relations of cooperation. Therefore, each enterprise in the supply chain starting from their own interests to make cooperation countermeasures.In fact, the relationship between each enterprise is actually in the green supply chain is a principal-agent relationship, its living in the mutual relationship between information superiority and disadvantage participants.

## **2.2 Concept model of green building supply chain system**

Because the participation of the main body of the green building supply chain is broader compared to the construction supply chain, its includes not only members of the construction supply chain, and the regulation of the ecological environment system, government and international organizations, supply chain operations in which the culture and value system and other factors.Therefore, from this perspective, we can divide green building supply chain into four subsystems:Production systems, consumption systems, environmental and social systems, Construction supply chain emphasis on the production system,the other three subsystems is relatively weak .Among them, production systems including the development to completion of the construction of the whole process from raw material; consumer systems including consumer the process of final consumption; environmental systems, including resource and energy inputs, recycling and waste recycling; social systems from government regulation, supervision of social, cultural and ethical factors such as guidance, motivation, constraints compatible with the natural environment in order to promote the activities of the actors. Therefore, we can use the above description of the establishment to make a more comprehensive system of green

building supply chain conceptual model Shown in Figure 1:

Figure 1 Concept Model of Green Building Supply Chain System

### 3 Green Building Supply Chain of Technology Diffusion Mechanism

Green building technology diffusion mechanism can be illustrated from the material flow and information flow two aspects :First of all, the green building, as a special kind of material goods, the upstream suppliers transfer green building materials and equipment to construction enterprise or real estate developers, build the green products;And the downstream enterprises through research and development and clean building activities to promote green technology development and application of upstream suppliers, it's the performance of adverse movement of information flow.The real estate development enterprise or the total package enterprise which in the core of green building supply chain tend to reduce cost and specialized business because of the strategic planning, these enterprise spread their green building techniques paid or unpaid to upstream suppliers, make its supply of raw materials into the green building department product, construction standardization system.In addition,by the supplier building materials equipment, the builders and developers to build,property service is responsible for operation and management on construction products with eventually material form to the consumers, this is the expression of material flow form.Technology diffusion path of green building supply chain as shown in Figure 2 shows:

Figure 2 Technology Diffusion Path of Green Building Supply Chain

Whether in low carbon technology of architecture and material development, or energy saving and low carbon innovation in the architectural decoration industry, highlights the form with real estate as the

core of green building supply chain, in the exploration of the supply chain integration mode on the green building products, not only to realize the idea mentality of the set, but also to realize the implementation of the rational division of labor. In the front, promote "green volume rate" research, and improve the efficiency in the use of land resources; In the medium, strengthen the new systems, new products, new methods of the development, improve the content of science and technology to build; In the end, enhance the service management, improve "green added value". All these need upstream and downstream enterprises cooperation in technological development, forming a cycle closed technology development path.

#### 4 Co-existence Game Analysis of the Green Building Supply Chain Technology Diffusion

The fundamental difference of the green building technology diffusion and the general building technology diffusion that is the node enterprise mainly displays a "co-existence game", not "competitive game" in the green building supply chain formation and green building technology diffusion process, only the Node enterprises have known surely to increase the enterprise earnings by using the green materials, equipment and construction technology, can it apply positively, or to refuse or to slack. Besides the enterprise's own relative interests, the usage effect of the green building technology diffusion still depends on the green regulations degree of perfection and supervision and the mutual supervision of the internal enterprise among supply chain members. in order to state the green building supply chain members attitude towards the green building techniques, the author use the static game mixed strategy Nash equilibrium to further explain.

##### 4.1 Mixed strategies and mixed strategies Nash equilibrium

Mixed Strategies that is a random selection decision way, a game party though a certain probability distribution to choose in optional Strategies, it is of great significance for no Nash equilibrium game and multiple Nash equilibrium. If there was indeed a strict mixed strategies combinations (i.e. not degenerate into pure strategy combinations) constitutes a Nash equilibrium, it is known as "mixed strategy Nash equilibrium", at this time the Nash equilibrium means that any single party game change their strategy or randomly select each pure strategy of probability distribution can't increase oneself income. Here is a strict definition of the mixed strategies<sup>[5]</sup>:

In the game  $G = \{S_1, \dots, S_n; u_1, \dots, u_n\}$ , the game party  $i$  strategy space is  $S_i = \{S_{i1}, \dots, S_{ik}\}$  the game party  $i$  with probability distribution  $p_i = \{p_{i1}, \dots, p_{ik}\}$  choose "strategy" in the random  $k$  optional strategies, called a "mixed strategies", all  $j = 1, \dots, k$  was established among  $0 \leq p_{ik} \leq 1$ , and  $p_{i1} + \dots + p_{ik} = 1$ .

##### 4.2 Constructing model

Assuming that the node enterprises of the green building supply chain are opportunist, that is the choice of strategies space: taking a completely green technology will greatly increase the cost burden; not using green technology completely will lose other supply chain members cooperation relationship, and punished by the risk, therefore, the node enterprises will decide to the degree of green technologies engagement according to the factors of green supply chain cost and the enforcement of the supply chain to green.

Model variable description:

$p_1$  indicates the regulatory probability that other supply chain members supervise the node enterprise to implement green management behavior

$p_2$  indicates the probability of the node enterprises adopt green technology or the degree of the will.

$I$  indicates the costs of the node enterprises exploit green technology or introduce green imitation. Because this investment has the positive externality, which can bring overall efficiency for the others among the whole chain enterprise, show multiplier amplification effect that  $\omega$  said for here.

$K$  said the supervision cost of green supply chain.

$\beta$  said the supervision and punishment probability under the condition of node enterprise of green building in losses from the supply chain was found in certain supervision mechanism and technical feasibility.

$d$  said the losses of the whole green building supply chain is not green product or service for

lacking of regulation.

$f$  said the fines of the node enterprises for the green behavior pay for supply chain.

$R$  said the income that the node enterprises use green technology to achieve.

The model and its profit of the node enterprises adopt green technology and other supply chain partners take supervision and Mixed strategy Nash equilibrium, the matrix in figure 3 shows:

		<b>Goal node enterprise</b>	
		Use green technology $p_2$	Don't use green technology $1 - p_2$
<b>Other enterprise members</b>	Take supervision $p_1$	$\omega I - K, R - I$	$\beta f - K, -\beta f$
	Don't take supervision $1 - p_1$	$\omega I, R - I$	$-d, f$

**Figure 3 Green Building Supply Chain Technology Adoption and Supervision in the Game of Matrix**

**4.3 Model solution and mixed strategy**

The game party shall follow two principles in the mixed strategy game:

Principle 1: can't let your rival know or guessed your choice, so we must use randomness to make decision;

Principle 2: the probability of choosing each strategy must make the rival lock out Detroit exactly, that is, let the other side can't get the upper hand by the specific tendency of a strategy in games.

In this example, the will degree of the goal node enterprise by the green technology will depends on the effect of the mixed strategy, when the other members supervision makes the enterprise to choose the supervision expected revenue and choose not to supervision of the expected yields are equal, it reached the desired effect of the mixed strategy, we can get the following relations:

$$p_2(\omega I - K) + (1 - p_2)(\beta f - K) = p_2\omega I + (1 - p_2)(-d) \tag{1}$$

Solution:

$$p_2 = 1 - \frac{K}{d - \beta f} \tag{2}$$

Formula (2) is mixed strategy that the target enterprise use the green technology. It indicates that strategy selection is influenced mainly the supervision factors of the other supply chain members , including other enterprise supervision cost  $K$ , no supervision of technology spillovers caused loss  $d$ , specific regulatory mechanism and supervision efficiency under a specific technology conditions .When regulatory costs  $K$  is bigger, it will set aside larger space for speculative behavior of the goal node enterprise rejected the green technology, it lead to weaken the greening will; Conversely, when  $K$  is smaller, which will promote the node enterprises to research and develop green technology. Proportional relationship indicates the supply chain internal is facing with the pressure of competition that is from external other green building supply chain, in this case, the supply chain must take more supervision to the goal node enterprise. In addition, the regulation efficiency will promote the node enterprise use green technology will.

**5 Suggestions on Establishing Green Building Supply Chain Technology Sharing and Coordination Mechanisms**

(1) In green building technology diffusion mechanism, the mechanism between technology transfer and transferee is mainly the interest coordination mechanism of symbiotic game, which is clearly distinguished from the competition game relationship shown in other types of technology transfer. The path of implementing green product or technology innovation for any enterprise in the supply chain is mainly as follows: transaction contagion and competition imitation induced by market activities, green building technology induce related vertical or horizontal supply chain enterprises to absorb or R & D. This requires that member companies recognize that they must work together with partners, independent on each other, actively spread green technology and enhance the green added value of the whole supply

chain in today's market environment of the supply chain competition.

(2) The spread of green building technology belongs to voluntary corporate action under the guidance of the market. Because of its characteristics of public sector and positive externalities, this can effectively promote green construction and industrial ecology links in the enterprise communities. Therefore, enterprise members should take full advantage of the positive externalities brought by technology diffusion in order to enhance own operational efficiency and green brand image.

(3) As a developing country, the social awareness of environmental protection, public green consumer behavior and corporate clean production is still in its infancy in China. The various links that supply chain enterprises spread the green technology to the chain do help to enhance the green building requirements of the external environment. The development and adoption of green technology for enterprise members are mainly affected by the supervision efficiency and punishment strength. It can improve the credit worthiness of the entire supply chain through mutual supervision between each other. Besides, the enterprise green technology investment efforts will be more strengthened. So it is necessary to note the supervisory role between enterprise members.

## 6 Conclusion

The green building supply chain is related to the node enterprises' interests of suppliers, manufacturers, distributors, retailers, logistics providers, consumers, recyclers and so on. Compared with general building, the relationship in the green building supply chain is mainly symbiotic game rather than competition game. Its connotation is broader. In addition to focusing on the production system, it is more committed to the harmonization of consumer systems, social systems and environmental systems. For node enterprises which have technical intersections, whether they can promote the spread and sharing of technology depends on the supervision efficiency and punishment strength of the entire supply chain. Therefore, only by establishing the effective green building supply chain technology sharing and coordination mechanisms and coordinating the relationship between supply chain members can it promote the development of green building.

# Research on Countermeasures to Improve China's Renewable Energy Management

Qi Xiangdong

Beijing Benefit Technology of Energy and Environment Ltd, Beijing, P.R.China, 100086

(E-mail:qixiangdong6128@sina.com)

**Abstract:** China has proclaimed the law of renewable energy resource for about 7 years, but there are too many problems. All these problems need to be generalized and summarized. The paper brings up countermeasure system, applying questionnaire about satisfactions. It also brings up main problems about the application and management of renewable energy in China by designing questionnaire and exerting statistician and analysis. Figuring out all these problems are very important in management of renewable energy, the paper makes up system about countermeasures of management, educating Some directions about countermeasures of renewable energy management, such as the core technology development and standards, planning and design, manufacturer, usage by land agent (purchased by customers), charge collection to the users, operation management, monitoring and assessment, feedback and policy adjustment, personnel training, government function, industry association, international cooperation, financial instruments and tax preference. At last, we can get the conclusion that the countermeasures of china's renewable energy management must be done, at the same time the paper gives some advices about how to improve the management about renewable energy of China.

**Key words:** Renewable energy; Management; Improvement; Statistical analysis

## 1 Introduction

China has a plenty of renewable energy resource. With the rapid economic growth, our country proclaimed the law of renewable energy. But there are too many problems in the application work of the renewable energy<sup>[1]</sup>.

Major Western countries for the utilization of renewable energy is very seriously, among the major countries from the Western point of view, the basic use of renewable energy sources account for the total energy consumption of more than 10%. On this basis, the United States, Europe, Japan, Brazil, India and other countries are going in the use of renewable energy development in the forefront of their economies, they have established a clear share of renewable energy targets, implementation of laws and administrative compulsory measures development and implementation of preferential policies and incentives to establish a relatively complete industrial service management system.

From the research provided by the policy of Western countries, it seems that Western developed countries in the application of renewable energy has a very significant policy bias, and all policies are conducive to the use of renewable energy, industrial development, in order to accelerate the development of related industries, they are by political, legal, fiscal, financial, administrative, technical development, information, education and training aspects of an integrated role in development and utilization of renewable energy to provide a very valuable experience<sup>[2]</sup>.

The paper wants to give some countermeasures through the research of renewable energy problems. In order to know the fact, The paper designing questionnaire of satisfaction to the model. The model are deputation of the renewable field. Generalizing and summarizing the problem of the management of renewable energy. The paper analysis the scores of the satisfactions about questionnaires, using mathematics model to analyze the main idea about how to improve the management of renewable energy, it is very important to this paper.

In order to improve the management of renewable energy, we design the questionnaire. All the questionnaires concern of the application and management about the renewable energy, and they all come from government, consultation and industry.<sup>[3]-[8]</sup>

Through the questionnaire, we hope to realize the actuality of the application and management of the renewable energy, and let us to think about the problems. At last some directions about how to improve the problems are given in this paper.

This questionnaire is about solar energy, geothermal energy and wind energy. The survey is primarily focusing on the following questions:

- 1) Renewable energy resources and social needs of the investigation;
- 2) The design to improve regional planning of the renewable energy;

- 3) The core system technology of the renewable energy;
- 4) The development of manufacturers of the renewable energy;
- 5) The investment conditions of the application of renewable energy;
- 6) The fee about the using of renewable energy and social operation management;
- 7) Operation and maintenance of the renewable energy system;
- 8) Renewable energy system operation monitoring and evaluation of energy efficiency;
- 9) Personnel training of renewable energy;
- 10) The government functions of the renewable energy;
- 11) The development of industry association about the renewable energy;
- 12) National standards and local standards of the renewable energy;
- 13) International technical cooperation of the renewable energy;
- 14) Financial tools and tax policy of the renewable energy applications.

Questionnaire is in two parts, first choice, each choice question designed three different items, you can survey according to different situations in which you choose. Followed by appropriate satisfaction surveys, the choices of items for the selected design are “very dissatisfied, dissatisfied, generally, satisfied, very pleased” which are the five satisfaction rate range. Survey of the situation can be for one's own position to rate their satisfaction. Each degree of satisfaction is out of 10. Finally, the survey's scoring for statistical analysis is gotten.

**Table 1 Application of Renewable Energy Design of the Questionnaire Survey**

Survey object	Estimated number
Equipment company	30
System integration	15
Design and consultation	15
Government agency	5
Industry association	5
Real estate developer	5
Total	75

## 2 Samples and Tools for Search

In accordance with the unified arrangement of the questionnaire, a total of 75 questionnaires issued were returned 60 questionnaires, 80% recovery rate. The specific recovery is as follows:

**Table 2 Questionnaires Return Percent**

No.	Survey object	Ratio and proportion	Collection numbers	Recovery	Sample rate
1	Products	35 (46.7%)	29	83%	48.3%
2	System integration	10 (14.3%)	8	80%	13%
3	Consultation and design	15 (20%)	12	80%	20%
4	Government agency	5 (6.7%)	4	80%	6.7%
5	Industry association	5 (6.7%)	3	60%	5%
6	Real estate	5 (6.6%)	4	80%	7%
7	Total	75 (100%)	60	80%	100%

From the questionnaire obtained, it can be seen that according to the pre-set value of enterprise adjustment table, the basic business reached a predetermined nature of the questionnaire for proportion. The survey questionnaires were collected for the entire sample. In a survey of 60 samples, the statistical data and analysis the survey sample table in Appendix -1 table.

Through these investigation and study, setting up data analysis method, in this questionnaire survey, the main analytical tool is taken as follows:

Method 1: company with the same nature items, the percentage options selected.

Through this ratio to understand the company with the same nature's thinking about perspective view and focus.

Method 2: company with different type items, the percentage options selected

The selected key areas of choice with different types of enterprises, which we can understand judge the entire industry.

Method 3: the percentage of items about the whole survey company's choice selected

The view is taken by the different enterprises within the industry about the management approach, nowadays.

Method 4: the percentage options selected by the company with the same character in the same satisfaction scores questionnaire

If the companies have the same satisfaction of the view, it means that the whole companies have some general conclusions on the phenomenon.

Method 5: different types of enterprises in selected key areas of satisfaction percentage choice

Different types of enterprises in satisfaction level, they are same or different.

Method 6: the percentage scores of the Satisfaction key about the whole investigation, the choice of key aspects of business.

Appendix table 2 is provided there, it is about all the survey records into the study sample. Data is the basis for discussions of this paper.

### 3 Statistics Analysis

This part concluded the survey questionnaire and the components of the comments are summarized, specifically through statistical analysis of the current status of renewable energy, derived from different survey and analyzed the statistical results.

Through Appendix table 1-2, data must be done to the statistics. Calculation method of weighted average adopted, through these method, the paper give the average percentage scores about satisfaction .weighted average formula is:

$$X_1 = (x_1f_1 + x_2f_2 + \dots + x_kf_k) / n,$$

$$\text{Set } f_1 + f_2 + \dots + f_k = n,$$

$f_1, f_2, \dots, f_k$ ----- weights,

$X_1$  ----- average satisfaction scores,

$x_1, x_2, x_3 \dots \dots x_k$ -----satisfaction scores

According to the survey data from samples analyzed, the analysis of the questionnaire is as follows.

### 4 Data Analysis and Statistics

**Table 3 Survey Results**

No.	No Problem	The results
1	Made whether the project area carried out a census of renewable resources	80% of the sample that the lack of data, the state parties have not formed the basis of effective management
2	It has a clear regional renewable energy planning, within the region where you can clear the use of renewable energy	80% of the sample that the lack of planning for renewable energy
3	Renewable energy applications to support financial and tax policy	Sample of more than 80% think the Government for the application of renewable energy, lack of financial and tax support.
4	Renewable energy, personnel training	70% of samples that lack the relevant training of personnel
5	Are there high-quality production of renewable energy companies	Sample of SMEs in China more than 75% think that more foreign enterprises to enter the rapidly capture the market
6	Whether domestic solar and geothermal local standards and national standards	More than 85% of the sample countries and the manufacturers that are part of the standard, but not very healthy
7	The use of renewable energy equipment operating charge management	More than 95% of the sample that did not explicitly state charges, but the light of other executive

8	Operation and Maintenance issues	More than 89% of the sample that renewable energy equipment operation and maintenance of existing management problems, lack of management support for the country
9	System Operation Monitoring and Evaluation of Energy Efficiency	85% of the sample testing device that is useless to run the country without the development of related management measures and means
10	Renewable energy government functions	Sample of more than 81% of general laws that state a strong operational differences, the procedure is cumbersome, does not have a dedicated department.
11	Association issues	80% of the samples that trade associations do not play a relevant role.
12	International cooperation in renewable energy issues	70% of the sample that international cooperation is not enough
13	Domestic projects done using solar and geothermal technology is a core technology	60% of the sample countries have the core technology that is not enough
14	Community investment in renewable energy applications attitude	90% of the sample that the state subsidy policy difficult to implement. Such as the willingness to implement the use of renewable energy

**Table 4 Satisfaction Survey Results**

No.	No Problem	Select answer	Satisfaction results (Out of 600)
1	Made whether the project area carried out a census of renewable resources	A	84
		B	137.8
		C	9.5
2	It has a clear regional renewable energy planning, within the region where you can clear the use of renewable energy	A	56
		B	151
		C	7.56
3	Renewable energy applications to support financial and tax policy	A	74
		B	85
		C	34
4	Renewable energy, personnel training	A	38
		B	186
		C	12.3
5	If there are high-quality production of renewable energy companies	A	69.9
		B	164.3
		C	6
6	Whether domestic solar and geothermal local standards and national standards	A	37
		B	205.4
		C	3.55
7	The use of renewable energy equipment operating charge management	A	11
		B	176.1
		C	21.2
8	Operation and Maintenance issues	A	29
		B	132.7
		C	37.5

9	System Operation Monitoring and Evaluation of Energy Efficiency	A	40
		B	140.1
		C	22.55
10	Renewable energy government functions	A	66
		B	84.6
		C	52
11	Association issues	A	70.8
		B	97.6
		C	34.7
12	International cooperation in renewable energy issues	A	95
		B	96.4
		C	8.8
13	Domestic projects done using solar and geothermal technology is a core technology	A	124.1
		B	82
		C	8.55
14	Community investment in renewable energy applications attitude	A	32
		B	106.2
		C	40.25

## 5 Results

From the above analysis of satisfaction survey results suggest the following conclusions:

1) The overall issues is raised by the questionnaire satisfaction scores did not exceed 50% of the total score, indicating the overall industry, renewable energy management policy for the country's low satisfaction.

2) We state the application of renewable energy is just the beginning stages, did not sound management system and the detailed management rules. Therefore, the satisfaction scores in the questionnaire were satisfied with B option to score over the other two choices.

3) Answer choice C scored the lowest, indicating the survey of renewable energy for national development is very much like to have better management of national policy.

4) The satisfaction questionnaire were the highest score is a healthy plant-level standard, indicating the current survey, most of the production enterprises engaged in renewable energy expertise, they are to the development of enterprises from the renewable energy industry to a certain promotion.

Through the above renewable energy law for China to improve the content of understanding known:

1) A renewable energy law in the actual operation is not able to give full play to the management of renewable energy should be the role and function. Strategy formulation is very accurate, but not a better organizational behavior management.

2) The state department in charge of renewable energy in China Development and Reform Commission, its own management of both renewable energy policy-making departments, while the coordination of departments, it is a major oversight. This has a lot of difficulties, one for the executive branch are easy to deal with the management of the affairs of the administrative agencies adversely buck each other. The lack of organization and management structure in the form of renewable energy, management structure, and organizational behavior management is not blocked; in accordance with the principles of organizational behavior management is necessary to establish service in the relevant industry sector structure.

3) Renewable energy law lays an emphasis on policy formulation (the strategic level), while the contempt of renewable energy in policy implementation, monitoring and management process (formulation and management of organizational behavior). Legislation which is also adopted the "should be broad rather than detailed" principle. Renewable energy legislation has led to the legal provisions which are too principled and abstract, in some places is difficult, some simply can not operate, such as renewable energy law which were referred to in Article XVII, "The State encourages units and individuals to install use of solar water

heating systems, solar heating and cooling systems, solar photovoltaic systems, solar energy.” In this section, which referred to "encourage" do not know what measures to "encourage"? To the price of solar heating is not currently available large area of the use of heating means, while solar refrigeration technical guidance how to encourage the development stage are also being installed on?

4) Another on the geothermal heat pump system is applied in some reports, but did not offer affordable heat pump system is to encourage the others? "Real estate development enterprises shall, according to specifications provided, in the design and construction of buildings for solar energy to provide the necessary conditions," this one among the real estate business is among the market economy of enterprises, with no policy guidance and related Department of mandatory provisions, how can make a reservation in accordance with the provisions of it? All of this illustrates the operability is not high, it is difficult to maintain the one hand, countries in the interests of renewable energy, but also very difficult to safeguard citizens and legal persons in the market economy among the legitimate rights and interests of society. Principle in place, but the uncertainty of organizational behavior directly affects the implementation of the strategy and objectives to achieve.

5) According to the Renewable Energy Law to formulate the implementation of the principle, it is difficult to reach lawmakers had expected to achieve. Renewable energy from existing power management configuration, the current state of institutional arrangements (multi-sect oral management of renewable energy) sectors involved in too many too many local interests, is difficult to quickly establish effective law enforcement. Far, China has realized this problem, but because of the current renewable energy covers a wide range of administrative power to bring the cross and distributed between the executive bucks, buck-passing problem in the future may be a long time. Therefore, we must quickly improve our renewable energy laws and regulations.

## 6 Conclusion

Under the current management of renewable energy analysis, I believe that improving the management of renewable energy from the strategic level, organizational behavior level, technical innovation is the following several aspects:

1) A renewable energy law, at the strategic level has been made a strategically advantageous position of renewable energy development direction, goals and strong. The principles of its legislation are the focus of renewable energy legislation, the provisions of the Government's authority and management scope. This is the strategic level issue in the state and advocated to manage the configuration of what is right, what is the configuration of executive power to oversee what the configuration of power problems. By addressing these issues, it determines the management of the Basic Law of renewable energy or "Constitution."

2) The management and renewable energy executive's perfection. Management and implementation is the focus of administration, to the management and implementation of legislation, he is the way to solve the management and implementation of workflow actions of legislation, by means of legislation regulating the management of work, while standardizing the implementation of the work of administrative authorities process and working methods and means, and not the punitive measures. Renewable Energy Law to ensure implementation of the principle.

3) Renewable energy management oversight legislation (regulations), includes the implementation of technical specifications and standards, in strict accordance with national standards of acceptance and punitive measures, operation monitoring, and data feedback.

4) Renewable energy management technology among the perfect. The state must to research and develop the renewable energy systems technology. National must be competitiveness and innovation core technologies with independent intellectual property strength.

Under the current management of renewable energy analysis, we deeply feel: As the renewable energy to manage their own problems, resulting in the application process in geothermal heat pump system in the management of problems. Improve the management of renewable energy is a very important and very complicated process; fully realize the improvement in the management of renewable energy will take a very long practice and exploration. This article from the case of heat pumps in the process of management reality, according to the management of which the above-mentioned problems, propose solutions to problems of management methods and means. It designs of a relative scientific management mode of heat pump system. A related model can be extended to other renewable energy technologies among management applications to. This can be targeted based on relevant experience improved management of these renewable energy problems. It speeds up renewable energy cause rapid

development.

# An Empirical Study on Scenic Spot of Travel Brand Influencing Factor on University Students

Xu Peng

School of Art, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lambency.xu@gmail.com)

**Abstract:** College students, as a segment market of tourism industry, are contributing to a growing consumption in the whole market, which has drawn much attention of the marketers. According to the analysis of currently existed related literature, researches on the factors influencing college students in choosing tourism brands are rare to be found. On the basis of the analysis of literature, this paper combines brand theory, customer satisfaction theory and theory on tourist attractions, and by analyzing an author-designed scientific, reasonable and reliable questionnaire with SPSS, the author comes to some meaningful conclusion.

**Key words:** Brand; Scenic spot of travel; Survey design; Customer satisfaction; Multiple Analysis

## 1 Introduction

Nowadays people always look forward to a better Brand construction of tourist attractions and have a highly market requirements. The combination of rapid growth in the tourism industry, in the competition of economic globalization, knowledge production and consumption demand of personalized and the market environment, traveling scenic area brand will integrate into all aspects of the social life. In the face of increasingly sophisticated consumers, situations of intense market competition at home and abroad, making schedule as soon as possible for how to management the brand of tourist attractions, which has drawn much attention of the marketers.

Based on the exist Literature review, why research is crucial to market researchers has illustrating the importance of consumers value. First of all, consumers value evolved into consumer behavior from two important dimensions: the economy (for example values are links to detect price and it is commonly referred as transaction value) and psychological (the really factors that influencing product selection by customer: more emotion recognition and more reasonable). Secondly, from a methodological perspective, value structure can be interpreted into different parts of the consumer behavior: product selection (Zeithaml, 1988), purchase intent (Dodds&Monroe, 1985) and repeat purchases (Nilson, 1992). Thus, in academic research (Parasuraman&Grewal, 2000)and marketing management (Bolton, Kannan,&Bramlett, 2000), the price always closely related to customer loyalty. Third, price and major structures such as consumer behavior is closely related to quality and satisfaction. In all documents relating to services, look further at the distinction between satisfaction and quality, especially in the tourism literature, whether studies on external factors (Bolton&Drew, 1991; Ostrom & Iacobucci, 1995; Woodruff & Gardial, 1996; Oliver,1997; Day & Crask, 2000; Cronin et al., 2000) or internal (Yu • ksel&Yu • ksel, 2001a, b; Oh &Parks, 1997; Oh, 1999, 2000; Baker & Crompton, 2000; Brady, Robertson,&Cronin, 2001) tends to a further discussion of the value concept. In the early 90 's, some scholars have a further research on service quality, core value is consumer services assessment (Cronin&Taylor, 1992; Bolton & Drew, 1991). Since then, we have "three waves concept study of the services market" (Cronin et al., 2000): service quality, customer satisfaction and perceived value. But for the most critical of the concept and methodology of construction is to explore how to combine these three make the most out of their advantages. Compared with other areas, empiricism in the tourism literature believe that perceived value is very important for study and also suggested details examples; Studies revealed that in terms of quality, satisfaction and value model in the study of the relationship between a shortcut (Bojanic, 1996; Oh, 1999; Kashyap & Bojanic, 2000; Murphy et al., 2000)

## 2 Research Design

Based on literature analysis, brand theory, and tourism theory, and customer satisfaction degrees theory for guidance, through on tourism attractions object of market subdivision—college students, through questionnaire design, using SPSS17 version statistics software as analysis tools, on recycling of samples that: near 50 by in colleges and universities of freshman to senior, and different professional, and gender, and area, and income, of differences, and the questionnaire of 36 a problem for has corresponding of data statistics analysis. Come to scenic brand impact factors of college students based

on distribution of proposed a number of measures for promoting tourist brand impact. This survey is a survey on undergraduates nationwide, and focuses on investigation and understanding come from different professions, different regions, different family situations and different emotional experiences of their own differences in students' choice of brand of tourist attractions, as well as satisfaction and loyalty on influence factors for school students. Questionnaire issued mainly to network as a medium, the use of MSN,QQ,BBS, or group messages for all forms of questionnaire disseminated widely to friends and relatives around students, or are familiar with enthusiastic Netizen in the network. To a certain extent to ensure authenticity of the questionnaire was filled in and the recovery rate. This electronic document is expected to issue the questionnaire 260, 226 actual recovery of electronic document, including effective electronic questionnaire, 219, 86.9% per cent of the questionnaires, effective rate of 96.9%. Gender composition by try males slightly larger than females, 51.6% and 3 per cent respectively. Questionnaire relating to a wider area, colleges and universities in all regions have access to survey data and distribution more reasonable. Investigation focuses in Lake donghu, Wuhan University, Wuhan University, College, engineering, Wuhan University, zhongnan University, Huazhong agricultural University in the 6 universities, its share of valid questionnaires, respectively, 32.4%、5.0%、3.2%、2.7%、1.4%.

### 3 Data Analysis

#### 3.1 Reliability analysis of questionnaire

Reliability refers to the reliability or stability of the scale. Reliability standard coefficients are commonly used for measuring Cronbach's  $\alpha$  coefficient. The larger the coefficient, indicates a higher variable degree of internal consistency, describes the survey project has a good correlation between variables. Judging standards, scholars are not uniform, some scholars such as Nunnally (1978) argues that Cronbach's  $\alpha$  0.7 per cent, was the minimum acceptable value is greater than 0.8 has a good reliability and suggested coefficients between 0.35 and 0.7, up 0.7 means higher reliability, generally on each measurement Cronbach's  $\alpha$  coefficient 0.6 per cent is acceptable. This article uses SPSS17.0 software "reliability analysis" for reliability analysis of questionnaire data, based on standardized Cronbach total table's  $\alpha$  coefficient of 0.86 percent. Thus, the credibility of the survey was very strong.

**Table 1 Reliability Statistics**

Cronbach's Alpha	Based on the standard item Cronbachs Alpha	Item number
.775	.806	76

#### 3.2 Multiple analysis of influencing factors to tourism brand

Through multiple analysis of influencing factors, factors that affect students' scenic brand mainly for three areas: (1) Travel brands access to scenic information channels. For college students, many of them was through family and friends, as well as network access to information for these 3 aspects. Which friends and relatives on the number used is 23.3% per cent of the total number of searches on the Internet 31.4%, how college students beyond the relatively stable values, as well as a high degree of loyalty. Network audiences as a new generation of college students, the major brands should pay more attention to this aspect of tourist attractions information. (2) When a remote tourist influencing factors of brand you select scenic. College students' sensitivity to price is extremely high. Travel in remote, 21.2% against him in college students find affordable choice of brand of tourist attractions is the impact of a large factor. 16.6% in the school students think that security on remote travel choices greatly influenced brand of tourist attractions. 16.2% of students considered that integrity and visitor evaluations have a great impact on their chosen brand of tourist attractions. (3) The weekend while short-term factors that affect your choice of scenic brands. When you can see short visits on weekends, sort of factors influencing college students' choice brand of tourist attractions for affordable 27.5% security 15.8% a friend 13.3% integrity and tourists' evaluation on quality brand 9.6% reliable 13% service 13.2% service network is perfect 4.2% bundled customized reasonable 2.3%. As can be seen in most college students are price-sensitive, followed by safety requirements, and relatively low requirement of a brand is, in sixth.

#### 3.3 The analysis of customer's satisfaction to the brand of scenic spot of travel

Analysis on brand satisfaction survey of tourist attractions, there are the following five factors most affected. (1) The scenic brand awareness I evaluate the area greatly influenced the overall quality of service satisfaction. There are 31.1% students agree, agree somewhat 21.9% classmate, 15.1%

classmates disagreed. Over all quality of service satisfaction of this scenic spot Scenic spot of brand awareness in college students' evaluation is the larger impact. (2) Scenic overall spending has a higher cost greatly influenced to my satisfaction. Select agree somewhat to fully agree with percentages as high as 84.4%, so scenic overall spending has a higher cost for college student satisfaction evaluation of scenic brand impact is the largest. (3) The scenic tourist packages tailored for student groups launched a big influence on my satisfaction. 68.9% undergraduates for scenic spots launched customized for groups of students of tourism scenic spots tickets for student groups on tourist satisfaction a great representation of the brand was endorsed. From the point of view, groups of college students, for a relatively high price sensitivity is. (4) Safety factor in the tourism scenic spot high and low satisfaction had a great influence on me. 34.2% student select is fully agrees that 33.8% students choose agree, 16.4% of students selected is agree somewhat, 9.1% student select is hard to say, 2.7% student select is not agreed, 0.9% student select does not agree with. Visible tourist attraction within the safety factor of high and low for students enrolled in colleges and universities for brand satisfaction evaluation of scenic effect is particularly large. (5) Humanistic feature of the scenic area has the unique satisfaction had a great influence on me. 23.7% student select is fully agrees that 27.4% students choose agree, 23.7% of students selected is agree somewhat, 16% student select is hard to say, 4.1% student select is not agreed, 1.8% student select does not agree with, 0.5% student select is a completely different meaning. Indicate whether the area has a unique human characteristics of college students for the tourism brand satisfaction evaluation selection of effects is a very strong positive impact.

### **3.4 The Analysis of Consumers' Loyalty to the Brand of Scenic Spot of Travel**

There are many factors influence the brand loyalty to collage students' tourists, through the analysis of the questionnaire, the main factors influencing brand loyalty in scenic has two main aspects. (1) I would like to ask for my opinion of relatives or friends recommended me the satisfaction of tourist attractions. 27.9% student select is fully agrees that 38.4% students choose agree, 16.9% of students selected is agree somewhat, 11% student select is hard to say, 1.8% student select is not agreed, 1.8% student select does not agree with. From the Select results can be seen, this emerging consumer markets with great potential for college students, more inclined to seek the views of relatives or friends recommended me brand of tourist attractions. Description, University student groups, and such a market, to their favorite brand of tourist attractions, the loyalty of performance is extremely high. Therefore, tourism should be even more focused on brand communication efforts and the brand's service quality. (2) I would like to share wonderful travel experiences around. 38.8% student select is fully agrees that 35.2% students choose agree, 13.7% of students selected is agree somewhat, 10% of students selected is hard to say. Close to 70% of people around college students choose to share wonderful travel experiences. Tourism brand should pay more attention to groups of college students that consumer satisfaction and loyalty, thereby enhancing the competitive strength of their brand-building, and to expand their market share, lends itself to higher brand value.

### **3.5 The variance analysis of factors influencing the choice of difference to the brand of scenic spot of travel**

In order to understand the differences of brand choice of tourist attractions of college students, gender, specialty, grade, students, family structure, income variance analysis for six. (1) Analysis of factors affecting gender differences on the tourism brand of. Will men and women gender of differences on tourism scenic brand of select effects factors for analysis Hou, concluded that "can accept of for students of mass custom a tourism scenic brand packages of price range" of significantly sexual differences value for 0.047, and "family tour" of significantly sexual differences value for 0.000, and "gourmet" of significantly sexual differences value for 0.028, and "monuments" of significantly sexual differences value for 0.026, and "folk style" of significantly sexual differences value for 0.000, and "University campus" Significant differences in values of 0.014. (2) Factors affecting the differences on the tourism brand of the Professional category analysis. An analysis of the factors influencing differences in the Professional category the brand of choice of tourist attractions to conclude that "billboards in school" of significant difference value is 0.020, "brand awareness" of significant difference value of 0.058. (3) Influencing factors of different grades on tourist brand. Will is located grade of differences on tourism scenic brand of select effects factors for analysis Hou, concluded that "couples outing" of significantly sexual differences value for 0.051, and "10 service network perfect" of significantly sexual differences value for 0.027, and "entertainment" of significantly sexual differences value for 0.031, and "seaside beach" of significantly sexual differences value for 0.011, and "no brand scenic" of significantly sexual differences value for 0.048. (4) Home brand influence factor analysis of regional difference on scenic. Hometown regional differences in the analysis of the factors affecting the

choice of brand of tourist attractions to conclude that "economic benefits" of significant difference value of 0.006, "Cate" significant differences in value of 0.006, "entertainment" of significant difference value of 0.042, "brand-free area" of significant difference value of 0.037. (5) Family structure differences on influencing factors of brand of tourist attractions. Will family structure of differences on tourism scenic brand of select effects factors for analysis Hou, concluded that "tendencies select of tourism schedule" of significantly sexual differences value for 0.005, and "annually for tourism of spent probably is how many" of significantly sexual differences value for 0.000, and "travel agency Advisory" of significantly sexual differences value for 0.020, and "family tour" of significantly sexual differences value for 0.004, and "service quality reliable" of significantly sexual differences value for 0.080, and "security guarantees" of significantly sexual differences value for 0.033 And "integrity and tourists ' evaluation" of significant difference value is 0.017, "local character" of significant difference value of 0.025, "Cate" significant difference value is 0.002, "garden area" of significant difference value of 0.057. (6) Monthly income difference on influencing factors of brand of tourist attractions. Analysis of the factors affecting to "Monthly income difference", the choice of brand of tourist attractions to conclude that "annual spending on tourism is probably how much" significant difference value of 0.042, "solid economic.

#### 4 Conclusion

This subdivision of college students of potential tourism markets are gradually affected by tourism enterprises concerned, this article through questionnaire investigation and analysis of the factors affecting the students ' brand of tourist attractions, drew the following 3 points. (1) Creating City tourism brand, formed of intercity travel, the introduction of one-stop low price dining accommodations and tourist attractions packages. According to this survey found that 21.2% against him in college students still find affordable choice brand of tourist attractions is the impact of a large factor. 68.9% of undergraduates launched by the very respected scenic tourist packages tailored for student groups. I believe that tourism brands join hands, forming tourist city circle, the introduction of one-stop low price dining accommodations and tourist attractions packages, might better meet students ' requirements for cost-effective brand of tourist attractions. (2) Multidimensional multi-channel brand of tourist attractions, focus brands network propaganda, from the perspective of the emerging brand image, brand image of tourist attractions here to stay. Scenic brand awareness to college students evaluate the overall quality of service satisfaction of this scenic spot is 31.1% students expresses its consent, agree somewhat 21.9% classmate, 15.1% classmates disagreed. It can be seen that brand awareness for college students ' choice of tourist attractions had a bigger impact. For college students, know much about brand of tourist attractions from friends/relatives 23.3% and online search 31.4%, describes this huge potential customer base among college students, in addition to have relatively stable values, as well as a high degree of loyalty. And the network as a medium of popular media, network audiences as a new generation of college students, the major brands should pay more attention to this aspect of tourist attractions information. Due to modern highly developed network, college student before traveling on to pay special attention to tourism scenic spot of brand information. survey of undergraduates attaches, 37.4% of the students thought it has great importance for them to thoroughly understand the area's various information before traveling through a variety of channels. (3) Focus on the internal management, reduce operating costs, optimize the scenic quality of service of staff in the brand, and improving students ' groups on tourist brand satisfaction and loyalty. Almost 70% surveyed college students choose to "share wonderful travel experiences around." Thus, the brand of tourist attractions in the face of college student groups, and this huge potential consumer customers, brand communication efforts of tourist attractions and scenic quality of service, are of paramount importance.

(E-mail: luc\_stevens@hotmail.fr, jeanstevenson@hotmail.com)

**Abstract:** SMEs play a vital role in China's economy as generators of employment, revenue and innovation. With the unprecedented economic development of China, the important increase of SMEs amount is resulting to massive resources and energy consumption producing significant generation of waste by-products. In this article, we analyze the reasons that push Chinese SMEs to be reluctant or slow to implement efficiency measures and improved environmental practices, and illustrate the support of environmental sound technology to environmental sustainable development. We argue that Chinese SMEs are facing several challenges that limit their implementation of environmental practices and environmental sound technology: lack of environmental responsibility awareness, lack of technological absorptive capacity, lack of financial resources, difficulty to access conventional loans, and short-term economic perspective. Environmentally sound technology (EST) represents a necessity for allowing economic development without significant environmental degradation. Our main recommendations for Chinese SMEs to achieve environmental sustainable development include a strengthening of firms' technological absorptive capacity, implementation of "good housekeeping" procedures; building linkages between financiers of SMEs and EST owners and centers, providing support mechanisms to encourage the development of financial flows; diffuse EST through a combination of effective knowledge transfer and diffusion mechanisms; and finally promote technological and financial synergy with SMEs different stakeholders.

**Key words:** Environmental sound technology; Eco-Innovation; Chinese SMEs; Environmental sustainable development

### 1 Introduction

For centuries, China has been the nation that concentrated the highest population on Earth. Taking advantage of his huge national market opportunity, the low cost of the labor, the establishment of different reforms on several sectors, and the opening to foreign trade and investment, the country has been able to develop a strong economy heavily industrialized. However, the rapid economic growth of China is resulting to numerous economic challenges that the government need to solve regarding the reduction of environmental damage and social conflicts related to the rapid transformation of the economy.

China's over population and economic growth have made the environment extremely hazardous to the health and well-being of the country. China, since its economic reforms in 1978, has rapidly modernized causing environmental problems and in addition, huge investments in infrastructure have also brought about negative ecological impacts (Jean Yen-chun Lin, 2007). Most of SMEs are often unaware of their environmental impact or the environmental legislation affecting them (UNIDO, 2011). China's current environment degradation is rapidly increasing and similarly followed by growing awareness and interests of the public. The past year has witnessed a number of major pollution incidents resulting from the anger of the public to confront industrial environmental abuses, and on micro-blogging sites the public is more engaged on environmental issues than ever (Malcolm Moore, 2009).

With the government objective to become an "innovation-oriented society", massive investment has been done in terms of research and development to develop Chinese technological capacities and knowledge transfer. This initiative comes with the government program aiming to move from "Made in China to Created in China," and pursuing a less energy intensive development path with energy consumption growth lower than economic growth to the greatest extent possible (Yojana Sharma, 2010). This would make China's fast growth more sustainable with lessened adverse domestic and global environmental impacts. However, this can be only achieved if Chinese SMEs are massively participating to the government program. SMEs play a vital role in China's economy as generators of employment, revenue and innovation. By 2007, China had 42 million SMEs, which accounted for 99.7 percent of the total number of enterprises in the country. SMEs also accounted for more than 68 percent

of China's exports and 75 percent of the new jobs created nationwide each year, while registering more than 65 percent of China's patents (Lauren Hilgers, 2009). SMEs are a vibrant force for the sustained development of the Chinese economy.

As with their larger counterparts, Chinese SMEs exert considerable pressure on the environment, not individually, but collectively. SMEs are voracious consumers of resources and energy and the result is a significant generation of waste by-products. There are a number of problems that deprive SMEs from achieving their full potential: they use obsolete technology; lack finance; lack access to export markets; lack market information; are resistant to change; and, the decision-making is done by the owners of these companies. These problems contribute to the environmental degradation of China. In this article, we aim to analyze the reasons why SMEs may be slow or reluctant to adopt efficiency measures and improved environmental practices. After having highlighted the limit of Chinese SMEs on implementing environmental solutions to achieve environmental sustainable development, we seek to illustrate the support of environmental sound technology to solve environmental problems. Finally, we present set of strategies for the implementation of environmental sound technology for Chinese SMEs.

## **2 Why Chinese SMEs are Hesitant to Adopt Environmental Practices and Technologies?**

During the last several years, numerous SMEs in different provinces of China have been the target of media, environmental protests and environmental movement campaign because of their environmental hazards. China toys scandal (Jonathan Watts, 2007; Lee Moran, 2011) milk scandal (BBC, 2008), water pollution scandal (China Daily, 2011; Jonathan Watts, 2011) are some examples of incidents resulting from the lack of environmental integrity from some Chinese SMEs. Environmental scandal represent an important threat for Chinese SMEs. It harm deeply the brand image of SMEs since customers are losing their trust on the firms' products resulting to massive economic lost. Unethical behavior can no longer hide in the dark waiting around for an investigation to ensue. Wrongdoings are in an instant communicated to the world via computers and broadcasted by media.

As traditional business models primarily emphasize the economic aspects of a company's activities (e.g. profitability and growth), the massive environmental degradation, rising environmentalism among Chinese public and enterprises environmental scandal are shifting consumers preferences to SMEs adopting a business model socially and environmentally responsible (Setareh Korkchi and Azalee Rombaut, 2006). Regarding the competitive advantage of implementing efficiency measures and improved environmental practices, the question remains why many Chinese SMEs are still reluctant to invest on environmental practices and technology?

There are several reasons why SMEs may be slow or reluctant to adopt environmental-friendly management process:

First, many Chinese SMEs are often unaware of their environmental impact or the environmental legislation affecting them. The main reason is because many of them are family enterprises based on traditional business models (Jean Lee and Hong Li, 2008). Further, many SMEs lack the in-house expertise to identify and even properly implement environmental technologies. The principal challenge facing by Chinese SMEs is not their access to technology, but their absorptive capacity, including physical, human, and institutional capacity; and the extent to which their social and political environment is supportive of entrepreneurship, investment, and technological progress (UNIDO, 2011).

Second, SMEs often don't carry substantial assets or collateral and therefore have difficulty accessing conventional loans and credit. This lack of resources often leads to SMEs being risk-averse and less willing to invest in new environmental technologies; partly because the payback period of these investments is often over several years. Unlike larger companies, Chinese SMEs are limited in the scope that they can rely on internal financing and are therefore much more dependent on private external sources, whether through joint ventures or third parties. These include inadequate availability of working capital, banks insisting on collateral and third party guarantees, and a risk-averse banking system for small projects etc. Furthermore, banks generally perceive small projects as being high risk due to non-disclosure by the borrowers and lack of reliable information on technology, markets, and investment potential. Although, favorable loans (such as soft or revolving loans) for improved resource efficiency have encouraged producers, especially SMEs, to adopt changes to make production more efficient. However, SMEs commonly have difficulty accessing conventional loans, as they are often family enterprises lacking the necessary collateral (Lauren Hilgers, 2009). The inherent limitations on

private capital acquisition are made even more binding due to ignorance about the financial advantages of ESTs.

Third, SMEs also tend to have a short-term economic perspective, which often results in the perception that environmental management is peripheral to core business. The WWF (2010) survey on social responsibility and sustainability of Chinese companies has shown that 92% of the respondents said that they have adopted a sustainable development strategy. However, there exist differences between the positive expectations held by Chinese SMEs and their practices in reality. When asked which aspect of environmental protection is most important, relatively few companies said it was technological innovation. Only 32% of them suggested that technological innovation could be developed as a solution to reduce energy and natural resources consumption, and only 9% of the companies mentioned that they cooperate with other companies to find solutions for sustainable development. The way SMEs are organized and their operating procedures are significantly different from those in larger companies. SMEs are unlikely to have an environment division or a designated specialist responsible for environmental compliance and management in the company. 92% of companies claim to have formulated a sustainable development strategy, but only 50% of them have assigned departments or staff to be responsible for the coordination and management of sustainability and environmental protection. The most frequent approaches to this issue are passive, primarily donation (91%) and organizing employees for CSR events (77%). Additionally, proactive innovation of environmental protection and leading other companies is not yet popular, although 1/3 of the companies have started to pay more attention to 'green' innovation and hope to be leaders in environmental protection.

### **3 Environmental Sound Technology Contributions to SMEs Environmental Sustainable Development**

Persuading Chinese SMEs to develop their environmental performance is a challenging task since they need to preserve their competitive advantage and are consequently hesitant to adopt measures resulting to increased costs. Environmentally sound technology (EST) is needed for allowing economic development without significant environmental degradation. EST refers to technology that "protects the environment, are less polluting, use all resources in a more sustainable manner, recycle more of their wastes and products, and handle residual wastes in a more acceptable manner than the technologies for which they were substitutes" (UNIDO, 2005). EST is not just individual technologies, but total systems which include know-how, procedures, goods and services, and equipment as well as organizational and managerial procedures. This implies that when discussing transfer of technologies, the human resource development and local capacity-building aspects of technology choices, including gender-relevant aspects, should also be addressed. Environmentally sound technologies should be compatible with nationally determined socio-economic, cultural and environmental priorities.

In adopting ESTs, companies need to consider where the technologies fit into the five phases of product life cycles (design, production, distribution, use and disposal), and to think about not just the impact of individual pollutants, but the effects of the whole production process, which means adopting an integrated approach to pollution prevention and control. This approach includes: minimizing energy, materials and wastes used or created per unit of product; high process accuracy for the entire range of products; anticipating and preventing defects at each step in the process; system cut-off if defects are found; a workforce trained to ensure quality control at all stages. Almost all these systems will incorporate ESTs. There are a variety of general technology selection criteria for companies that, of course, include among other things: financial feasibility, compatibility with existing facilities, environmental acceptability and energy and water consumption. In technology choice, the accuracy of the selection depends on the technical capability of the recipients/end users and on the availability or data on alternative technologies.

In China, most companies currently base their pollution control efforts on end-of-pipe techniques, where the waste is treated before being discharged. This is not always the most effective mean for preventing pollution, especially when these facilities are not properly maintained. Although end-of-pipe technologies result in less waste, they have costs involved while EST, by reducing input materials, fines and disposal fees, has the potential for generating undiscovered profits. Although many people consider EST to be an expensive alternative in relation to end of pipe treatment, there are many low or no-cost options that can be implemented bringing economic returns almost immediately (UNIDO, 2009).

EST has immense potential in China and is an emerging market. The transfer of EST may produce economic benefits for all parties involved and the environmental protection will be enhanced through pollution prevention and resources conservation (Cristina Tébar Less and Steven McMillan, 2005).

#### **4 Strategies for Implementation of Sound Technology for Chinese SMEs**

Since most of enterprises make technological progress through implementation and adaptation of pre-existing technologies, the first step is to enable Chinese SMEs capacities to absorb new technologies. Building firm capability or “absorptive capacity” to enable companies to implement and adapt new technologies is critical. Knowledge and skills underpin the economic success and environmental performance of firms by providing the technological know-how or “capacity” to innovate and to adapt and adopt new technology solutions. More specifically, technical capacity facilitates the imitation and adaptation of foreign environmental technologies and improves the extent to which positive spillovers (e.g. resource efficiency) from FDI and trade accrue to the rest of the economy. Such firm capability can be obtained by programs that change the management of systems through training personnel, demonstrating the techniques for energy and raw material use, creating demonstration projects to reduce raw material, energy or water use, making limited funds available for small investments and providing resources to monitor and disseminate results. Some of these initiatives are relatively inexpensive ways to foster change (OECD, 2000).

The second step is the Chinese SMEs source of finance for EST. Many SMEs don’t often have the resources to invest in creating their own technical solutions. The introduction of “good housekeeping” procedures can yield immediate environmental and financial benefits for individual enterprises. Good Housekeeping’ refers to a number of practical measures based on common sense that enterprises can undertake to improve their productivity, obtain cost savings, and reduce the environmental impact of their operations (Rachid Nafti, 1998). Good housekeeping’ practices can provide a real economic asset and advantage for a company in terms of minimizing waste, as well as the use of raw materials and energy. Minimizing waste can enable enterprises to reduce the loss of valuable material inputs and therefore reduce operational costs. Further, the importance of official support and funding over the transfer of ESTs has reasonably successfully moved into areas such as technology demonstration, information dissemination, and partner-finding. There is a need to build linkages between financiers of small and medium enterprises and EST owners and centers, and provide support mechanisms to encourage the development of financial flows. Such linkages offer the potential to accelerate the transfer of ESTs, and to enhance the leverage obtained by public sector finance in a time of budget reductions (DESA, 1999). Financial support instruments, such as Research & Development (R&D) grants, tax-breaks, and venture capital funds are not only important for the creation of new and emerging technologies, but also for supporting the adoption and adaptation of existing technologies.

The third step is the diffusion of EST. Chinese managers may have no accounting tools to identify the costs of waste and pollution because they are hidden in overheads. In some cases, industries are just simply unaware of the technologies and practices that exist. Technological solutions already exist for many of the problems in the manufacturing and services sector; they just need to be diffused more widely among enterprises, and adapted to local circumstances. Dissemination and demonstration of the benefits of environmentally sustainable and resource-efficient industries (e.g. lower energy inputs, raw material usage) represent an effective way of fostering the adoption of new production methods. This requires a combination of effective transfer and diffusion mechanisms, along with increased capacity building within enterprises to enable the adoption and adaptation of new technologies (UNIDO, 2011). Chinese government can facilitate knowledge transfer and the diffusion of environmental technologies through infrastructures such as science parks, clusters, incubators, global networks etc.

The fourth step is the technological and financial synergy between Chinese SMEs and stakeholders. As we have seen above, official support from Chinese government and private investor represent an important factor to finance Chinese SMEs capacities to implement and adopt EST. Although, countries tend to acquire technology more readily when domestic firms have their own in-house R&D programs and when public or private technical institution and universities have close ties to industry, less than 50% of Chinese domestic companies take into consideration the environmental impacts of potential investment partners. Most companies are not aware of cooperation with NGOs and similar agencies. Just over half of the companies are unclear about whether they should cooperate with NGOs for environmental protection. Only 21% of companies said they already do, or intend to discuss the possibility thereof and nearly a third doesn’t want to cooperate with an NGO (WWF, 2010).

Furthermore, overall information disclosed by Chinese firms are not transparent enough (Ni Huan, 2011). Many Chinese SMEs have to acknowledge the importance of collaborating with technological institutions and NGOs, and solve their lack of transparency if they want efficiently implement EST and achieve environmental sustainable development.

## 5 Conclusion

China is experiencing an unprecedented economic development that both fascinates and, at times concerns the World's most advanced economies. The country has achieved a spectacular economic take off, multiplying its global weight seven times over the last thirty years, to become the second largest power in terms of nominal GDP and the first in terms of exports. However, the cumulative impacts of many Chinese SMEs exert considerable pressure on the environment. Although, many Chinese enterprises are now thinking about environmental impact throughout their product's life cycle and are integrating environmental strategies and practices into their own management systems, many remains reluctant to adopt and adapt environmental practices and EST. There are several reasons that explain why Chinese SMEs are hesitant to implement EST: many are unaware of their environmental impact or the environmental legislation affecting them; important lack of technological absorptive capacity; lack of capital to invest on environmental solutions; difficulty to access conventional loans; and short-term economic perspective.

In order to implement efficient strategies to adopt and adapt EST, Chinese SMEs have to build firm capability or "absorptive capacity" to enable companies to implement and adapt new technologies; implement "good housekeeping" procedures to yield immediately environmental and financial benefits; build linkages between financiers of SMEs and EST owners and centers, and provide support mechanisms to encourage the development of financial flows; diffuse EST through a combination of effective knowledge transfer and diffusion mechanisms; and finally promote technological and financial synergy with different stakeholders.

Although, many Chinese SMEs still have to face many challenges to harness EST to follow the path of environmental sustainable development, important progresses have already been done in terms of environmental degradation reductions, corporate social responsibility, and environmentally technological innovations. It is without no doubt that if more Chinese SMEs adopt efficient environmental practices and technologies, China will be able to achieve its objectives of economic growth and harmonious society.

(E-mail: Yixiduomr@yahoo.com.cn, 332766865@qq.com)

**Abstract:** The purposes of the architecture and interior design are to meet the needs of different groups of people's working, living, entertainment and some other requirements. So the core and essence of space design in architecture and interior design is to use emotional expression factors to produce visual stimulation for audiences; and then transform these visual stimuli into specific experience in order to make space to meet all the needs of the audiences from function to form. Through the analysis of different spatial form the basic point, line, surface combination of elements this study shows the relationships between the various elements of the combinations of space and the content of the potential language; then translate this essential language into the three-dimensional spatial form to express the emotion; to get the conclusion that the direction of innovative design of the spatial form and the emotional expression of different forms derived from the spatial elements themselves.

**Key words:** Spatial Shape; Performance; Innovation; Documentary research

## 1 Introduction

The modernists see buildings as living machines; they advocated in the form follows function; thus form its characteristics of monotonous, lack of emotion and too materialistic. Since the postmodernism architects began to consider the extension of history and so on; the form has no longer been limited by function; they pursue the innovation of forms under the premise of meet the basic functions; the emotional expression of construction has become the mainstream of the contemporary designers during their creations.

Nowadays the real estate boom in China leads to a rapidly development in architect design and interior design industry. However, the vast majorities of now a days design are attempt to meet the needs of the audience simply through the use of colors, materials and textures as well as light and the combinations of those elements; but as we know the core of constructions is the space; that is to say the purpose of constructions is to meet the requirements of space from separate individuals; of course, this requirement lies not only in the satisfaction of plane functions but also in the satisfaction of composite requirements brings by various spatial shapes. With the development of technology the spatial design of the information age have a stronger performance with the help of computers; this kind of performance is completely subvert the traditional concept of geometric space; the use of nonlinear shapes and a variety of distorted shapes make the space able to express more emotions with richer, stronger and more stimulate kind of language; of course, this connotation is directly linked to social form of the informational age; therefore, how to make better use of contemporary scientific and technological achievements to show the charm of contemporary designs is a urgent problem which contemporary designers want to solve.

## 2 Spatial Elements

Human express and transmit emotions mostly through literary or artistic works; such as paintings express emotions by using two-dimensional shapes. By refining visual language in paintings into geometric elements and systematic analyzing of the sentiments expressed by the different elements; Wassily Kandinsky found that these elements could be used in paintings and graphic designs with a purpose. Similarly, the geometric shapes in three-dimensional space could express the emotions that two-dimensional geometric elements can.

### 2.1 Point

In the book <Point and Line to Plane> Wassily Kandinsky think that the emotional characteristics of point are peace, quiet and its tension is inward. Point in the three-dimensional space could be a sphere; such as the National Centre for the Performing Arts (china) designed by Paul Andreu is a semi-ellipsoidal shape; and combine with its reflection in the water to form a complete ellipsoid. This ellipsoid has an inward tension which brings concise and stable; gentle and beautiful; harmonious and restrained feelings to the audience.

### 2.2 Line

Lines can express various emotions; different form and different directions of lines can express different emotions. The type of line is divided into three categories—straight lines, polylines, and curves according to the different forces exerted on lines.

#### 2.2.1 Straight line

The straight line is formed by a point which moves with an unchanged direction; these lines with features of concision and unlimited possibilities. Straight lines play a very important place in the modernist architectural space which esteem of less is more.

The different directions give a straight line of different emotions. The performance of the horizontal straight lines is cold and infinite; the vertical lines express the possibility of warm, the rising momentum can also be reminiscent of plant growth, the vitality of life which makes them opposite to horizontal straight lines. In addition to the horizontal and vertical lines there is a combination of arbitrary linear; the combination expresses unstable emotional momentum to split and break the plane.

#### 2.2.2 Polyline

The polyline is a straight line with external forces; the size of the force determines the angle of a corner in the polyline; the stronger force makes the angle the smaller and the rebound momentum greater. The polyline commonly used in the performance of grief after suffered the great harm; such as the top view of the Jewish Museum Berlin is a polyline composed of acute angles which is subject to powerful external forces from multiple directions; but also contains a powerful rebound momentum. Daniel Libeskind use such a typical polyline to the performance of the persecution suffered by Jewish and a strong consciousness of resistance.

#### 2.2.3 The curve

The meanings of the curves present in those arcs which compose curves. Arcs' formation requires three tension; one of which is opposite with the other two. The arc shows the toughness of the curve and the rebound momentum hidden in. Therefore, curves are often used in the place that needs a relaxed and vibrant surrounding such as the design of waterfront space; in the design of Benidorm Seafront designers use varied the shape of curves to echo with waves, adding vitality to the space and also to meet the functional requirements of coastal space for rest and recreation.

### 2.3 Plane

Based on the constructivist's theory, the emotion of a plane decided by those elements form the plane and the methods of combinations. Different elements make different sounds, the size and position of those elements determine the main emotion of the whole picture. Therefore, the selection and combination of elements have determined whether it's success or not of express the specific emotion.

In the composition of Falling Water, the horizontal elements have occupied dominant positions; its form language is calm and peaceful. The scattered arrangement makes sure the plane not to feel dull; but two weak vertical elements in a relatively central location will strength the sound of vertical elements; the sound of this combination shows more peaceful than movement. The design intent is to emphasize the natural properties of the building in order to integrate the building into a tranquil natural environment; but at the same time as to meet the function of life the construction cannot looks like too boring; thus the vertical elements of the building added some vitality for the plane.

### 2.4 The non-linear shape

Strictly speaking, all natural forms are nonlinear shapes; the linear forms are the results of natural form though simplify and summarize with the help of mathematical methods. In recent years due to the development of computer-assistant design and engineering advances in construction the non-linear form can be built. The nonlinear form becomes more and more in contemporary designer works because of its infinite possibilities and new and peculiar spatial experience.

The appearance of the non-linear form will change unpredictably with the changes of the points of view; so it's impossible to express specific emotions in all aspect. And it's difficult to find separate point, line and plane elements on the appearance; so the constructivist method cannot use to analyze the emotional features of nonlinear forms. The tensions of non-linear forms are three-dimensional; the form is a result of numerous external forces; but in order to make it separate from the emotion of the point form there must be some of the forces showed out those forces determine the momentum and emotions of the non-linear form.

## 3 Proportion and Scale

### 3.1 Proportion of the form

Proportional relationship between shapes determines the strength of the sounds of forms in the

space; no space could only formed by one shape, it must be composed of a variety of shapes. Such as the elevation of Barcelona Pavilion formed not only by a single horizontal elements there are vertical elements in the space; but the proportional relationship between the two forms is very clear- the tension of the horizontal direction was significantly stronger than the tensions of vertical shapes; so the audiences' initial feel of form is its emotion expressed by horizontal elements these are quiet and broad.

### 3.2 Scale of the form

The spatial scale refers to the size of the shape and the distance between shapes which can express emotions in the space. The use of scale could make tremendous impact on the emotion of the audience in the space especially in the interior design. The greater the shapes are the weaker the affinity shows; if the distance between shapes becomes smaller compares to the scale of the shape it conveys to the audience a greater pressure; which explains why people live a life in metropolis all of skyscrapers easier to be anxiety and feel depressed.

## 4 The Performance of Emotions

One emotion is not only corresponding with one visual experience; for example, beautiful can be used to describe a single flower and can also be used to describe the dance; beautiful can be static scenes and also can be dynamic visual experiences. So the expression of emotion must first choose the most common experience that the story we all familiar about. The second step is to select spatial elements; using accurate space elements to perform the story and scenes. Finally, to determine the proportion and scale of the form element and organize those elements with the appropriate form; thus completing the spatial composition to express a particular emotion. I will express four emotions-throb, grace, miserable and stun as examples in 4 separate space of 9 m\* 5m \* 8m to prove the feasibility of the spatial elements could express a particular emotion.

### 4.1 Throb

The explanation of throb is a flustered heart with an excited mood; it can be likened to the mood when one seeing his or her valentine. Lot of people have the experience of waiting for someone in the airport or train station; when our sight searching the crowd we will feel confused and disturbed and when finally found the target the throbbing mood appears instantly and then restore to calm right again.

Select two elements of two opposite emotions - the horizontal element and vertical element; then organized multiple horizontal elements in the space densely and randomly to create a loss and quiet atmosphere; place the only vertical form in a location away from the audience close to the wall and when the light shine on the horizontal elements audience's attention will be focused on the vertical elements and bring emotions of the audiences' out of the confusion to the climax; the throbbing emotions appear instantly.

Figure 1 Picture of Throb Space

### 4.2 Grace

Grace has many characteristics such as harmonious, delicate, light, fresh, elegant, etc.; so the shapes been chosen must be static, flexible, with no conflict or contradiction. Ballet contains all these features; the scene in the ballet Swan Lake when swan dancing in the moonlight is a graceful visual experience; so the elements could be the beautiful and gentle curve with slightly undulating surface signify the lake surface and the swan neck.

Beautiful space must have simple and elegant features; so only two elements organized in the space a horizontal elements and a vertical elements; use small ups and downs of non-linear surface instead of the horizontal ground and brings a serene feeling to the audience; the vertical non-linear shape been

placed on the main position; the light and soft feature are highlighted in the sunlight. With the utilize of characteristics of the nonlinear shapes; the audiences in the space are able to observe the beautiful changes of the shape from different angles like a gentle and soothing ballet dancer's dance.

**Figure 2 Picture of Graceful Space**

#### 4.3 Miserable

Miserable refers to the desolation and sorrow, is often used to express feeling when separated with friends and relatives or life to death. Helpless old people, orphans or other vulnerable people in novels or movies often convey a miserable mood to the audience. To create a cold and depressing space with a small-scale soft shape placed in the center; with such a strong contrast to highlight the theme of the vulnerable and helpless, as an expression of miserable mood.

Cold and unfriendly space is often reflected in the large-scale and hard straight shapes; use these shapes densely arranged in front of the wall facing by audience and overlay those shapes to strengthen the pressure of shapes. The horizontal shapes scattered and interspersed above the ground; on one hand could strengthen the pressure from the top and on the other hand split the light from the top; with the effect of light and shadow to enhance the miserable mood. The main part has been shaped into the small-scale soft shapes and the contrast between the shapes and scale expressed the miserable mood.

**Figure 3 Picture of Miserable Space**

#### 4.4 Stun

Surprised and shocked when seeing a very beautiful scene is the emotional characteristics of stun. Stunning mood often created by nature; I was shocked when the first time I saw the scene of Snow Mountains. The image of the mountain is rise and full of change especially the endless variations of light and shadow created by the sunshine

Organize vertical forms with upward trend to imitate the shape of the mountain; the highest shape should taller than 4m to create a looking up angle for the audiences. By changing the skylights shape to lead irregular sunlight into the space; as the sun moves the light and shadow changed smoothly on the shapes. The vagaries of the beauty bring audiences a stunning experience.

Figure 4 Picture of Stunning Space

#### 4.5 The Jewish Museum Berlin

designed by Daniel Libeskind. The museum would like to tell a story about the bloody massacres and brutal persecution of the Jewish during World War II; the story is a Jews in concentration camps suffered the oppression and torture, witnessing the death of his companions and crazy massacre and desperately wanted to flee from the camp. Though the ups and downs he could see the distant hope but the constant disappointment eventually brought about despair to the fate.

The point of the museum space is oppressive, the fear of death, disappointed, and finally in despair. The form of the spatial shapes is hard and straight, the scale of shapes is much larger than the scale of human body; the space is narrow and compact in order to express audiences with pressures. The space indicates the hardships of the escape process with the narrow and long space; the huge and sloping walls create a feeling of constriction and a tense atmosphere; bright and high skylights above show the distant to hope; dark corner exudes the fear of death and the unknown future; finally, the museum has no exports express the despair to all the audiences.

#### 5 Conclusion

Consciousness itself has instinctive reaction to spatial forms; this reaction is direct, without thinking and doesn't have to transform by experience. More and more designers are realizing through the use of spatial elements can achieve the purpose of expressing a particular emotion; this language compared with other languages-color, material, and the mechanism is more simple, more direct and more powerful. Due to the differences of personal experiences; they would choose different shapes and organized in different ways when it comes to express the same emotion; so the innovations of space are endless. As a new methods to express moods in space the use of spatial shapes must base on a clear understanding of the sentiments expressed by the spatial elements and then through the combination and organizations of elements to achieve the purpose of accurately expression of emotion.

**Abstract:** With the location theory, this article lays a great emphasis on programming problems such as the choice and allocation of key location factors including logistics hinge, logistics area, logistics center and terminal distribution network in the development of logistic industry. It constructs a model or mechanism of related factors programming, and explores the logistics industry's status and function in the process of urban-rural integration. In addition, it also comes to a conclusion that these factors are both cores and joint points in the integration of urban-rural resources, with a direct influence on the strength, speed and density of urban-rural integration.

**Key words:** Urban-rural integration; Logistic industry; Location factor

### 1 Introduction

One of the limitations in China's modernization is the speed of rural civilization progress, while urban-rural integration is the crucial pattern to speed up rural civilization promotion. As a source for third profit in human society reproduction, the logistics industry plays a leading role in the urban-rural integration. The analysis on location factors in the logistics industry will accelerate the agglomeration and restructuring of urban-rural resources.

Location factors are defined by Professor Li Xiaojian as the influential reason for location subject distribution, with impacts on certain natural, economic and social conditions and factors. In the early 20th century, a German economist Alfred Weber published Theory of the Location of Industries (1909), became the first one who advanced the concept of location factor. From the perspective of economic location, he studied on industrial production activities of production, circulation and consumption in social reproduction process. And he pointed out that, productive places are determined by location factors, which attracted enterprises into a site with lowest production expenses and highest cost-saving expenses. In 1927, Harshorne R., an American geographer, adopted the concept of location factor in Location as a factor on geography. Notice of National Major Function oriented Zoning, printed and distributed by the State Council on 21st, February, 2012, shows the role of location factor in economic and social development in depth.

Location factor in logistics industry mainly refers to logistics hubs, logistics parks, logistics centres and terminal distribution nodes. This article aims at further exploring the programming, distribution and influence of location factors with related location theories and positive experiences.

### 2 Scientific Programming of Location Factor in Logistics Industry

One of the crucial indexes in urban image standard is urban efficiency, and the core element of urban efficiency is logistics. Since in the flow collection of people, goods, information and capital, the flow of goods plays a backbone's function, a scientific programming of location factor in logistics industry is significantly needed.

#### 2.1 A Macro-distribution of Logistics Hub

A hub is an important component element of comprehensive transportation system, and centrum in operation coordination and combined transport organization. Transportation centrum is a multi-functional transportation complex formed in the process of several transport patterns or trunk lines' cross-cutting and convergence. With the development of China's transportation and logistics management conception, the comprehensive transportation system structured by various transport equipments has gradually developed into a complex system combined by equipment, information and

---

\* This paper is supported by China society logistics research subject in 2011 (code: 2011CSLKT072), Ningbo University of Technology research funding project (code: 0080011540088) and 2010 ' Henan province postdoctoral programs (code: (2011)8-10)

transport organization, and has become a vital carrier in logistics development.

A logistics hub is a comprehensive integration of logistics facilities, which relies on comprehensive transportation, with a close inter-cooperation, rational division, convenient transport patterns and functions of inter-regional transferring, exchange and connection of main logistics. A logistics hub is usually located in centre cities of logistics, with a few in important logistics node cities.

The distribution of a logistics hub is influenced by regional city type. The geological distribution of plain city, mountainous city and costal city has a direct impact on the density of logistics hub distribution. This is because the type of city determines the logistics cost in the city. Plain cities have advantages in road transit, railway transit and air transit. Mountainous cities regard air transit as main, road transit and railway transit as secondary. In costal cities, marine traffic has a more obvious advantage, while road, railway and air transits are changing in different conditions in plain and mountain areas.

The distribution of logistics is generally in freight transfer cities, which is determined by logistics cost. Logistics cost is mainly consisted by transfer cost and costs of storage, handling and trucking in stations. Logistics cost(Lc) is a function of many variables, including transport distance(d), transport method (m) and place cost(Pc).

$$Lc=f(d,m,Pc) \tag{1}$$

Among four common transport methods, including air transfer, railway transfer, road transfer and water transfer, the long-distance transfer cost of air transfer is the most higher, and then are road transfer, railway transfer and water transfer. The relationship between transfer cost (Tc) and transfer distance (d) is demonstrated as Figure1.

Figure 1 The Relationship Between transportation Cost and Transportation Distance

Figure 2 Location Map of Logistics Hub

Suppose the good's ton-kilometre fee is 0.20 Yuan, the transfer fee of Company A from O1 and the transfer fee of Company B from O2 with opposite directions can find a common location (shown as in the area BB1B2 in Figure2), according to the long-distance decremental conduction of logistics cost and transfer fees. Since point B makes the vehicle fee from O1 and that from O2 achieve a balance from the perspective of long-distance decremental conduction, point B is theoretically regarded as the optimum location of freight transferring.

In practical operation, transfer cost changes with different types of commodity, and different transfer methods and their fees are largely different as well. Therefore, the Marco-distribution of logistics hub can be confirmed on the scope as mentioned above when it is integrated with regional true statistics.

**2.2 A rational choice of logistics area**

As the downstream node of a logistics hub, logistics area is an emerging logistics distributing pattern produced in a certain period of logistics industry development. In space, it is a central-distributed place of various logistics facilities and different kinds of logistics enterprises, as well as a logistics assembly point with a certain scale and comprehensive service function. In fact, to rationally program a logistics area, is not only helpful to avoid disordered distribution of logistics centre and distribution centre leading to problems such as land resource waste and serious influence on city traffic, but also beneficial for logistics enterprises to get both scale benefit and concentration benefit, so as to rapidly accelerate an effective development of logistics industry.

Since logistic area is an important component of regional economy, in choosing it rationally the boundaries model of market areas of two producers under the condition of income decrease suggested in Zone theory and shoe leather industry written by American economist Hoover can be referred to. Because logistic area performs the function of store, process and transportation, etc, the logistic park operation cost in addition to influenced by store, process and etc factors mainly take into account of transportation. Logistic area as intermediate node of logistics operation, under the condition of limited coverage area freight increase as downstream node far away from the logistic park will inevitably occur, at this time, and the best boundary of logistic park P1 and P2 market area is intersection E of Hoover boundary (shown in Figure3)

**Figure 3 The Market Dividing Point of Logistics Park**

In actual operation, factors which influence the layout of logistic park still have the number of regional city, industry development degree, urban and rural resident density and topography distribution and etc. Confirm the area of logistic park we generally consider the following contents:

(1) Estimate the immediate and long-term cargo throughput of logistic park (t)

Warehouse capacity tonnage of the park = the annual throughput/ annual turnover

Estimate the required warehouse capacity tonnage according to throughput and take accounts of annual turnover of park cargo.

(2) Estimate the used land of the park(s)

The land area of the park can be deemed as the sum of warehouse land, yard land, processing land and auxiliary transportation land. Calculate warehouse or workshop area use ratio, load of unit area, building storey, building density and etc .

Warehouse land area (s<sub>1</sub>) =(Warehouse capacity tonnage × Into the warehouse coefficient) / (Load of unit area× use ratio of warehouse area× storey × building density

Yard land area ( $s_2$ ) = [ Warehouse capacity tonnage  $\times$  (1- Into the warehouse coefficient)] / (load of unit area  $\times$  use ratio of warehouse area)

Workshop land area ( $s_3$ ) = (park processing tonnage  $\times$  unit processing area/ use ratio of workshop area)

Auxiliary transportation land ( $s_4$ ) is confirmed according to multi-modal transport and the relevant cargo throughput.

Therefore, The park land area  $s = s_1 + s_2 + s_3 + s_4$  (VI)

### 2.3 A specialized identification of logistics centre

A logistics centre is a facility and institution which is set up to receive and deal with purchasing order information from downstream customers, finish tasks like centralized storage and processing of bulk merchandise from upstream suppliers, and batch transfer to downstream customers. A modern logistics centre is a comprehensive logistics centre with an integration of various transport methods, including air, road, railway or water carriage terminal.

Modern logistics centre is the multiplier of enlarging location advantage. Modern logistics centre plays an important role in social circulation field and supports the whole logistics network. It not only plays an important role in optimizing the logistic network but also performs the link up, coordinator and hub role in the circulation infrastructure of the whole society. Whether Logistics element in any area such as airport, dock, railway, land route, freight centre and kinds of commercial networks can play their roles and realize expected design ability, the modern logistics centre does perform the multiplier role. Only with the support of transition and distribution role of modern logistics centre can circulation infrastructure function be enlarged and logistics condition and logistics efficiency get improvement. In one sense, lacking modern logistics centre will inevitably result in a waste of infrastructure and circulation element resource within the region. The defective development of modern logistics centre also severely affects the effective performance of infrastructure function.

The modern logistic center is the host platform of developing modern circulation. The modern logistics is marked by transportation rationalization, storage automaton, package standardization, load and unload mechanization, processing trade integration and management network informatization. The modern logistics center as rear-service economy department of chain enterprise provides the host platform for the modern logistics, playing an important role in the operation of management and having already became the main site to generate economic benefit among time and space which connects production and consumption and solves supply and demand conflict. The operation of modern logistics center can realize minimum circles, shortest delivery distance, lowest cost and maximum benefit. The modern logistics center elongates circulation industry chain, expands the circulation industry space and efficient allocation of circulation resources.

The modern logistics centre is an organic combination of material flow and information flow. The modern logistics centre achieves the unification of business flow, material flow, information flow and capital flow, which gradually become the centre of commodity of collecting, distributing, processing, commodity trade, price-forming, information-published, inspection and quarantine. With the performance of processing and supporting roles such as online transaction, electronic clearing, forward business and regional purchasing, professional logistics personnel are depended on to improve the informatization, modernization and internationalization standard of modern logistics.

The specialized identification of logistics centre is divided into two aspects. One is to achieve the specialization of logistics products, concentrated on transport, storage, processing or distribution of one certain type. Two is to achieve the specialization of logistics expertise. After a long-term operation, logistics centre has a production-supply-marketing integration consisted with specialized teams, tools and routes as well as certain customers.

Since most of modern logistics centres have not reached a specialized level, we need to speed up specialized integration to meet the demands of rapidly upgraded urban-rural integration distribution. All the circles from the informationalized transformation of enterprises themselves, to the confirmation of specialized products and certain routes, and to the improvement of personnel qualities need to be intensified.

After the specialized logistics centre is confirmed, reasonably choosing the site is undergoing. The choice of logistics centre site is restricted by place of manufacture of logistics products, category, upstream enterprise, targeted customer factors. The choice of logistics centre site directly affects the cost of each activity of the centre at the same time relevant to the normal operation and development of the centre. So the choice of logistics centre and layout must base on sufficient investigation and analysis

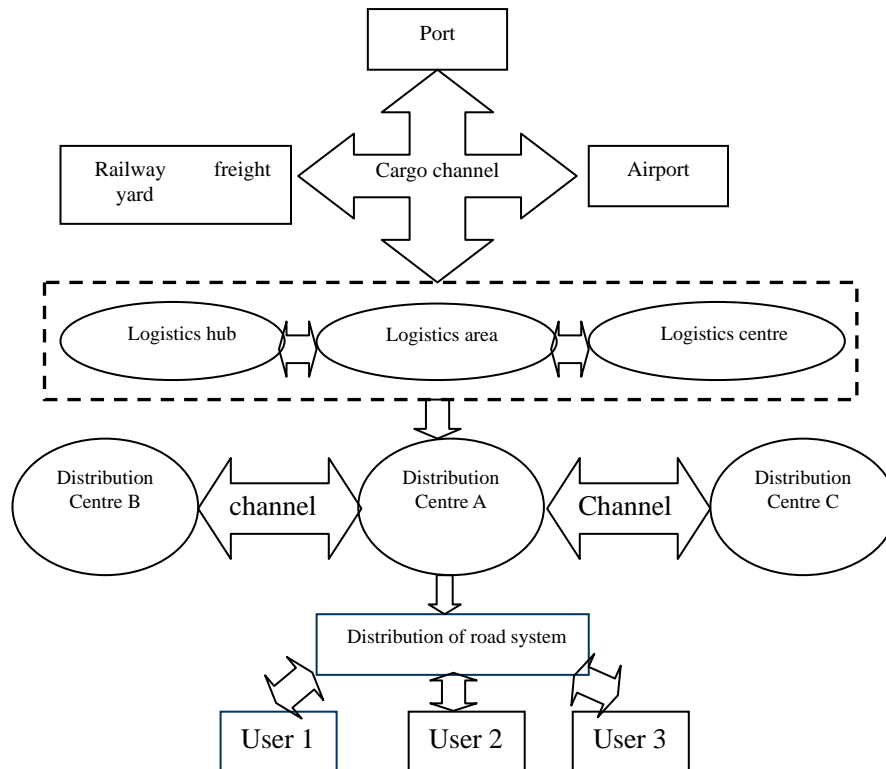

taking account of the characteristic of self-operating, the features of operating commodity and the surrounding traffic condition factors, which makes detailed analysis based on the current condition and prediction to choose the site of logistics centre. The basic premise is the vehicles “could come into, go out”.

**2.4 The network of terminal distribution node**

Terminal distribution node is at a relatively important status in logistics activities, due to it pays great attention to the systematic principle of logistics. The stronger the concept of systematic logistics is, the more emphasis will be put on overall coordination, smooth and optimization. Terminal distribution node is on a position that connects the system, and it also represents the overall level. Logistics nodes in modern logistics network lead a crucial role in the optimization of the whole logistics network. By the look of development, it not only performs general logistics functions, but also performs more and more functions of nerve centres, such as managing and information processing. It is the soul of the whole logistics network, and therefore, it is given more and more attention.

The setting of network distribution nodes encounters limitations, like the business volume of distribution enterprises, the practical requirements of target customers and urban traffic pressure. The few network nodes are beneficial to save fundamental facilities’ cost and make the large-scale operation of distribution centre much easier. But the practical service level is not helpful to open and occupy target market. Since antinomy is an existing problem of many links in logistics businesses, a scientific overall planning is necessary when pursuing an overall optimization and rationalization of distribution network nodes in the logistics field of view.

The planning of distribution network nodes should take the support of logistics fundamental facility platform into account, which includes distribution centre, cargo channel, foreign ion transport fundamental facilities and distribution road system. A distribution centre is a key and breakthrough point of integration and optimization of regional logistics systematic resources. Cargo distribution road system is a indispensable element of realizing the connection of high-speed road, airport and railway, and influencing the achievement and efficiency of goods as well. The distribution network structure is not only limited by transport dock ports, railway goods yard and airport, but also influenced by the logistics hub, logistics area and logistics centre of upstream nodes. Meanwhile, it has a close relationship with the optimization level of distribution pattern. The relationship among fundamental facility elements of distribution network nodes is shown in Figure 4.

**Figure 4 The Urban-Rural Distribution Element**

### **3 The Impact of Logistics Industrial Location Factors on Urban-Rural Integration Process**

Urban-rural integration is neither to connect urban and rural areas with reinforced-concrete-structured buildings, nor to cancel the existing space of agriculture. Instead, it is to sequentially take on a new visage with co-existence of primary industry, secondary industry and third industry. It means the living standard, civilized literacy, recreational activities, traffic and living condition in urban and rural areas to meet an integrative standard. To achieve this, location factors in logistics industry will undoubtedly play a promoting role.

#### **3.1 Timely goods support the equality between urban and rural areas**

Urban civilization itself integrates various functions, including living, business, office work, going out, cultural entertainment, social activities and traveling. Through methods of compound functions, mutual impacts and mutual value chain, urban civilization forms a comprehensive urban system with high intensity and convenient living standards. One of the core connotations of urban civilization is the timely accessibility of goods in demand.

If the planning of location factors in logistics industries confirms the density of nodes according to the geographical features of urban-rural areas, set up a specialized direction of logistics centre according to the needs in regional economic development and citizens' consumption desire, build docking facilities of logistics transport patterns such as airport, port and station, according to fast-response objects, overall-planned logistics location factors will inevitably realize the timely accessibility of goods movement.

The timely accessibility of goods meets the consumption demands of urban-rural citizens. On the premise of fully covered information network, the timely delivery of on-line goods and the household distribution of daily necessities will increase the living taste of rural residents who stem from idyllic sceneries, improve psychological index of urban-rural equality and accelerate the integration of urban-rural living concepts.

#### **3.2 The reduction of logistics cost in promoting urban-rural integration**

A rational program of location factors in logistics industry will inevitably form the optimization of logistics pattern and logistics routing, so as to realize the minimum of logistics cost. As the experiences of advanced countries' urbanization process show, when the adequate and systematic service level achieves a certain height, a trend of suburbanization in urban development will be presented, with continuous urban line or rural cities.

In some degree, the distribution of logistics network has inter-attractiveness, devoting to concentration effecting the construction of residential settlement. Therefore, the planning of urban-rural integration has to consider the logistics network program as main content, and the minimum node of logistics cost as the ideal residential settlement. In line up with such standard, the construction of new rural or urban areas will have a sustainable development vigour and dynamic.

In the process of urban-rural integration, the largest difficulty is the removal and reconstruction of residential settlement. The integration of urban and rural areas will be promoted effectively, if government proactively injects a certain number of expenditure into the construction of logistics node network, increases the intrinsic value of newly programmed residential settlement through inexpensive logistics cost and directs residents' expectation by it.

#### **3.3 The upgrade of logistics products in promoting urban-rural civilization**

The transformation of ticketing methods in spring rail put migrant rural workers who are the largest group of floating population into a passive position. Consequently, it requires the buyers to have relevant knowledge background when buying tickets through advanced online ticketing method. With the improvement of informationalization level, online marketing, e-commerce and household distribution will be an important part of urban civilization in the future, and the concept of non-core business outsourcing will rapidly penetrate into residents' consumption idea.

As a vital component of modern service industry, the speed of logistics industry's transition and promotion is also accelerating. Three sides, logistics enterprises, logistics industry and government, will research on the upgrading problem of logistics products according to market direction. New products of logistics enterprises, new leagues of logistics industry and new policies of local government will jointly create a fair and competitive environment for new logistics products to exist, compete and develop, in order to realize a healthy upgrade and evolution of logistics industry.

For logistics industry as a significant element of social civilization, the upgrade of its products will inevitably improve the civilization grade of the whole society. The upgrade of logistics products fully

demonstrates a series of advanced concepts, such as rapid response, delayed production and personalized service. The formation of these concepts will pull the progress of behaviours and good social behaviours will naturally promote the whole urban-rural civilization.

#### **4 Conclusion**

The agglomeration of reform and opening up achievements over the past three decades have broken the binary structure in urban-rural areas in China, with the pace of urban-rural integration quickening. The status of location factors in logistics industry during the urban-rural integration process cannot be ignored. Many key elements including logistics hub, logistics area, logistics centre and logistics terminal distribution network are both a main part and a binder in the integration of urban-rural resources. The level of optimized distribution and scientific programming of these location factors have a direct impact on the aggregation strength, speed and density of urban-rural integration. Due to a serious unbalance of production development level in China, the research, development and utility of location factors in logistics industry in some developed costal areas have won initial success, while how to essentially perform the functions of location factors in logistics industry still has a long way to go.

# The Perceived Destination Image of Hangzhou City of China as Received in the Travel Blogs of Western Tourists

Xiao Mali, Bao Yafang, Sun Zhia

School of Tourism and Health, Zhejiang Agriculture & Forestry University, Hangzhou, 311300, China  
(E-mail: xiaomalistudy@hotmail.com, boyafan@126.com, curelandscaper@tom.com)

**Abstract:** This study explored travel blogs as a manifestation of travel experience, along with the destination image of Hangzhou city of China from the perspective of western tourists. Frequency analysis, semantic network analysis as well as content analysis were taken in this study which aims to reveal the perception of western travelers to Hangzhou. The data for this study was from the blogs of western tourists who had been to Hangzhou. Empirical results revealed that the overall perceived destination image of Hangzhou was positive, with particular strengths in tourist attractions and major weaknesses in meals and transportation.

**Key words:** travel blogs; Hangzhou; destination image; Western tourists

## 1 Introduction

Destination image which provides an important basis for consumers' purchase destination influences tourist decision making and, consequently, their behavior and destination choices.<sup>[1]</sup> Destination image formation and psychological characteristics help to shape the image, develop marketing strategy and promote the core competitiveness of a particular destination.<sup>[2]</sup> In this study, Hangzhou was chosen as the tourist destination for this qualitative blog data collection. In 2011, as the fifth largest inbound tourism city in China, Hangzhou received more than 3 million inbound tourists—11.1% increase over the previous year (CNTA, 2012). For selling points of Hangzhou in its outbound tourism market, researchers had reached a consensus—selling points should vary in different markets. Thus, in order to promote the outbound tourism market of Hangzhou in western countries, it is necessary to conduct a study about the destination image of Hangzhou from the perspective of western tourists. Up to now, there are some scholars who have conducted latent researches on the destination image of Hangzhou from the aspect of the tourists' perception. However, from the view of travel blogs, few studies have been done. The effects of travel blogs on destination image have been largely overlooked. Blogs present a new and easy means of experience-sharing, where both positive and negative electronic word-of-mouth are exchanged.

This sharing of information has undoubtedly had a direct impact on destination.<sup>[3]</sup> In this study, frequency analysis, semantic network analysis as well as content analysis are taken which aims to reveal the perception of western travelers to Hangzhou. The data for this study is from the blogs of western tourists who have been to Hangzhou. The purpose of this study was to, from a marketing perspective, assess western tourists' opinions posted on leading Internet travel blogs to better understand the experience being communicated about the strengths and weaknesses of Hangzhou.

## 2 Literature review

### 2.1 The perceived destination image and its impact on tourism

Researchers stated that the perceived destination image plays an important role in consumers' purchase decisions, consequently, their behavior and destination choice.<sup>[4]</sup> Foreign scholars have reaped bumper academic achievement. Gartner put forward eight types of destination image agents, including overt induced I image, overt induced II image, covert induced I image, covert induced II image, autonomous image, unsolicited organic image, solicited organic image and organic image.<sup>[5]</sup> Echter and Ritchie undertook an empirical analysis, settling the essential elements which engender when the perception striking tourists.<sup>[6]</sup> Gallarza et al. reviewed the methodologies of empirical studies of destination image.<sup>[7]</sup>

### 2.2 Tourist information search behavior and travel blogs

Tourism is an information-intensive industry and the tourist organization markets their products and builds customer relationships through various channels. Internet has become one of means for tourists to seek travel-related information, which is more effective and flexible compared with the traditional types of media such as advertisements, personal experience, advice from friends and relatives. The development of Internet is inevitable for its extensive source of pre-purchase information. It has

been found that an increasing number of consumers were relying on online opinions when making decisions<sup>[8]</sup>, which is especially true for tourism products because of their features of exclusivity and untransferability.

In the Internet era, consumers become “the media” themselves.<sup>[9]</sup> The web provides consumers with various channels, from which they are able to access the others’ opinions of tourist destinations. Bloggers judge online blogs to be more trustworthy than other types of media.<sup>[10]</sup> Travel blogs, as narratives, provide textual artefacts of consumer identity and sense-making and narrative analysis of these texts offers a commonsense approach to developing a deeper and more meaningful understanding of tourists’ experiences and behavior.<sup>[11]</sup> Recently, researchers suggested that travel blogs provided a new way of understanding consumers’ perceptions of a destination, its products, and service. After analyzing travel blogs on Charleston, South Carolina, Pan et al. (2007) identified strengths and weakness of the destination. Choi et al. (2007) compared the image of Macau represented in different online information sources. Similarly, Wenger (2008) analyzed blog entries relating to Austria and found that blog authors are quite different from Austria’s market in demographics and touristic characteristics.<sup>[12]</sup>

### 3 Methodology

In this study, diverse means were adopted to investigate further relationship between bloggers and the tourist destination as well as grasp insight into the meaning of blogs. The text contained in blog was analyzed by frequency and semantic network analysis, after that, the text of each gathered blog entry was analyzed by content analysis.

#### 3.1 Data collection

An essential reason for choosing Google as the search engine is that Google’s PageRank algorithm ranks documents based on popularity, which was put forward by Brin and Page in 1998. What’s more, Google is generally identified as the most popular and reliable search engine through the world. As a result, two top travel blog sites travelblog.org and travelpod.com were selected in terms of the rank of Google. These sites have a hierarchical directory of blogs (continents, countries, provinces and cities). All travel blogs on China, Hangzhou were downloaded from the two sites. Besides, all travel blogs analyzed in this study were created from December 2005 to April 2012. Totally, 127 blogs were collected up to April 18, 2012. The remaining valid 102 blogs were placed in a master file for qualitative data analysis. Each blog retained its title and identification information.

#### 3.2 Data analysis

After detailing the 102 blogs, frequency analysis, semantic network analysis and content analysis were employed in this study. In order to acquire what the greatest concern of western tourists, the frequency analysis was chosen to analyze the full text of 102 blogs. After analyzing, the high- frequency keywords were built into a semantic network. The adjacency of two keywords represents their relative distance of semantic meaning, meanwhile the relative frequencies of words or phrases and the relative distance of them reflect the correlation of their meaning. Content analysis was the third method used in this study. While classifying data, a coding and classification system was adopted to analyze the content efficiently and clearly. As can be seen in Table 1, the categories were labeled meals, hotels, transportation, shopping and attractions. Each category included subcategories. Different evaluation criteria were settled according to different items. The number of the accumulated positives, negatives, neutral comments and the percentage of negatives were the basis of the content analysis.

**Table 1 Category, Subcategory and Evaluation Criteria**

Category	Subcategory	Evaluation Criteria
Meals	By the type of cuisine (e.g., Asian, Western)	Price, products, service ,environment, other
Accommodation	By the type of accommodation (e.g., hotels, hostel)	Price, room, service, environment, other
Transportation	By the type of transport (e.g., buses, taxis)	Fare, convenience, environment and user friendliness, other
Shopping	By the type of goods (e.g., tea, silk products)	Price, service, other
Attractions	By the name of attractions	Positives, negatives

### 4 Results

As a manifestation of communicated travel experience, travel blogs express the attitude of visitors

towards Hangzhou. The results of frequency, semantic network analysis and content analysis for travel blogs presented the strengths and weaknesses of Hangzhou as a notable tourist destination in detail.

#### 4.1 Profiles

The demographic information of bloggers was acquired from the hosting sites where bloggers were permitted to post their personal portraits, disclose their gender and hometown in the traveler profiles. Despite a small minority of bloggers were from Canada, Switzerland, France, Spain and Germany, most of them lived in USA and UK. For those users who disclosed their gender, male users were more than females in this segment, with 30 females (44%), 38 males (56%) and 12 blogs owned by couples or families (13%). For the blog profiles, except for some bloggers posting several pieces for one trip to describe their experience, the most users preferred producing one posting for the description of one trip. The majority of blogs were composed after the trip, and the rest were posted the same day the trip was taken. In the blogs, the number of words ranged from 2 to 3121, and every blogs contained photos.

#### 4.2 Frequency analysis

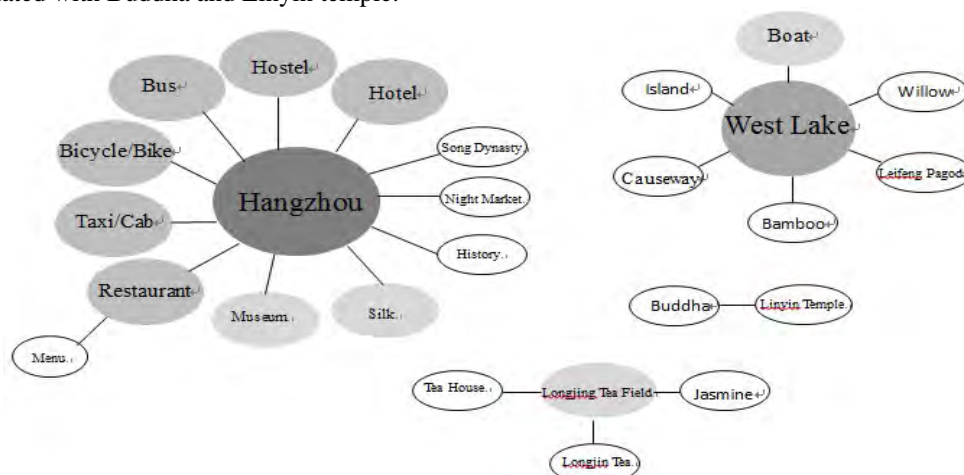

Table 2 revealed the most frequently used keywords or phrases in travel blogs. It demonstrated the priorities travelers focused on, and it expressed many aspects of travel experience in their travel blogs, including meals, accommodation, transportation, shopping and attractions.

**Table 2 Most Frequent Keywords in Blogs for Hangzhou City of China**

Keywords	Frequency	Keywords	Frequency	Keywords	Frequency
Hangzhou	307	boat	45	bamboo	14
West Lake	136	silk	26	menu	14
hostel	97	Longjing tea fields	26	Lingyin temple	11
bus	70	island	26	Tea house	8
bicycle/bike	67	history	24	Leifeng pagoda	7
taxi/cab	67	night market	19	willow	7
hotel	59	Buddha	17	jasmine	7
restaurant	51	Causeway	15	Sony dynasty	5
museum	45	Longjing tea	14		

#### 4.3 Semantic network analysis

Based on frequency analysis, semantic analysis presented a clear and valuable framework for the construction and analysis of communication content of Hangzhou. In the Figure1, a large frequent occurrence of keywords was illustrated by a larger and darker colored circle and vice versa. As can be seen, Hangzhou is the most dominant cluster with accommodation, transport tools and some other tourist attractions. The second cluster is West Lake as the major tourist attraction of Hangzhou. Three keywords related to Longjing tea field belong to the third cluster. In addition, there is also a small cluster associated with Buddha and Linyin temple.

**Figure 1 Semantic Network of Travel Experience to Hangzhou City of China**

#### 4.5 Content analysis

After the text of each collected blog was analyzed, a coding and classification system was adopted and the texts were categorized by meals, accommodation, transportation, shopping and attractions.

Every category included subcategories.

1) Meals

As Table3 shows, compared with the 51 total sentences of comment, there are only 5 comments for bars and pubs indicating that western tourists attached more attention to Chinese food but less to bars and pubs. Additionally Japanese and Korean food won more praises from bloggers. Specifically, Chinese cuisine was most often commented among bloggers, but its prices generated a relatively large number of negative comments.

**Table 3 Coding Categories and Number of Positive and Negative Comments for Meals**

Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentence	Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentence
Asian food					Bars and pubs				
Chinese food					Price	0	3	3	100
Price	1	4	5	80	Products	1	0	1	0
Products	27	12	39	31	Environment	1	0	1	0
Environment	0	0	0	0	Other	0	0	0	0
Other	0	6	6	100	Subtotal	2	3	5	80
Subtotal	28	22	50	44	Western food				
Japanese/Korean food					Price	0	0	0	0
Price	0	0	0	0	Products	2	0	2	0
Products	4	0	7	0	Environment	1	1	2	50
Environment	0	0	0	0	Other	0	1	1	100
Other	4	0	7	0	Subtotal	3	2	5	40
Subtotal	8	0	14	0					
					Total	42	28	70	40

2) Accommodation

Both bloggers who chose hostels and these who preferred hotels poured less attention to price and room. The detailed results are listed in Table4. Regarding hostels, bloggers were discontent with the service and hotels received the most negative comments on environment.

**Table 4 Coding Categories and Number of Positive and Negative Comments For Accommodation**

Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences	Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences
Hotel					Hostel				
Price	0	0	0	0	Price	1	0	1	0
Room	0	0	0	0	Room	1	0	1	0
Environment	1	1	2	50	Environment	3	1	4	25
Service	2	1	3	33	Service	0	4	4	100
Other	2	0	2	0	Other	1	2	3	67
Subtotal	5	2	7	29	Subtotal	6	7	13	54
					Total	11	9	20	45

3) Transportation

As Table5 shows, among 26comments on transportation, 65% comments were negative. All comments on buses and taxis were negative. In contrast, bicycles and boats received a relatively high proportion of positive comments.

**Table 5 Coding Categories and Number of Positive and Negative Comments for Transportation**

Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences	Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences
Buses					Boats				
Convenience	0	1	1	100	Convenience	0	0	0	0
Fares	0	0	0	0	Fares	0	1	1	100
Environment and user friendliness	0	1	1	100	Environment and user friendliness	1	0	1	0

Other	0	1	1	100	Other	0	0	0	0
Subtotal	0	3	3	100	Subtotal	1	1	2	50
Taxis/Cabs					Trains				
Convenience	0	1	1	100	Convenience	1	0	1	0
Fares	0	0	0	0	Fares	1	0	1	0
Environment and user friendliness	0	1	1	100	Environment and user friendliness	1	0	1	0
Other	0	4	4	100	Other	0	3	3	100
Subtotal	0	6	6	100	Subtotal	3	3	6	50
Bicycles/Bikes									
Convenience	1	0	1	0					
Fares	3	0	3	0					
Environment and user friendliness	1	0	1	0					
Other	0	4	4	100					
Subtotal	5	4	9	44	Total	9	17	26	65

4) Shopping

As shown in Table 6, shopping in Hangzhou received a total of 27 comments, one-third of which were negative. The categories that had the highest percentage of positive comments were tea and silk products, especially for silk products, all comments of which were positive. However the range of clothing and accessories, appliances and digital products fall shorts of expectation.

**Table 6 Coding Categories and Number of Positive and Negative Comments for Shopping**

Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences	Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences
Tea					Jewelry				
Price	1	0	0	0	Price	1	0	1	0
Products	4	0	4	0	Products	0	0	0	0
Other	3	1	4	25	Other	0	0	0	0
Subtotal	8	1	9	11	Subtotal	1	0	1	0
Silk products					Groceries				
Price	0	0	0	0	Price	1	0	1	0
Products	1	0	1	0	Products	0	1	1	100
Other	1	0	1	0	Other	4	1	5	25
Subtotal	2	0	2	0	Subtotal	5	2	7	29
Clothing and accessories					Appliances and digital products				
Price	0	3	3	100	Price	0	3	3	100
Products	0	0	0	0	Products	0	0	0	0
Other	1	0	1	0	Other	1	0	1	100
Subtotal	1	3	4	75	Subtotal	1	3	4	75
					Total	18	9	27	33

Attractions

The results revealed the diversity of travel experience in Hangzhou. As shown in Table7, attractions in Hangzhou received a total of 146comments, only 6% of which were negative. Compared with other 4 categories, attractions received the highest percentage of positive comments.

**Table 7 Coding Categories and Number of Positive and Negative Comments for Shopping**

Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences	Coding categories	Positives	Negatives	Total Sentences	% of Negative Sentences
West Lake	37	2	39	5	Longjing Tea Fields	14	1	15	7
Leifeng Pagada	5	0	5	0	Wushan Square	1	0	1	0

Botanical Gardens	1	0	1	0	Museum	57	2	59	3
Yue-Wang Temple	1	0	1	0	Song Dynasty	5	0	5	0
Dreaming of the Tiger Spring	2	0	2	0	Wushan Birds and Flower Market	1	0	3	67
YunQi bamboo path	3	0	3	0	Hideout of Linbiao	1	0	1	0
Linyin Temple	5	0	5	0	Chongyi Church	3	0	3	0
Klippe	1	2	3	27	Overall Impression	28	5	33	15
					Total	165	14	179	78

#### 4.6 Strengths and Weaknesses as Reflected from Travel Blogs on China, Hangzhou

A total of 341 comments were extracted from 102 western travelers' blogs, with 253 positive and 88 negative comments. Strengths and weakness identified in the coding process, as shown in the Figure2. Three out of four comments were positive (74.2%), that is to say, most travellers expressed their favor to Hangzhou. Looking at the major categories, the results showed that attractions were the major strengths of Hangzhou while most complaints came from meals and transportation.

Figure 2 Percent of Positive and Negative Sentences in Travel Blogs on Hangzhou

#### 5 Conclusions

This study analyzed the destination image of Hangzhou as revealed in the travel blogs of western tourists. Analysis of blogs on travels in Hangzhou revealed strengths and weaknesses of this city. The results revealed that the major strengths of the destination of Hangzhou lie in its attractions. Besides the West Lake which is the most charming attraction, the temples and museums also received a wide range of praise. The major weaknesses of Hangzhou were meals and transportation. There were unfavorable perceptions about the price of food and beverage and service of restaurants, which ask local restaurants to control the price as well as improve the service. As for the transportation, bloggers' complaints were mainly about traffic congestion which caused by the growing number of vehicles and the traffic violations of drivers, passengers as well as pedestrian. Additionally, foreigners also confused about the language barrier which was a big factor affecting their trips. Thus, to solve the traffic problems, Hangzhou government should intensify the publicity and education to improve the levels of citizen qualities. Furthermore, in order to improve the service on accommodation, hotels and hostels need to recruit good workers as well as organize staff training. Lastly, marketers have to orient Hangzhou tourism to the needs of public, highlight the strengths of Hangzhou as a tourist attraction and send the correct message conceptually to western travelers.

It is important to note several limitations of the study. First, the findings were not generalizable over foreign visitors to Hangzhou. The sample was not stratified based on demographic variables such as nationality, age and gender. Second, only manifest content was analyzed in this study. In the course of this research, myriads of photos were found along with the main text. Hence, future research analyzing the study with visual pictures to obtain a more comprehensive understanding of the image of destination would provide more comprehensive implications.

# The Research on the Sustainable Growth of Listed Companies in Chinese Steel Industry

Li Guirong, Yang Guoli, Wang Wei

School of accounting, Hebei University of Economics and Business, P.R.China, 050061

(E-mail: lgr6699@163.com, lee7301@126.com, wang790707@sina.com)

**Abstract:** Based on the development status of listed companies in China's steel industry, this essay selected 33 companies in the steel industry listed in Shanghai and Shenzhen Stock Exchange before 2006 after removed those having special conditions, such as "ST" companies whose stock exchanges were specially treated because of consecutive losses, and companies experienced a major business restructuring, etc. With the Robert Higgins' sustainable growth model, we tested the sustainable growth of the selected listed companies in the steel industry between 2006-2010 by using Wilcoxon's signed rank test. The empirical results show that the samples have not achieved sustainable growth whether as a whole or separated year by year. We also concluded that there was an increasing gap between the real growth rates and the sustainable growth rates in five years, which indicated that it was very serious for these companies to blindly pursue high-speed growth, and the financial sustainable growth in the steel industry has not got enough attentions in these companies. So it is not optimistic to achieve sustainable growth for listed companies in the steel industry.

**Key words:** Steel industry; Sustainable growth; Listed companies

## 1 Introduction

Since the 1980s, China's steel industry has made considerable progress that is crude steel production ranks first in the world year after year with an average annual growth rate of 21.1%. In 2007, crude steel production reached 500 million tons accounting for 38% of global production, realized the profit of 243.6 billion yuan accounting for 9% of the total profit of industrial enterprises and the amount of employment directly engaged in the production of steel was up to 3.55 million, which can be said the steel industry made outstanding contribution to the sustainable and rapid growth of the national economy. However, with the rapid development of the steel industry, it inevitably appears the steel enterprises' one-sided pursuit of capacity and the industry's over-expansion. Especially since the spread of the global financial crisis in 2008, China's steel industry has been suffered a serious blow, all kinds of contradictions accumulated for years of the extensive development have suddenly broken out, so that many large steel enterprises shutdown to reduce production and other conditions. According to the China Iron and Steel Association statistics, the profit of the entire iron and steel enterprises in 2008 is only 84.6 billion, declining 43.70 percent. To ensure the sustainable operation of the steel industry, the Ministry of Industry and Information Technology (referred to as the Ministry of Industry) in 2009 January launched "The steel industry restructuring and revitalization plan", trying to restructure and revitalize the steel industry.

The steel industry is the pillar industry of China's national economy and the basic industry related to national economy and people's livelihood, which has played an irreplaceable role in China's industrial modernization process. As a raw material production and processing department, the steel industry is in the middle position of the industry chain. Its development has a strong correlation with the country's infrastructure and the speed of the industrial development, so a relative fluctuation of the steel industry will have effect on China's overall economic stability and development. Therefore, the research on the sustainable growth of the steel industry has important significance to make sure sustainable development of China's economy.

## 2 Literature Review

In 1959, Penrose presented and studied sustainable growth in his enterprise growth theory preliminary. Later, Leibenstin's the road to growth model (1960), Starbuck's research on organization growth motivation (1965), Baumol's enterprise behavior, value and growth (1967) and Chandler and others' research on the growth stage (1962) studied and presented enterprise growth rate from different aspects, too. Unfortunately, for the problem of enterprises growth rate economists only made qualitative theoretical analysis and lack of rigorous logical mathematical model.

In 1977, financial expert Robert . C . Higgins<sup>[3]</sup> began to research the growth of enterprises from

the quantitative aspect and established corresponding sustainable growth model. He defined enterprise sustainable growth as: “based on the support of the enterprise financial resources which will not produce adverse effect on the enterprise growth in future, enterprise sales or assets can achieve a state of sustainable growth.” The connotation of enterprise sustainable growth is to show enterprise can't focus on short-term rapid growth, and should make the enterprise growth match with its own financial resources and the ability to obtain financial resources to enable enterprises to maintain a steady growth in the long term. It requires no matter under what circumstances, financial resources must meet the growing needs of enterprise, that is, the growth rate must be supported within a limit by financial resources. The core indicators of sustainable growth theory (Robert · C · Higgins, 1977)<sup>[3]</sup> is the sustainable growth rate. He believes that the sustainable growth rate (SGR) refers to under the conditions of issuance of new shares and maintaining current operation efficiency and financial policy, the company could achieve sales of the biggest ratio. Among them, operation efficiency refers to net profit margin on sales and asset turnover ratio; financial policy refers to dividend payout ratio and capital structure. Meeting above conditions, the real sales growth rate and the sustainable growth rate are equal. Its computation formula is:

$$SGR = P \times A \times T \times R \quad (1)$$

Among them,  $P$  refers to net profit margin on sales,  $A$  refers to asset turnover ratio, for rights multiplier, retained rate for income,  $T$  refers to equity multiplier, and  $R$  refers to retained earnings rate.

After Higgins, more financial experts dedicated to study and construct the sustainable growth model of enterprises.

Van Horn (1988)<sup>[4]</sup> defines sustainable growth rate as sales may reach the maximum growth rate based on predetermined operating rate, debt ratio and dividend payout ratio. Van Horn's sustainable growth theory is actually consistent with Higgins', that is, the increase of assets from the increase of liabilities and shareholders' equity. However, Van Horn stresses that the sustainable growth rate is the target value not the actual value and he put forward the sustainable growth rate is sales may reach the maximum annual growth rate based on pre-established management, debt and dividend payout target ratio.

American scholar Rappaport (1980)<sup>[5]</sup> put forward Rappaport Model on the basis of considering the cash flow, in which Rappaport thinks sustainable growth should be consistent with sustainable value creation. According to Rappaport's definition, the value refers to shareholder value. He believes that sustainable growth should bring about sustainable increase of shareholder value. However, high-speed growth of many enterprises not only didn't make the increase of shareholder value, but reduce shareholder value. So he put forward enduring growth that is the maximum business growth every year based on not raising new shares, locking operating profit margin and the growth of investment corresponding to every dollar of sales growth, target asset-liability ratio and target rate of dividend distribution. He thinks that the enduring growth ratio is the growth rate when cash inflows equal to cash outflows, which could be a method to measure the feasibility of a financial plan.

Coray (2003)<sup>[6]</sup> in his book *Corporate Strategy* discusses the relationship between cash flow and growth rate. By setting a series of assumptions, such as asset-liability ratio and dividend payout ratio remaining unchanged, current assets, current liabilities and fixed assets of the same percentage growth with sales and so on, he estimates cash flow and growth rate and point out that the relationship between cash flow and growth rate is a negative linear correlation, that is, when the actual growth is greater than the growth rate, the cash flow is negative, but when actual growth is less than the growth of the cash balance, cash flow is positive. So he according to this to define the growth rate when the cash flow is equal to zero as the growth rate of the cash balance (Cash-based Growth Rate), that is the sustainable growth rate.

After the above model other financial scholars have taken into key financial elements of cost control and so on and research method of gradually liberalizing assumptions to make the sustainable growth model closer to reality.

### 3 Model Selection

The above mainly introduces four sustainable growth models. Among them, Higgins' sustainable growth model and Van Horn's sustainable growth model are calculated based on accounting-caliber sustainable growth model, but Rappaport's and Coray's sustainable growth model are sustainable growth model based on cash flow caliber.

Higgins studies the enterprise financial sustainable growth from a static perspective. The advantage of his model is to answer those financial factors that influence and restrict the growth of the enterprise and the model is simple and easy to operate. Van Horn sets sustainable growth model when the company's operating efficiency and financial policy change and segment the model for the static and dynamic. Its advantage lies in researching the growth of the enterprise from the dynamic aspect, which matches to the dynamic business environment of the enterprise, but the maneuverability of the model is poorer. Rappaport Model calculates the sustainable rate from cash inflow and outflow, concise and easy to understand, but it regards net income directly as the source of cash inflow, which does not fit with the model establishment logic. Considering the above problems, this essay adopt Higgins' sustainable theory and its model to research.

On the basis of the definition of the sustainable growth rate Higgins (1981)<sup>[21]</sup> deduces enterprise sustainable growth equation, this equation based on the following assumptions:

(1) The company intends to have the growth rate the same as the growth allowed by market conditions;

(2) Managers may not be or do not want to issue new shares;

(3) The Company has and intends to continue to maintain a target capital structure and target dividend policy.

In order to increase sales next year, enterprises must also increase such as inventory, accounts receivable and other assets and production capacity. Because it is already assumed that the enterprise does not issue new shares, the cash needed because of increasing assets must be retained from the profits and the increase in liabilities. In other words, under the condition of not changing the capital structure, with the growth of shareholders' equity liabilities should be the same percentage growth, so the main factor to limit sales growth rate is the expansion speed of shareholders' equity. Therefore, the calculation model of the sustainable growth rate as follows:

$$\begin{aligned} SGR &= \frac{\Delta E}{E_0} \\ &= \frac{NP \times (1-d)}{E_0} \\ &= \frac{NP}{S} \times \frac{S}{A} \times \frac{A}{E_0} \times (1-d) \end{aligned} \quad (2)$$

In the model:  $A$  refers to assets,  $E_0$  refers to beginning shareholders' equity,  $S$  refers to current income,  $NP$  refers to net income,  $d$  refers to dividend payout ratio,  $\frac{NP}{S}$  refers to net profit margin on sales,  $\frac{S}{A}$  refers to total assets turnover,  $\frac{A}{E_0}$  refers to initial rights total assets multiplier,  $(1-d)$  refers to retained earnings rate,  $SGR$  refers to sustainable growth rate.

#### 4 Sample Selection and Data Sources

The sample that this study needs ranges for the listed companies in Shanghai and Shenzhen Stock Exchange in the steel industry. In order to avoid the negative financial sustainable growth rate calculated because of continuous loss of profits, or the over-high sustainable growth rate because of the wholesale restructuring of the business, during the analysis period companies that have continuously loss or have wholesale business restructuring are not considered. After screening according to the above criteria, there are 33 companies ultimately included in the sample.

In order to test whether a listed company is of sustainable growth, the data usually can be convinced only requires a longer period of time, and general this time should not be less than five years, otherwise the analysis is not of stability in time. To avoid accounting caliber differences, in the empirical analysis this essay selects the period of listed companies in steel industry from the year of 2007 when new accounting standards was implemented to the year of 2010 as the analysis period, which contains sample companies of 2007 to 2010 a total of four years' financial data taken directly from the report of the year, and the data of 2006 is the data of 2006 disclosed in the company annual report in 2007 adjusted according to the new standards. Therefore, this essay's analysis is based on reality and efficiency of the financial data announced by each sample company.

The above financial data comes from the annual financial report of the year from 2007 to 2010 announced by sample companies on Shanghai and Shenzhen Stock Exchange website, the financial data involved mainly includes sales revenue of listed companies, total asset turnover, total Assets at the end of the year, the beginning of rights and interests, cash dividends and net profit margin on sales, etc.

## 5 The Analysis and Result of the Sustainable Growth Model for Listed Companies in the Steel Industry

### 5.1 The calculation results of the sustainable growth rate and the real growth rate

Apply Robert · Higgins' sustainable growth model to calculate the sample companies' sustainable growth rate (SGR) and the real sales growth rate (G), the result is shown in table 1.

**Table 1 The Calculation Results of the Sustainable Growth Rate**

company serial number	2006		2007		2008		2009		2010	
	SGR	G	SGR	G	SGR	G	SGR	G	SGR	G
1	0.0584	0.1227	0.1740	0.5175	0.3791	0.4457	0.0137	-0.3826	0.0097	0.2350

### 5.2 The results and discussions of Wilcoxon's signed rank test

#### 5.2.1 Wilcoxon's signed rank test

Wilcoxon's signed rank test is used to test whether two relevant samples come from the same mean overall, or test whether the two relevant samples have the same distribution. This essay regards the sample companies' sustainable growth rate (SGR) and the real sales growth rate (G) as two relevant samples, uses Wilcoxon's signed rank test to make aggregate and annual analysis, and examines whether the sample companies' sustainable growth rate (SGR) is in accordance with the real sales growth rate (G), and whether realize the financial sustainable growth.

Wilcoxon's signed rank test can perform as the following steps:

Assume that the sample contains  $n$  listed companies, according to Higgins' sustainable growth

model, the sustainable growth rate (SGR) and the real sales growth rate (G) are respectively  $X_1, X_2, \dots, X_n$  and  $Y_1, Y_2, \dots, Y_n$ , then

(1) establish null hypothesis alternative hypothesis:

$H_0$ : The sample companies' sustainable growth rate (SGR) and the real sales growth rate (G) have no significant difference, that is,  $X_1, X_2, \dots, X_n$  and  $Y_1, Y_2, \dots, Y_n$  have no significant difference;

$H_1$ : The sample companies' sustainable growth rate (SGR) and the real sales growth rate (G) have significant difference, that is,  $X_1, X_2, \dots, X_n$  and  $Y_1, Y_2, \dots, Y_n$  have significant difference.

(2) Calculate the difference of positive and negative.  $D = X_i - Y_i (i = 1, 2, 3, \dots, n)$

(3) make the difference absolute value, arrange in numerical order and make the level, that is, determine the sequence number. For the adjacent equivalent, then take its average of sequence number as the level.

(4) restore the original positive and negative sign of the difference of each level, plus the level of positive and negative sign respectively presented with  $T^+$  and  $T^-$ , and take the smaller value  $T$  for the test statistic.

(5) Make sure the total number  $n$  of deference with plus sign or negative sign. If the difference of a matching observation is zero, it should be distinguished and the sample size  $n$  should be correspondingly reduced.

(6) In the significance level  $\alpha$  check the standard normal distribution  $\alpha/2$  quantile  $Z_{\alpha/2}$ .

When  $|Z| > Z_{\alpha/2}$ , reject the null hypothesis  $H_0$  that there are significant differences between the sustainable growth rate (SGR) and the real sales growth rate (G) of listed companies; otherwise there is no sufficient reason to reject the null hypothesis  $H_0$  that there are no significant differences.

5.2.1 The results of Wilcoxon's signed rank test

(1) the overall condition analysis of the sustainable growth of the samples

Make use of SPSS software to test listed companies' real growth rate and sustainable growth rate for five years by Wilcoxon's signed rank test, the result is shown in Table 2:

**Table 2 The Result of Wilcoxon' Signed Rank Test of the Samples' Sustainable Growth**

		N	Average of ranks	Sum of ranks
G-SGR	Negative rank	65	83.15	5405.00
	Positive rank	100	82.90	8290.00
	sum	165		
$Z$			-2.347	
Asymptotic significant (bilateral) $\alpha$			0.019	

From the result of Wilcoxon's signed rank test, the sustainable growth rate and the real sales growth rate of 33 listed companies of China's steel industry from 2006 to 2010 are not accordant, so the samples are not to achieve sustainable growth. In the five years, most part of the companies' growth speed exceeds the sustainable growth rate, which reflects most listed companies in steel industry are in the state of growth rapid and capital devoted insufficient.

(2) The test result and analysis of the year level of the samples' sustainable growth situation

Make use of SPSS software to test listed companies' real growth rate and sustainable growth rate of every year by Wilcoxon's signed rank test, the result is shown in Table 3:

It can be seen from the test results that during the process of development from 2006 to 2010 of the listed companies in steel industry, the year of 2006 basically remained the sustainable growth; the result of 2007 is not significant that can not clearly determine whether the real growth rate and the sustainable growth speed are accordant; in the year of 2008, 2009 and 2010 the real growth rate and the sustainable growth speed are not accordant. The value of  $|Z|$  increases year by year from 2006 to 2010, which suggests that the listed companies in steel industry do not achieve sustainable growth and the real

growth rate, has made increasing deviation with the sustainable growth rate in five years. It can be seen from the phenomenon that in today's modern enterprise system of continual establishment and perfection of listed companies in steel industry, the problem of sustainable growth has not been taken seriously by the companies, the concept of sustainable growth has not been in the depth mind of the companies' executives and popularize the concept of sustainable growth is a long way to go.

**Table 3 The Test Result of the Year Level of the Samples' Sustainable Growth Situation**

	2006	2007	2008	2009	2010
Negative rank	17	10	6	30	2
Positive rank	16	23	27	3	31
Z	-0.456	-1.706	-3.529	-4.815	-4.923
$\alpha$	0.649	0.088	0.000	0.000	0.000

### 5.3 The summary

The above empirical results show that:

(1) Generally speaking, the whole listed companies in steel industry do not achieve sustainable growth that 60.61% of the companies are in the state of excessive growth and the others are in the state of insufficient growth.

(2) From the analysis of each year, listed companies in steel industry of China didn't achieve sustainable growth and fluctuated seriously in the last three years. Due to the influence of the world economy's rapid development before 2007, the majority of the samples about 81.8% were in the high-speed growth state in 2008; because of the tremendous impact of steel industry suffered from the global economic crisis, 90.9% of the samples were in the insufficient growth state in 2009; due to the support on the steel industry by the Chinese government in 2010, 93.9% of the samples were in the excessive growth state. It shows that Chinese listed companies in steel industry are still in the blind follow state, generally lack of sufficient attention for the sustainable growth concept and do not adopt the sustainable growth theory to the management of companies' growth.

In a word, it can be seen from the above empirical results that whether the general situation for five years or the year of listed companies in steel industry, the sustainable growth is not positive that it did not only achieve the sustainable growth, but has made increasing deviation with the sustainable growth standard.

## 6 Conclusion

By using Robert · Higgins' sustainable growth model and Wilcoxon' signed rank test, this essay analyzed and discussed the real growth rate and the sustainable growth rate of listed companies in Chinese steel industry between 2006-2010, and found that listed companies in Chinese steel industry did not achieve sustainable growth because they made too fast growth in most years, which has influenced the healthy development of Chinese steel industry. To some degree, it also indicates that listed companies in Chinese steel industry did not carry out effective managements for financial sustainable growth.

The above research results show that even though Chinese steel industry developed rapidly and have made great achievements, they consumed tremendous energy and resources, and affected the sustainable development of industry. The expansion speed of steel industry was very fast, and the increasing expansion of the industry mainly relied on extensive growth mode merely pursuing the increase of quantity, which is not desirable. At present, the price of raw material in Chinese steel industry stays at a high level. The price of steel is depressed and the profits of steel companies are meager, so it is urgent to find a kind of sustainable growth model.

# A Research on Forewarning Appraisal of Urban Carrying Capacity Based on Complex System Vulnerability\*

Deng Mingran, Tang Hui, Zhao Fuqiang

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: dengmr@whut.edu.cn, fayhuitang@yahoo.cn, zhaofq@whut.edu.cn)

**Abstract:** With the development of the urbanization and the industrialization, all kinds of disasters often happen to the big urban. This made the vulnerability of the urban stronger and stronger. Due to the population concentrating in the city and the flourishing economy, the sudden disaster affairs usually bring the graveness loss. Therefore, the research on the vulnerability problem of the urban became more and more important. Based on above, the paper aimed to research on the vulnerability of the urban. Firstly, the paper indicated the importance of the research on the urban carrying capacity vulnerability. Secondly, the paper reviewed the relevant literature of the urban carrying capacity vulnerability. Thirdly, the paper illustrated the definition and the expression of the urban carrying capacity vulnerability. Fourthly, the paper put forth the appraisal framework of the urban carrying capacity vulnerability. Fifthly, the paper designed the forewarning appraisal system of the urban carrying capacity vulnerability.

**Key word:** Complex System Vulnerability; Urban Carrying Capacity; Forewarning Appraisal

## 1 Introduction

With the development of the urbanization, the sudden affair often took place in the urban, and the urban carrying capacity vulnerability became more and more obvious. Because the population and the economy concentrate in the urban, the disasters usually brought the urban the graveness loss. Therefore, the research on the vulnerability of the urban carrying capacity became more and more important. Now the research on the vulnerability not only broke through the natural system but also the social field. What's more, World Economic Forum began to list the reducing vulnerability as one of the six big threats in the word from 2002. Though the vulnerability is a new project in the academic research field, the research on the vulnerability of the urban carrying capacity still remains to be a whole system. As we all know, the research on the vulnerability of the urban carrying capacity can be helpful to find the urban vulnerability, to adopt the countermeasures to reduce the vulnerability, to strengthen the urban carrying capacity, and to avoid the risk and the loss of the disasters. Based on above, the paper aimed to research on the vulnerability of the urban. Firstly, the paper introduced the importance and the content of the research on the urban carrying capacity vulnerability. Secondly, the paper reviewed the relevant literature of the urban carrying capacity vulnerability. Thirdly, the paper illustrated the definition and the expression of the urban carrying capacity vulnerability. Fourthly, the paper put forth the appraisal framework of the urban carrying capacity vulnerability. Fifthly, the paper designed the forewarning appraisal system of the urban carrying capacity vulnerability.

## 2 Relevant Literature Review of Urban Carrying Capacity Vulnerability

The vulnerability is usually defined as the possibility, the degree or the status that the system is easy to be injured. However, the definitions of the vulnerability are different in different fields, objects and aspects. Only if learning about the relevant literature, we can grasp the essence of the urban carrying capacity vulnerability.

The concept of the vulnerability originated from 1970s. Phil O'keefe(1976) put forth that the disaster is a never natural outcome, but result from the weak link of the social system. UNDR0(1982) defined that the vulnerability is the losing degree when some factor or system suffer from some strength natural phenomena. Bohle(1989)indicated that the vulnerability of the social system is the comprehensive measurement to the mankind's social welfare, and the defense ability to cope with a series of latent harm. Fenghui Wang(1989) advanced that the eco-environment vulnerability is deteriorate degree the degree of the environment when the mankind activity exceed its acceptance ability and flexibility limit. Downing(1991) put forward that the vulnerability means the result of a kind of disadvantage but isn't a kind of cause. B.Kochunov(1993) indicated that the vulnerability of the different eco-system is relevant to its dynamic function process closely. If being subjected to a

---

\* supported by "the Fundamental Research Funds for the Central Universities" (2011-1b-081)

perturbation, the normal function of the system will be disrupted, the system starts heading for vulnerability when losing its instauration ability. From 1990s, University of South Carolina established Hazards & Vulnerability Research Institute to research on the vulnerability index. UNU-EHS hold the annual lecture of the social vulnerability from 2006.

Recently, the concept of the vulnerability continuously evolves and mainly points to the ability system to resist reply and resume when the mankind society being subjected to the disaster. Jinsong Zhou(1997) put forth that the vulnerability of the eco-system means the ability of an eco-system easily evolves from a kind of status to another status and then turn back to the original status again under the certain mechanism function. Yanrui Shang indicated that vulnerability means the quality of being easily subjected to property of the injury and loss when some particular loading body to a certain natural disaster under certain society, economy and cultural background<sup>[1]</sup>. Xiaohong Yu etc (2007) illustrated the urban vulnerability in the ecosystem, the environment, the interpersonal relation, resource and the security etc, and put forth the countermeasures [2]. Lei Jin (2008) indicated the vulnerability problems in the urban eco-environment, the disasters, and the infrastructure and so on [3]. Yingying Yu(2011) advanced that the vulnerability means that the ability of the system to defense, cope with and restore from the disasters from the sudden affair[4]. The concept of the vulnerability includes three objects such as the carrying object, the disaster and their relations. The carrying object is the impacted and damaged part of the city being subjected to the sudden affairs. The disaster means the reason resulting in the damage and the impact. The relations are the ability to defend and restore when being faced with the disasters.

According to the literatures, we can lean that the scholar from the natural science define vulnerability usually from the environment, and their research object is mainly a natural eco-system; The scholar from the social science pays attention to the vulnerability in the political, economy and society aspects. Their research object is mainly a humanities system.

### **3 Definitions and Contents of Urban Carrying Capacity Vulnerability**

#### **3.1 The Definition of the Urban Carrying Capacity Vulnerability**

Though the research objects are different in different subjects, all of them will bring the reference to the research on the urban carrying capacity<sup>[5]</sup>. The urban carrying capacity is an open system. If we want to keep it in a good status, the urban government needs to cope with all kinds of disturbance from the internal and external. Therefore, we should adopt the system standpoint to research on it, but can't split it into different isolated pieces.

Based on above researches and the definition of the urban carrying capacity, the paper put forth that the urban carrying capacity vulnerability means the sensitivity to the outside and inside perturbation because of the bad development ability, and the status to the disadvantage due to be deficient in the ability to cope with the disturbance when the external condition are disadvantage. The urban carrying capacity vulnerability is a gifted attribute, and it will be found when the urban carrying capacity is be disturbed. Therefore, the internal characteristics of the urban carrying capacity are the direct reason of the vulnerability. The disturbance and the mutual action are the drive factors of the urban carrying capacity vulnerability.

When the urban carrying capacity vulnerability is accumulated into a certain degree, it will make the urban head for a negative direction. If we can't suppress the negative trend, the sustainable development of the urban carrying capacity will sink into the stagnation and even the collapses. The factors result in the urban carrying capacity vulnerability come from not only itself but also the natural and social system. When the vulnerability is higher, the governments have to reduce and control it with the policy and the market<sup>[6]</sup>.

#### **3.2 The Content of the Urban Carrying Capacity Vulnerability**

The urban carrying capacity is a complex system, its vulnerability result from not only the natural reason but also the artificial<sup>[7]</sup>. Therefore, The content of the urban carrying capacity vulnerability includes itself vulnerability, the environment vulnerability, the relation vulnerability, the resource vulnerability and the security vulnerability and so on<sup>[8]</sup>.

The first is the system vulnerability in itself. The urban carrying capacity is a vulnerable system in itself firstly. This system needs the material and resource input from the external, at the same time it is necessary to output a lot of waste, so it depend on the artificial material transporting system. However, once something's wrong with any link of the transporting system, the urban normal function will be affected. Secondly, the natural regulation mechanism will malfunction in the urban carrying

capacity system. The concentration of the population, material, resource and other artificial factors destroyed the natural regulation mechanism of the urban carrying capacity system. Thus these factors aggravated the vulnerability of the urban carrying capacity. Finally, the food chain simplification of the urban carrying capacity system made the self-regulation ability worse and worse. Due to the reduction of the urban species diversity, the mode and way of the energy flow and the material recycle all changed, the relationship between the urban carrying capacity system and the ecosystem is inverse, so the urban self-regulation ability is worse and worse.

The second is the external environment vulnerability. With the intensification of the urbanization, the urban environment become more and more serious, the pollution is more serious in the air, the water, the waste and the sound and so on. The content of harmful substances in the air is from double to eight times of the maximum limit in WHO. More than 70% of the cities distributed along with the rivers and lakes, 80% of their river are not suitable as a source of drinking water. More than 50% of the urban groundwater is contaminated. The urban annually produces 0.1 billion tons of garbage and the waste are increasing by 10% annually, at least 2/3 urban are surrounded by the garbage<sup>[9]</sup>.

The third is the vulnerability of the social relation. With the urbanization development, there occur the serious problems in the social relationship. The idea and the behavior criterion of the residents have undergone the major changes. The traditional social relationships encountered hitherto unknown challenge. The neighborhood interpersonal relationship become gradually alienated indifference and apathy. Therefore, the illegal crime is increasing, the prevalence odds of the autism and depression increase<sup>[10]</sup>.

The fourth is the urban resource vulnerability. The urban development needs a lot of material and energy that must be input from the external. The larger the urban scale is the more of the material and energy input needs and the stronger the degree of depending on the external is. With the development of the city and the energy consumption increasing, the urban resource vulnerability becomes more and more prominent. Now the dependence of the national energy foreign is nearly 50%.

The final is the security vulnerability. The reason for the security vulnerability includes natural and artificial aspects. The natural factors resulting in the safety problems include the earthquake, the tsunami, the mud flow, the landslide, the collapse and other geological and meteorological disaster. The anthropogenic causes the city security including the war, the terror, and the large construction threats and so on. The peace and development have become the main theme of the times, but the world is not peaceful. The modern city as the focus of social wealth has become a preferred place of the war and the attack targets.

#### **4 Conceiving of Mutual Action Forewarning Appraisal Framework of Urban Carrying Capacity Vulnerability**

The urban may face unexpected events in various forms, not only the natural disasters such as the earthquake and flood and so on, but also the artificial affairs such as the traffic accident, the leakage of dangerous goods, and the industrial poisoning. The outcome of the disasters is relevant not only to the carrying factors but also to the urban carrying capacity vulnerability. The stronger the vulnerability is under the same sudden affair, the more serious the loss of the urban is. In some extent, the vulnerability is the relationship between the carrying object and the carrying subject. That is, the carrying capacity vulnerability is the relationship among the carrying pressure, the support ability and their coordination ability.

The carrying pressure is the status that the carrying objects support the social and economic activity. The more the carrying pressure is, the stronger the carrying capacity vulnerability is. The support ability is the maximum that the carrying object can support the social and economic activity. The stronger the support ability is, the worse the carrying capacity vulnerability is. The coordination ability is that the government copes with the unbalance between the carrying pressures and the support ability. The stronger the coordination ability is, the more quickly the urban carrying capacity restore, the worse the vulnerability is<sup>[9]</sup>.

According to the characteristics and the mutual relationships of the pressure, the support and the coordination, the paper put forth the mutual action forewarning appraisal framework of the urban carrying capacity, which is shown in Fig.1. The urban carrying capacity vulnerability includes the mutual action relationship and process among the pressure, the support and the coordination.

According to Fig.1, the forewarning appraisal framework of the urban carrying capacity vulnerability includes the carrying pressure, the support ability and the coordination ability. The driving

factors can combine the three concepts. No driving factors, the environment won't change, there won't be the disturbance. Though there exists the vulnerability, it won't bring any loss to the carrying capacity. Therefore, the support ability is that the urban carrying capacity resist to the disturbance, the coordination ability is that the system restores its origin status with the resource allocation. Based on above, we can conclude that the carrying pressure is positive relevant to the vulnerability, the support and the coordination ability are helpful to reduce the vulnerability.

Figure 1 The Forewarning Appraisal Framework of the Urban Carrying Capacity Vulnerability

### 5 Designing of Forewarning Appraisal System of Urban Carrying Capacity Vulnerability

The forewarning appraisal system of the urban carrying capacity vulnerability consists of the pressure, the support ability and the coordination [10].

#### 5.1 The pressure indicator of the urban carrying capacity vulnerability

The pressure includes three aspects such as the social system, the economic system and the eco-environment system. Firstly, the social system indicator responds the pressure, the dynamic change and the comprehensive exploration status of the population to the urban [11]. Secondly, the economic system indicator responds the pressure status, the dynamic change and the structure status. Finally, the eco-environment system indicator responds the water consumption, the pollution and the green land. The specific indicators are shown as Table 1.

Table 1 The Pressure Index of the Urban Carrying Capacity

Objective Level	Rule Level	Indicator Level	Indicator Criteria
Social System Pressure	Population Number and Structure	Population Growth Rate	Similar
		Population Density	Similar
		Urban Population Ratio	State
	Residential Environment	Per Capita Green Area	Similar
		Per Capita Forest Coverage	Similar
	Housing Land	Per Capita Living Space	Similar
	Infrastructure	Per Capita Road Land Area	Similar
		Per Capita Sports Infrastructure Investment	Similar
		Per Capita Hospital Bed	Similar
		Communication Popular Rate	Similar
Residential Water Consumption	Per Capita Annual Residential Water Consumption	International	
Residential Energy Consumption	Per Capita Annual Residential Energy Consumption	Similar	
Social Development Level	Per Capita GDP/ GDP <sub>max</sub>	International	
Economic System Pressure	Economic Scale and Structure	Per capita GDP	Similar
		GDP Growth Rate	Similar
		First Industry Ratio	Similar
	Industrial Environment	Waste Water / GDP	Similar

		Waste Gas/ GDP	Similar
		Solid Waste/ GDP	Similar
	Industrial Land	Land Consumption/ GDP	Similar
	Industrial Infrastructure	Infrastructure Investment/GDP	Similar
	Industrial Water Consumption	Water Consumption/GDP	Similar
	Industrial Energy Consumption	Energy Consumption/GDP	Similar
<b>Environmental System Pressure</b>	Eco-environmental Land Consumption	Eco-environmental Land Consumption Rate	Similar
	Eco-infrastructure Investment	Eco-infrastructure Investment Rate	Similar
	Eco-water Consumption	Eco-water Consumption Rate	Similar
	Eco-energy Consumption	Eco-energy Consumption Rate	Similar
	Eco-environment Quality	Water Comprehensive Pollution Index Forest Coverage Rate Land Pollution Rate	Similar

**5.2 The support ability indicator of the urban carrying capacity vulnerability**

The support indicator measures the quality, the quantity and the exploitability of the urban carrying factors [12]. The specific indicators are shown as Table 2.

**Table 2 The Support Index of the Urban Carrying Capacity**

Objective Level	Rule Level	Indicator Level	Indicator Criteria
Environmental Support	Environmental Resource	Environmental Capacity Index	Similar
	Environmental Exploitation	Waste Air Attainment <u>Rate</u>	State
		Waste Water Attainment <u>Rate</u>	State
		Solid Waste Handling Rate	State
Land Support	Land Resource	Land Resource	Similar
		Land Exploitation Rate	Similar
Water Support	Water Resource	Unit Area Water	Similar
		Water Exploitation Rate	Similar
Energy Support	Energy Supply	Per Capita Annual Energy Supply	Similar

**5.3 The coordination indicator of the urban carrying capacity vulnerability**

The coordination system not only responds the impacts of the carrying factors change on the society, the economy and the environment, but also expresses the total coordination status. The specific indicators are shown as Table 3.

**Table 3 The Coordination Index of the Urban Carrying Capacity**

Objective Level	Rule Level	Indicator Level	Indicator Criteria
<b>Urban Cooperation Appraisal Indicators</b>	Total Cooperation Indicators	Supply and Demand Equilibrium Index	Similar
	Resource and Society	Per Capita Land Area	Similar
		Per Capita Water Resource	Similar
		Per Capita Energy	State
Resource and Economy	Resource and Economy	Residential Waste Water Exhausts Rate	State
		Water Consumption / GDP	Similar
		Land Consumption / GDP	Similar
		Energy Consumption / GDP	Similar
Resource and Eco-system	Resource and Eco-system	Industrial Waste Water Exhausts Rate	International
		Ecosystem Water Shortage Rate	State
		Industrial Waste Water Mark Rate	State
		Waste Water Recycle Rate	State

## 6 Conclusions

Based on above, we can get the follow conclusions. Firstly, the research on the vulnerability of the urban carrying capacity can be helpful to find the urban vulnerability, to adopt the countermeasures to reduce the vulnerability, to strengthen the urban carrying capacity, and to avoid the risk and the loss of the disasters. Secondly, the vulnerability is usually defined as the possibility, the degree or the status that the system is easy to be injured. Thirdly, the content of the urban carrying capacity vulnerability includes itself vulnerability, the environment vulnerability, the relation vulnerability, the resource vulnerability and the security vulnerability and so on. Fourthly, the urban carrying capacity vulnerability includes the mutual action relationship and process among the pressure, the support and the coordination. Fifthly, the forewarning appraisal system of the urban carrying capacity vulnerability consists of the pressure indicator, the support ability indicator and the coordination indicator.

# Research on Coordination Support Mechanism of Urban Carrying Capacity\*

Xu Xiao, Deng Mingran, Zhao Fuqiang

School of Management, Wuhan University of Technology, Wuhan, P. R. China, 430070

(E-mail: xxiao@petrochina.com.cn, dengmr@whut.edu.cn, zhaofq@whut.edu.cn )

**Abstract:** With the development of the urbanization, the population and the urban scale grew dramatically. The urban carrying capacity is faced with the serious threats. Based on this, the paper firstly indicated the importance of the research on the support mechanism of the urban carrying capacity. Secondly, the paper defined the structural model, the subsystem and the factors of the urban carrying capacity system and indicated their effects. Thirdly, the paper analyzed the content and the framework of the urban carrying capacity coordination system, which includes the structural, the functional, the target, the management, and the internal and external coordination. Fourthly, the paper conceived the support mechanisms of the urban carrying capacity system, which includes the constraint mechanism of the resource and environment, the support mechanism of the science and technology development, the cluster and spread mechanism of the factors and products, the driving mechanism of the industrial upgrading, the innovation mechanism of the policy and the guiding mechanism of the plan. Finally, the paper concluded the research on the coordination support mechanism of the carrying capacity.

**Key word:** Urban Carrying Capacity; Coordination Framework; Support Mechanism

## 1 Introduction

With the development of the urbanization and the industrialization, the urban population and scale are enlarged quickly. The carrying capacity began to restrict the urban development gradually<sup>[1]</sup>. It becomes more and more important to coordinate the relationship between the urban sustainable development and the constraints of the urban carrying capacity. It is relevant to not only the future sustainable development of the urban but also the peripheral region<sup>[2]</sup>. Therefore, the paper aimed to define the structural model, analyze the coordination framework and design the support mechanism of the urban carrying capacity to provide the reference to the urban management. The content of the paper can be concluded the follow. Firstly, the paper indicated the importance of the research on the support mechanism of the urban carrying capacity. Secondly, the paper defined the structural model, the subsystem and the factors of the urban carrying capacity system and indicated their effects. Thirdly, the paper analyzed the content and the framework of the urban carrying capacity coordination system, which includes the structural, the functional, the target, the management, and the internal and external coordination. Fourthly, the paper conceived the support mechanisms of the urban carrying capacity system, which includes the constraint mechanism of the resource and environment, the support mechanism of the science and technology development, the cluster and spread mechanism of the factors and products, the driving mechanism of the industrial upgrading, the innovation mechanism of the policy and the guiding mechanism of the plan. Finally, the paper concluded the research on the coordination support mechanism of the carrying capacity.

## 2 Structural Model Definition of Urban Carrying Capacity

The urban carrying capacity system included the hardware carrying capacity system, the software carrying capacity system, the combination system and the expression system<sup>[3]</sup>.

### 2.1 The hardware carrying capacity system

The hardware carrying capacity system includes the carrying capacity of the environment, the infrastructure, the water and the energy and so on. Firstly, the urban environment is the indispensable condition of the social and economic activities. It will make impact on the cost and effectiveness of the urban industries directly. Therefore, if there are not the environmental supports, the city won't develop. Secondly, the scarcity of the urban land make the exploitation improve or restraint the development of the industries. The land exploitation in the city is the indispensable precondition of the urban consumption. It directly influences the external cluster economic effects. The structure of the land exploitation in the city also makes effects on the industrial structure and the distribution<sup>[4]</sup>. Thirdly, the

---

\* supported by "the Fundamental Research Funds for the Central Universities" (2011-1b-081)

urban infrastructure is the foundation of the social and economic activities, the key of the industrial development, decide on the utility of the urban function, influence the liquidity of material, the capital the information and the talent. At the same time, it directly influence the opposite cost of the urban industry development. Fourthly, the energy is the blood of the urban social activities and economic activities. If there is not the support of the energy, the urban industry won't realize the sustainable development. Finally, the water is the necessity of the urban life and production. It not only decides on the industrial structure in the city, but also influences the different development of the urban industry. Therefore, the hardware carrying capacity system decides on the total performance of the urban carrying capacity.

**2.2 The software carrying capacity system**

The software carrying capacity system includes the carrying capacity of the culture, the policy, the management, the technology, the learning and the opening. Firstly, the culture is the non-formal system arrangement, and the special citizen society consciousness, moral concept and city cultural atmosphere and customs etc. These factors make effect on the behavior method of the citizen and influence the exertion of hardware carrying capacity. Secondly, the policy is the allocation system of the resources in the city. The government change the trade cost and the use cost of the urban hardware through the system and the policy in order to regulate the urban carrying capacity. Thirdly, the management means the development strategy, the management tactics, the management level, the management efficiency, the management means and the management measures. All these will influence the efficiency of the urban hardware and the sustainable development of the city. Fourthly, the science and technology is productivity, the double effect reactor of the urban resources, one of the factors with vitality. The science and technology is able to produce the double carrying capacity through integrating with the urban hardware. So it is the decisive motivation of the urban carrying capacity. Fifthly, the learning means absorbing the successful experience of other cities through exchanging with them to improve the urban hardware carrying capacity. Finally, the opening is that the city is open to learn the culture, the system, the management, the technology and on of other cities in order to enhance the urban carrying capacity. The more open the city is, the higher the software carrying capacity is, and the easier the urban makes full use of the hardware. However, the software can't influence the urban carrying capacity independently, it have to depend on synthesizing with the hardware.

**2.3 The combination system**

The combination system responds the condition of the combination between the hardware and the software. The urban carrying capacity expresses its action only through the combination of the different industries in the urban. So the combination carrying capacity is namely the industry carrying capacity. The industry is the gathering source of the urban resources, a convertor change the resource into the product and service, and the radiation source that the product and service head for the world. Therefore, the reasonably development of the industry is the foundation of the urban social and economic activities. If there isn't the development of the industry, there is not the urban carrying capacity.

Figure 1 The Structural Model of the Urban Carrying Capacity System

**2.4 The combination system**

The urban social and economic activities are the specific expression and the target of the urban carrying capacity. The specific indicators relevant to the social and economic activities can respond the urban carrying capacity. The humankind is the corpuses of the production and life in the cities. The

living standard will have the mutual influence with the carrying capacity. In different stage, the living standard is different, and the demand to the urban hardware and software is different. So the urban carrying capacity is different.

Therefore, all the subsystem informs the urban carrying capacity through mutual action with each other. This is shown in Figure1.

### 3 Coordination Frameworks Conceiving of Urban Carrying Capacity

#### 3.1 The Definition of the Urban Carrying Capacity Coordination

The coordination means the consociation function or collective behavior that the sub-systems are in conjunction with each other through the mutual Moderation, cooperation and synchronous. The coordination of the urban carrying capacity is the relationships of cooperation among its subsystems and factors, and the structure and status of the urban carrying capacity resulting from the relations. These relations are not fixed constantly, but dynamic coordination. Only if the governments want to realize the coordination of the urban carrying capacity, they must learn about the needed relations among the subsystems and factors in order to obtain their objects.

#### 3.2 The Frameworks of the Urban Carrying Capacity Coordination

If the governments want to realize the coordination of the urban carrying capacity, it is necessary to conceive the coordination framework through regulating the subsystems and factors. According to the content of the urban carrying capacity, the paper put forth the coordination framework of the urban carrying capacity that is shown as Figure2.

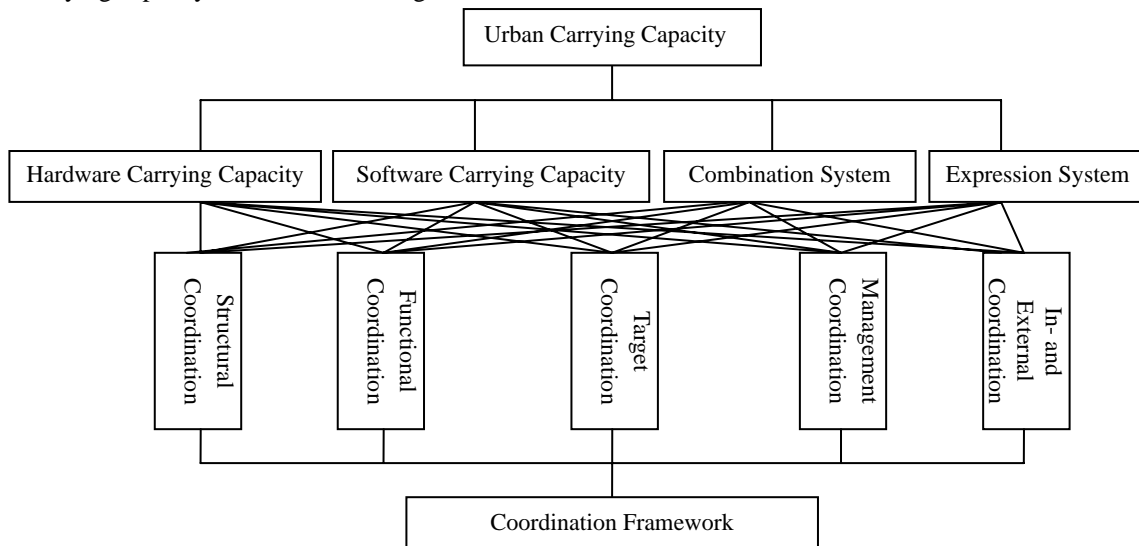

Figure 2 The Coordination Framework of the Urban Carrying Capacity

The coordination content of the urban carrying capacity includes the coordination of the structural, the functional, the target, the management and internal and external. The structural coordination reflects the mutual combination, mutual permeation, mutual constraint, mutual promotion and mutual connection among the system and its factors, their actions and structure are reasonable. So the structural coordination is the basic for the normal operation of the urban carrying capacity. The functional coordination is the concrete performance of the total coordination in the whole system of the urban carrying capacity. The urban carrying capacity system will obtain the excellent function through the combination of the subsystems and factors. The target coordination is the performance and purpose of the system coordination. It makes the total objects realized through coordinating the system target and the subsystem objects with the various feedback control mechanism of the complicated system. The management coordination responds the consistency of all kinds of management systems, methods, measures and means, and the management orientation consists with the system target. The internal and external coordination reflects the self-regulation mechanism adapting to the internal and external environment. The urban carrying capacity realizes the evolution through this kind of coordination.

The urban carrying capacity is an open system consisting of many subsystems with reasonable structure

and function <sup>[5]</sup>. The coordination of the urban carrying capacity needs the continuous recycle from the diagnose, the moderation, to the evaluation.

## **4 Support Mechanism Designing of Urban Carrying Capacity**

The urban carrying capacity reflects the mutual action of all kinds of factors from the internal and external. The normal operation of the urban carrying capacity needs the support of them. In the whole, the reasons resulting in the dynamic change of the urban carrying capacity include the resource and environmental mechanism, the technology development mechanism, the factor clustering and product spreading mechanism, the industrial upgrading mechanism, and the policy and plan guiding mechanism.

### **4.1 Resource and environmental constraint mechanism**

The resource and environmental constraint mechanism includes two aspects such as the natural environment and the resource gift. Firstly, the natural environment is the natural foundation of the urban, and also the natural power of the urban carrying capacity. Generally speaking, the distribution of the natural condition directly influences the urban carrying capacity. The function path of the natural environment to the urban carrying capacity mainly influences the space distribution of the industry. The natural condition influence the space distribution of the life and production such as the sunlight, the water, the soil...etc. the condition of the geography and the weather affect the distribution of the industry. At the same time, the space distribution of the urban industry will improve the clustering and the spreading of the social and economic activities. All these will influence the exertion of the urban carrying capacity. Secondly, the resource gift is the material foundation and the precondition of the urban development. At the same time, the regional distribution of the resource affects the urban carrying capacity. Such factors will enhance the urban carrying capacity as the wide distribution of the resource, the better resource combination, the excellent location and the perfect transportation condition <sup>[6]</sup>.

### **4.2 Support mechanism of technology development**

The technology development is very important to support the urban carrying capacity. The support mechanism of the technology development includes two aspects such as the traffic technology and information technology. Firstly, the traffic technology can change the direction of the urban space development. The contact relation and the function of the space will influence the space structure of the city, which depend on the traffic technology innovation. Secondly, the information technology accelerates the communication efficiency of the organization and the people. At the same time, it reduces their trade cost and communication cost. It makes the space relation attractive and convenient, and enhances the social and economic activities. All these will strengthen the total effect of the urban carrying capacity <sup>[7]</sup>.

### **4.3 Factor clustering and product spreading mechanism**

The formation and development of the urban carrying capacity is a kind of the complicated process with the integration among the social, economic and cultural activities. The urban carrying capacity is influenced by the clustering and spreading mechanism. The clustering and spreading process of the factor and product is the formation and development process of the urban carrying capacity. It will also affect the total function of the urban carrying capacity. Therefore, the clustering and spreading of the factor and product will result in the change of the space gravity center in the city. When the urban clustering enter into the uneconomic stage, it means that something wrong with the urban carrying capacity. The spreading will become more and more important at that time. With the strengthening of the urban clustering and spreading, the factors such as the capital, technology and information and so on will fluid reasonably in the urban space. At the same time, the urban carrying capacity will be enhanced.

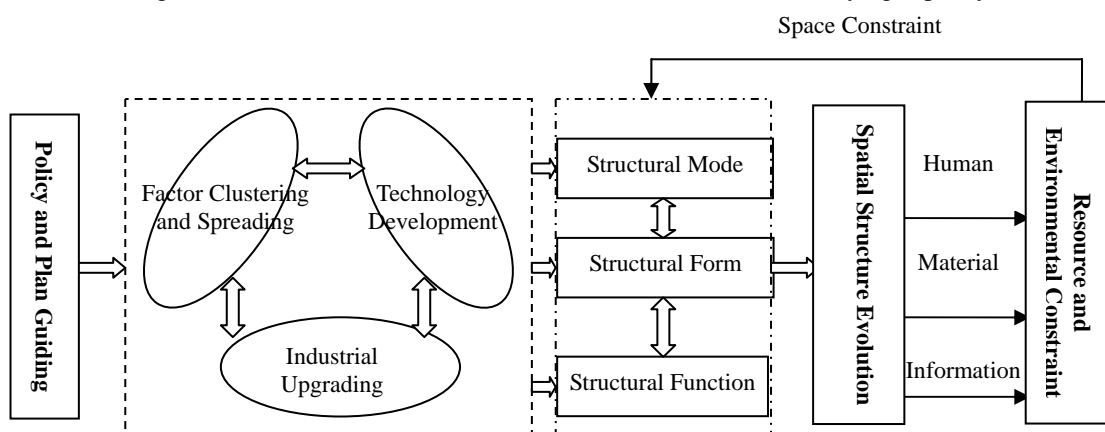

### **4.4 Driving mechanism of industrial upgrading**

The speed, scale and the way of the industry economy directly influence the development of the urban carrying capacity. So the industrial upgrading is the direct driving power of the urban carrying capacity development. The industrial integration will improve the cluster and scale effect of the industry, and enhance the structural and functional optimization of the urban carrying capacity. The industrial knowledge will establish the mutual dependence relation in the city, form the industrial chain, and enhance the structural optimization of the urban carrying capacity. Therefore, the industrial upgrading enlarges the spreading scope of the central city, and strengthens the reasonable distribution of the urban carrying capacity <sup>[8]</sup>.

### **4.5 Policy and plan guiding mechanism**

The formation and development of the urban carrying capacity depend on the regulation of the government. The government can ensure the reasonable liquidity of all kinds of factors through the

policy and system in order to keep the normal operation of the urban carrying capacity. The urban system innovation will accelerate the flowing of the factors among the different regions in the city, and optimize the factors distribution among the different space unit. The combination between the system and the culture will be helpful to the exploitation and application of the urban carrying capacity. Though the formation and development of the urban carrying capacity is a self-evolution process, it depend on the artificial regulate and introduction. The distribution and regulation of the urban carrying capacity is realized through the urban plan and management. The plan should pay more attention to guide the combination between centralization and decentralization. It also coordinates the industrial distribution in different region to ensure the reasonable function structure of the urban carrying capacity<sup>[9]</sup>.

**Figure 3 The Support Mechanism of the Urban Carrying Capacity**

According to the analysis, the formation and development of the urban carrying capacity is the result of the mutual action among the above factors. The coordination support mechanism of the urban carrying capacity is shown as Figure3.

## 5 Conclusions

According to the research, we can conclude the follows. Firstly, it becomes more and more important to coordinate the relationship between the urban sustainable development and the constraints of the urban carrying capacity. Secondly, the system model of the urban carrying capacity includes the hardware carrying capacity, the software carrying capacity, the combination system and the expression system. Thirdly, the coordination content of the urban carrying capacity includes the structural, the functional, the target, and the management, the internal and external coordination. Finally, the normal operation of the urban carrying capacity needs the support of the resource and environmental mechanism, the technology development mechanism, the factor clustering and product spreading mechanism, the industrial upgrading mechanism, and the policy and plan guiding mechanism.

## Environmental Accounting and GDP in China And India

Xu Fengju, Alireza Soleimani Damaneh

Department of Financial Management , Wuahn University of Technology, Wuhan, China  
(E-mail:xufju@163.com & santa\_m1984@yahoo.com )

**Abstract:** Environment is a rich heritage handed over by previous generations. However the nature's stragglng behind the economic development creates a chaotic atmosphere. Accountants are justifiably among those who might be criticized for this chaos because accounting which is the language business has never spoken for nature and environment except for the recent decades. The author tries to make the tragedy of environmental degradation More palpable through the numbers and accounting for senior managers and other participants to have a better understanding of the issues. Green economy means an economy that has the ability to rebuild itself as a stable one. The present economy of China and India are moving too rapidly in recent years and kills the environment that nourishes it which is a sort of suicide like a cancer that eventually led to its death with the elimination of host cells.

**Key word:** Environmental accounting; Green GDP; The green GDP accounting

### 1 Introduction

Accounting sometimes referred to as the language of business hence it can describe all type of business activity even environmental activity. In this article struggles to be the language of environment and language of business for China and India. Accounting is required to submit various types of user information on the financial position and performance of entities in the management of resources at their disposal. In recent decades a growing number of entities give great importance to environmental issues and their reflection by accounting, either under the influence of administrative regulations or because of their information needs. In certain circumstances, for certain fields, they can have a significant impact on the financial statements, and that of their users. Green accounting has been around for two decades. As in all cases, environmental management accounting is a tool to inform managers about the environmental costs, to quantify the environmental effects of the entity. In 3 recent decades, The rapid economic rise of China, followed by that of India, has led to a new balance of power in the world economy .Spectacular economic growth in China and India has serious environmental consequences.. China and India are still in the process of industrialization and urbanization which will exert more pressure on the environment. And since India and China have more than 36 percent of the population of the world the evaluation of the subject in these 2 countries has the greatest importance. In many respects, China and India seem similar. Both are large geographically and have enormous populations that remain very poor. That's why authors have chosen 2 huge population countries in the world (China 1.36 billion and India 1.22 billion in 2012 ) with , the average real rate of GDP growth (during 1978-2007 is 9.9% in China and 5.6% in India) to compare . Environmental pollution becomes so acute and the stakeholders' awareness to the issue becomes so serious that environmental accounting has become a strong branch of accounting. Still, attention towards the style and recognition of environmental accounting is not a generalized one. Legal authorities, standard setting bodies and other regulators cannot come to a consensus regarding the conceptual framework of environmental accounting and its disclosure. Thus, such disclosure is not mandatory rather voluntary that has no specific style or format. With the passage of time, more guidelines are coming in customized format that may lead us to reach a common format for recognizing environment

Related data and disclosure thereof through financial statements. Still, such disclosure is guided by the social responsibility and commitment on the part of the entities that work as strong agents for polluting the environment. More emphasis is given on environmental accounting and awareness for that as this is supposed to be the need of today.

The adverse environmental effect of economic development has become a matter of great public concern all over the world. Gradually, environment is becoming a much more urgent economic, social and political problem Accountants, as the basic custodian and light bearers of economic development, can no longer shut their eyes to the effect of environmental issues on business management, accounting, auditing and disclosure system. Protection of environment and the potential involvement of accountants is becoming a common subject of discussion among the accountants all over the world. Now-a-days, accountants are expected to take a proactive role in the environmental protection process. With the advent of liberalization, removal of trade barrier makes it logical that the costs of environmental

degradation due to industrial activities should be internalized in corporate accounts to the extent possible. That's why environmental accounting and reporting thereof is of paramount important today.

## 2 Green GDP In China and India

$GDP = \text{Consumption} + \text{Investment} + \text{Government spending} + (\text{Export} - \text{Import})$

$\text{Green GDP} = \text{GDP} - \text{Environment costs} - \text{Social costs}$

Green GDP methodology is an adjustment to traditional measures of a country's output of goods and services taking pollution and waste of resources into account. This method refers to an accounting system in which environmental degradation costs and natural resource depletion costs are factored into the calculation of GDP growth. The goal of this methodology is presumably to provide a better measure for guiding public economic policy and thereby contributing to a more welfare-rich outcome than could be achieved using traditional measures. The green gross domestic product (green GDP) is an index of economic growth with the environmental consequences of that growth factored in. In 2004, Wen Jiabao, the Chinese premier, announced that the green GDP index would replace the Chinese GDP index itself as a performance measure for government.

The first green GDP accounting report, for 2004, was published in September 2006. It showed that the financial loss caused by pollution was 511.8 billion yuan (\$66.3 billion), or 3.05 percent of the nation's economy. As an experiment in national accounting, the Green GDP effort collapsed in failure in 2007, when it became clear that the adjustment for environmental damage had reduced the growth rate to politically unacceptable levels, nearly zero in some provinces. In the face of mounting evidence that environmental damage and resource depletion was far more costly than anticipated, the government withdrew its support for the Green GDP methodology.

A measure of Green GDP will almost certainly give policymakers and the interested public a more defensible estimate for the extent and scope of environmental challenges. Based on a review of the two strategies in combating pollution, this paper suggests that a combination of governmental intervention and free-market operation could be a better strategy to reverse China's heightening environmental challenge. The concept of Green GDP was initially developed in the West in the 1960's (Pearce, Markandya, & Barbier, 1989). This concept is a relatively new idea in China and there is controversy over how to implement a financial accounting approach to measure the costs of environmental damage and degradation caused by pollution and resource exploitation. In spite of these difficulties, two Chinese government agencies, the National Bureau of Statistics (NBS) and the State Environmental Protection Agency (SEPA), were designated to research and develop the Green GDP index and use it as a standard measure of China's environmental sustainability. These two government agencies measure environmental costs in terms of economic growth. By so doing, China will be the first country in the world actually implementing the Green GDP concept in the measurement of its economic activities. To better understand the background for the issues involved in China's recent request for Green GDP, it is necessary for a historical review of human activities and environmental protection. Let me briefly review the environmental crisis China now confronts. In the 1960s and early 1970s, when the international community started to pay serious attention to environmental issues, China was experiencing chaos because of the Cultural Revolution. With ignorance, the Chinese government chose to deny its pollution problems and refused to participate in the international conference on human environment by claiming here is no need to participate in a global conference to address the environmental protection. A socialist nation does not suffer from the environmental ills of capitalism" (Ferris & Zhang, 2002).

Unfortunately and ironically, forty years later, China became one of the most polluted nations in the world. The air and water were badly polluted and much of China's land was contaminated, Stalinized or deforested. According to the World Bank, in 2000 China had 16 of the world's 20 most polluted cities. According to the International Energy Agency (IEA) forecasts, the increase of greenhouse emissions from 2000-2030 from China alone will nearly equal the increase from the entire industrialized world.

China's emissions of sulfur dioxide were the highest in the world in 2004. Acid rain caused by coal-burning plants caused striking damage to agriculture, buildings, and public health."(SEPA, 2006). Green GDP accounting is closely related to the basic situation of a country. China and India as developing countries are at the stage of rapid economic development. It has wide territory, huge population and is relatively lack in natural resources. At the same time, the soaring development of economy has resulted in rapid growth of exploitation and utilization of natural resources. The rapid economic development in China and India thus mainly depends on the competition of resource, competition of environment and competition of investment. It is almost impossible to accurately figure

out the pollution costs of China's GDP because of the lack of standards for measurement and the difficulties in collecting relevant data on pollution damage. The World Bank estimated that pollution costs China 5% of its GDP, including health care and lost productivity. In 2004, the Economist estimated that pollution decreases China's GDP by 12%.

At present, green GDP accounting has become an irresistible international trend and will gradually become the important basis for formulating and implementing sustainable development strategy by different countries. It is even more important and urgent to China and India.

Think twice before you cut that tree or throw a plastic bag into the river - you might be lowering India's GDP. India aims to factor the use of natural resources in its economic growth estimates by 2015, environment minister Jairam Ramesh said, Pilot projects have already been initiated and the ministry of statistics & programme implementation is in the process of preparing a national database, making depletion of natural resources a key component in its measurement of GDP.

Beginning in 2010, India, as part of the country's five year plan, aims to factor the use of natural resources into its GDP as a means of underscoring its actions in the fight against global warming. Despite not being obligated to reduce carbon emissions under the Kyoto Protocol, India is taking unilateral domestic actions to move toward a greener economy and to strengthen the country's position as a major player in international environmental initiatives. India's environmental minister Jairam Ramesh hopes to make "green accounting" a reality as part of India's governmental policy on economic growth. Ramesh estimates that by 2015, India should be able to provide alternative GDP estimates that account for the domestic consumption of natural resources. Specifically, these estimates will provide details on the amount of natural resources that are consumed during the course of economic growth, the degree to which the environment is being degraded as part of the growth process, and the amount of mitigation that occurs as a means of correcting this degradation. This obviously presents a number of institutional and policy related challenges. First and foremost, governments do not want to give off the impression that economic growth and development has stalled, either to their constituents or to the international economic community. Accounting for environmental degradation may lead to a significantly lower GDP, which has made many developing countries reluctant to measure environmental impacts. The Chinese example, the preeminent experiment in green GDP, has served to reinforce this fear.

From a policy standpoint, the primary concerns surround how to properly measure environmental degradation in monetary terms, and how that information will be gathered. In developing countries like India, this often has to do with the issue of property rights. Clarifying ownership will help to put a value on clean air, clean water, and other resources. Commonly, this valuation system takes the form of cap and trade or similar policies, effectively allowing the market to determine the price of environmental goods and services. For green GDP to be most effective, companies and other users are relied on to accurately report pollution emissions. This is one of the many problems of being able to "buy" the "right" to pollute - market prices may encourage a polluter to lie in order to keep its emissions within its allotted limits, which would reduce the accuracy of a green GDP measurement. Putting a price on the right to pollute may also stall green innovation that may be beneficial to development and traditional GDP - it may be more economically beneficial for a polluter to buy up more pollution credits than to implement new technologies or retrofit existing ones.

Over the last three decades, the world has been astonished by the miraculous economic growth of China and India. Though there is a gap in the growth performance between the two countries, India has caught up with China in the past decade, particularly in recent years. With both countries' governments being fully committed to the goal of high economic growth, the current development momentum is expected to continue for decades.

However, high growth has been achieved with severe environmental damages such as deforestation, widespread acid rain and deteriorating ambient air quality. These consequences threaten human living space and health, and are costly to deal with. A government report shows that the environmental cost accounts for about 3% of China's GDP. In India it is estimated that the damage and degradation of natural resources is equivalent to about 10% of the country's GDP. While these estimates may be debateable, there is no doubt that pollution has serious health and economic consequences. Independent estimates of the cost to China of environmental degradation and resource depletion have for the last decade ranged from 8 to 12 percentage points of GDP growth. These estimates support the idea that, by this measure at least, the growth of the Chinese economy is close to zero. The most promising national activity on the Green GDP has been from India. The country's Environmental Minister, Jairam Ramesh, stated in 2009 that "It is possible for scientists to estimate green GDP. An exercise has started under the

country's chief statistician Pronab Sen and by 2015, India's GDP numbers will be adjusted with economic costs of environmental degradation. Currently, a framework of China's green GDP accounting has been set up. The next step is to, in addition to improve the current framework, speed up the local pilot work so as to verify the practicability of the theoretical framework. Besides, it is also imperative to strengthen international cooperation to establish a green national economic accounting system that keeps pace with the international society.

### **3 Further Improve the Green GDP Accounting Method**

The green GDP accounting is a complex system, involving not only a complicated economic system but also various kinds of natural resource and environmental elements. As seen from the international research experience, green GDP generally begins with local accountings, or focuses on specific resource types or environmental problems. The statistical institutions within international organizations have timely summarize these local accountings and upgrade them into theoretical and methodological researches, which can serve as methodological direction on the green GDP accounting in China and India.

The improvement of China and India's green GDP accounting theories and methods can be considered from the following four aspects: 1) Further improving the theoretical framework of green national economic accounting. Currently, two relatively ideal frameworks, i.e. China Resource and Environmental Economic Accounting Framework and China Environmental Economic Accounting Framework, which are connected with China's national statistical accounting system and keep pace with the international society, have been formulated. However, there are still leave many detailed problems in the two frameworks. These problems are to be further improved in combination with pilot work. 2) Formulating technical guideline on physical quantity accounting for both the environment and the resources. 3) Formulating technical guideline on value quantity accounting for both the environment and the resources, which are a focus as well as a difficult for carrying out green GDP accounting. The value quantity accounting mainly includes two parts, i.e. natural resource consumption and environmental degradation. 4) Carrying out countrywide survey for environmental pollution loss accounting. The theories and methods of environmental pollution loss accounting will be accomplished on the basis of the national environmental pollution loss evaluation work already undertaken. This is a basic work for green GDP accounting.

### **4 Speeding up Local Pilot Accounting Work**

As a new accounting system, green GDP has the problems of being not in line with traditional national economic accounting system and having difficulty in collection and analysis of statistical data. In addition, it requires huge data and involves many departments for data collection and thus will be difficult to promote. It is possible to first carry out some pilot work in some areas. This will be of realistic significance for the promotion of green GDP in China.

Therefore, SEPA and NBS have determined to first choose 10 provinces (municipalities) to carry out pilot work on green GDP accounting and environmental pollution loss survey during 2004~2006, in order to earn experience for establish national green GDP accounting and environmental pollution loss evaluation system. It has been planned to establish an initial framework of green GDP accounting system that is fit for China's own situations in 3 to 6 years. At the same time, the public awareness on green GDP will accordingly be enhanced. China and India's GDP growth rates have outperformed world average growth rates and, indeed, those of other lower and middle income countries for the most part of the last 15 years. China has grown at an average rate of close to 10% annually during 1990-2006; a rate at which income more than doubles every seven years. Although regarded as a success, India's performance was less spectacular than China's with an approximate rate of growth of 6% annually. The growth of world economy in the corresponding period amounted to approximately 3% annually. Green GDP was weak to begin with because the environment remains a tertiary priority behind growth and social stability. As long as growth continues to generate wealth and social stability, the central leadership will have very little motivation to prioritize the environment, and local governments will have even less motivation to follow central environmental policies.

In the end, the Green GDP program was effectively a strawman set up to appease the global audience and the critics of India and China's environmental record. While the initiative initially made the Chinese and Indians government look progressive and proactive, the numbers that came out of the program revealed a shocking level of environmental degradation, leading Beijing and Delhi to cancel

the program rather than face the embarrassment of more damning statistics.

Key problem in policing a shift towards a greener economy in China and India are highlighted in the experiences and failure of its green GDP project. China and Indian's governance structure for environmental management, the degree of additional data collection required, and lack of consistent rules for environment valuation all contributed to the failure of the use of green GDP in China and India.

## 5 Conclusion

Greening the national accounts is useful, especially in developing countries like China India which are characterized by high population growth and pressure on natural resources. The adjusted GDP acts as a deflator to the real GDP. The gap between GDP and the adjusted GDP serves as a signal of importance of environmental effects. China and Indian's miracle of economic growth might end soon because it will be overwhelmed by environmental problems. Regardless, the Green GDP estimates provide a better understanding as to the serious extent of the environmental challenge. The Green GDP report serves as a wake-up call for China to undertake the challenge seriously and immediately.

**Abstract:** This paper aims to find out the critical factors that play a role in the mind of tourists and non-tourists. The primary objective of this analysis is to understand differences among the groups (as defined by the dependent variable- tourists and non-tourists), and to predict the likelihood that an observation will belong to a particular group. To investigate this, discriminant analysis has been conducted that is a multivariate statistical technique used to estimate the relationship between a single categorical dependent variable (such as tourist versus non-tourist) and a set of metric (interval or ratio level) independent variables.

**Key words:** Tourism; resort visit; customer attitude; relationship.

### 1 Introduction

There is little doubt that the tourist industry is an important sector of economy. It is amazing to note that, tourism is the world's largest industry and so is of vital importance to the global economy. Its contribution has risen dramatically over recent decades. The World Travel and Tourism Council (WTTC) estimate that travel and tourism were directly and indirectly responsible for generating 11% of world GDP and 200 million jobs across the global economy.<sup>[1]</sup> China is also making huge revenue from the tourism in the recent years.

While gaining from tourism, customer retention is getting concentration day by day as well as the new customer generation. Management is pressing more pressure on the satisfaction of the existing customer as it makes the firm unbeatable in the complex and competitive business world as well it helps to create new customers.

Another important aspect is that most of the time international tourism and tourists are the peak of discussion. But from the marketing point of view China itself has a huge market that consists of almost 1/6<sup>th</sup> of the total world market. So, determining the salient characteristics of the domestic tourists is worth of investigation. In this paper we have conducted a two-group discriminant analysis. Its predictive function might be used to classify potential customers to differing marketing programs depending upon known social, economic and geographic characteristics.

### 2 Literature Review

Tourism is primarily a service-based industry, principal products provided by tourism and recreation businesses are recreational experiences and hospitality.<sup>[2]</sup> So, past experience with different tourism sectors is a key for customer retention or simply said- revisit intention.

Lee<sup>[3]</sup> considers the pleasure market as the more fickle of the travel industry's market segments. It is price-sensitive and easily affected by economic conditions. Tourism industry faces great competition from non-travel entertainment for both individual's leisure time and discretionary income. Factors such as lack of transportation facilities and poor weather may also have negative effects on the decision on whether or not to travel.

Echtner and Richie (1991) argue that many studies on destination image only focus on the attributions, and neglect the important factor of attitudes that significantly shape the holistic image perceived by tourists.<sup>[4]</sup>

Gartner (1993), Prebensen (2007) also shows that most image studies dealing with tourism have employed attribute lists to measure the cognitive component (people's perceptions) of destination image.<sup>[5, 6]</sup>

Caswell & McConnell (1980), Eymann & Ronning (1992, 1995) and Walsh et al. (1992) consider that family size (a commonly used indicator of household size) plays an important and deterrent role in recreational decisions, both in the realization of holidays and in the determination of the destination, as large family size restricts holiday spending.<sup>[7-10]</sup>

### 3 Methodology

On the basis of literature review, a primary questionnaire was developed. In primary questionnaire, there were six variable. Dependent variable was categorical. Independent variables were metric variables. The family or household that visited a resort during last year are coded as 1 and those who did not were coded as 2 (travel). Data were also obtained on annual family income (income), attitude towards travel (travel attitude), importance given on family vacation (family vacation importance), family size (fsize), age of the family head (age), earlier experience with tourist agent (experience), Places of historical or cultural interest (cultural interest).

SPSS software has been used for the mathematical computation. Discriminant Analysis Model is as follow:

#### 3.1 Discriminant Analysis Model

The discriminant analysis model involves linear combinations of the following form:

$$D = a + v_1X_1 + v_2X_2 + v_3X_3 + \dots + v_iX_i \quad (\text{here } i=7)$$

Where,

$D$  = discriminant score (discriminate function)

$v$  's = discriminant coefficient or weight for that variable

$X$  's = predictor or independent variable (respondent's score for that variable)

$i$  = the number of predictor variables

- The coefficients, or weights ( $v$ ), are estimated so that the groups differ as much as possible on the values of the discriminant function.
- This occurs when the ratio of between-group sum of squares to within-group sum of squares for the discriminant scores is at a maximum.

#### 3.2 Output:

**Table 1 Group Statistics**

		2	0	30	30
	%	1	92.0	8.0	100.0
		2	.0	100.0	100.0
Cross-validated <sup>a</sup>	Count	1	40	10	50
		2	2	28	30
	%	1	80.0	20.0	100.0
		2	6.7	93.3	100.0

a. Cross validation is done only for those cases in the analysis. In cross validation, each case is classified by the functions derived from all cases other than that case.

b. 95.0% of original grouped cases correctly classified.

c. 85.0% of cross-validated grouped cases correctly classified.

#### 4 Conclusions and Recommendations

This paper aims to find out the critical factors that plays a role in the mind of tourists and non-tourists. The primary objective of this analysis is to understand differences among the groups (as defined by the dependent variable- tourists and non-tourists), and to predict the likelihood that an observation will belong to a particular group. The signs of the coefficients associated with six predictors out of seven are positive. This suggest that high family income, attitude towards travel, importance given on family vacation, family size, age, earlier experience with tourist agent are more likely to result in the family visiting the resort. It would be recommended to develop a profile of the two groups in

terms of the six predictors that seem to be the most important. This research methodology might be used to classify potential customers to differing marketing programs depending upon known social, economic and geographic characteristics.

# The Impact of Wayfinding Signage System Setting on Visitors' Wayfinding Behavior Model in Theme Park: A Case Study of The Summit in Hong Kong Ocean Park\*

Wen Jing, Xiong Wenfei

School of Art and Design, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: 812705369@qq.com, xiongwenfei@gmail.com)

**Abstract:** Theme park is a kind of modern travel destination integrated of leisure, entertainment and services. Fine service is an important factor of evaluating a theme park, and to allow visitors to travel without wayfinding puzzle in the theme park is the basis of good service. The essence of wayfinding signage system is to guide visitors to their destinations quickly through effective wayfinding information-delivery, and, at the same time, to balance the number of the visitors in order to improve the utilization of recreational facilities and service facilities. Based on the investigation combined with the actual observation to position setting and types setting of different types of signage, the text puts forward the portfolio management methods for wayfinding signage system and describes the impact of wayfinding signage system setting on visitors' wayfinding behavior.

**Key word:** Theme park; Signage setting; Wayfinding Behavior; field survey

## 1 Introduction

### 1.1 Theme park background

In recent years people's spiritual and cultural life becomes increasingly rich, and choices of leisure entertainment have been diversified. Theme park, which creates specific environment, atmosphere, games and activities around one or several themes to attracting a large number of visitors, is still a relatively new way of amusement to Chinese. Besides the theme park in mainland of China, Hong Kong's theme park, Disneyland and Hong Kong Ocean Park will also usher in a large number of visitors from mainland each year.

At the current stage, there are many researches of vision and setting of wayfinding signage in the field of landscape design. The management science also has mature research in the visitors' behavior. But there is a lack of the combination of the two related research, especially the impact of wayfinding signage system setting on visitors' wayfinding behavior in theme park, and this study will carry out case study in this point.

### 1.2 Visitors' wayfinding behavior in theme park

Wayfinding, in the concept of geography, refers to the behavior that people find the way in unfamiliar environment, which is a purposeful and initiative action to solve problems of dynamic space. In general, wayfinding can be divided into two steps: making a decision and implementing a decision. People in unfamiliar environment should firstly confirm their destination, then determine the spatial relationship of their location and the destination, and finally work out a plan. Throughout the process of wayfinding, whether the information of signage in the environment is adequate and correct enough to convey information effectively or not, is the key to decide if visitors can possibly establish correct cognitive maps and find the way.

Usually, people need the help of landmarks and spatial differences to find the way in unfamiliar environment, so the unique identifier of the space plays a vital role in wayfinding. However, in theme parks, there are rare symmetrical, repetitive space structures. Different shape, multi-dimensional constructions, various decorations, materials and colors are used to create visual highlights to attract tourists. Hence, wayfinding in theme park differs from that of general space.

In different occasions, there are different factors to measure wayfinding of tourists. Referring to wayfinding indicators from Carpmann Grant and Simons (1984) research, this paper statistically analyzes the wayfinding in theme park. The observed programs include backing, wrong turning, stagnating, looking around and watching signs.

### 1.3 Method

#### 1.3.1 Case background

Hong Kong Ocean Park is a 17-hectare marine-based theme park, with more than 40 attractions.

---

\* This paper is supported by "the Fundamental Research Funds for the Central Universities "

There are two theme areas—The Waterfront and The Summit. The latter one also includes four sections: Marine World, Thrill Mountain, Rainforest and Adventure Land. Since Hong Kong Ocean Park has a vast area, complex path and all kinds of rides, there are much more wayfinding signage needed than other common theme parks. In addition, whether the wayfinding signages are reasonably set according to their type and location should be seriously considered.

### 1.3.2 Contents and method of survey

This paper, using field survey method, makes a statistical analysis to the selected representative wayfinding signage. The investigation site is The Summit of Hong Kong Ocean Park. The specific program include drawing a sketch of The Summit according to site inspection and cartographic material and marking the specific location of wayfinding signage; inspecting the status quo of wayfinding signage system in The Summit and classifying them; using non-participatory observation method to observe the wayfinding behavior of visitors and find out what effect the wayfinding signage have on the visitor's wayfinding behavior.

## 2 Wayfinding signage system in theme park

### 2.1 The characteristics of Ocean Park

Wayfinding signage system is a visual wayfinding information-delivery system based on the spatial cognition style of human, helping people move in the right direction. It usually includes graphics, font, color, map and other visual elements. There is no difference in the overall design principles of wayfinding signage system between theme park and general park. However, the particularity of theme park results from its different starting point and demand of design. To Hong Kong Ocean Park, there are the following characteristics:

1)High reputation. There are a large number of tourists no matter in working days or holidays. The rationality of the design of wayfinding signage system directly affects the diversion between the adjacent theme areas, which is very important to balance the number of visitors.

2)Broad area. The space form is more complex, and there are more attractions. Wayfinding signage setting should adapt to the complex path and play a correct role in wayfinding.

3)Due to the entertainment properties of Ocean Park and visitors' demands of exploration, the setting of the number and position of wayfinding signage needs to be carefully considered. Unreasonable settings will lead to waste of resources, and visitors will lose interest in exploring the park.

4)Ocean Park is divided into The Waterfront and The Summit two theme areas. Every theme area has its unique atmosphere. Wayfinding signage system will have to adapt to the atmosphere and balance the unity between different needs and decoration, in order to create a seamlessly unreal atmosphere.

### 2.2 Classification of wayfinding signage in Ocean Park

Ocean Park's wayfinding signage system can be categorized into several signage types: Identification sign, direction sign, orientation sign, explanation sign and prohibition sign according to the information content.

1)Identification sign. Name identification is the most basic identification information. It is used to indicate the name of the object. From a functional point of view, such sign helps visitors to identify their destination, location and establish a certain degree of spatial cognition. It is the most commonly used type of sign in the process of wayfinding.

2)Direction sign. The main function of direction sign is to guide visitors to the right place. It usually contains two parts of compositions: arrows and names of places. This kind of sign is mainly used for identifying the information, when visitors walk on the road. So the setting number of the sign and recognizable degree has larger demand.

3)Orientation sign. The orientation sign generally will provide more comprehensive regional spatial information. Providing visitors with overview of the space by maps, charts and other forms helps visitors to make a route-decision. Due to the large amount of information, it usually takes a long time to read. "You Are Here" map belongs to the orientation sign.

4)Explanation sign. The explanation sign is used to elaborate the intention of setting the sign, such as services interpretation, operating norms and usages, etc. It is necessary to deliver a very large amount of information. In the theme park this kind of sign often used to explain the security and operating norms of attractions. It's a kind of quite important sign.

5)Prohibition sign. Prohibition sign is a kind of regulative sign mainly used to regulate visitors to the rules in park, including functions such as warnings, reminders, and recommendation, etc.

### 3 Case Study

This paper mainly chooses the route from Summit Plaza to Pacific Pier in The Summit of Ocean Park as the research object. Summit Plaza is the first stop to The Summit by the Ocean Express from The Waterfront. The Summit contains these four theme areas: Marine World, Thrill Mountain, Rainforest and Adventure Land. This paper takes Summit Plaza as a start place and Pacific Pier as a destination, the Pacific Pier is the second attraction from Summit Plaza to Marine World. There is only one path between two places. However, visitors will pass by Rainforest and meet two t-junctions in this path which is about 250 meters and contains 12 wayfinding signages. It is a very typical path which demands clear wayfinding signage settings.

#### 3.1 The portfolio management for wayfinding signage system setting

In the concept of management, portfolio management refers to optimization and balance of the individual's advantages and strengths. Then put these advantages together scientifically to avoid risks and maximize the benefits. This approach is often used for economic activities, but in fact the same can be applied on the setting of wayfinding signage system. Each kind of wayfinding signage contains different elements, which are scientifically combined to form an effective set, so that the wayfinding signage brings a benign influence to visitors' behavior.

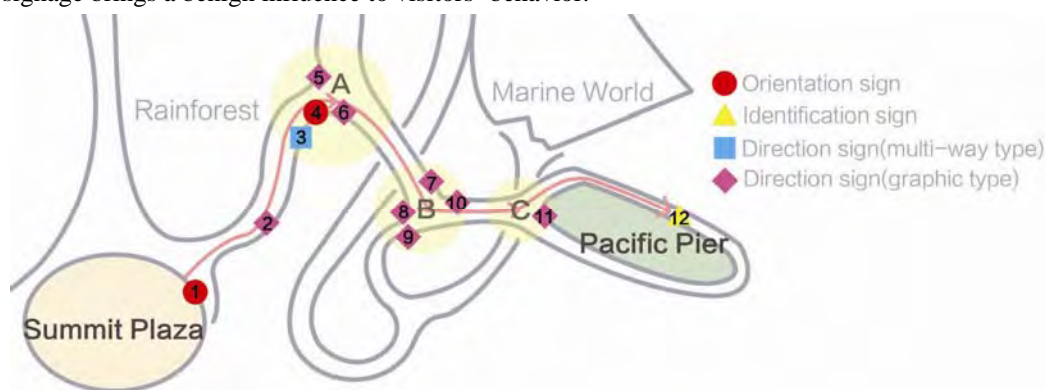

Figure 1 Location of Classified Wayfinding Signage

Table 1 Types of Wayfinding Signage

Orientation sign <span style="color:red">●</span>	Identification sign <span style="color:yellow">▲</span>	Direction sign(multi-way type) <span style="color:blue">■</span>	Direction sign(graphic type) <span style="color:purple">◆</span>
(1)(4)	(12)	(3)	(2)(5)(6)(7)(8)(9)(10)(11)

Figure 1 and table 1 show that:

1) There are five types of wayfinding signages, but actually only three kinds of signage existing in Summit Plaza to Pacific Pier path, including orientation sign, identification sign, and direction sign. The direction sign can be categorized into multi-way type and graphic type. Among these types the graphic type of direction sign distributes most.

2) In the path from Summit Plaza to Pacific Pier, about 70 meters distance apart will distribute a direction sign in order to maintain the coherence of wayfinding signage.

3) Multi-way type of direction sign can be adapted to the multiple directions of visitors and uses stereoscopic approach to give directions. The entire layout only has simple text and arrow, as the identifiability is quite strong, it is suitable for visitors to read and make judgments quickly when they are walking. Graphic type of direction sign doesn't have intuitive indication of the direction, but carries more abundant information with the highlighted text of main items and assisted with images and icons., which suits for all kinds of visitors' wayfinding behavior with wayfinding target.

4) Point A, point B and point C are three different levels of intersections. There are three alternative paths radiates from point A and point B, as only one valid path to the Pacific Pier from point C. Point A and point B are both road junctions, while point C is at the junction of Rainforest and Marine World and has a higher flow of visitors so that there will be more visitors needing to make decisions at point A. According to the field survey, Point A has three types of signages: orientation sign, direction sign (multi-way type), direction sign (graphic type) and Point B only has direction sign (graphic type). At secondary intersection, point C, there only exists one graphic type of direction sign.

**3.2 The wayfinding signage setting at key position and visitors' wayfinding behavior**

The following table of data uses the non-participatory observation method to experiment. 10 visitors under test start from Summit Plaza to find their way to Pacific Pier, and record their wayfinding behavior at point A, point B and point C.

**Table 2 Statistics of Visitors' Wayfinding Behavior at the Key Position**

Key Position \ Statistical indicator	A	B	C	Unit
backing	2	1	0	Number of people
wrong turning	2	1	0	Number of people
stagnating	6	6	3	Number of people
looking around	10	7	4	Number of people
watching signs	10	10	10	Number of people

Table 2 shows that:

1)As the visitors under test looking for destination with purpose, there will be more behaviors such as stagnating, looking around and watching signs to help them find their way. At point A, B and C, all the visitors under test have behavior of watching signs. With the help of wayfinding signage, most visitors are able to find the right path and only few of the visitors behave in looking around and watching signs, which indicate the wrong wayfinding.

2)Road junction point A and B are the places where visitors are more likely to get lost and behave in slowing down, which is generated from stagnating and looking around. As point A and B are the intersections that have more optional direction and more wrong wayfinding behaviors than point C, these places are the key positions that should be enhanced the signage system setting. Therefore it is very reasonable for different types of wayfinding signage setting at key positions as gathering point. In addition to the intersection, the attractions and public services are also the key positions that should be enhanced the setting of wayfinding signage.

**3.3 Different types of wayfinding signage and visitors' behavior**

**Figure 2 The Visitors in Different Behaviors at Key Position A**

**Figure 3 The Stagnant Visitors Focusing on Different Types of Wayfinding Signage**

Figure 2 and figure 3 show that:

1) There are two types of visitors at key position point A: one will pass by point A directly without stay, one will slow down or behave in stagnating, looking around and etc, which refer to stagnant behavior. The visitors passing by directly account for 82% of the visitors, while the visitors in stagnating account for 18%.

2) Among visitors who are in stagnating and need to make wayfinding decisions at point A, 78% choose to watch orientation signs, 60% choose to watch direction signs, between which 38% of visitors use both two types of signage to find their way. More visitors of those who looking for destinations with purpose choose the help of the orientation signs.

## 4 Conclusions

### 4.1 Visitors' touring pattern in the theme park can be divided into two types: wandering, purposely finding.

1) Wandering. Due to the demands for leisure and exploration, the majority prefer wandering pattern in the touring process. In other words, they won't determine their own attractions firstly, but choose playpoints freely according to their interest. To visitors who play randomly, identification signs have greater impact on them. The identification signs in bright colors or strong visual effects are likely to attract tourists, while direction signs are often saw by chance when walking, let alone orientation signs and maps.

2) Purposely finding. Purposely finding can be divided into two cases, one is finding attractions and another is looking for public service facilities such as restaurants, toilets, and stroller parking, etc. To those visitors, they have strong purpose so the orientation sign and maps are more useful for them.

In general, both touring patterns exist in the touring process rarely one of them emerges separately. Therefore, the portfolio management method is used in the setting of wayfinding signage system; according to different visitors and combining directional signs effectively is necessary.

### 4.2 The impact of wayfinding signage system setting on visitors' behavior at the key positions of theme park

1) At key positions, such as the intersection, especially the intersections of park junction usually need to deal with the wayfinding needs of visitors from different directions. Visitors' divergence at the intersection is crucial for crowded theme park; appropriate wayfinding signage setting can balance the number of visitors for each theme area. Simple graphic type of direction signs cannot completely satisfy the wayfinding needs of the tourists from all directions and need the assistance of multi-way type direction signs, which will give more intuitive directions to visitors. Also, it is suitable for visitors who choose the wandering touring patterns to identify the directional information quickly while walking.

2) Key positions usually are the decision-making intersections or direction changing places, where the combined setting of direction signs and orientation signs make the process of wayfinding easier. The surrounding circumstances related to visitors' location are quite important when the visitors have the purpose of looking for an attraction but have no idea where they are. The orientation signs and direction signs that only contains regional or overall map of the park do not work. Only the direction signs and the "you are here" maps can provide better help to visitors' wayfinding.

3) The key positions are also the places need to enhance the wayfinding signage setting, including the intersections, junctions of theme areas, public service facilities, attractions, etc. In visual aspects, increasing identifiable degrees, adding more artistry and interest, can be applied in enhancing wayfinding signage. Setting types, quantity and the orientation of the panels should be considered when setting wayfinding signage as well.

4) Adding pictures or icons of important attractions on the layout of the direction signs, allow the visitors without reading ability receive the right directional information; general visitors also have a more intuitive impression about their destination. As everyone has a different capacity for remembering information, the cognitive ability of visitors and personal wayfinding experience are diverse, more forms of signs are needed to meet the wayfinding demands of different visitors.

### 4.3 The impact of wayfinding signage coherence on visitors' behavior

Wayfinding signage system plays its role for orientation through a series of composite signs. The coherence of wayfinding signage is a key factor for the success of visitors' wayfinding behavior and relates to the sense of wayfinding security. To those who prefer a casual wandering in the theme park, their wayfinding model usually is: picking a way casually at first and making a turn when they meet a

sign. Visitors may keep walking straight if they miss the sign until they meet next sign. If the next sign doesn't exist or the destination is wrong, they will turn back and that's how the wrong wayfinding behavior forms. Wayfinding signage system can be seen as information reconfirming process in which visitors' memory is related to the wayfinding success. The distance between two signs should be suitable, so that visitors are able to confirm whether they choose the right path. And the wayfinding signage also should be set at the intersections where visitors need to make decisions, so that visitors' wayfinding behavior can continue.

# The Development and Innovation of Urban Public Transport System

Wang Junshan

Tian An Public Transport Limited Liability Company in Erdos, Inner Mongolia, Neimenggu, P.R.China,  
017000

(E-mail:tajt888@126.com)

**Abstract:** With the accelerated urbanization process in China, the rapid development of the city, and the improvement of people's living standards, the process of motorization has accelerated noticeably. Giving priority to the development of public transport is not only the key to improve the urban transport, but also directly related to the city's sustainable development. As the accumulation of practical experience, the deepening of the theory understanding and the needs of modern urban development, major cities have presented the strategy about the development of urban public transport system. Among them, some theories are noteworthy, such as the public transportation system, urban and rural public transport co-ordination, integration of urban and rural public transport, public transport based on TOD mode and the bus rapid transit system, and so on. According to the study of these theories and the discussion for the planning of the Bus Priority network, this paper finds a system thinking about the planning of Bus Priority.

**Key Words:** Public transport; Sustainable development; Public transportation system; Integration

## 1 Introduction

With the rapid development of social and economic construction, the size of modern city has been continuously expanding. As a result, the city is more dependent in the transport system. Traffic congestion and environmental pollution, which seriously restrict the operation efficiency of urban transport, have become the focus of attention, waiting to be solved. The United States put forward a set of system of transport planning theory, which emphasizes detailed investigation and analysis to the condition of the future traffic, the vehicle growth trend and the existing infrastructure. Generally speaking, the urban traffic planning result is based on urban development planning, transport strategy planning, recent traffic action plan and the major traffic facilities of the assessment. In recent years, according to the different characteristics of the urban traffic, some developed countries put forward some characteristic planning theories. The most typical is that Japan puts forward "railway nodules point" theory and Russia puts forward "traffic ShuNiuDian" theory. "Railway nodules point" theory in favor ShuNiuDian railway scattered on the cultivating the urban function, in order to form the function and structure of the big cities. And these theories are viewed as the prerequisite in realization of the central city structure.

On the basis of increasing the urban infrastructure, how to using modern high-tech and giving priority to the development of public transport is not only the key to improve the urban transport, but also directly related to the city's sustainable development. Some theories are noteworthy, such as the public transportation system, urban and rural public transport co-ordination, integration of urban and rural public transport, public transport based on TOD mode and the bus rapid transit system, and so on. These theories can be regarded as a kind of way to achieve the optimal control of the urban transport, which can not only effectively improve the traffic conditions, reduce the mounting congestion and auto environmental pollution, but also improve the overall level of transport and provide an all-around quality service.

## 2 The Back Ground of Urban Public Transport

As the development of China's economy and society and the implementation of urbanization, on the one hand, China's urbanization process is continuously deepening which drive a lot of rural labor migrating to the city or changing to other non-agricultural field, making the connection closer between urban and rural areas, villages and towns. As a result, the scale and scope of public flow has been expanding which brings the increase of passenger flow volume; on the other hand, the gradually expanding of the urban scale and the significantly increasing of the urban population make the traffic problem more and more serious, such as traffic environmental pollution, traffic congestion and traffic accidents, and so on. In modern process of China's urbanization, urban and rural population structure has undergone tremendous changes, mainly reflected by the increasing urban population and the

aggregation of the floating population. The urban public transport and short-haul highway passenger between city and countryside, which grew up in 1980s, meet the travel needs of the urban and rural residents to a certain extent. However, since the beginning of the new century, the deep drawbacks of the original public transport mode gradually exposed because of lacking unified planning and management, such as the lack of coordination of the development of many transport modes between the urban and rural passenger, management system intersecting with each other, the lack of unified planning for infrastructure construction and using, there always being contradictions and unfair competition between the urban public transport and road short distance passenger, having no unified planning of departing, scheduling and the stops.

The management system of urban public transport and short distance passenger between city and countryside artificially separates the traffic connection between downtown and countryside, which apparently can't adapt to the needs of modern city's development. Under this background, the concept of the development of modern big cities' public transport system came into being.

### **3 The Development Strategy of Urban Transport System**

The concept and connotation of urban public transport is the lifeblood of the city, the main symbol of urban modernization, the critical infrastructure which is closely related to people's production and life and a kind of social welfare undertaking which is related to the national economy the people's livelihood. As the accumulation of practical experience, the deepening of the theory understanding and the needs of modern urban development, major cities have presented the strategy about the development of urban public transport system. Among them, some theories are noteworthy, such as the public transportation system, urban and rural public transport co-ordination, integration of urban and rural public transport, public transport based on TOD mode and the bus rapid transit system, and so on.

#### **3.1 The concept and connotation of large public transportation system**

Two concepts "large public transportation" and "large public transportation system" frequently appear on some papers, magazines, conferences, newspapers and network. However, up to now, academia and the public utilities departments have not give authoritative definition to their meanings. The explanation on some magazines is that "large public transportation" is to establish the dominant position of public transport in urban traffic, founding an urban public passenger transport system which is economic, convenient, efficient and sustainable development and radiating to the urban and rural areas. As the continuous advance of China's urbanization process and the in-depth development of the public transport, "large public transportation" and "large public transportation system" is indeed able to express the development trend of public transport in metropolitan area today. However, urban development needs the academic community to determine the accurate definition of these two concepts as soon as possible so that they can play an active role to the reform of China's urban public transport in theory and practice.

With the combination of the explanation given by the above mentioned newspaper and some practice of establishing large transportation system, the author thinks that the definition should be: a large transportation system is a development theory of "people oriented" and bus priority which is established in the process of urbanization today and to establish a secure and economic, efficient and fast, convenient and comfortable and sustainable development regional public transport system and make the culture between cities, city and countryside come true via the integrated use of advanced technology and a variety of public transport resources. Its connotation includes the following aspects:

- 1) The core concept of large transportation system is to give priority to the development of urban public transport and to establish the dominant position of public transport in urban traffic.
- 2) The connotation contains the combination of a variety of transport modes, including regular bus, rail bus, taxi and free bicycles, and cable car, water ferries in some cities, and so on.
- 3) It is benefit for promoting urban sustainable development and regional economic development,
- 4) It has a strong radiation function so that it can promote the process of urbanization.
- 5) It should be organically connected with urban external transport system.

#### **3.2 The concept and connotation of passenger transportation in the urban and rural**

There are some statements whose meanings are similar in the development process of urban and rural passenger, such as coordination of urban and rural public transport, integration of urban and rural transport, integration of urban and rural passenger, passenger transportation in rural areas and integration of urban and rural road passenger transportation, and so on. Among them, coordination of urban and rural public transport, integration of urban and rural passenger, and integration of urban and

rural road passenger transportation are the more common concepts. If there are too many different concepts whose content are similar, people may be confused so that the concept and connotation should be unified to a clear concept. Although these concepts are not uniform, they are suggested under the background of the continuous improvement of passenger transport infrastructure in urban and rural roads, the rapid development of road passenger transport and the transition of urban and rural road passenger transport management system, which inevitably can provide a well reference to the study of urban and rural passenger. Although these concepts and assertions express differently, we can find that they include the following common elements through analysis:

(1) Background. They are all under the background that the process of China's urbanization is speeding up, with the expanding of the metropolitan areas, and based on the reform of the existing passenger transport system and breaking the dual structure of urban and rural passenger.

(2) Guiding ideology. They all have proposed the integration of urban and rural passenger transport, focusing on exploring to make the urban and rural passenger comply uniform regulations, according to the unified planning, and implement an integrated management and operation.

(3) The ultimate aim. They are all in order to establish a passenger system which is convenient for the urban and rural residents and promotes the synchronic development of the urban and rural society and economy.

The essence of the reform of urban and rural passenger transport is to break the urban-rural dual structure, making the urban and rural residents equally enjoy the convenient travel resources. In view of this, the author thinks that the urban and rural passenger transport should be included in the scope of public transport, and it is more accurate to use the concept of "the integration of urban and rural public transport" which can be call as "public transport" or "bus" to a certain stage of social development. The author agrees with the definition given by Zhang Jianfeng: the integration of urban and rural public transport organically combined the elements of stations, operating structure, vehicle operation, and network expending and management system through the rational allocation of the various elements of the urban and rural road passenger. It use the operation way of public transport to achieve the orderly flow of passengers and the orderly operation of the market, and ultimately achieve the aim of making the passenger's travel more convenient and promoting social and economic development.

### **3.3 Public transport based on the TOD mode**

Transit-oriented development model (TOD) is a community which is compact layout and has a mixed function. It encourages people do their best to reduce the use of private car and use more public transport through reasonable planning and regarding a public transport site as a center. After many years of theoretical exploration and practice of summary, TOD has gradually developed into a special kind of "land unit" from the early concept of a planning, becoming a new urban basic constitute structure which is different from the traditional "car transit-oriented" structure. Its development and construction has a positive effect at the aspects of guiding the city reasonably expanding, giving priority to the development of public transport and effectively controlling the car using.

In China's urbanization process, the scale of the city expands rapidly, proactively combining the urban development planning and the public transport development planning to found a public transport based on TOD mode. This will be an important way to achieve the urban comprehensive transport system whose main part is the public transport.

### **3.4 Bus rapid transit**

Bus rapid transit (BRT) is a kind of new public passenger transport system and a road transport mode with large capacity which is between the rapid rail transit (RRT) and normal bus transit (NBT), usually called "the subway system on the ground". It is a unique urban passenger transport system which opens up the bus lane roads, constructs new bus stations and achieve an operation services which is similar to rail transit through the combination of modern public transport technology and the intelligent transportation technology, and operation management, so that it can be close to light rail service.

BRT is a kind of high quality, high efficiency, low power consumption, low pollution and low-cost public transport mode, fully embodying the development philosophy of people oriented, and building harmonious society. We can know that the environment pollution of BRT is lower than other auto traffic measures in figure 1. At the same time, the table 1 shows that the BRT is more convenience and it costs lower than other traffic measures.. At present, BRT has been a new public transport mode which is widely promoted in the world and its effect for the development of urban transport has been paid more and more attention in China. So far, some cities in China have founded BRT system, such as Beijing, Guangzhou, Zhengzhou, Jinan, Xiamen, and so on.

Figure 1 Data of Carbon Dioxide Emissions (G/1 Person·Km)

Table 1 Comparison of Technical Economic Among BRT, Light Railway And Subway

Index	BRT	Light railway	Subway
Road characteristics	Special or Mixed flow lanes	Special or Mixed flow lanes	Special lanes
Distance(Km)	350-800	350-800	500-2000
Capacity(person)	40-120	110-250	140-280
Average speed(Km/h)	20-40	20-45	25-60
Safety performance	High	High	Highest
Cost of construction(10 thousand\$)	600-1500	1200-3400	1,2000-1,8000
population	750,000	1,000,000	2,000,000

#### 4 Internal Relation of the Above-Mentioned Concepts

The above context has made a simple description to several important concepts in the development of modern public transport system. These concepts are not isolated, and there must be a necessary connection between them because they appeared simultaneously during the process of urban space rapidly expanding and the rapid development of public transport.

People’s demand for fast travel, caused by the expansion of the urban space and the evolution of the urban-rural relations, promotes the appearance of BRT. In turn, because the development of urban public transport has active effect on city’s development, the appearance of BRT provides a foundation for the concept of urban development based on TOD mode. They are the two aspects of one question: TOD is the mode of urban development, while BRT is the support of urban development. The city Kultiba’s practical experience of combining BRT and TOD has proved the coordination between public transport and urban development.

The integration of urban and rural public transport, leaded by urban development (the expansion of the urban space and the evolution of the urban-rural relations) and the common development of public transport system, has become a historical necessity.

The integration of urban and rural public transport is the initial stage of the large public transportation system. The construction of the integration of urban and rural public transport is the foundation of the construction of urban large public transportation system. As the integration of urban and rural public transport gradually becoming mature, it can establish a regional public transport system which is secure and economic, efficient and fast, convenient and comfortable and sustainable development and achieve passenger transportation between cities and the urban and rural areas by integrated use of advanced technology and a variety of public transportation. That is to say, it is the ultimate purpose of the integration of urban and rural public transport to construct large public transportation system.

## 5 Conclusion

The essay makes an explanation and analysis of the city's public transportation system development of the bus system, and we also put forward some advises based on the TOD and BRT model. The future development of public transport system in major cities should not only reflect high efficiency, but also ensure that it has high enough quality of service. In order to achieve high efficiency of the urban traffic, there must be a fast means of transportation; only owning a high enough quality of service can the citizens conveniently use public transport services, the attractiveness of public transport be improved, and make the public transport play the main role in urban transportation system. The future development of the public transport system in major cities must consider the sustainable development of cities and should be matched with the layout of the city's land. The future development of the public transport system in major cities should also abandon the backward traditional planning and management methods, as well as the traditional mode of public transportation system. According to the needs of modern urban development, a new modern urban public transportation system should be constructed. In view of this, the main direction of future development of the public transport system in major cities is the construction of large public transportation system which is based on TOD mode and supported by BRT mode. What need to be emphasized is that different cities should find a suitable large public transportation system for itself according to its own actual situation of natural conditions, cultural background.

In modern time, the BRT and TOD are improving quickly, but there are some problems which should be solved in the future. For the BRT, the most serious problem is the illegal across the street, vehicles damaged and that the BRT special channel is used by other cars. As to the construction of bus TOD mode in our country, we should introduce bus classification ideas and strengthen the urban planning of foresight, systematic, and make it adapt to the need in the nature to ensure the effectiveness of implementation of the bus TOD mode.

# Study on Rivalrousness Between Midland Intercity Track Transportation and Highway Transportation Based on Logit Model

Li Xiang, Jiang Huiyuan

School of transportation, Wuhan University of Technology, Wuhan, P.R.China 430063

Wuhan,430063, China

(E-mail: jimmy-play@163.com)

**Abstract:** With the boost of the intercity track transportation in China, traditional highway transportation will face increasingly fierce challenge. The factors are analysed that influence the rivalrousness between them. The distribution rates on passenger flows between the intercity track transportation and highway transportation are estimated based on Logit model. A new method is used to calculate the utility value of transport product. And the utility function of transport product is applied instead of the traditionally used linear regression functions in the Logit model. Finally some suggestions about the development of highway transportation are given.

**Key words:** Logit model; Distributing rates; Rivalrousness

## 1 Introduction

With the rapid development of economy in the midland of China, Intercity passenger flow is growing rapidly. With the appearance of the intercity track transportation, traditional highway transportation face the increasingly fierce competition. The competition between the two are mainly embodied in the distribution rates on passenger flows .Therefore, the estimation of the distribution rates on passenger flows, the analysis of the highway passenger competitive advantage and coping strategies for highway transportation is very significant.

## 2 The Main Index Which Influence Rivalrousness between Midland Intercity Track Transportation and Highway Transportation

The rivalrousness between midland intercity track transportation and highway transportation is mainly embodied in the passenger flow. The result shows the distribution rates on passenger flows between them. There are some factors which influence the midland intercity track transportation and highway transportation, for example safety, promptness, economy, comfort and convenience, service, quality, etc. This paper selects the safety, promptness, economy, comfort four index as main index which influence rivalrousness between midland intercity track transportation and highway transportation. Based on the four indexes, this paper selects Wuhan-Yichang intercity track transportation as example for the estimation of distributing rates.

## 3 Distribution Rates on Passenger Flows between Midland Intercity Track Transportation And Highway Transportation

Logit model is a relatively mature method on estimation of distribution rates, usually used to estimate the distribution rates of traffic origin and destination points.

### 3.1 Logit model

The general form of Logit model is:

$$P_i = \frac{e^{U_i}}{\sum_{i=1}^m e^{U_i}}$$

In the formula,  $U_i$  is utility value of product i. m is the amount of product i.

$P_i$  is the probability of product i being selected, and  $\sum_{i=1}^m P_i = 1$ ,  $0 < P_i < 1$ .

The utility function of product i is usually presented as a linear combination of safety, speed, economic and comfort etc. as

$$U_i = \sum_j W_j C_j$$

In the formula,  $w_j$  is the weight of j character;

$W_j$  is the value of j character;

Utility value of Logit model is mainly determined by effect factors and respective weights. Once the weights are determined, the parameters of the model are confirmed. There are several methods as below.

(1) Maximum-Likelihood method

This method evaluates future situations depends on present data, deviations inevitably exist. Maximum-Likelihood usually faces shortage of sample data in practice because ticket price remain the same and it is difficult in obtaining data.

(2) Experienced opinion poll to determine weight

Firstly, choose evaluation indexes. Then build evaluation matrix through survey and confirm weights of evaluation indexes by paired comparison. Possible changes can be given as assumptions in the process of survey, choice of respondents can be obtained. But its basic idea is still the linear correlations between utility value and effect factors; it is not the accurate description of actual situation.

(3) Possible satisfaction method

Choosing the basic indexes and confirming their utility values, total possible satisfaction comes by linear combination. Utility value of each index comes by expert assessment and evaluation. It is different with the actual situation as this method has not considered the weights of parallel factors.

This paper chooses an improved possible satisfaction method to estimate the distribution rate on passenger flows between Wuhan-Yichang intercity track transportation and highway transportation based the characteristics and feasibilities of above methods. This method not only overcomes shortage of sample data, but also no more be confined to linear combinations of effect factors. The improvement in solving characteristic function of Logit model expands the scope of application of the model to some extent.

**3.2 Utility value**

The basic idea of possible satisfaction is the “possibility-satisfaction” curve which is composed by possibility  $p(r)$  and satisfaction  $q(s)$  of attributes. The curve quantitatively describes the degree of possibility and satisfaction, as  $W(a) \in [0,1]$ . In the context,  $W(a)$  is used to get utility value of transport product.

Possibility-satisfaction of category index is composed by indexes  $W(a)$  through multi-dimension assembly rule of multi-objective decision according to their importance and correlations after utility values of basic indexes have been confirmed. Utility value  $V$  is the total possibility-satisfaction of the scheme. Addition rule and multiplication rule are mostly used in the process of combination.

Addition rule: If effect factors which determine an attribute are independent, their functions are different only in degree and can be linearly compensated by each other. Addition rule runs.

$$V = \sum_{k=1}^n C_k(A, B, \dots, F) W_k$$

In the formula,  $C_k(A, B, \dots, F)$  is weight index, and  $0 \leq C_k \leq 1, \sum_{k=1}^n C_k = 1$ .

Multiplication rule: If effect factors which determine an attribute are independent, their functions are different only in degree and essentially the same. But only when all factors are effective, the attribute effect. Once a factor is not effective, the attribute is not effective though other factors are effective. So multiplication rule comes.

$$V = \prod_{k=1}^n W_k C_k(A, B, \dots, F)$$

In the formula,  $C_k(A, B, \dots, F)$  is weight, and  $0 \leq C_k \leq 1, \sum_{k=1}^n C_k = 1$ .

To compare Wuhan-Yichang intercity track transportation and highway transportation, this paper choose four indexes: safety, speed, economic and comfort. Utility value of transport product is determined by the formula below.

$$V = W_1 C_1 (W_2 C_2 + W_3 C_3 + W_4 C_4)$$

In the formula,  $W_1, C_1$  respectively represent possibility-satisfaction and weight of safety;  $W_2, C_2$

respectively represent possibility-satisfaction and weight of speed;

$W_3, C_3$  respectively represent possibility-satisfaction and weight of economic;

$W_4, C_4$  respectively represent possibility-satisfaction and weight of comfort.

Confirm possibility-satisfaction and weight through survey and data of Wuhan-Yichang intercity track transportation and highway transportation.

### 3.2.1 Confirm possibility-satisfaction

Considering the correlations of indexes and utility value, rules must be obeyed: safer, more utility value; faster, more utility value; less ticket price, more utility value; more comfort, more utility value. Indexes of possibility-satisfaction are confirmed through market survey and expert assessment and evaluation. As followed:

#### (1) Safety

Statistic analysis shows that passengers prefer track transportation to highway transportation in safety. But safety of intercity track transportation still has space to improve at hardware-software. Safety possibility-satisfaction value of track transportation is 0.9 while highway transportation is 0.8.

#### (2) Speed

Speed mainly embodied in journey time and speed. Run time of track transportation has 3 kinds: 108min, 120min and 132min; the average departure interval is 30min. Total average journey time of track transportation is  $T = (108 + 120 + 132) / 3 + 30 / 2 = 135 \text{min}$ . Average run time of highway transportation is 255min; the average departure interval is 30min. So the total average journey time of highway transportation is  $T = 255 + 30 / 2 = 270 \text{min}$ . Possibility-satisfaction value is 1 when the total journey time is less than 150min. So speed possibility-satisfaction value of inter-city track transportation is 1 while highway transportation is 0.6.

#### (3) Economic

Economic mainly embodied in ticket price. Price of inter-city highway transportation has two classes, class I and class II. Because station of Wuhan, Wuchang and Hankou locate in different places, each class has 3 kinds of prices. Class I : 114 Yuan, 107 Yuan and 103 Yuan; Class II : 95 Yuan, 89 Yuan and 85 Yuan. Respectively the train number is: Class I : 5, 9 and 19; Class II : 5, 9 and 19. The majority of passengers prefer cheap price, the weight of Class II is 0.8. Average ticket price of highway transportation is  $C = (114 \times 5 + 107 \times 9 + 103 \times 19) / 33 \times 0.2 + (95 \times 5 + 89 \times 9 + 85 \times 19) / 33 \times 0.8 = 91 \text{Yuan}$ . Ticket price of highway transportation has 4 kinds: 60 Yuan, 80 Yuan, 110 Yuan and 150 Yuan. Respectively the weights are 0.6, 0.2, 0.1 and 0.1. Average ticket price of highway transportation is  $T = 60 \times 0.6 + 80 \times 0.2 + 110 \times 0.1 + 150 \times 0.1 = 78 \text{Yuan}$ . The majority of respondents feel that the ticket price is high, so economy possibility-satisfaction value is 1 when the price is 60 Yuan. Then economy possibility-satisfaction value of inter-city highway transportation is 0.75 while highway transportation is 0.85.

#### (4) Comfort

Inter-city highway transportation is better than highway transportation in comfort, so possibility-satisfaction value of highway transportation is 0.9 while highway transportation is 0.8.

### 3.2.2 Confirm the weights

Weight of index which apply to multiplication rule is 1. Sum of index weights is also 1 if the indexes apply to addition rule. So safety weight is 1 and sum of speed weight, economy weight and comfort weight is 1. The weights of factors come through paired comparison. Compare the importance of speed, economy and comfort, weights come as followed.

$X_1, X_2$  and  $X_3$  respectively represent comfort, speed and economy. To highway transportation passengers, results show as below.

(1)  $X_1$  To  $X_2$ ,  $X_2$  is more important.

(2)  $X_1$  To  $X_3$ ,  $X_3$  is more important.

(3)  $X_2$  To  $X_3$ ,  $X_2$  is more important.

Comparison matrix is:

$$A = \begin{bmatrix} 1 & 1/5 & 1/3 \\ 5 & 1 & 3 \\ 3 & 1/3 & 1 \end{bmatrix}$$

Result comes through sum-product method:

$$C = \begin{bmatrix} 0.106 \\ 0.633 \\ 0.260 \end{bmatrix}$$

Consistency check,  $\lambda_{\max} = 3.038$ .

$C.I. = 0.019$ , when  $n = 3$ ,  $C.R. = 0.58$ ,  $\frac{C.I.}{C.R.} = \frac{0.019}{0.58} = 0.033 < 0.1$ , so result of the survey is acceptable in consistency, the weights is reliable. Similarly, corresponding index weights of highway transportation is

$$C = \begin{bmatrix} 0.106 \\ 0.633 \\ 0.260 \end{bmatrix}$$

Above all, possibility-satisfaction and weights of Wuhan-Yichang intercity track transportation and highway transportation show in table 1.

**Table 1 Index Possibility-Satisfaction and Weights**

	index	Inter-city track transportation	highway transportation
safety	possibility-satisfaction	0.9	0.8
	weight	1	1
speed	possibility-satisfaction	1	0.6
	weight	0.633	0.26
economy	possibility-satisfaction	0.75	0.85
	weight	0.26	0.633
comfort	possibility-satisfaction	0.9	0.8
	weight	0.106	0.106

$$V = W_1C_1(W_2C_2 + W_3C_3 + W_4C_4)$$

Utility value of track transportation and highway transportation:

Inter-city highway transportation:

$$V_1 = 0.9 \times 1 \times (1 \times 0.633 + 0.75 \times 0.26 + 0.9 \times 0.106) = 0.83$$

Highway transportation:

$$V_2 = 0.8 \times 1 \times (0.6 \times 0.26 + 0.85 \times 0.633 + 0.8 \times 0.106) = 0.62$$

Distribution rate of Wuhan-Yichang intercity track transportation:

$$P_1 = \frac{e^{V_1}}{e^{V_1} + e^{V_2}} = \frac{e^{0.83}}{e^{0.83} + e^{0.62}} = 0.55 = 55\%$$

Distribution rate of highway transportation:

$$P_2 = 1 - P_1 = 45\%$$

In present conditions, distribution rate of Wuhan-Yichang intercity track transportation is 55% while highway transportation is 45%. Considering safety, speed, economy and comfort, highway transportation has the advantage of speed while highway transportation has the advantage of price. Pursuing speed and comfort is the development trend, economy weight will decrease. Highway transportation should work out corresponding policy to take the advantage of accessibility and convenience.

#### 4 Competitive Analysis of the Intercity Rail Transit and Highway Passenger Transport

The boost of intercity track transportation is a huge challenge undoubtedly for highway transportation. The intercity track transportation caused a serious threat for highway transportation.

To enhance the comparative advantages to intercity track transportation, highway transportation enterprise must further optimize the allocation

of resources, make scientific development strategy, make full use of its advantages in avoid direct conflict with intercity track transportation and continuously improve its competitiveness.

The fare is one of the important influence tourist factors. It is necessary to low down the price of bus and improve transportation hardware to face competition from intercity track transportation. Through the integration of line resources, it is possible to reduce line overlap, eliminate peer competition and improve the profession competitive power.

## 5 Conclusion

Based on the analysis of the factors which influence the trip of people, Logit model is used to calculate the distribution rate of midland intercity track transportation and highway transportation. A new method is used to calculate the utility value of transport product. And the utility function of transport product is applied instead of the traditionally linear regression functions in the Logit model. The application scope of Logit model is expanded. Finally some suggestions about the development of highway transportation are given to make full use of its advantages and continuously improve its competitiveness

**Abstract:** Based on the perspective of stakeholders, this study has carried out the complete information dynamic game tree analysis between the residents and the government, the incomplete information game analysis on the payoff matrix between residents and the tourism developers, the incomplete information dynamic game analysis between the government and tourism developers and has put forward three measures of optimal utilization for tourism suburban land: scientific planning to coordinate the development between urban and rural; intensive conservation to use suburban land reasonably; leading by the government to achieve the dynamic management of land.

**Key words:** Optimization Mechanism; Stakeholders; Land for Suburban Tourism; Game Analysis

### 1 Introduction

With the accelerated process of urbanization and the rise of the city circle, cities get closer than before and the noisy from city agglomeration makes people more eager to visit the pure leisure place. The good ecological environment and convenient geographic conditions of suburb gradually attracts more and more tourists, and a mass of “rural tourism”, “farmyard tourism” and other tourism products spring up. Suburban tourism land is a general term of the land which can directly or indirectly meet the visitation, recreation and relaxation demands of visitors on the transition zone shifted from urban function to the countryside function, and can provide space for tourists to make a series of tourism activities. Urban expansion will possibly make the landscape disappear in rural and urban handover zone and also will exacerbate land contamination, which would undermine the use of suburban tourism land. In tourism development, there are some various conflicts of interest among the local residents, government and developers, so how to guarantee and coordinate all parties also has become an important issue. Optimal utilization of suburban tourism land has guiding significance for protecting people's leisure needs, promoting rational planning of urban functions and achieving the scientific management of land utilization. This article researches on the mechanism of suburban tourism land in order to find some ways to promote their sound development.

The research on suburban tourism land started in 1960s abroad. Scholars' researchers were mainly from the stakeholders' attitude on tourism land and the development and utilization of tourism land. On the aspect of stakeholders' attitude, Wesley and Fesenmaier (1987) have discussed that there were many local residents in America holding a negative attitude to developing tourist destination. Yalein Kuvan and Perran Akan (2005) have researched on people's attitude for developing tourism land in Turkey Belek resort town. According to the result, the residents held a positive attitude on developing local tourism, and at the same time, they were concerned about the negative effects on local forest tourism resources brought by travel industry. On the aspect of development and utilization of tourism land, Hammes (1994) has analyzed the land market could be influenced and caused changes by what kind of factors in the spatial pattern of land rent from the perspective of developing the tourism resort town. About the researches of Richard Sharpley(2002) and Abby Liu(2006), the former thought that financial support and technical support were two essential aspects in developing rural tourism land and the latter researched the development of tourism land in Malaysia through investigating stakeholders' views, planning agencies, travel communities, development initiatives, etc.

Study of suburban tourism land in China only has nearly a 20-year history, but the content has been very broad. Zou Tongqian(2002) has divided the planning of suburban tourism land into two parts:land for the tourism industry and tourism activities. Chen Yuping and Li Jiangfeng(2003) have taken JingXia district of Wuhan City as an example, they analyzed quantitatively mutual conversion among the land utilization types. Xi Ya(2004) has thought that the development of small spots in suburban is an

important aspect to optimize the land utilization structure. Cheng Xu(2006) has proposed the concept of leisure agricultural land from the perspective of multifunction of suburban land utilization.

Reviewing the literature, we can find that foreign scholars tend to emphasize the relationship between the human and the tourism land while the domestic scholars tend to study the development and planning of land utilization. It is need to strengthen the management mechanism from the perspective the coordination of the stakeholders.

## 2 The Game Theory of Suburban Tourism Land Stakeholders

The main stakeholders in the development and utilization of suburban tourism land are the local residents, the government and the tourism developers. There is a game of interests among the three parties.

### 2.1 Interests between local residents and government

When developing a suburban tourism land, the government needs to expropriate large areas of land from local residents. The land is farmers' lifeblood. Only when the government guarantees the farmers' more superior living standard and the source of income after losing the land, will farmers hand over the land to the government. However, the local government always played a leading and controlling role while the residents are generally in a vulnerable position in the game and sometimes their demand is very difficult to satisfy (Zhang Anmin, 2007).

We may regard the land-levying as a complete information dynamic gambling process between the government and local residents. (Figure 1, represent local government, B represent local resident):

Figure 1 Game Tree Between The Local Residents and The Government

The land-levying is one kind of government action. We assume that the government acts first, and the strategy collection is (negotiation, enforcement), while residents' corresponding strategy collection is (cooperate, boycott). They take appropriate action after the government, both parties can predict gains and losses of their actions, so that can form the following four groups of strategy collection: I (the government consultation, residents cooperation); II (consultation with the Government, the residents resisted); III (government forces, residents of cooperation) and IV (the government forces, residents boycott). Through the Figure 1, we may make the following analysis of these four combination ways: if the local government is willing to consult the land-levying way and the local residents would like to cooperate, both parties reach the agreement through the voluntary consultation, and they may obtain the greatest income. Uses  $a$  and  $b$  separately indicated and the gross revenue is  $a+b$ . This is an ideal equilibrium state, represented by I; if local residents resist the local government's land-levying, and the two parties cannot reach a voluntary agreement through consultation, government's land-levying way and the income will not change, which still is  $a$ . The residents' resistance can make their cost increased, and their income reduced, the income value is  $b_1$  ( $b_1 < b$ ), total income is  $a+b_1 < a+b$ , represented by II; If the local government expropriate the land by force and the residents accept this way, the land-levying agreement may achieve, but the bilateral benefit proportion has certain change. The government compulsory land-levying makes its income increased, the income value is  $c$  ( $c > a$ ), which represents the government's compulsory land-levying can get more profit. Under this condition, the residents' profit value is  $d$  ( $d < b$ ), which expressed that the way the government compulsory land-levying make the

resident benefit impaired. The assumption  $c+d < a+b$ , expresses that government's compulsion needs to spend certain cost, so the gross revenue reduces, represented by III; if the local government compulsory land-levying way is resisted by residents, the government land-levying way has not changed, the income is invariable, which still is  $c$ . The resident resists under the compulsion, which will recall their partial rights and interests, so the profit will be higher than that in cooperation state of government force, and simultaneously it will be lower than in the voluntary consultation state. Assume that profit is  $d_1$  ( $d < d_1 < b$ ), then  $c+d < c+d_1$ , and assume  $c+d_1 < a+b$ , which is expresses that both parties spend the cost against each other. Total income is less than voluntary state, represented by IV.

Based on  $b_1 < b$ ;  $a+b_1 < a+b$ , the local government would choose the consultation way and the best choice for local residents is cooperation because it reaches the balance and makes the benefit maximization and achieves a win-win situation. Specifically speaking, the government builds roads and provides hydropower, invests money, develops the economy and resolves the appropriate farmers work for the development traveling. And the local residents get corresponding compensation. Take tourism development as an opportunity to try new rich channels, so as to ultimately promote local economic development.

**2.2 Interests between local residents and tourism developers**

Tourism developer's aim is profit. They pay attention to short-term gain and the shorter payback period project of investment capital. This is conflicting with the long-term development interests of local residents. Residents are the ultimate undertakers of locally comprehensive developed economy, environment, and society. Whether the tourism developers take the local residents' profit into account through the construction process, including solving the employment problems of inner area, providing a entrepreneurial opportunities, dealing with the pollution problems, eliminating unhealthy entertainment activities, has a profound impact on residents(Lu Xiaoli, 2006).

Tourism developers' attitude to the interests of local residents is either consideration or not-consideration. Local residents' attitude to the construction of tourism developers is either support or not support . We can design the following payoff matrix model to analyze:

**Table 1 Local Residents and Tourism Developers Pay Matrix Model**

		Tourism developer	
		<i>Consideration</i>	<i>Not consideration</i>
local residents	<i>Support</i>	1, 1	-1, 2
	<i>Not support</i>	2, -1	0, 0

Assumptions are as follows: When tourism developers' attitude is consideration and local residents support, the income is (1, 1),when tourism developers' attitude is no consideration and local residents support. the income is (-1, 2), we know that when local residents choose support, the optimal strategy for the tourism developers is not-consideration. When tourism developers consider and local residents not support, the income is (2,-1),when tourism developers not consider and local residents do not support, the income is (0, 0), obviously that when local residents select not-support, the optimal strategy for the tourism developers is not-consideration .So (Not consideration. Not support) constitute a balanced game NASDAQ. However, this can result in conflict in both parties. Pareto is not the most optimal, because the income of combination strategy (consideration. support) is (1, 1), so that both sides have Pareto improvement. If the government department has come forward to coordinate, specifically discuss the rights and obligations of both parties and constrain in the form of contract in development, it can achieve (consideration. support) win-win result.

**2.3 Interests between government and tourism developers**

The main interests focus on whether developing tourism between government and tourism developers is destroying or protecting the environment on the traveling development. Local government bears direct responsibility for the protection of vegetation and forest fires, water pollution and so on. If the original ecology of the areas around the city developed tourism, facilities construction and visitors entering will impact on the environment. And on tourism development enterprise, investment in pollution prevention is large and there is comparison of investment benefit among enterprises, perfectly competitive market economy without government intervention and constraints, Game party governed the admissibility of the tend to co-operate, the formation of non-cooperative game(Yuan Yazhong, 2007), needed for government intervention.

We will view all relevant tourism developers as an Enterprise B, which constitutes a dynamic game

with the Government A. Figure 2 is a subgame of Government (A) and tourism enterprises (B) dynamic game.  $p_1, p_2, q_1, q_2, p_3, p_4$  refer to the probability of selected corresponding strategy for game player which is hard to know for each other.  $(w, u)$  refers to the benefit of A, B game parties. In this subgame, if  $p_1 = 1, p_2 = 0$ , then the game ended prematurely. When people's living standard improves continuously, they are more demanding on the quality of the environment, so the government begins to set new environment standards. Then the game begin again and the quality of environment will continue to improve. The government's "heavy fines and legal prosecution" for tourism enterprises is a "threat ". If  $q_1 > q_2$ , it is a credible threat, the business in the last stage is likely to select the "To implement environmental standards, to perform environmental obligations"; on the contrary, if  $q_2 > q_1$ , then the game will continue, the situation will be exacerbated and the environment develop toward the vicious direction. The manufacturers and the Government of the dynamic game shows that, although the government is involved in, if it did not play authority, mandatory and so on features well, the government failure to make this dynamic game unlimited proceed.

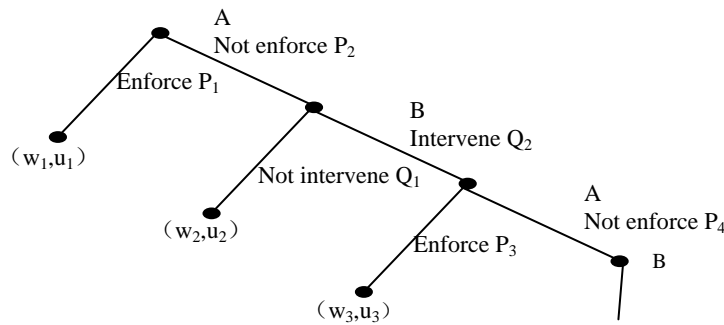

Figure 2 Game Tree Between the Government and Tourism Developers

### 3 Conclusions

In the suburban tourism development and protection, government, local residents and tourism developers' interests all should be balanced, not only to promote tourism development in the short term ,but also to achieve long-term sustainable development of regional economy .Based on the above game analysis, the article proposes the following measures of optimization mechanism:

#### 3.1 Planning scientifically, and develop harmoniously in urban and rural area

The key points of suburban tourism land planning as follow: Firstly, the lands can not be over-exploitation, secondly, should study city and suburban as a whole. Establish the development of tourism industry chain and promote economic development, prevent the local residents' living environment destroying, increase tourism development opportunities for residents to participate in, solve the corresponding employment problems and improve residents' life quality. Develop and utilize suburban tourism land rationally, optimize upgrading and adjustment of urban industrial structure, divide the production sites and ecological sites among cities scientifically, so economy development and people life will coexist harmoniously.

#### 3.2 Utilize suburban land rationally, intensively and conservatively

Infrastructure construction and project classification layout are serviced in the intensive use of land and sustainable development. The existing land use policies focuses primarily on the inner city, but the thinking of suburban tourism land intensive utilization is deficient. As to develop tourism, Government can take preferential polices to attract foreign investment, but it needs to consider that urban suburbs as the city's "back garden", urban and rural areas of the buffer zone, is the lifeblood of the local residents, citizens' basket and an important role in regulating climate(Li Jiangmin,2005).It need to consider the resource protection in the industrial setting and make the project assemble in industrial zone.From extensive to intensive development of tourism sites. Change the extensive way into intensive in exploiting tourism land, create a leisure ecological space with rich culture, focus on energy recycling, utilize land intensively conservatively, and achieve sustainable development.

#### 3.3 Led by the government to achieve the dynamic management of land

Assess suburban tourism land Comprehensively and quantitatively from the economic, social and environmental aspects , deal with the most optimal problem of land allocation by using systems engineering theory and approach, legislate strictly and strengthen the management. On the basis of fully considering the local industry structure, location characteristics and environment protection

requirements, guide the urban and rural land using and constructing. To developers, government has to separate suburban tourism land and industry land so strictly that they will not influence each other, and decrease the pollution as minimal as possible (Qu Jian, 2008). To developers, government should play its authority and mandatory well on rational utilization and environment protection of land, set effective regulation to promote sustainable use of land. Besides, government needs to establish a land information system which is compatible with land use characteristics and adjusts the land using purpose screamingly and rationally according to different requirements in different development stages, makes dynamic and efficient management in land utilization.

## A Probe into American Marine Management Policy

Ye Jing

School of Foreign Languages, Wuhan University of Technology, Wuhan, P. R. China, 430070  
(E-mail: yjwhut@126.com)

**Abstract:** A nation's marine management policy assumes great importance to its national safety and development. In this essay, the author analyses the marine management policy of the U. S. A. in hope to provide some references to the management policy in China. The author thinks that without correct and effective marine management policy, the country can not protect its sea rights and interests and consequently lead its marine industry to failure. It concludes that effective marine management policy will absolutely attack maritime terrorism, smuggling and transnational crimes, keeping peace and order and improving marine environment.

**Key Words:** Marine management ; Sea rights; Sea interests; Peace and order

### 1 Introduction

In a sense, the development course of global ocean order incarnates the historical trend from maritime hegemony politics to maritime rights politics, which is the process from western countries striving for and expanding maritime hegemony, eroding colonies and semi-colonies to the fact of developing countries fighting and rebuilding the international ocean order. The global ocean politic is basically the combination of realpolitik and right-orientated politics. On one hand, in the state of anarchism of colonialism and imperialism dominating the international politics, the emergence and development of sea powers depends mostly on their strong gun boats. And nowadays, the national power system, which is composed of many factors of sea power, economic strength, scientific and technological strength, state institution and national quality, is still the important indicator to distinguish the nation's power and strength. On the other hand, International Law of the Sea constitutes one of the important parts of International Law. From the early period, Portugal and Spain divided their vested maritime interests by conventions. In 1930s, The International Federation of International Law Committee compiled the ocean law and at last published the United Nations Convention on the Law of the Sea, which laid off lots of international maritime legal institutions, including territorial sea, exclusive economic zone, continental shelf, the open sea and marine environment protection. All of the above reflect the global effort of the world trying to solve the problem of distributing sea rights and sea interests. As a matter of fact, the core of international marine management is the concern of sea power, sea rights and sea regime.

### 2 The Importance of formulating Marine Management Policy

#### 2.1 The evaluation of the vast wealth of U. S. oceans and coasts

America is a nation surrounded by and reliant on the oceans. Whether the fisherman in Maine, or the home maker in Oregon, whether the businessperson in Miami, or the farmer in Iowa, every American influences and is influenced by the sea. Careful stewardship of the ocean and coastal resources is imperative to conserve and improve the financial, ecological, and aesthetic benefits.

America's oceans and coasts are big business. The United States has jurisdiction over 3.4 million square nautical miles of ocean territory in its exclusive economic zone—larger than the combined land area of all fifty states. Millions of families make a living directly or indirectly from the resources of the sea.

In 2000, the marine economy contributed more than \$117 billion to American prosperity and provided well over two million jobs. Roughly 75% of the jobs and half the economic value were produced by ocean-related tourism and recreation. For comparison, ocean-related employment was almost 1.5 times larger than U.S. agricultural employment in 2000, and total economic output was 2.5 times larger than that of the farm sector.

The level of overall economic activity within the coastal area is even higher. More than \$1 trillion, or 10% of the nation's annual gross domestic product (GDP) is generated within the near shore area, which is the relatively narrow strip of land immediately adjacent to the coast. Looking at all coastal watershed counties, the contribution swells to over \$4.5 trillion, half of the nation's GDP. The contribution to employment is equally impressive, with 16 million jobs in the near shore zone and 60

million in coastal watershed counties. (See table 1 )

**Table 1 Marine and Coastal Value and Comparison of Government Investment**

Evaluated Value	Financial Year	percentage
The proportion of Marine Economy in National Budget %	2004 Financial Year	7. 4
The proportion of Marine Economy in National GDP %	2004 Financial Year	1. 2
The proportion of the Federal Marine Spending in National budget %	1990 Financial Year	0. 6
The proportion of the Federal Marine Spending in National budget %	2004 Financial Year	0. 3
The proportion of the Federal Marine Spending in National budget %	2006 Financial Year	0. 3

The oceans provide tremendous value to our national economy. Annually, the ports handle more than \$700 billion in goods, and the cruise industry and its passengers account for \$11 billion in spending. The commercial fishing industry's total value is over \$28 billion annually, with the recreational saltwater fishing industry valued at around \$20 billion, and the annual U.S. retail trade in ornamental fish worth another \$3 billion. Nationwide retail expenditures on recreational boating were over \$30 billion in 2002. Governments at all levels, universities, and corporations provide many other jobs in oceans-related fields which range from management and law enforcement to pollution prevention and research. (See table 2)

**Table 2 The Change in Economy of Coastal Economic Zone in 1997-2007**

Employment	Average Annual change %	GDP	Average Annual change %
Coastal states ---107600000	1. 1	11. 4 trillion	3. 4
Watershed county---69300000	1. 0	7. 8 trillion	3. 4
Coastal economic zone ---56200000	1. 0	6. 6 trillion	3. 6
Coastal county ---45600000	1. 2	5. 1 trillion	3. 3

In addition, valuable oil and mineral resources are found off shores and in the seabed; they fuel cars as well as economy, provide materials for construction and shoreline protection, and offer exciting opportunities for the future. Currently, about 30% of the nation's oil supplies and 25% of its natural gas supplies are produced from offshore areas. These energy supplies also provide a major source of revenue and numerous jobs. Since the beginning of the offshore oil and gas program, the Department of the Interior has distributed an estimated \$145 billion to various conservation funds and the U.S. Treasury from bonus bid and royalty payments related to ocean energy.

## 2.2 The importance of formulating marine management policy

Marine management policy is a significant part in a national politic system which is the operative norm set up by the government to achieve the ocean development goal in a particular time. A nation's marine management policy embodies the requirement on its political and economic development that is the basic principle to draw up the definite policy about its marine development and utilization, marine environment protection and sea rights and interests maintenance. In a sense, it's vital to direct national marine development.

The earth is the only planet human can survive on, more than 75% is covered by water. Maritime strategy, cultivation and comprehensive utilization is the cornerstone for national existence and competition. Whoever gains the initiative on ocean will hold the privilege on marine cultivation. In a sense, the evolution of international maritime policy shows a historical trend of maritime hegemony policy to power policy. The global maritime politics itself is combination of power and rights. Maritime policy is vital to a country's economic and social development, which is the action rule of international maritime struggle and cultivation. The maritime policy is the reflection of national policy, economy and social aim which is the main principle of maritime cultivation, maritime environmental protection and interest maintenance. As a matter of fact, international maritime policy is the combination of all the political activities focusing on national sea power, sea rights and sea interests. Sea power and sea interests make up the two basic aspect of international research into maritime policy and strategy. Marine issue is becoming an important area which involves international relationship and international law.

However, international marine management is the combination of all sorts of political activities that the sovereign states conflict and coordinate with each other centring on sea power, sea rights and sea

interests, the core of which is the distribution of sea power and the sharing of the sea rights (as a matter of fact, those reasonable and unreasonable policies both exist).

The sea power is the significant base for maintaining the national sea interests. On the one hand, mighty sea power and successful marine management policy can effectively defend national sea interests. On the contrary, weak sea power and loose management policy is likely to lead to the damage or even deprival of national sea interests. That is to say, sea power is the effective measure to maintain and realize national sea interests. On the other hand, maintaining and realizing sea interests is the aim of sea power construction. The scale, nature, content and extent of a nation's sea power construction must be under the guidance of its purpose of sea interests, and serve the overall requirement of its sea interests.

In a sense, the international political disorder which surrounds sea power struggle plus the international conflict on sea power is the interior motive of laying down international law of the sea, whereas the purpose of which is to get rid of the state of disorder of the struggle, and realize the goal of reasonable distribution of the sea power and sharing of the sea rights. Sea power and sea interests exactly make up the two nuclear concept of international marine policy study, and from which extends the two important aspect of international marine management research—research on international politics and international law, coupled with the cross-banding of the two. Sea matter, at home and abroad, has been a very important area of research about international relation, international law and their cross-banding research.

### **3 The Theoretical Basis of American Ocean Policy**

Since the early days of the establishment of the federal government, the American marine policy was to serve the independence of the state, national economic construction and its territorial expansion in north America. The main point of its marine policy at this time was to protect America from the attack across the Atlantic ocean. From 1890 till the end of the cold war in 1991, the main purpose of its marine policy was to seek the maritime hegemony, during which time, the U.S. walked out the America and entered into the ocean to strive for its international position. As a result, many people regard the 20<sup>th</sup> century as “American Century”. Under the influence of the Mahan's Sea Power Theory, American Navy is becoming the tool for its territorial expansion and through the two world wars, it becomes the superpower over sea. And after the cold war, America has been increasing its strong desire to lead the world, thus it begins to adjust its marine policy by laying down a series of regulations and strategic documents to maintain its maritime and international hegemony.

In the implementation process of its marine development strategy, the U.S. is the country who has laid down the earliest and most documents on ocean management policy. Early in 1959, it formulated the first world military oceanography regulation—the United States Oceanography Ten Years Planning. And since 1960s, the U.S. government draw up a series of marine management and development policy, such as the United States Oceanography Long-term Planning by the U.S science and technology commission and oceanography commission in 1963; Our Country and Marine- the National Action Plan in 1969; The national Ocean Science and Technology Development Planning in 1986; The Marine science and Technology Development Report of 90s in 1990 and the United States Marine Work Agenda of 21<sup>st</sup> Century in 1998 etc. Most of the documents clearly point out that it should keep and improve its leading position on marine science and technology. And in 1999, the U.S. optimized its national marine policy and set up relevant national consultative committee, which explicated the definition of its coastal zone economy and marine economy and establish the management and evaluation system for its marine economy. In the same year, the U.S. government worked out the national marine economy policy aiming at providing a wider communication platform and mechanism which is closely related to modern economy and social information and predict its future development on marine interest relations and trends.

In July of 2000, the America issued its Ocean Law, according to which the national ocean policy research institute –National Ocean Policy Committee was established in 2001 and some other documents such as Marine Stereoscopic Observation System Plan and 21<sup>st</sup> Century marine Development Strategy Plan were successively formulated. Especially in the end of the year of 2004, the United States Marine Policy Committee submitted to the congress a report on marine policy named as 21 Century Marine Blueprint which has made a thorough evaluation of its marine management policy, marking that its ocean development strategy rose to a new height. The blueprint made a comprehensive deploy for maintaining its marine economy interest, enforcing its ocean and coastal protection, establishing

national marine exploration strategy and enhancing its ocean research and education levels. In Dec. 2004, President Bush issued the administrative order to publish the United States Marine Action Plan, which proposed some specific measures for implementing the blueprint. While the 21 Century Sea Power Cooperative Strategy that published in 2007 was regarded as a relatively integrated document about its national policy on sea power development. President Obama subscribed the memorandum on formulating national ocean policy and its implementing strategy, arranging its marine spatial planning which pointed out that ocean management policy must take into consideration the protection of the resources of the sea, coast and big lake regions, the improvement of marine economic activities, coordination of the profit among marine resources users and the sustainable utilization of the resources. All the documents enriched and fulfilled American marine planning system.

Since the 19<sup>th</sup> century, the fact that America is becoming more and more powerful is closely related to its national marine development policy. Without any doubt that 21 Century Marine Blueprint represents the most comprehensive and most thorough formulation of its marine management policy, which plays an important role in advancing national marine policy making the unfolding of series of American marine scheme, policy and procedure.

In the process of American marine management policy development, some issues have been attracted people's attention which influence the orientation of laying down policy on its marine management, such as the expansion of ocean city area being regarded as a challenge; the influence of population increase on agriculture, ocean and coastal areas; and the result of climate change on marine biological resources and their perched zone.

In general, the changing course of American marine policy is complicated but very effective. Firstly, the marine policy committee which was assigned directly by the president is the first action group that pushes forward its marine management policy development. The group, through extensive research and investigation, proposes the preliminary report of the policy. Then the report will be released to public for consultation and the report will be modified and evaluated to some degree. At last, a formal ocean policy report comes into being and is submitted to the congress. The government plays the leading role in the whole process because the government has already realized that its international status is threatened. Thus the determination to review and formulate more strategic marine development policy is a once for ever reform of its marine management policy.

#### **4 The Enlightenment of American Marine Management Policy to China**

The famous American military theorist A. T. Mahan once pointed out that since the beginning of history, a nation's policy on its sea power is the key factor to rule the world and control the sea power which is the primary task if anyone who wants to dominate the world and receive its national prosperity. In human history, there have been many wars fighting for sea power. In today's world, though peace and development have been the theme of current marine management policy, competition and conflict still exist. Especially in 21<sup>st</sup> century when the land resources were exhausted, sea power is becoming more and more important to a country's national power. As a result, the ocean is becoming the hot zone of national territorial control and scramble for resources. As a country of vast ocean region, in the situation of so many conflicts on sea rights and sea interests, how can China establish correct and effective marine policy to protect its safety of the land and sea is really a vital subject that will influence its national further development.

Facing these ocean problems, Chinese government lays down corresponding policy to settle all aspects of dispute and contradiction because protecting national sea rights and interests is necessary to develop and expand its power.

Firstly, sea rights and interests are the determinant of formulating and implementing national marine policy which are the most important components. National marine policy is the action principle for a country to realize its marine task which is determined by its national sea rights and interests and its national sea rights and interests is the starting point and the basis of laying down national marine policy. Our country is in the marine development period and if we want to become a marine economy developed country of strong ocean comprehensive ability, and play more and more important role in international marine affairs, a very significant premise is to take various effective measures to strengthen the marine management. Marine management is the guarantee for smoothly developing marine industry. Secondly, developing marine industry is the ultimate goal of formulating marine policy. Marine Technology Policy, which was published in 1993 as national science and technology blue paper, was the first comprehensive development guidelines on marine science and technology. The formulation and

implementation of blue paper greatly affect national marine policy and advance the national marine science and technology and promote the rapid development of national marine programs. In 1996, China Ocean Agenda 21 by National Oceanic Administration determines the sustainable development principle of marine industry and its strategic objectives, which presents a lot of specific measures to improve and optimize marine industry structure and to develop high-tech industry and clean production. Thirdly, environment protection is the precondition for formulating marine policy. China has adopted management policy of division and cooperation which specifies the role and authority of each department of marine management and environment protection. For now, these measures basically adapt to China's national conditions and play very important role in protecting marine environment and law enforcement.

## 5 Conclusion

The U. S. effective marine management policy has and will continue to give the nation global reach and persistent presence. This strategy reasserts the use of sea power to influence actions and activities at sea and ashore. The explorative character and versatility of maritime management policy provide the United States the superiority of scaling its military presence in areas where access might be denied. The sea is a vast space, where the effective implementation of a nation's marine management policy can be adjusted as conditions dictate to enable flexible approaches to escalation, de-escalation and deterrence of conflicts between nations. The sea power of U.S. is a force for good, which protects its nation's vital interests even it joins with others to promote global security and prosperity. The oceans and waterways of the world are and will increasingly become the domain for building a better world in the future.

It's the necessary strategic choice for a country to go to the ocean to be strong. As a result, all the countries attach greater importance than ever to the strategic position of the ocean. In the 21<sup>st</sup> century, the conflict on international sea rights and interests which centred on striving for marine resources, controlling marine space, has become more and more intense and the rights protection situation that China faced is becoming more and more severe and complicated. Therefore, how to protect Chinese land and sea, defend Chinese sea rights and interests, get on well with neighbouring countries and maintain the peace and order is a very significant subject that we must take seriously.

## Early Warning Management Mechanism for Fog Navigation Safety in the Three Gorges Reservoir Area

Jiang dan, Zhou Caiyun

School of Navigation, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 65518385@qq.com, zhoucy1988@163.com)

**Abstract:** In order to remedy the defects of linkage mechanism and improve the operating capability of the early warning to the navigation safety in fog of the three gorges reservoir area, this paper presents the coordination mechanism for early warning to the navigation safety in fog based on HUB model from the aspects of information management, previous warning and control and resource support using the complex network and synergetic theory. On the basis of Hub model, through the coordination and integration of the warning information and safety resources, the dynamic synergetic early warning organization can be realized.

**Key words:** Fog navigation safety; Early warning management; Vulnerability; HUB model; Synergetic theory

### 1 Introduction

Since the water storing of the Three Gorges reaches 135m, the Yangtze River three gorges channel has turn to reservoir channel from natural navigable waterway. The broadening of surface of the river and the retard of the flow velocity helps creating the condition for fog forming. Because fog cut visibility, it's hard to watch navigation mark and other vessels clearly, which may led to maritime traffic accident like collision, stranding, rocking and etc.

On account of early warning management for fog navigation safety in the three gorges reservoir area involves multiple safety management subjects, and the external support system is complex, command coordination mechanism is lack of efficient unity, hence, it's necessary to built a multisystem, multi-sector and multi-unit efficient coordination mechanism of early warning management.

Synergetic do research on synergy effect generated through nonlinear interaction between every subsystem and the mechanism and discipline of the order-disorder transition of system in a certain external condition. Currently, the synergy theory hasn't ever been applied in waterway traffic safety management, but some researchers have proposed the systematic framework, synergy mode and technical support of synergy mechanism of emergency management to city safety (Lin Chong and Zhao Lindu, 2008; Han yu and Chen hu, 2012). This paper innovatively applies synergetic theory into early warning management of water traffic and combine the complex network with coordination management principle, establish the overall process coordination mechanism for early warning management to the navigation safety in fog of the three gorges reservoir area from the aspects of information management, early warning and control and resource support.

### 2 Analysis of Characteristic of Early Warning Management for Fog Navigation Safety in Three Gorges Reservoir Area

#### 2.1 The early warning management system in the three gorges reservoir area

At present, the maritime sector of the Yangtze River has built the early warning management system to the navigation safety in fog of the three gorges reservoir area based on existing water traffic safety supervision organization system, which is shown in figure 1. Thereinto, the Changjiang MSA (maritime safety administration) commands uniformly, manage and harmonize the early warning to the navigation safety in fog. The embranchment in Chongqing, three gorges, Yichang and subordinate marine department and numerous enforcement units which add up to 21, take charge of enforcement of early warning of the areas under their jurisdiction.

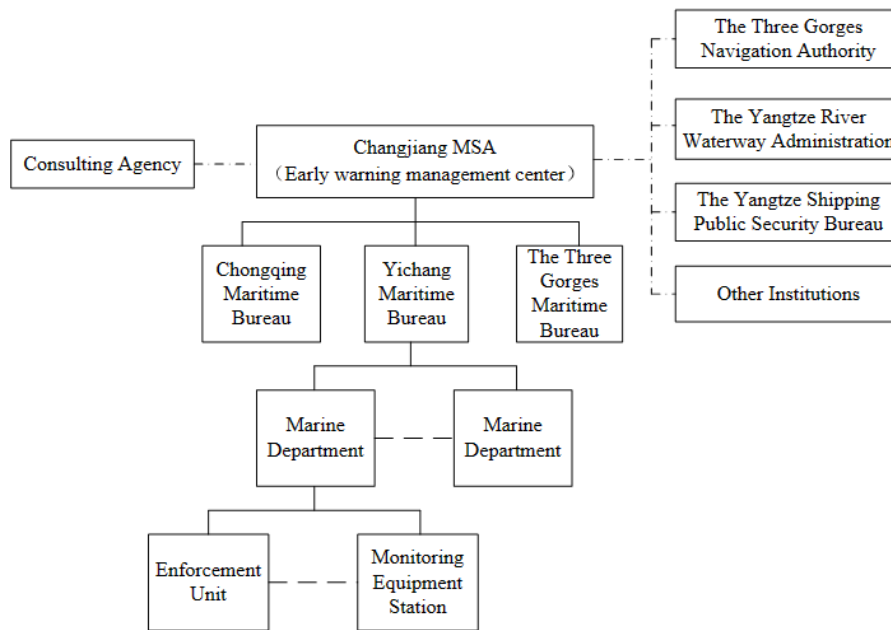

Figure 1 Early Warning Management System of the Three Gorges Reservoir Area

In the process of early warning management, the maritime sector of the Yangtze River implementing early warning management activities according to the early warning information by using security resources to realize the management goal. Early warning information, organization and resource are the three factors of early warning management. In reality, they are not evenly distributed, but gathered in several safety management nodes.

**2.2 The defects of the early warning management system in the three gorges reservoir area**

The early warning management system is a complex multi-factor open system which combines multiple related departments. Since the internal structure and external environment is of complexity, there are lots of leaks and potential safety problems when it runs, the specific performance characteristics are as follows,

(1) The system is very complicated and demanding for acquisition techniques of information of fog. It requires a lot of technical equipments to obtain timely and accurate trends of fog. At present, due to the limited personnel and equipment of meteorological department, and the insufficiency of characteristics and evolution laws of fog in the three gorges reservoir area results in delay and inaccuracy of fog forecasting.

(2) Internal relevance and external dependence of the system is heavy. The effect of the operation is highly demanding for support. The early warning management system contains multiple management units; each unit is interlocked and interacted with the whole system. In addition, normal operation of the system must depend on wide range of security provided by external system, like channel department, fire protection department, public security department, meteorology and etc.

(3) External supporting system attach to different professional system or department, they lack of communication channel between each other which should be real-time, comprehensive and clear. Information sharing among the departments is of low level and only within the scope of their respective duties, lack of efficient unified coordination mechanism.

Therefore, the linkage mechanism of the early warning management in existence goes against the total control of safety information flow, organization and resources. It can't keep to the safety management activities strategically and not integrated operation and teamwork. In the event with more sudden and uncertainty, the fog navigation safety warning management system can't work efficiently.

**3 Analysis of Failure Mechanism of the Early Warning Management Based on Vulnerability**

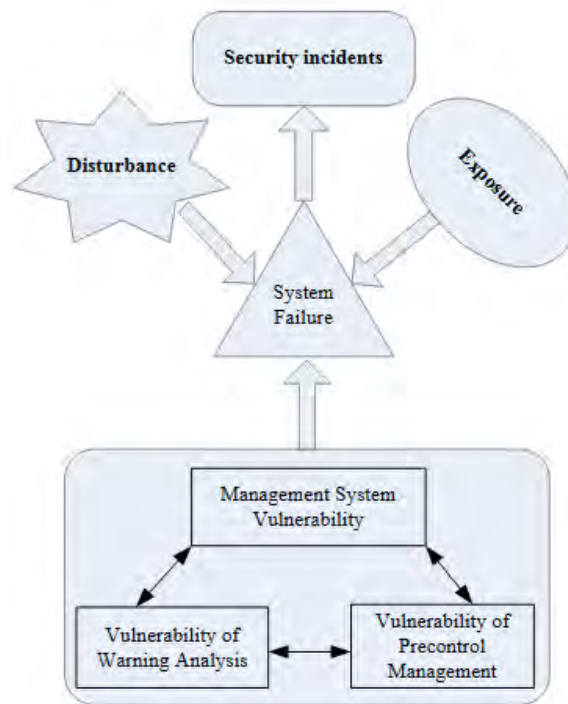

**3.1 The characteristic of vulnerability**

The vulnerability is a kind of natural attributes of system, as an extension of reliability and safety

of a system, to describe inherent defects, weakness and weak links of the system. Or in normal operation or under sorts of effect of random factors, tolerance of interference or failure and the trend and influence it may have when the system can't maintain the normal operation. Vulnerability of management system lies on the management level and the anti-disturbance ability (Han yu and Chen hu, 2011).

**3.2 The failure mechanism of the early warning management**

Failure of the early warning management for navigation safety in fog of the three gorges reservoir area results from congenital defects and the leak of system, there are inherent vulnerability. When exposed to a certain degree of interference that the system can't resist, it will lead to all or part of the functions lost of the system, or can't meet the warning requirements, leading to shipping accidents or deterioration of the event. Theoretically, interference, exposure and vulnerability constitute the causes chain of failure of the early warning management system. It's the consequence of combined action of the three factors, none is dispensable. Therefore, only when the interference and exposure exceed a certain threshold, management system will turn to failure.

**Figure 2 Failure Mechanism of the Early Warning Management System**

From the point of view of the safety management, interference and exposure is the factors of environment system, strong uncertainty and unpredictable of specific characteristics make it low degree of controllable and the early intervention is difficult. Fog in the three gorges reservoir area is of strong sudden, its form, scope and the variation are difficult to know accurately. While vulnerability is the build-in attribute of early warning management system for fog navigation in the three gorges reservoir area, by repairing security flaw and defects of the system, the condition of the vulnerability of the system can be obviously improved.

**4 Synergy Mechanism of Early Warning Management for Fog Navigation Safety in Three Gorges Reservoir Area**

**4.1 Hub node model of early warning management**

HUB is the node with large numbers of network connections; its amount and value express the radiation of network. It has significant impact on vulnerability and robustness of network.

HUB mode (shown as figure 3) of early warning management in the three gorges reservoir area is to add HUB into the traditional warning management network, integrate the originally dispersive alert information, organization and resources and then form an integrated and transparent multi-level management network of warning for fog navigation to achieve the unified coordinated optimization of

warning information, organization and resources.

According to the organization structure and level distribution of the warning management in the three gorges reservoir area, the system can set a level 1 HUB, three level 2 HUB and several level 3 HUB, to realize harmony management from upper, middle and low level respectively. As is shown in figure3, in the early warning HUB mode, M1, M2... M13 are safety management nodes, H1 is level1HUB, H2, H3, H4 are level2HUB, H5, H6, H7, H8 are level3 HUB.

Figure 3 HUB Mode of Safety Management for Fog Navigation

In coordination mechanism, HUB work for sharing, coordinating and transferring. When security incident occurred, the directly related safety management node transmit alert information which is synchronous change with progress of the event at the same time when it response to the management task. Transfer the information to all safety management nodes gradually through HUB network by sharing and make the warning information access for all. HUB at all levels coordinates early warning management organizations between levels according to the alert information, transfer the required safety resources to the terminal safety management node via the optimal path selection though HUB, in order to realize the coordination of early warning management system.

**4.2 Synergy mechanism of early warning management for fog navigation**

**4.2.1 Information management mechanism**

Early warning information management mainly includes collection and transmission of early warning information, early warning information processing and releasing. Collaboration of early warning information is the important basis and prerequisite of coordination mechanism operation. In the early warning management network, the safety management node is the primary source of information and the final destination. The early warning information of each node firstly converges to the lowest HUB, then step-up to the upper HUB. After the real-time analysis and processing and top-down transmission, information is eventually delivered to various safety management nodes by level 3 HUB again. Thus information synergism can be achieved via dynamic interaction of information between safety management node and HUB mutually. Rapidly transmission and linkage of early warning information between each management unit and the transparency and sharing of information can promote the efficiency of security organization and the utilization of security resources.

**4.2.2 Early warning and control mechanism**

According to the maritime management organization settings in the three gorges reservoir area and the Hub node model of early warning management for fog navigation, the early warning mechanism which is 2 level early warning and 3 level network publishing can be built. According to the urgency, danger level and coverage it may cause to the water traffic safety and environmental safety, the mist navigation warning is divided into two levels, viz level 1 (red), level 2 (orange). Early warning information is delivered from the level 1 HUB, Yangtze River maritime bureau to level 2 and level 3

HUB, related branches of the maritime affair bureau, and release cooperatively with authority. Furthermore, a comprehensive multi-sector and multi-system security threat warning system and decision support system and also an effective communication and early warning sharing mechanism should be established, so as to share and transfer the early warning information timely.

There is no need to set special executive department for pre-control execution. On the basis of the existing water traffic safety management department, set up warning and control coordination station in departments like maritime, public security and fire control, channel, correspondence and regional government respectively. Thus the coordinative management and control can be implemented initiatively under the command of the leadership with mutual coordinate communication.

#### 4.2.3 Resources guarantee mechanism

Resources guarantee mechanism plan and coordinate the emergency resource of the network-wide with grading, level and classification through HUB. When a navigation safety event takes place, the HUB in vicinity transfer resources of the security management node directly connected with it in timeliness principle. Meanwhile, transfer the resources demanding information to security management node all over the network collaboratively and prepare the subsequent resources which are available according to the estimated development situation. As events unfold, when the resources that the preferred HUB can schedule is insufficient, the rest of HUB can supply resources, and then assemble resources to the security incident point. Resources of the external support system converge gradually through various levels to the HUB, after global optimization then distributed to all level layered safety management node. Thus, the coordination, scheduling and whole planning of the resources all over the network can be fulfilled.

## 5 Conclusions

This article analyze the characteristics of early warning management for mist navigation safety in three gorges reservoir area from the point of view of vulnerability, argues that vulnerability is the cause of failure of management system, the hinge of the early warning management in three gorges reservoir area is to improve the vulnerability of the system and their own security ability. At the same time, structure the early warning management coordination mechanism for mist navigation safety from the aspects of information management, warning pre-control, resource security on the basis of complex network and coordination management.

Along with the growing of ship flow in three gorges reservoir area, the fog navigation safety management is faced with even more complex navigation environment. How to carry out comprehensive, round-the-clock and real-time monitoring using advanced technology and equipments and master the dynamic ship movements and the situation of fog accurately and timely, providing decision support for early warning management, in order to improve the pertinence and effectiveness of early warning management still deserves further study.

(E-mail: mhm\_72@163.com, jos.hernandez.gomez@gmail.com)

**Abstract:** For the development of countries economy, great investment decisions must be made every year about what shall be done, what shall be invested, what shall be prepared for future. No sector of the world economy or industry feels this more profoundly than energy. The study is firstly conducted to have an overview of the Electricity Sector of Dominican Republic, and describe important issues on the current sector reform, that still in process among Latin American countries. Secondly, the paper aims to determine the elasticity of demand on energy generation sector, through the log linear regression method on variation of price and quantity of demand. Related researches concerning Elasticity of demand in other countries, as Australia, Israel and United States, shows close similarity of our result, where the elasticity tends to be inelastic (0.57) but not perfectly inelastic to variation on price. Although the complexity of the Energy market structures by sectors, Customers' response to pricing signals can promote efficient investment (in the long run term), help mitigate short-run market power by generators and transmission owners, reduce price spikes, lower price volatility and reduce customers' bills.

**Key words:** Price Elasticity of demand; Electricity Responsiveness; Energy Pricing; Problems of Power Industry

## 1 Introduction

Energy sector plays a determinant role on economy's growth and quality life of nations. The power sector in the Dominican Republic has traditionally been, and still is, a bottleneck to the country's economic growth. According to the World Bank, the revitalization of the Dominican economy depends mainly on a sound reform of the sector. Energy production, transmission, and distribution operate on a massive and pervasive scale, and take years -often over a decade- to design, organize, finance, build, and operate.

Power sector reform has been widespread throughout Latin America and the Caribbean. It introduces comprehensive reforms aimed at opening the sector to private participation and competition. With only a few exceptions, lack of efficiency incentives and tariffs that did not reflect actual costs led to the poor performance of state-owned enterprises (SOEs), which accumulated huge financial deficits. This paper aims to determine the elasticity of demand on the generation electric sector, through the variation of price and quantity of demand. We have seen closely similarity in the structure of market, but we will try to situate and focus on the factors that characterize the Energy sector of Dominican Republic, as a developing country.

## 2 Literature Review

For nearly a century, the whole electricity sector has been thought of as a "natural" monopoly industry, where efficient provision requires a regulated public or private monopoly. Most utilities have historically met their obligations by jointly providing the four primary electricity supply functions: generation, transmission, distribution and retailing. The generation segment of this industry involves the creation of electricity using different technologies (e.g., falling waters and steam turbines powered by fossil fuel). The transmission of electricity involves the use of wires, transformers and sub-station facilities to "transport" electricity between generation and distribution centers, which includes the interconnection and integration of generating facilities into a synchronized network.

This function includes i) scheduling and dispatching generating facilities to balance demand and supply (in real time) and ii) management of equipment failure as well as network constraints. Finally, the distribution and retailing functions are related to the final distribution of electricity to residential and business consumers at relative low voltages. The former requires the use of wires and transformers along and under streets to get to customers, and the latter involves retailing functions which include metering, billing, making arrangements for supplies of power from generators, and other demand management services. Typically, retailing and distribution have been viewed as integrated functions.

According to economic theory, on a free market electricity demand will fall as the energy price increases, holding all other factors constant. The consumer's sensitivity to price changes can be measured by the

coefficient of price elasticity – the percentage change in demand divided by the percentage change in price. Customers react to changes in prices that they see by adjusting their desired quantity of demand. As prices rise, customers will reduce the quantity demanded. As prices drop customers will increase the quantity demanded.

### 3 Data and Methodology

The study is conducted firstly to have an overview of the Electricity Sector of Dominican Republic. Important issues to considerate are the in-process sector reform, which might has an important impact in the short and long run of the economy development. Likewise we will analyze the electricity supply, installed capacity, principals sources for energy production, the quantity of demand, principal’s obstacles and problem on energy losses, among others issues.

In addition, we took into consideration the fluctuation of price and quantity demand in order to determine the price elasticity of demand. We looks for investigate the hypothesis of “though the electric market is an inelastic market by definition, is not perfectly inelastic; and the responsiveness of customer on demand play a role for the regulation and efficiency of market”. We used historic data from the National Energy Commission (CNE), Superintendence of Electricity and the 3 distribution-retailing companies (Edesur, Edenorte and Edeste). Likewise we used the CPI USD index of the World Bank database in order to deflate Electricity Price, and then apply log regression method to find out with more precision the Price elasticity estimation.

#### 3.1 Case description

Dominican Republic, like many countries in Latin America, ahead of final 1990's a process of reform of electricity subsector to solve problems associated with high generation costs, energy rationing and inefficient management of a vertically integrated state monopoly. The reform introduced a market model with private participation and regulation independently, maintaining hydro generation and transmission in the hands of the state.

On early 2001 The reform was modified with the capitalization of private investors of 3 new distribution companies and 2 thermal generation companies, which resulted from the restructuring of the Dominican Electricity Corporation (CDE), the state monopoly, the creation of the Superintendence of Electricity (SIE) and the Commission National Energy (CNE), independent bodies responsible for regulation and policy formulation, respectively. General Electricity Law came into place giving the regulatory and institutional framework. The process had difficulties due to: substantial rise in international oil prices, political difficulties to transfer electricity rates rising production costs in a generation system approximately 85% dependent on imported fuels, inability to reduce commercial losses of electricity and improve the collection in sustainably, and macroeconomic imbalances that caused a devaluation and accelerated inflation.

#### 3.2 Electricity supply

The Electricity Generation in the Dominican Republic network is produced from Steam turbines, Gas turbines, diesel and fuel oil engines (mostly by imported oil or liquefied natural gas); and other important portion by hydroelectricity and combined cycle. At the end of 2006, total installed capacity of public utilities was 3,394 MW, of which 86% was thermal and 14% was hydroelectric . The installed capacity for every technology is as follow:

**Table 1 Installed Capacity by Technology as of Dec-06**

Technology	Instaled Capacity-Mw	Percentage-%
Steam turbines	606.2	17.9%
Gas turbines	572.7	16.9%
Combined cycle	804.0	23.7%
Fuel oil engines	912.0	26.9%
Diesel oil engines	30.0	0.9%
Hydroelectricity	469.3	13.9%
<b>Total Instaled Capacity</b>	<b>3,394.2</b>	<b>100.0%</b>

Source: Operations Coordinating Agency Report

Currently, there are plans for the construction of two 600MW-coal fired plants, Montecristi and Azúa, by the private sector. It is also expected that, by 2012, an additional 762MW of hydroelectric capacity will have been added to the generation system. Total electricity generated in 2006 was 10.7 TWh. Generation experienced a 7.7% annual increase between 1996 and 2005. However, between 2004 and 2006, there has been an average annual decrease of about 10% in total electricity generated.

#### 3.3 Electricity price and demand

Electricity demand in the Dominican Republic has grown considerably since the early 1990s, at a yearly average of 10% between 1992 and 2003. Consumption is very close to the regional average, with annual per capita consumption of 1,349 kWh in 2003. Total electricity sold in 2005 was 3.72 TWh. Demand has constrained supply, which in turn is limited by subsidies.

**Figure 1 Net Electricity Generated Curve (Gwh)n**

Electricity tariffs in the Dominican Republic are among the highest in the Latin American and Caribbean region. The reason of this is cause from several factors: Dependence on imported oil, weak institutional environment, difficulties to pursue large non-payers, high prices negotiated in power purchase agreements with the generators, high commercial risks faced by generators such as non-payment or delayed payment by the distribution companies and/or the government, low cash recovery index (CRI), and high operating costs in the distribution companies.

The country's policy of cross-subsidizing residential tariffs by disproportionate increases in commercial and industrial tariffs translates into higher rates for industrial and commercial consumers compared to residential consumers. For example, in 2007, the average residential tariff was US\$0.160 per kWh (LAC weighted average was US\$0.115 in 2005), while the average industrial tariff was 0.230 (LAC weighted average was US\$0.107 per kWh in 2005) and the average commercial tariff was as high as US\$0.290 per kWh.

**Table 2 Ponderated Tariff of Electricity (US \$/Mwh)**

Year	Months	Nominal Price	Price CPI
		US \$/Mwh	US \$/Mwh
2007	May	105.42	105.42

	Sep	155.42	149.65
	Oct	151.36	145.60
	Nov	157.19	151.10
	Dec	165.42	159.29
2010	Jan	161.08	154.58
	Feb	165.77	159.05
	Mar	162.62	155.39
	Apr	162.52	155.02

As we mentioned, we used the Consumer Price Index for USD from the World Bank Database. This enables to make sensible comparisons across time periods even as prices move, due to inflation. With this in mind, the elasticity of demand equation can be converting from:

$$\varepsilon = \frac{\% \Delta demand}{\% \Delta price} = \frac{\Delta q / q}{\Delta p / p} \tag{1}$$

$$\varepsilon = \frac{P}{Q} \times \frac{\delta Q}{\delta P} \tag{2}$$

In other way, we substitute Elasticity for the next equation:

$$\frac{1}{Q} \times \frac{\delta Q}{\delta P} = \varepsilon \frac{1}{P} \tag{3}$$

From this derivate equation, we can convert it into a linear model:

$$LnQ = \varepsilon LnP + b \tag{4}$$

### 4 Results

The results obtaining the Price Elasticity of demand for the electric sector is showed on the following table. We may note that R Square rounds in 99.98%, which shows that the coefficient € (elasticity) has strong approximation on the linear regression equation.

The overall price elasticity in Dominican Republic, estimated by using the historical data is 0.57, showing a moderate responsiveness of electricity consumption to changes in prices. This level of responsiveness for Dominican Rep. has an adequate similarity to the elasticity of other countries of our literature review. For example the research made by Dr. Fan and Hyndman<sup>(13)</sup> conclude that South Australia rounds about  $-0.036 - 0.43$ ; Israel rounds from  $-0.02 - 0.58$ ,  $0.002 - 0.44$  for residential and industrial sector respectively. Likewise in USA rounds in  $-0.2$  for the short run and  $-0.70$  for the long run in the residential sector. Nevertheless, in the short run we can observe that in peak months of summer, the absolute value of elasticity decrease to 0.18, (2008) in relation with previously months. It could be attributable to the weather condition (high temperature).

Figure 3 Residual and Log n Equation Graphics

## 5 Conclusion

Dominican Energy Sector is affected by high dependence on petroleum for electricity generation, financial crisis of the distribution companies, lack of investment, non-payment of the purchase of energy, high unmet demand, higher tariffs and subsidies, electricity non-payment culture, and high losses in commercial energy, among others. Although significant progress has been made about it, those factors still are an impediment on economy growth.

We can note the similarity of the consumer responsiveness in the variation of price for different countries (from 0.40 – 0.60 in log run). We observe that, even different conditions, it does not represent a higher gap of discrepancy. It may allow us to say that while the market framework tends to have a low level of price elasticity- because high cost of substitutes- no necessarily is a perfectly inelastic market. Furthermore, this responsiveness can be an important indicator for energy suppliers, especially the generation sector rather than transmission and distribution.

When the customers do not react to market prices, all pricing mechanisms are left in the hands of the market suppliers. In the presence of competition, the suppliers will, on their own, be unable to raise prices above the production cost of the least efficient unit in operation. In this competitive situation the market price will adequately reflect the production costs. The reacting of customers to pricing signals (demand response) in the electricity marketplace can promote efficient investment (in the long run term), help mitigate short-run market power by generators and transmission owners, reduce price spikes, lower price volatility and reduce customers' bills.

Lack of demand response also increases the ability of electricity suppliers to exercise market power and raise prices. In order to achieve efficiency in the marketplace, prices should reflect the cost of the good. Market power contributes to price volatility and price spikes observed in today's electricity markets, including Dominican Republic. An alternative may be the transition to Renewable Energy, such as solar PV grid, wind, biomass, etc; that will reduce the oil import dependence, green house gas emission and will promote the environment conservation. This will require a deeply study to determine whether what may be the best alternative, relatively to cost investment on Dominican economy and when is the appropriated time for implementation.

## Analysis of the Status Quo and Improvement of Sports Consumption by the Elderly in Wuhan Urban Area of China

Chen Yan, Wei Xin

Hubei Institute of Fine Arts Department of public Education, Wuhan, P.R.China, 430060

(xiaoyongli1961@sina.com)

**Abstract:** This paper analyzed on sports consumption status of the elderly of Wuhan urban area by applying documentation method, questionnaire method, and mathematical statistics and analysis method. It's found that improving spirit, adjusting mood and spiritual longing accounts for very big proportion in sports consumption motives of the elderly; in sports consumption structure, they emphasizes on material consumption; their consumption ability have direct proportion with income. This paper further proposed the following market development strategies: strengthen and guide the consumption awareness of the elderly; construct and reasonably use stadium and gymnasium; improve the government's attention; cultivate professional talents on serving the sports consumption of the elderly.

**Key words:** Wuhan Urban Area; The Elderly; Sports Consumption; Market Development Strategies

### 1 Introduction

As per the standards of UN on classifying the country of aging population: the countries or regions with the elderly of 60 years old or above account for 10% of the total population, or with the elderly of 65 years old or above account for 7% of the total population, then such countries or regions are called aging countries or regions<sup>[1]</sup>. According to the press conference on the aging population info of Wuhan City, the total population of the registered permanent residents of Wuhan City was 8.2724 million ended 2011, and the negative growth rate was 1.13%. The whole city had 1.3205 million of the elderly above 60 years old, accounting for 15.96% of the total population. It shows that there's one old people in every 6 residents of Wuhan City. Wuhan City has entered rapid development stage of aging population<sup>[2]</sup>.

Confronting with such huge the elderly consumption market, there's only few businesses among numerous that seized this opportunity. Sports exercises can promote the physical and psychological health of the elderly, prevent disease and cure diseases, and let the elderly keep exuberant energy. So sports consumption has become an important content of the daily sports and cultural life of the elderly. China has huge sports consumption market for the elderly, and its potential and prospective earnings cannot be underestimated.

The study on the development of sports consumption market is the vital aspects of the development of sports industry. Seen form the study conditions of the current China, there're 306 articles (referred to China's periodicals website for 20 years) on elderly consumption, the earliest research was in 1994; there're 33 articles that study on the sports consumption market development for the elderly, and the earliest was originated in 1998; there's no study on sports consumption market development for the elderly of Wuhan City. Therefore, this paper studied on the development countermeasures of such market basing on sports consumption status of the elderly of Wuhan City.

## 2 Sports Consumption Status of the Elderly

### 2.1 Consumption motives

According to the investigation on sports consumption motives of the elderly, health, prevention and cure diseases and spiritual longing account for a large proportion. Various factors may bring sense of loss and sense of loneliness to the elderly after their retirement, which require them to change their living mode, continuously adjust themselves and seek spiritual longing. Moreover, the elderly may more or less have some chronic diseases. Currently the majority of the elderly regard health as the first priority, then it's successively social contact, recreation and entertainment, others and athletic ability. For preventing disease and pursue "prolonging and lengthening life", the mass old people turn their view to sports consumption integrating recreation and fitness as a whole.

**Table 1 Sports Consumption Motives of the Elderly of Wuhan City (multiple choice) N=817**

Motives	Health	Recreation	Spiritual Longing	Athletic Ability	Social Contact	Preventing Disease	Others
Population	632	85	291	19	182	320	45
(%)	77.3	10.4	35.6	2.3	22.2	39.1	5.5

## 2.2 Consumption Consciousness

Those who hold positive attitude on sports consumption accounts for 95.8%, believing that “sports consumption is very normal, and it’s worthwhile to spend money for health”. Study shows that: the elderly with high education level have relatively high cognition on the social and economic benefits of sports consumption, so their sports consumption awareness is higher than those with low educational level. 573 old people have different investment on sports consumption, accounting for 70.1% of the total. Meanwhile, 25.7% of the elderly hold positive attitude on sports consumption, but have no actual consumption behavior. Such proportion of old people have the consumption willingness, who temporarily do not participate in consumption because of economic or other reasons. Only 4.2% of the elderly hold negative attitude, believing that “sports consumption is a waste” or “have no interest in sports consumption”

## 2.3 Consumption Structure

Investigation shows that in sports consumption structure of the elderly of Wuhan City, material consumption is emphasized, which has reached 83.3% in frequency. Then it’s participatory consumption, which accounts for 25.7% in frequency. Appreciation type and game type respectively accounts for 10.5% and 9.5%. It’s worth noticing that in game type consumption and material type consumption, there exhibits two totally different trends between the elderly who have RMB 501-1500 yuan of monthly income and the elderly with above RMB 1501 yuan of monthly income. The former’s consumption frequency in game type is 32 and material type consumption frequency is 77. They are obviously higher than the elderly with relatively high income level in game type consumption, while their material consumption is obviously low, which has close correlation with their income level and financing mentality.

**Table 2 Construction Structure of the Elderly of Wuhan City N=817**

Construction Type	Material Type Consumption	Appreciation Type Consumption	Participatory Type Consumption	Game Type Consumption
Frequency	681	86	210	78
Proportion (%)	83.3	10.5	25.7	9.5

**Table 3 Monthly Income Status of the Elderly of Wuhan City N=817 Unit: RMB yuan**

	Below 500	501—1000	1001—1500	1501—2000	Above 2001
Population	63	197	246	237	74
(%)	7.7	24.1	30.1	29	9

## 2.4 Consumption Capacity

Investigation results shows that sports consumers of the elderly who consume less than RMB 100 yuan yearly accounts for 14.68%, those between RMB 101-500 yuan accounts for 58.98%, and those above 501 accounts for 19.33%. Seen from the general situation, the performance of the elderly in sports consumption shows: both ends low while the middle is high. Such form is in conformity with the monthly income status of the elderly, which matches with the relations (direct proportion) between income and consumption. Their sports consumption are mainly for health care, exercise at charging places, and purchase clothes, shoes, hats and fitness equipment, etc. of which, purchasing sports health care products occupied large amounts. Currently, the general economic development level of Wuhan City is limited, the physical and cultural living level of the elderly is still not high, and their expenditure on various cultural entertainment and sports activities would not be much, therefore, the sports consumption level of the elderly is not high, which is normal. With the social and economic development, especially the continuous development of sports industry of Wuhan City, the sports consumption level of the elderly would have a relatively big development.

**Table 4 Annual Consumption Capacity of the Elderly of Wuhan City N=817**

Amount (RMB)	Frequency	Percentage (%)
No Consumption	53	6.48
Below 100	120	14.68
101 — 200	144	17.62

201 — 300	206	25.21
401—500	132	16.15
501—800	93	11.38
Above 800	65	7.95

### 3 Influence Factors

According to investigation, the most influencing factor of sports consumption of the elderly is consumption concept, which reached 47.7%. Personal sports consumption concept is plain and thin, Chinese people have the concept of "make ends meet with small surplus" and "save money first and then consume" formed by self-contained economy for a long time, which resulted in the consumption mode and consumption concept of the elderly have distinct differences with that of western developed countries. Just such thrift and hardworking concept has been the restraint for the elderly to pursue consumption desire and seek higher level enjoyment. Meanwhile, primary stage economic development level also decides that the elderly firstly pay attention to health care consumption, those with relatively backward sports consumption, even with relatively high income, often pursue "big" and "luxury" in sports consumption. They go to pay sports site for exhibiting body and pursuing fashion, who seldom pay attention to the true value of fitness. So they would ignore sports as the right that the elderly should enjoy to pursue health. Sports should become the life-time need of the elderly and the eternal demand of the whole people. (Senior citizens' work committee of Wuhan City. <http://www.whllw.gov.cn/text.asp?id=838>)

Whether the perfection of sports site and facilities would also become the important elements of restraint has reached 35% of the influencing factor, ranking the second. Currently, the sports sites of Wuhan City has increased to 7351, the area of sports site per capita has reached 1.32m<sup>2</sup>. Although it surpasses the index of 1.08m<sup>2</sup> per capita for creating national civilized cities, as compared to the 4m<sup>2</sup> of sports site area of the developed countries including Japan, France, America, etc, it has a great gap, which cannot meet people's sports consumption requirements, thus it restricts the increase of sports consumption<sup>[3]</sup>. (Wuhan Sports Bureau. <http://www.whsport.gov.cn/content.jsp?id=3882>)

## 4 Development Countermeasures on Sports Market of the Elderly

### 4.1 Use high level cultural thought to influence the value orientation of the elderly, and guide the aging population to carry out healthy and conducive sports consumption

Reasonable and right sports value concept and active and stable sports attitude are the important factors for promoting the elderly to participate in sports activities. The sports behaviour of the elderly originates from their demand on sports. It needs to trigger their motives, which can result in target selection. Then under certain scene role, it can generate behaviour. Positive sports attitude has promotion role on personal sports behaviour, negative sports attitude has impeding role on sports attitude. Strong and distinctive sports attitude is the main factor for people to overcome various difficulties and insist on sports exercises, thus long-term sports consumption can be attained<sup>[4]</sup>.

Currently the sports consumption of the elderly of Wuhan City is mainly the consumption on various sports goods, while the consumption on various sports service consumables is not common. Although such sports consumption structure valuing material while ignoring service is correlated with the income of consumers per capita, it has certain relations with traditional consumer awareness and consumption habit. Currently China is entering moderately prosperous society, more and more people have the ability to consume various sports service goods. We should seize this opportunity and strengthen publicity strength, so as to lead the transition of sports consumption from material type to non-material type.

### 4.2 Increase the construction on sports infrastructure and reasonably use existing stadium. Moreover, we should attach importance on enhancing the openness of sports sites which are suitable for the activity characteristics of the elderly

As per the requirements on civilization construction work of the whole city, the relevant departments should enhance the construction strength of stadium. It's estimated that the newly increased area of sports site of the whole city will reach 0.2 million m<sup>2</sup> in 2012. Various stadiums should speedy the transition to operation style, so as to make the limited sports facilities be used reasonably. It can execute enterprise management, gradually attain compensated use, operate independently and assume

sole responsibility for its profits or losses. Build sites convenient for residents to do exercises at compact communities, meanwhile, encourage school, enterprises and public institutions to open the existing stadiums to the public, and equip with corresponding social sports instructors. While strengthening the construction on stadiums, the government of Wuhan City should encourage social forces including enterprises, collectives and individuals, etc to build various public places of entertainment through providing preferential policies. Achieve the diversified investment mode and use economic measures and market rules to utilize sports facilities, so as to build benign circulation operation mechanism of self investment and self benefit.

#### **4.3 The government should improve attention, emphasizes on social benefits, supervise and adopt award measures so as to cultivate the social responsibility of operators**

Indeed, sports products of the elderly should face the market under market economic conditions. It should attach importance to market demands and expand the operation channels as per requirements, so as to obtain good economic benefits, expand economic strength and achieve continuous development in market economy. However, in the the development of sports industry of the elderly, it's permeated with welfare factors. Such industry particularly has more the dual nature of spiritual products and material products. Therefore, we should not pursue the maximum profit as the target like other products, while ignoring social responsibilities. The development of such products should not only follow economic rules, but also attach importance to social benefits and serve the demands of the elderly. So the social responsibility scope of sports industry of the elderly should be clearly defined, and it should be combined with supervision and award to cultivate the sense of social responsibility of operators, so as to make the operators know that only the elderly are able to obtain true benefits, can sports industry of the elderly have existing significance.

#### **4.4 Reform the existing sports scientific research institutions and cultivate sports operation talents of the elderly**

We should vigorously support and develop scientific research institutions on sports industry of the elderly, encourage the commercialization of the technical achievements of scientific research institutions, adapt to scientific research enterprises integrating R & D, production and trade, execute the operation mechanism of self operation, assuming sole responsibility for its profits or losses through self development and self restraints, and develop scientific research enterprises. Meanwhile, we should strengthen the investigation, study and theoretical discussion on China's elderly sports industry, so as to pave the way theoretically. Moreover, we should vigorously cultivate the operation talents on elderly sports, create a talents team who can not only understand the sports rules, operation and management of the elderly, but also are familiar with various laws, international conventions and financial settlement and estimation, which is a long-term matter of fundamental importance in developing sports industry of the elderly.

## **5 Conclusions**

The majority of the elderly of Wuhan urban area have positive attitude on sports consumption. In sports consumption structure, they lay particular stress on material consumption, which has close correlation with income level. The sports consumption behaviour of the elderly shows diversified characteristics, the first demand on sports consumption is "health", the second is "preventing disease", the third is "spiritual longing". When approaching the development of sports consumption market, we need to correctly guide the consumption view of the elderly, strengthen publication strength and lead sports consumption achieve the transition from material type to non-material type. We should attach importance to the development and utilization of sports field which can meet the sports consumption demand of the elderly, perfect diversified operation measures on existing social sports facilities, form the benign circulation operation mechanism of self investment and self benefit. Moreover, we should enhance the governmental supervision strength, and hold encouraging attitude on the development of this "silver industry", and promulgate pragmatic policy on awarding or preferentially treating relevant operators. We should not only follow economic rules, but also emphasize on social benefits. It can serve the needs of the elderly, and meet the economic benefits of merchants and cultivate the sense of social responsibility of operators. We should vigorously cultivate the operation talents on elderly sports, create a talents team who can not only understand the sports rules, operation and management of the elderly, but also are familiar with various laws, international conventions and financial settlement and estimation.

**Abstract:** This paper discusses the formation of networks and the types of proximity that comprise the foundation of regional industry promotion in peripheral areas. Anecdotal surveys and analysis of the networks in a typical peripheral area are utilized, in a region where the typical multilayer elements that include geographical proximity and the compound effects of these elements do not exist.

**Key words:** Proximity; Innovation; Network; Ties

### 1 Introduction

In the past, according to Seki (1995), Japanese economy had grown up with a “full set mode” of manufacturing. The metropolitan industrial agglomerations had specialized in prototype creation, while the regional industrial areas had functioned as low cost and mass production bases. However, in the last few decades, the situation surrounding industrial structure has dramatically changed, because of globalization, domestic economy slump, high yen and other irresistible trends worldwide. The regional industrial areas have heavily suffered from this structural shift, and the local governments have struggled to overcome accelerated hollowing out of their manufacturing foundation for sustainable regional economy. The regional economies came to realize the accumulated knowledge were mainly about effective mass production which were useless in the absence of large manufacturing plants, but not about innovation driving endogenous growth. While regions are now competing to attract firms to invest in by offering luxury financial incentives, the true cost of luring plants from outside must be quite high nowadays and sometimes the cost might be far exceed the benefit they would enjoy (Kotler and Gertner, 2011), as firms can choose a location from global perspectives.

Meanwhile, Japanese government strongly initiated the regional-industrial promotional policies, following the industrial cluster framework proposed by Porter (1998) for resolving fragmentation in regional economies and reshaping the economies into autonomous and innovative ones, breakaway from mass production factory centered economy. Thus, the policies have been designed to help regional small and medium-sized enterprises (SMEs) as a whole better respond to many factors that cause market instability, such as the globalization of the economy, by achieving flexible specialization among them. However, these policies implicitly assumed that regional economies have, at least to some extent, existing base of target industries (e.g. accumulation of human resources) and research and development facilities. Then what would be happened if all municipalities spontaneously rushed to pick up winners? And how can peripheral regions, which are not with the industrial infrastructure, compete with more developed areas? Moreover, owing to the rapid development of ICT, network relationship observed in the business world has become more complex and global. While the geographical economy literature including Porter insists the economies of agglomeration in an industry cluster, the sharp rise of collaborative activities taking advantage of virtual network casts serious doubts on the benefits of geographical agglomeration itself, or at least implies the decline of the economy. In a nutshell, it is difficult challenges than ever for peripheral regions to transform themselves into successful innovative areas almost from scratch and achieve competitive advantage, especially with high tech industries even if possible.

We sympathize with Hospers et al. (2009), which argues policymakers should start from ‘Regional Realism’ rather than to try to build the next Silicon Valley and take ‘do-not-harm’ approach, but the only lesson ‘do-not-harm’ approach gives policymakers of peripheral regions is “sleep and wait for good luck” or, at the worst, “waiting to die” since their realism are almost empty. The policymakers there should either accept the reality or create peculiar scheme reflecting global competition and virtual network.

Matsue city, the capital city of Shimane prefecture which is a typical peripheral city in Japan, then in tandem with the prefecture, has initiated a regional IT industry promotion project since 2006 built around the emerging open source programming language Ruby. Shimane prefecture at least on surface

was loser even in the domestic competition. The only potential advantage it preserved at the beginning was that the star programmer, who had created Ruby and been embraced in the virtual community spreading across the globe, lived there. It has been suggested that the geographical proximity of related actors in a region profoundly influences regional industry promotion, as summarized by Huggins and Johnston (2009). In contrast, in this regional promotion project, the network of actors has extended outside the region. Therefore, actors in the region of Matsue City know about their own interests in the area and a certain amount of ‘activations’ of the project, which has led to its success. It has further been suggested that many types of elements exist, comprising geographical proximity and other items, which combine to produce compound effects. Therefore, this research aims to determine which elements are effective in regional industry promotion in peripheral areas and the mechanisms of how these elements are carried out. To do so, we investigate the networks and types of proximity that form the foundation of industrial promotion activities

## 2 Previous Works

### 2.1 Proximity and innovation

Porter (1998) expands the concept of innovation by geographical density based on the definition of a cluster, which is a group of companies and related institutions that are located within a geographically close area. Knobon and L.A.G. Oerlemans (2006) categorize proximity into three dimensions: geographical proximity, organizational proximity and technological proximity, based on results of previous works. In this paper, we analyze a case study using these three dimensions of proximity. Additionally, proximity can be regarded in terms of general ideas on innovation (e.g. Oerlemans et al., 2001), interorganizational cooperation (e.g. Sternberg, 1999) and regional economic development (e.g. MacKinnon et al., 2002).

Geographical proximity is generally defined as the geographic distance that separates actors (Knobon and Oerlemans, 2006), which leads to shared knowledge and innovation from information exchanges (Torre and Gilly, 2000).

Organizational proximity is defined by similarity in the style and beliefs of actors who are geographically close (Torre and Rallet, 2005). Actors who share the same style and believe that their attributes are similar are more likely to achieve mutual understanding. Organizational proximity can further be regarded as a prerequisite for transfer of implicit knowledge, a joint foundation for determining new resources through collaborative study, and innovation (Burmeister and Colletis-Wahl, 1997; Kirat and Lung, 1999; Knobon and Oerlemans, 2006).

Technological proximity is defined by commonalities in the level of knowledge actors possess about technology (Knobon and Oerlemans, 2006). The term technology itself refers to knowledge that leads to the creation of new products and services using tools, devices, and processes (Tushman and Anderson, 1986). Technological proximity drives the acquisition and development of technical knowledge (Tremblay et al. 2003; Zeller 2004). The concept of technological proximity is important because of its implications in an actor’s capacity to absorb knowledge based on observation. This is based on one’s ability to recognize and take in new external knowledge and apply it for commercial rewards (Cohen and Levinthal, 1990).

These three dimensions of proximity (geographical, organizational, and technological) complement each other. For example, enterprises which share organizational and technological dimensions can compensate a lack of geographical proximity by substituting face-to-face interactions with modern communication technologies (Knobon and Oerlemans, 2006). Additionally, the dimensions of proximity interact with each other with the passing of time. They may strengthen one another at one point in time and weaken each other in the next. Take the actors in Silicon Valley as an example. Though they come from distinct cultural backgrounds, they often have some cultural and normative routines in common (Saxenian, 1991). This results in frequent face-to-face interactions that lead to the development of many different applications of common technologies. In this case, the three dimensions interact with each other. Therefore, Silicon Valley is said to have a climate that promotes collaboration and continual knowledge exchange and innovation (Castells and Hall, 1994).

Moreover, there are case studies of temporary geographical proximity where actors have face-to-face interactions by traveling or changing locations. It is not necessary for actors to have constant encounters when collaborating. Instead, organizational proximity through meetings, brief visits and temporary trips enable collaboration beyond geographic distances (e.g. Gallaud and Torre, 2004, 2005; Hyypiä and Kautonen, 2005; Torre and Rallet, 2005). Geographical proximity is only necessary

for certain processes, such as the acquisition of basic and implicit knowledge, or in the negotiations stage. It is not necessary in the development of knowledge and the business operations stage (Gallaud and Torre, 2004, 2005).

## **2.2 Networks and ties**

Networks are defined as a part of the organization in which individuals are bound together through their relationships. Efficient utilization of human resources is important for continued innovation (Bresnahan and Gambardella, 2004; Crescenzi, 2005; Garnsey and Lawton Smith, 1998; Goman, 2000). Therefore, a knowledge network is regarded as an important element in developing regional economies and increasing the competitiveness of regions (Asheim, Isaksen, Nauwelaers, and Toedting, 2003; Bathelt, Malmberg, and Maskell, 2004; Cooke, Heidenreich, and Braczyk, 2004; Rutten and Boekema, 2007). Human resources are especially limited in peripheral regions, so external knowledge from enterprises and organizations outside the region plays an important role in the development (Chesbrough, 2003; Cooke, Heidenreich, and Braczyk 2004; Brown and Duguid, 2001). It is important to create networks appropriate for importing this valuable external knowledge.

This leads to the question, "What are the most desirable network characteristics for a regional economy?" Knowledge networks are categorized into two types. One is a formal network based on an explicit agreement, such as an alliance between enterprises. Exchanges among the allies' actors occur frequently in this type of network. The other is an informal network with external actors, such as an informal interaction with members of a trade association or union. This network is more dynamic, with partnerships changing constantly (Huggins and Johnston, 2009). In fact, the rate of change is so great that enterprises must update their contacts continuously (Huggins and Johnston, 2009), which can provide a competitive advantage. In the formal network, actors acquire a competitive advantage by accessing the resources of established partners (Huggins and Johnston, 2009). Therefore, much depends on the qualifications of one's partners (Grant and Baden-Fuller, 2004; Ireland, Hitt, and Vaidyanath, 2002; Stuart, 2000). On the other hand, in the informal network, actors can access the latest information directly. The most desirable knowledge network for regional economies alternates constantly, but should be comprised of the most suitable members and partners who can effectively respond to changing needs (Dokko and Rosenkopf, 2003).

It is important to discuss the issue of "Ties," as this element enhances the quality of a network. Ties refer to the relationships between humans and can be categorized into 'Strong Ties' and 'Weak Ties' depending on the strength of relationships (Granovetter, 1978). According to Granovetter (1978), Strong Ties are defined as relationships typically with familiar, close persons and with those with whom a person has frequent contact. Weak Ties are the opposite. Generally, Strong Ties encourage transfers of complicated knowledge, and Weak Ties encourage that of simple knowledge. However, Weak Ties are also believed to provide diverse information (Sorenson, Rivkin, and Fleming, 2006). Knowledge from outside regions is more important than that from inside regions, and it can boost performance (Cooke, 2004). This suggests that regional innovation is based on the interaction of knowledge creation and subsystems linking an enterprise to outside regions. To construct networks that confer competitive advantage on regional areas, it is important to link enterprises, organizations and research institutes with outside regions, and to take advantage of both Strong Ties and Weak Ties appropriately.

Though knowledge networks based on geographical proximity alone are an important factor for the development of regional economies (Malmberg and Maskell, 2006), businesses do not solely acquire the necessary knowledge from inside a region. Enterprises driving innovation flourish by acquiring knowledge from resources beyond national borders (Davenport, 2005). Enterprises that are not able to absorb technologies quickly and efficiently tend to rely on a network inside their region, while others that are more technologically capable tend to have global networks (Drejer and lund Vinding, 2007). Though these actors are not geographically close to each other, the transfer of complicated knowledge is possible through highly effective network structures (Davenport, 2005; Dunning, 2000; Lissoni, 2001; McEvily and Zaheer, 1999; Palazzo, 2005; Teixeira, Santos, and Oliveira Brochado, 2006; Zaheer and Bell, 2005).

Moreover, modern information technologies have enabled the transformation of implicit knowledge

## **2.3 Virtual community and collaborative knowledge network**

The development of ICT and rapid diffusion of the internet in the recent years had changed the meaning of time and space for organizations (Castells, 2000) and allowed them to establish the communities that benefit from networking information advantage, delocalization and fast-paced processes. The concept of "cellular forms" is composed of knowledge workers and designed to avoid the rigidities of bureaucratic hierarchy, and enhance the learning process and development of dynamic

capabilities in order for them to adapt to sudden shifts in the market and new knowledge and technologies (Gloor, Maggio, Passiante, 2006). They function as parts of a virtual community. Virtual community can be defined as a group of people who use ICT as the main means of communication (Cothrel and Williams, 1999) but they also utilize other communication means such as face-to face meetings to support building cohesion and trust in the communities (Storck and Hill, 2000). The most distinctive difference between virtual communities and real communities is that technology is the base of virtual communities, and it enhances the flexibility of the communities to adopt to highly complex business environment (Hildreth *et al.* 1998)

According to Gloor (2006), virtual communities can be systematically categorized into three types of networks; Collaborative Innovation Networks (COINs), Collaborative Interest Networks (CINs), and Collaborative Learning Networks (CLNs).

1) Collaborative Innovation Networks (COINs) are composed of self motivated people with a common vision, and they meet on the web to exchange ideas, knowledge, experiences. They work in a collaborative way to achieve a common goal.

2) Collaborative Interest Networks (CINs) are composed of people with the same interests, but they do not work in a virtual team. Such communities are very frequent on the web. Only a few members are active to share the knowledge and experiences within the community and the rest are silent members who keep information from the web sites, portals, but do not share in the community.

3) Collaborative Learning Networks (CLNs) are composed of people who share knowledge and practice to benefit reciprocally from personal mastery and the collective knowledge accumulation of a group of attitudinally similar people.

These three types of virtual communities from a Collaborative Knowledge Network (CKN) form a high-speed feedback loop. CKNs function with the mechanism that the innovative results of COINs are immediately taken up and tested, refined or rejected, and fed back to the originating COINs (Gloor, 2006). COINs are the creative foundation of CKNs, and with their fundamental principles of “creative collaboration, knowledge sharing and social networking”, they play a role as an enabling factor for the creation of fluid organizations. COINs are generally born around new interesting ideas which were absorbed outside organizations, brought inside and discussed in a collaborative and creative way to improve individual knowledge and capabilities and organizations’ performance.

CKNs link big organizations and exchange information and collaborate with other people over the geographical proximity utilizing ICT. CKN is the key concept to establish a successful network (Gloor *et al.*, 2003).

#### **2.4 Problem of activations in peripheral regions**

Compared to urban areas, peripheral regions fall behind in the leading indicators of knowledge-based enterprises, including innovation and number of patents (Huggins and Izushi, 2007). Knowledge-based enterprises depend highly on intellectual efforts and invest heavily in research and development. On the other hand, small and medium-sized enterprises in peripheral regions have limited resources and depend excessively on knowledge from within their firms. This creates a barrier that discourages innovation and growth (Smallbone, North, and Vickers, 2003). It is, therefore, necessary for them to increase their knowledge networks outside the region (Malecki and Hospers, 2007).

In this paper, we refer to the activities taking place in Matsue City, Shimane Prefecture, where networks of actors are expanding outside this region thanks to the Ruby programming language. In accordance with the suggestions and issues found in previous work, we investigate the elements of desirable networks that add vitality to peripheral regions using of Ruby as a primary reference.

### **3 Regional Industry Promotion with Ruby and Utilization of Network Proximity**

#### **3.1 The case example**

As previously mentioned, peripheral regions lack ready access to potential elements that can support local revitalization, making traditional approaches such as cluster policies, ineffective. The case in point is in Matsue City, Shimane Prefecture, where the Ruby programming language is used to determine the effective elements for peripheral regional industry promotion. There are very few industries existing in this area, so the enterprises there were in a situation in which they needed to find a unique method for regional industry promotion.

Matsue City then initiated a regional industry promotion project relying on the Ruby programming language, a local, homegrown resource developed by someone living in the city. From 2006, when the promotion project started, through the present, it is believed a certain amount of activations of the

project has been maintained. Therefore, we chose this area as the case example to investigate the phenomenon of local revitalization.

### **3.2 Ruby programming language**

Ruby is an object-oriented script language first created in 1993 by Mr. Yukihiro Matsumoto, a man called “Matz” in open source communities, and was released to the public in 1995. Matz lives in Matsue City and has been developing Ruby with many open source developers all over the world through the Internet. In its early stages, although Ruby was popular in the technology community, its applications had not spread into the business world. However, in 2005, David Heinemeier Hansson, a Danish programmer, released Ruby on Rails, a web application framework constructed with Ruby. From then, Ruby began to attract widespread attention from a range of users and was introduced into a number of business areas.

Ruby is an interpreted language, a kind of lightweight script language which does not require compilation prior to running programs. The amount of description is less than that of other programming languages. The grammar is also similar to English, making it easy for programmers to write commands. Additionally, programmers can monitor their programs when running them sequentially. For these reasons, Ruby has received recognition as a highly productive language in the development process for web applications, in which speedy releases and frequent changes are crucial.

### **3.3 Activities of matsue city, shimane prefecture, and the local it industry**

3.3.1. Activities of Matsue City Matsue City, the prefectural capital of Shimane Prefecture, started the project, which attempts to create a new regional brand for the city based on the Ruby programming language, as part of its efforts to regenerate the city and its environs. The project built a physical facility called “Matsue Open Source Lab,” located a one-minute walk away from the Matsue central station. The Lab has become a hub for all activities relating to open source software, transforming Matsue City into a center for open source research, development, and exchanges. Matsue City supports the cultivation of human resources in the IT field with programming training courses in local educational institutions. The city’s main goal is attracting enterprises to the area.

To further support Ruby and advance the project, an organization called “Open Source Society Shimane” was established in 2006 by companies, technicians, researchers, students, and users who specialize in open source software. The group provides a platform for them to exchange knowledge and information, and to improve their technological development skills and project management abilities through utilizing Matsue Open Source Lab. Such activities will enable Matsue City to become a national center for open source software development, which will lead to technological innovation, increased competitiveness in the field of OSS, and above all the development of a modern workforce well versed in the intricacies of the IT world. Ultimately, it will make Matsue City a world-renowned Mecca for Ruby and OSS.

3.3.2. Activities of Shimane Prefecture According to its 2005 commercial report, Shimane Prefecture’s main market for IT enterprises focuses on “Information Service Industries,” amounting to 37% of the total. The proportion of businesses devoted to this market is quite high as compared to all of Japan, at 28.3%. This demonstrates the multiple layers of commission and mutual trust in the relations of similar industries within the Japanese IT field, which exemplifies a typical waterfall model of development.

Following the reduction in investment due to the global recession, Shimane Prefecture needed to decide its own policy course. The prefecture took control of market growth for the IT industry by promoting Ruby, which had received worldwide recognition, and prioritizing the IT industry in 2008. It has invested in cultivating IT human resources, increasing orders for IT system development since 2008. Its aim was to increase the number of employees in the region from 1,092 in 2006 to 1,600 in 2011.

3.3.3. Activities of the Local IT Industry Supporting the activities of Matsue City and Shimane Prefecture, Shimane Information Industry Association, a 40-member economic group of local IT enterprises, started to organize business workshops. Each enterprise also started to develop IT business systems using Ruby as a base. Taking advantage of support measures by Matsue City and Shimane Prefecture, businesses have been expanding their IT market share of Ruby and Open Source Software (OSS) by collaborating to accept orders for large-scale IT systems.

As a results, sales in the IT industry in Shimane Prefecture increased by 57.9% from 2006 to 2010, compared to a negative 3.7% growth rate in the rest of Japan during the same period. Furthermore, the number of employees in Shimane Prefecture increased by 77.8% from 2006 to 2010, while the national average was 12.9% over the same period. Local IT enterprises had already exceeded the target for total employees set by the prefecture in 2009, and the number rose to 1,817 in 2010.

3.3.4. Activities of Other Areas Activities associated with Ruby have been implemented not only in

Shimane Prefecture but also in other areas, including Tokyo and Fukuoka. In Tokyo, Ruby Kaigi is an annual technological conference mainly for Ruby engineers who come from all over Japan and abroad. Large enterprises such as Rakuten, Microsoft, GREE and FUJITSU sponsor the conference. The conference plays a pivotal role in the developmental activities of Ruby in Tokyo.

In Fukuoka, the Fukuoka Ruby Business Hub Promotion Committee was founded in 2008 and plays a central role in related activities in the region. The committee supports Research & Development (R&D) with Ruby and encourages connections with enterprises in Silicon Valley in the United States. In addition to these activities in supporting Ruby in other areas, a network has been expanding outside the regions of Shimane Prefecture and Matsue City.

A Ruby network has been established abroad, and International Ruby Conferences as well as numerous regional conferences are held every year. A representative example is the annual Ruby Conference in the United States, which has been held since 2001, with networks also being constructed in line with the conference. In Europe, the European Ruby conference (EuRuKo) has been held annually since 2004.

Moreover, Ruby Conference China and Ruby Conference in India have also started in recent years, showing the network's expanding influence in Asia.

## 4 Analysis of Network Structure

### 4.1 Methodology for investigation

To investigate how the network changed when activations of these activities occurred, and to verify what activations was from the cross-section of network analysis, we analyzed the structural characteristic of human network by comparison between 2006 and 2011 qualitatively. The questionnaires are, “a) three persons you contact frequently, b) three central persons of the network, you think”, and asked communication media, frequency and contents of the contact with each persons.

### 4.2 Analysis of survey results

Thus, we can make sure the following changes by comparison of network structure between 2006 and 2011.

Figure 1 Sociogram 2006

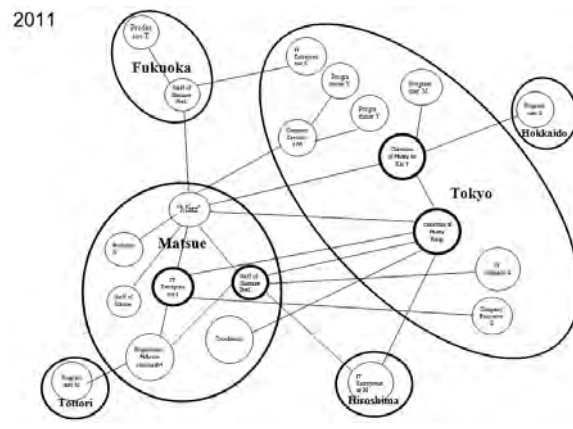

Figure 2 Sociogram 2011

1) Increase of Nodes the numbers of network nodes have slightly increased. This means the expansion of the network on the scale.

2) Increase of Creeks The numbers of n-creeks, groups of nodes that are not complete conjoined relation but neighboring conjoined one another, have increased. To include groups dissimilar in character by the increase of n-node makes network multifactorial. The less dense the region becomes in comparison, the network becomes more balanced.

3) Increase of Hubs the numbers of nodes which play parts of hubs by linking between creeks have increased. By this the communications between hubs not going through the center of network have also increased. This means the decreasing of the centeredness by the communications without Matz. The centeredness is the mark how nodes and edges that consist of network play the center stage within the network. The network structure not depending on unary element has toughness and desirable from the viewpoint of regional economy.

4) Existence of Strong Ties and Weak Ties We define high-frequency contact, once or more a week, as Strong Ties and otherwise Weak Ties. The proportion of Weak Ties has increased from 30% (2006) to 34% (2011). According to the recent researches, it is desirable to redress the balance of between Strong Ties and Weak Ties but the optimum magnitude of it must be examined carefully.

In our questionnaire survey of this time the number of sample is limited, so the result of analysis by the survey is restrictive. At the same time, according to the change of the network structure above-mentioned, we can make sure the expansion of the network which has the rate of information exchange and the multiplicity, by connecting with outside regions which have common technology and knowledge of Ruby, beyond the geographic distances.

## 5 Conclusion

In this research, we investigated the network structure of related actors in a region's business activities and the proximities that provide a foundation for such activities, with the aim of determining the most effective elements of peripheral regional industry promotion.

In the regional promotion project in Matsue City, the number of activations geographically close industries and actors in the area was limited, so they established networks to connect with outside actors who share common technological knowledge of Ruby. Geographically distant actors had face-to-face communications when needed and such temporary geographical proximity compensated for the lack of constant proximity. It is assumed that networks then encouraged communication based on their technological proximity and consolidated their organizational proximity. However, the samples and coverage of this research were limited and the matter will require further research to verify the stated hypothesis. In addition, research issues such as the definition of strength of ties, the desirable balance of strong and weak ties, and further research on web networks should be addressed in future research.

# The Concept of Architectural Knowledge of the Product\*

Gu Yuanxun

School of Economics and Management, Beijing Jiaotong University, Beijing P.R. China, 100044  
( E-mail: guyuanxun@bjtu.edu.cn )

**Abstract:** This paper presents a conceptual model of architectural knowledge of the product (AKP) from a perspective of the knowledge production and diffusion. AKP is defined as the cognitive ability of the organization on learning and applying the technique, skill and experience related the product that embedded into the product architecture design. A systematic expression of AKP was provided which consists of the context, modules and relations among modules. Especially, the context confines the boundary of the product architecture. Issues in the lifecycle of AKP, and strategic value of AKP are discussed, as well as directions future research.

**Keywords:** Product architecture; Architectural knowledge of product; Lifecycle; Strategic value

## 1 Introduction

The product is the main output of enterprise and play media role of value exchange of business. We could observe and analyze the product from the external aspect, i.e., attributes, or from the internal aspect, i.e., product architecture (PA). At present, the form is the dominant way to understand the product architecture (Ulrich, 1995; Baldwin&Clark,2000, Mikkola, 2006), in this paradigm the PA was commonly divided into two types, modular or integral. In fact, the form of architecture is evolutionary switching between modular architecture and integral architecture along with the context of the firm(Shibata et al.,2005; Fixson&Park, 2006; Gu,2012), then if we simplify the PA into either modular type or integral type , the essence of PA can not be grasped, and we have weak measures to improve the quality of PA. In this paper the purpose is to raise a systematic method to understand and grasp the essence of PA, that is, architectural knowledge of the product (AKP). Though AKP was mentioned by several papers (Henderson&Clark,1990; Sanchez,1996; Gu&Peng,2010). However, up to now, we did not get a full picture of the AKP. Then, the purpose of this paper is to establish a picture of AKP and outline related strategic value of AKP.

## 2 The Essence of Product Architecture

The PA is commonly regarded as the form of the composite of modules (Henderson&Clark,1990; Ulrich,1995; Baldwin&Clark,2000). Then, most of the extended researches based on the form-oriented way to explore the value of PA(Baldwin&Clark2000; Takeishi,2001; Mikkola,2006; Sosa,2011; etc.), what the existed research implicated that the modules of PA is homogeneous. What the homogeneous means that though the physical size of module is different, but the strength of relationships among the modules is identical. That is, if there exists a relation (denoted as R) between module A and B, then the strength of R is not varied along with the lifecycle of the product, step more, we can not accurately reflect the learning result of organization embodied in the PA. This case will incur in an organization who owned zero learning ability, but this situation seldom occurs for a rational firm. Therefore, the strength of R is a variable, not a constant. Deeply, the form of PA is a present of PA, the exploration of the essence of PA need a new method.

In order to obtain the goal of understanding the essence of PA, a conceptual model of AKP was established from a perspective of knowledge production and diffusion.

First, the module of PA is a representation of organizational knowledge of the firm which coordinated the total process of product value realization. The design of PA is not a single function of the R&D, but the cooperation and coordination of the whole organization, directly related the manufacturability of assembly department or process. If we consider the postpone strategy, the PA also involves in the delivery and distribution process, and stretch into the service process and the purchasing or outsourcing functions. Then the PA is an integrator of the firm efforts on product design.

Second, in general, the firm owns learning ability that could cope with some technical questions and optimize the knowledge in the total PA, or some modules, or the relationships among modules

---

according to the market trend, competing circumstance and technology progress. Then the strength of the relations will change along with the strategic need of PA and the process of value realization of the product from design to service. Then we need think the PA in a value chain perspective, and the knowledge embedded in the PA need a new expression means. Then the AKP is not confined in the PA area, but covers the value chain of the firm.

### 3 Conceptual Model of Architectural Knowledge of the Product

The conceptual expression of AKP constitutes two dimensions: one is located in the PA, the other lies in the value chain of the firm. According to the PA basic feature-decomposition and integration (Ulrich1995;Baldwin&Clark,2000), the AKP conceptual model need provide a structure that the AKP could be measured in two hierarchies, the first is the shared sense of AKP, which reflects one of the stage of the value chain get the cognition to the total PA construction and influences the toughness of coordination along the value chain. The second is the cognition to the modules and interface (where modules also could be named as chunk, element, or component in different literature), which reflects one of the sate of the value chain get the cognition to the constituents of the PA and directly influence the capability of the stage how to proceed the PA and the results of learning and absorption of the PA.

Turn to the component of the PA. What is the component? Though the component (or module, or chunk) was mentioned frequently in the literature, but up to now we can not get the truth of the component, and we can not describe the component definitely. As indicated by Baldwin&Clark(2000), the component is the result of task partitioning and complexity managing, also this is the dominant argument in the modularity related literature. But why and how to partition the task and why will produce the specific components are not self-event. Suppose, there is a task that one person can not deal with it, then he would search for methods to finish the task, by dividing the task into sub-process (Smith,1776) or into components(Simon,1962), as generally named module. Further, how many modules are proper? There are two dimensions could provide the analytic framework. One is the coordination which focuses on the internal perspective that emphasized on the efficiency of task accomplishment; two is the business which focuses on the external environment of the organization (including different types: individual, group, firm, even alliance of firms). Then, the component of PA is not a simple task partitioning, but the balance of management and business of the organization when faced the challenging task. So the existing of components is located into their context: managing capability and business model.

Although Henderson&Clark(1990) and Sanchez(1996) broadly defined the AKP as the knowledge of components and their interactions, if we considering the origin of the component, then we could get the structure of the AKP inferring form the above analysis, that is, the AKP has three basic constituents, i.e., the context of the PA, the interactions among components, and the components themselves. What more important is that the components are not homogeneous, but heterogeneous, which implies that the strength of the relationships of among components will vary along with some principles in the backside, where points out the future directions of the extended research of the AKP.

Now, we get a formal expression of AKP:

$$AKP = F(\text{Context}, \text{Module}, \text{Relations})$$

Where,

The Context is a vector with two dimensions: coordination and business; where defines the boundary of the PA, otherwise we may loss the wholeness of the PA. Though the PA could be regarded as an open system, but if we have not given a definite boundary to the PA, we may get the misunderstanding characteristics of the relations among modules due to various boundaries corresponding to unequal views of the PA entity.

The Module is a vector with multi-dimensions (1, 2, or  $n (n \geq 2)$ ) which determined by the results of recognition of the task partitioning. The module could be scored by the following dimensions singly or combiningly, i.e., the size measured by the person-based or group-based capability load; the interfaces of its boundaries by the technique requirements or coordination needs, or the business strategies; the strategies of encapsulation of the information.

The Relations is a vector with multi-dimensions (1, 2, or  $n (n \geq 2)$ ) which determined by the results of recognition of the strength of the relations. In common, the relations were sorted into tight coupling and loose coupling.

The Function ( $F$ ) is a filter embedded in the organization as argued in Henderson&Clark(1990) and Hendrson(SMJ 1994), with the added analysis oriented to the value chain where the PA moves along

in(Gu,2012). The construction of the function was not confined into the organization, but extended to the environment due to the firm as an open system (Scott, 2003).

AKP is the function of PA where it locates in, its component and the interactions of components. According to the general system theory (von Bertalanffy, 1968: 54-55), the AKP owns constructive characteristics which means “the whole is more than the sum of parts”, and comparing to the modules the PA appear as “emergent”.

#### 4 Lifecycle of Architectural Knowledge of the Product

Now, we could switch the attention of the expression of AKP to its lifecycle. The lifecycle of the AKP is constituted by three stages, that is, the birth, the formulation, and the transformation (Figure1).

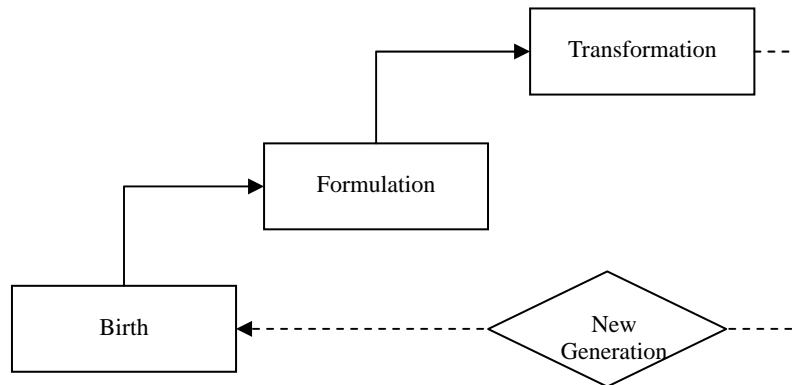

Figure 1 The Lifecycle of the AKP

In the birth stage, the AKP was born by the task partitioning guided by the division of labor, the technique requirements/constraints, and by the business strategies. This a starting point, where could be tracked from multi-sources. The origin of the AKP could from the creativity of the workers, from the learning results by the workers, or even the accumulation of the experience of workers which emerge into a somewhat clear expression of AKP in ones' mind and then was translated into the pragmatic works. There are few understandings of the birth of the AKP, but the naissance of the knowledge of human society provided a good base to explore the origin of AKP. Just as inventions in physical products, the AKP is another form of the presentation of the invention of how to organize the ideal model of the product where combined the experience, the learning, and the accumulation of the artificial intelligence.

When the birth was finished, we enter a process to formulate the AKP which to attain a more formal form of the AKP that could be grasped, understood by the participants. This formulation course may be very short or very long according to the progress of the technology applied in the product, the organizational capability and the attainment of the business goals. As the popular exemplar, the personal computer(PC), in macro level, its PA and AKP evolved in a long period only after vendors provided a professional chip- Central processing unit(CPU) (Intel company, Motorola company, and Texas Instruments company were the pioneers) that provoked the separation of the whole-production style of PC with the assembly style of the PC, where brought a revolution in the PA and AKP of the PC. When retrospect the historic development of the Intel company(Yu,1998), we could get deep understanding of the formulation of the AKP where filled by the techniques challenges, the organizational efforts and the tactics in business strategies.

Along with the progress of the AKP, the transformation is inevitable due to the change of industrial structure, the adaptive response of the firm and the new goal setting-up of the business. Return to the information industry, the software demonstration the transformation of the AKP. For a specific program, there exist many development method guiding the design of the program, for instance, the structural design, the top-bottom design, the object-oriented design, the model-driven design, the architecture-driven design etc., every method provides a new means to cope with the complexity of the software program along with the style evolving of the development organization, from individual-based

to mass collective cooperation-based style.

## 5 Strategic Value

When the PA moves along the value chain, there exist an absorptive relationship between the upstream stage and the downstream. Considering the learning and diffusion process and ability, the absorption effectiveness of the AKP(AEA) determines the opportunities and space of innovations in product design, business design and the optimization of the value chain.

From the product perspective, the operators of modularity (Baldwin&Clark,2000) rely on the AEA, and only when some conditions occurred then on of the operators will take effect. The PA and modularity is not living in a vacuum, but determined by the AEA. Since we mentioned above, the coordination and the business are the two wheels that drive the AEA(Gu,2012).

From the business design perspective, the space of profit exists in the AKP and its constituents, the profit could be produced from whole PA-based, or module-based, or relations-based AKP, then the competence of the business could be reified by the AKP in the product-level. When involved the business strategies, the product is not a sweeping concept, but a detailed presentation with the AKP. If we search for the paths of business model, here open a door.

From the value chain perspective, in general, the calculation of the amount of the products is a key of the economics of the value chain and supply chain. When to optimize the amount of the products, we always assume or neglect that there are zero frictions in the chain conduit. In fact, the frictions can not be eliminated without cost, and the frictions provide a new sight to explore the structure of the chain and will get a new gain of the mechanism of the optimization of the value chain and the evaluation of the PA.

## 6 Conclusion

The architectural knowledge of the product plays key role in the understanding of product architecture. There are three constituents structure the architectural knowledge, that is, the context of coordination and business, the relations among modules and the modules. The AKP is the function of the three constituents which function could be constructed covered the value chain. Especially, the module is the axiom of PA and the starting point of AKP which rooted from the division of the labor and the technique requirements, and determined by the coordination and business. Then the connotation of the module is the fundamental of the AKP conceptual model.

Then, from the perspective of structuralism paradigm, this research deepens the PA from form to structure, and from the perspective of the general system theory, this research defines a systematic approach to analyze the AKP. Correspondingly, to integrate the form, structure and system into AKP is a preliminary step in this conceptual exploration.

For the future directions, we regard the PA and AKP as kinetic entities, it is necessary to conduct research on the dynamics and evolution of AKP.

## Utilization of Closed Schools for Regional Revitalization

Makoto Hadeishi, Kazuhiro Fukuyo

Graduate School of Innovation and Technology Management, Yamaguchi University, Yamaguchi,  
Japan

(E-mail: r004wc@yamaguchi-u.ac.jp, fukuyo@yamaguchi-u.ac.jp)

**Abstract:** Recently in Japan, about 450 schools have been closed annually. More than 30 % of closed schools in Japan are not fully utilized at present. The closed schools should be utilized as the social capital. The necessity of the social business (hereinafter, referred to as “SB”) has increased recently. Based on the research of this paper, in order to make SB plan utilizing closed schools successful, local governments should give the economic support to the SB business operators and also make efforts to promote the closed schools utilization actively. The SB business operators and local governments should cooperate together to promote the closed schools utilization proactively. As one of closed schools utilization contributing regional revitalization, closed schools are required to be utilized for the business resources for the Social Business.

**Key words:** Closed schools; Social capital; Schoolhouse; Regional revitalization

### 1 Introduction

Today, the closed schools utilization is the common social agenda in Europe and Japan. According to the research result of web sites, in Europe, there are some cases that closed schools are utilized as business facilities (such as the diversion to the music business facilities in Germany). However, there are still many closed schools which remain unutilized.

The vital statistics in Japan showed that the population of Japan in 2005 was 127,760,000 and began to decrease. National Institute of Population and Social Security Research estimates the population of Japan will decrease for the future (Figure 1). It means that Japan has become a “declining-population society”. The National Institute also estimates that the population of our country in 2050 will be about 110,600,000 and the ratio of population under 15 years old will be only 11 %.

In Japan, the closed schools have recently increased due to the decrease of population. According to the research of the Ministry of Education, Culture, Sports, Science and Technology (MEXT)<sup>[1]</sup>, about 450 public schools had closed annually from 2001 to 2010 (Table 1). Furthermore, it is also estimated that more than 450 schools will be closed annually until 2050.

According to the research of the MEXT, the utilization ratio of closed schools nationwide has remained about 70 % (Table 2). The details of its utilizations are sociophysical training facilities (27.0%), social educational facilities (21.5%), governmental offices and others (7.4%), facilities for changing culture and experience (6.0%), corporate facilities (5.3%), cultural facilities (5.0%), social welfare facilities for the child (4.4%), social welfare facilities for the aged (4.2%), training facilities (3.0%) and so on (Figure 2). As for the utilization of the closed schools, “the public use” cases are quite easy to be converted accounts for the most cases.

Since the legal procedure of the closed-schools utilization was revised by MEXT in June 2008, private use of the closed schools became easier. In September, 2010, the closed-schools utilization was requested by the Board of Audit of Japan<sup>[2]</sup>. The closed schools are required to be utilized widely as the social capital for the regional revitalization.

Recently, the necessity of social business (SB) has been increased in order to solve the social agenda in Japan such as the decline of regional economy, the collapse of local community, and also the environmental problems, etc. According to the definition of the Ministry of Economy, Trade and Industry, SB is the continuous activity that NPOs, local organizations and private institutions, etc solve the social issues by using business method.

In this paper, the case research of SB which promotes regional revitalization by utilizing closed schools is described. Based on the research results, the success requirement of the social business utilizing closed schools are clearly proposed in this essay.

1) Sociophysical training facilities : Sports center, etc. 2) Social educational facilities : Community centers, and lifelong learning centers, etc. 3) Facilities for changing culture and experience : Nature experiencing facilities, Farming experiencing facilities, etc. 4) Corporate facilities : Factory, Office, etc. 5) Cultural facilities : Museum, art gallery, etc. 6) Social welfare facilities for the child : Nursery, students' club after school, etc. 7) Accommodations : Except facilities for changing culture and experience.

**Figure 2 Utilization Status of Closed Schools in Japan (FY 2002-2010)**

## 2 Research Results

In this paper, five research cases of SB utilizing closed schools were conducted. The overview of the research results are shown in Table 3-1 ~ 3-6. The schematic diagram is shown in Figure 3.

1) All the utilized closed schools are public elementary schools (Table 3-1). Elementary schools account for 63.7 % of closed schools occurring in these 10 years as shown in Table 1, therefore, they are easy to be utilized.

2) The contents of business are the operation of commercial facilities, accommodations, and the production facilities of agricultural products & processed animal foods, etc. (Table 1). These businesses have contributed to “Reconstruction of local community”, “Creating of local employments” and “Revitalization of local economy”.

3) In all cases of this paper, closed schools are owned by the local governments, not SB business operators utilizing closed schools. The SB business operators rent the closed school (Case 2, 3, 4, 5) or are consigned the management of them (Case 1) (Table 3-2, Figure 3). The reason why there are quite a lot of tenancy cases is that initial investment can be reduced and also that the local government can take a lead for utilizing closed schools by the tenancy.

4) For the SB business operators utilizing closed schools, there are one case operated by local resident organization (Case 1) and four cases operated by the private institutions (Case 2.3.4.5) (Table 2).

5) For the business promotion type, among the 5 cases, there are two “local leadership” types (Case 1.2) and three “invited-companies” types (Case 3.4.5) (Table 3-2). “Local leadership” type is that local resident organizations and private institutions plan and promote the business by taking the lead. “Invited-companies” type is that the local governments invite the private institutions out of that region. All the “invited-companies” type is operated by the institutions out of that region. In the “invited-companies” type, closed schools were utilized because the status of closed schools is suitable to the condition that the company seeks.

6) The number of employees is from 4 to 35. This means that SB contributes to “the creating of local employments”. The research result shows that there are many employees for the business operation such as production factories (case 4.5) (Table 3).

7) As for the fund raising for initial investment, there are 3 cases which were completely covered

by the subsidies (Case 1.2.4) and 2 cases which were covered by their own funds (Case 3.5) (Table 3-3).

8) For the reduction of rental charge for closed schools, there are 4 cases that reduction of rental charge for closed schools are given from the closed schools owner (the local government and others) (Case 2.3.4.5) (Table 3). As for the reduction of rental charge closed schools, the needs between the local government utilizing closed schools and the SB business operators who wants to reduce the expenses are matched properly.

9) All cases in this paper, the clear management concept and business plan based on the regional condition were established before starting the business. In 4 cases, local governments and the SB business operators utilizing closed schools have cooperated together to achieve this project proactively (Case 1.3.4.5). (Table 4)

10) The common policy of closed schools utilization by the local governments in each case is “the regional revitalization”. (Table 4)

11) As for the local procurement, there are three cases that materials of foodstuff and products were procured locally (Case 1.2.5). As for the local ordering, there is one case that all the repair works was ordered locally (Case 4). And, also there is one case that local procurement and local ordering were not conducted (Case 3) (Table 5). These local procurements and local ordering have contributed to the revitalization of local economy.

12) The business operations except case 3 are favorable. For the Case 3, the countermeasures for the recent decrease of sales could not be taken sufficiently. Therefore, the commercial facilities were closed in case 3 (Table 5).

13) The main merits of closed schools utilization is “Ensuring of business resources”, “Reduction of the initial investment” and others (Figure 3). These merits of closed schools utilization should be announced sufficiently by the local governments.

14) For the future planning, there is the business expansion of closed schools utilized presently and the utilization of the other closed schools at the same area, etc. Therefore, it is expected that closed schools are utilized as the business resources of social business in the future. (Table 6).

**Table 1 Research Results (1)**

Cases	Name of facilities	Name of closed schools	Contents of business
1	The birdhouse of the forest	Tokonabe elementary school	Commercial facilities and accommodations.
2	Akizuno Garten	Kami-akizuno elementary school	Commercial facilities, accommodations, etc.
3	Genki-mura	Fujiminami elementary school	Commercial facilities and plant factory.
4	Senko School Farm Tottori Co., Ltd	Hawai-Nishi elementary school	Plant factory. (The welfare type agriculture business)
5	Shirakami food Co., Ltd	Yamada elementary school	The uncured ham factory.

**Table 2 Research Results (2)**

Cases	The owner of closed schools	Business operators of closed schools utilization	The type of business promotion
1	Tsuno-cho (The local government)	The operational committee of the birdhouse of the forest	“Local leadership” type
2	The Kami-akizu-aikyokai (The management organization of local fortune)	Akizuno Co., Ltd (Agricultural Corporations : The corporation operating agriculture by the corporate form)	“Local leadership” type
3	Saga City (The local government)	Alumis Co., Ltd	“Invited-companies” type
4	Yurihama-cho (The local government)	Senko School Farm Tottori Co., Ltd	“Invited-companies” type
5	Odate City (The local government)	Shirakami food Co., Ltd	“Invited-companies” type

**Table 3 Research Results (3)**

Cases	The number of employees (persons)	Fund raising for the initial investment	Reduction of rental charge for closed schools
1	4	Subsidy	Not reduced
2	10	Subsidy	Reduced
3	9	Own funds	Reduced
4	35 (Disabled persons: 25, Aged persons:10)	Subsidy	Reduced
5	15	Own funds	Reduced

**Table 4 Research Results (4)**

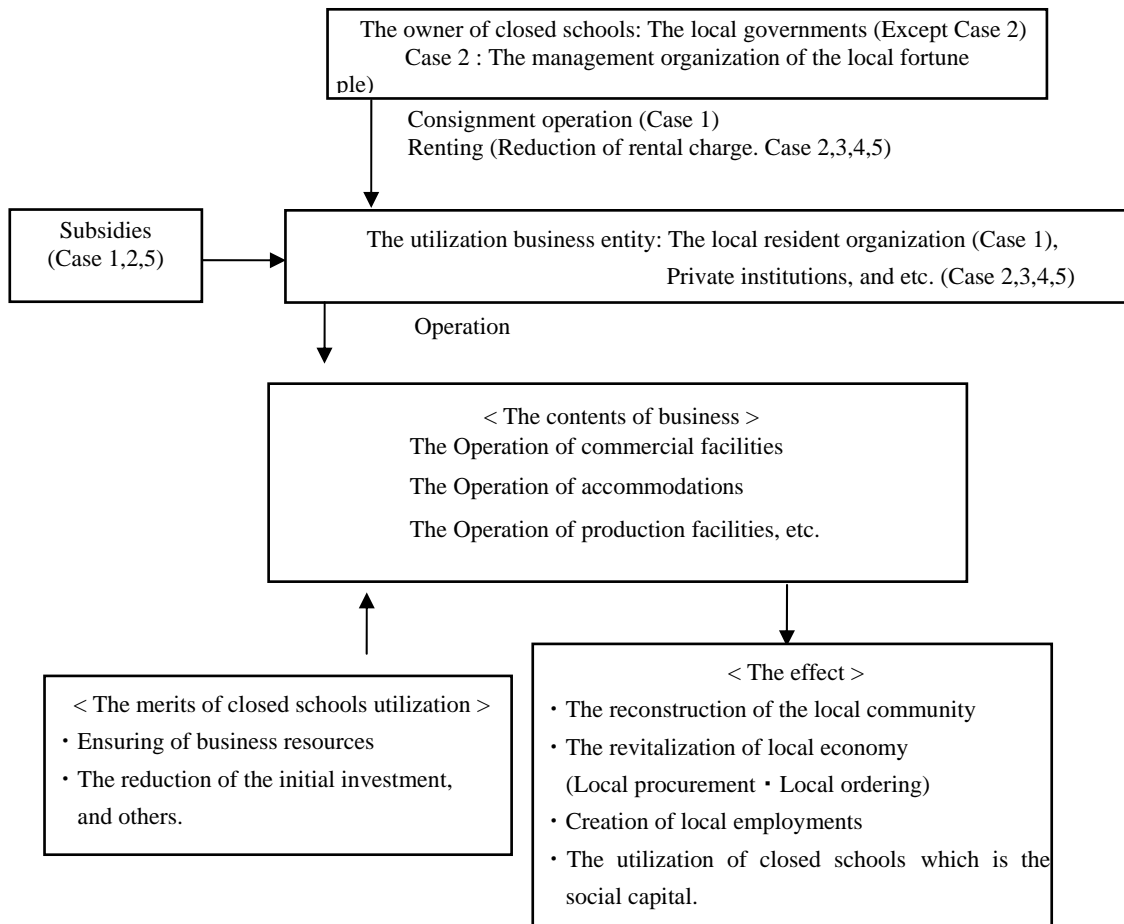

Cases	Process
1	For the first time, the closed school was scheduled to be demolished because there was no application of closed schools utilization. After that, the operating committee of the birdhouse of forest which is the local resident organization applied to Tsuno-cho for the closed schools utilization. Tsuno-cho decided to utilize the closed schools from the standpoint of regional revitalization. The operating committee of the birdhouse of forest was consigned the management of the closed school. This operating committee established the management concept of “Reconstruction of local community”, made the business plan and has started the business since April, 2003. The operating committee and Tsuno-cho have cooperated together in order to achieve this project.
2	The closed school was scheduled to be sold to get enough financing for building a new school. Tanabe City sold the closed schools to the Kamiakizuaikyokai which is the control & management organization of the local fortune due to the regional revitalization. Akizuno Co., Ltd, the agricultural corporation, rented the closed school from the Kamiakizuaikyokai with no charge. Akizuno Co., Ltd established the management concept of “the revitalization of local economy”, made the business plan and has started the business since November, 2008. Akizuno Co., Ltd has promoted this business by the original way.
3	At first, the schoolhouse was scheduled to be demolished because they were too old. After that, Alumis Co., Ltd which is the company located outside of that region applied Saga City for the closed schools utilization. Saga City decided to utilize the closed schools from the standpoint of creating local employments. After getting consensus from the local people, Alumis Co., Ltd rented the closed schools from Saga City by low rental rate. Alumis Co., Ltd established the management concept of “the regional revitalization”, made the business plan and has started the business since December, 2005. Alumis Co., Ltd and Saga City have cooperated together to achieve this project.
4	At first, the schoolhouse were planned to be demolished because it was scheduled to be used for the site of public facilities. After that, Senko School Farm Tottori Co., Ltd which is the company outside of that region applied Yurihama-cho for the utilization of closed schools. Yurihama-cho decided to utilize the closed schools from the standpoint of creating local employments and the revitalization of local economy. After getting consensus from the local people, Senko School Farm Tottori Co., Ltd rented the closed schools from Yurihama-cho by the low rental fee rate. Senko School Farm Tottori Co., Ltd established the management concept, “the welfare type agriculture business”, made the business plan and has started the business since August, 2010. Senko School Farm Tottori Co., Ltd and Yurihama-cho have cooperated together to achieve this project.
5	The policy of closed schools utilization in Odate City was the utilization by the local people. But there was no application of closed schools utilization by the local resident. After that, Shirakami food Co., Ltd which is company outside of that region applied Odate City for the closed schools utilization. Odate City decided to utilize the closed schools from the standpoint of creating local employments and revitalization of local economy. After getting consensus from the local people, Shirakami food Co., Ltd rented the closed schools from Odate City by low rental rate. Shirakami food Co., Ltd established the management concept of “the regional revitalization”, made the business plan and has started the business since January, 2010. Shirakami food Co., Ltd and Odate City have cooperated together to achieve this project.

**Table 5 Research Results (5)**

Cases	Local procurement / Local ordering	Operational status
1	Local procurement of vegetables	Have continued, Favorable condition
2	Local procurement of foodstuff & vegetables	Have continued, Favorable condition
3	Not available	Increase of deficit, The commercial facility was closed.
4	Local ordering of facility repair works	Have continued, Favorable condition
5	Local procurement of pork materials	Have continued, Favorable condition

**Table 6 Research Results (6)**

Cases	Future planning
1	Establishing the nursing care service facilities at the present facilities
2	Newly establishing newly the training business for reconstruction of the local community
3	Conversion of the closed commercial facility to Plant Factory
4	The business development of the welfare type agriculture business to the other area
5	1) The utilization of the other the closed schools in Odate City as the ham factory 2) The move of head office to Odate City. 3) Establishment of the Shirakami ham brand as the special goods in Odate City.

**Figure 3 The Schematic Diagram**

### 3 The Study about the Success Requirement of SB Which Utilize the Closed Schools

Based on the research results, the success requirement of SB utilizing the closed schools was summarized as follows.

Firstly, it is found out that SB business operators who want to utilize closed schools establish the clear management concept depending on the condition of that region, make the business plan and implement the promotion of business. However, there was the case (case 3) that they could not cope with the change of the market environment (the decrease of the sales) and are forced to stop the management of commercial facilities. Therefore, for the continuous business management, SB business operators which want to utilize closed schools should establish a clear management concept, make the business plan and take quick countermeasures depending on the situation. This is especially required for SBs which tend to have less competitiveness and the economic strength.

Secondly, it is also found out that the economic support by the local government (such as the

subsidy for the initial investment of closed schools utilization and reduction of rental charge for closed schools) for the SB business operators have achieved good results for the smooth business management. Therefore, for the smooth business management utilizing closed schools, this economic support for SB business operators by the local government is necessary.

Thirdly, the SB business operators utilize the any closed schools if the condition of closed schools is suitable to the condition that the operators seek. Therefore, the local governments should promote the closed schools utilization, not only in that local area but also in the outside of the local area proactively. As the examples of the promotion of closed schools utilization, closed schools information and the recruitment of the utilization person are found at the web sites of the concerned local government and the Ministry of Education, Culture, Sports, Science and Technology (the closed schools information site<sup>[3]</sup>). And, network building with the local industrial development organization for closed schools utilization are also necessary.

Fourthly, the closed schools are the place for community and also the place for memory. Therefore, about the closed schools utilization, understanding of the local resident should be obtained after enough discussion. Therefore, it is required that the SB business operators and the local governments should build consensus between them. As the examples of this attempt, the questionnaire to the local people and briefing with local peoples are conducted.

Fifthly, it is found out that the SB business operators and the local governments have cooperated together to achieve this project proactively.

Therefore, it is required that SB business operators and local governments should build the cooperative relationship to promote the business operation smoothly,

#### 4 Conclusions

This paper proposes the success requirement of the social business which utilize closed schools.

Main points of the success requirement in this research are summarized as below:

1) For the business continuity management (BCM), it is required that SB operators utilizing closed schools should establish the clear management concept, make the business plan and take quick countermeasures depending on the situation.

2) To promote the closed schools utilization business smoothly, the economic supports by the local government for SB business operators (such as the subsidy for initial investment for closed schools utilization or reduction of rental charge for closed schools) are necessary.

3) Local governments should promote the utilization of closed schools to the business operators not only in that region but also in the outside of that region proactively.

4) With regard to the utilization of closed schools, SB business operators and the local governments should obtain the understanding of local people and also build consensus between them.

5) In order to promote the business smoothly, SB business operators and the local governments should build cooperative relationship.

It is required that the closed schools should be utilized for the business resources of SB as one of the closed schools utilization which contributes to the regional revitalization.

# Exploring Innovativeness of Small and Medium Enterprises in Sri Lanka

Bandula Jayathilake, Hu Shuhua

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: bandulapmb@yahoo.com, sjxwhsh@163.com)

**Abstract:** Innovativeness has been recognized as one of primary means by which a firm can achieve sustainable growth, as well as address the key issues facing firms in today's competitive environment, greater cost efficiency and the provision of new products to meet customers demand and national economic development. This study aims to explore the factors that drive innovativeness of small and medium enterprises in Sri Lanka. Drawing upon data from 124 firms, the analysis was carried out using correlation and hierarchical linear regression analysis. The findings reveal the fact that besides firm internal factors such as strategic orientation, market orientation and structural flexibility, the external factors such as association with other firms and government assistance programs have positive impact on the firm innovativeness. In addition, high cost of innovation, lack of appropriate sources for finance and lack of information about technology and market are discovered as the obstacles which discourage the innovativeness in small and medium enterprises.

**Key words:** Innovativeness; Obstacles; Small and Medium Enterprises

## 1 Introduction

Small and Medium Enterprises (SMEs) are widely regarded as the engine of economic development due to their significant role in boosting employment and economic growth in both developed and developing countries. One of the vital means through which SMEs are expected to accomplish their goals is by developing and implementing innovations. Firm innovativeness has increasingly become a core focus at the individual, firm, regional, national and global level, across a diverse group of disciplines. Innovativeness is also considered as more important for SMEs than larger counterpart since SMEs operate under the various constraints such as limited resources, poor infrastructure facilities and intense competition, ect. On the other hand, today's business environment characterized with globalization, technological invention, changing customer demand and intensified competition have shorten cycle time of all the value chain activities by pressuring firms to be more creative and efficient in meeting ever rising demands in the market. In recent years, the governments in both developed and developing countries have used various measures to the development of the sector. However, policy makers in the developing countries, in the most cases, often craft regulations to support SMEs with backing of knowledge investigated in the developed countries since such knowledge till is scare in those countries.

Sri Lanka has recognized SMEs as one of prime secretors for promoting the economic growth and development. Given the importance of SMEs to Sri Lankan economy combined with lack of understanding on the factors that contribute to greater firm innovativeness, this study set out to answer the question what factors drive the firm innovativeness? The results of the study will extend our understanding of the significant issues that impact on firm innovativeness and provide valuable knowledge for firm owner managers to make their role better in becoming more competent to meet the needs of dynamic business environment.

However, without proper understanding about how SMEs innovative, what drive them to innovate and what restrict their innovativeness, policy makers and other significant parties could not identify best policies, appropriate assistance and other supportive services to encourage SMEs for the innovation. Therefore, the study further extends its scope to examine obstacles for the firm innovativeness.

The rest of this paper is organized as follows. The second section reviews the literature relates innovativeness in SMEs and presents the research frameworks adopts in the study. The third section presents a brief introduction of methodology used in the study. The forth section is devoted for empirical analysis and the conclusion along with managerial implications are presented with the final section.

## 2 Literature Review

Innovativeness is a broad concept that is regarded in a variety of ways and defined in various means. The terms innovation and innovativeness are often used interchangeably in the literature and yet

there remain significant confusion as to what being referred to. Innovation seems to incorporate the adoption and implementation of “new” defined rather in subjective ways, whereas innovativeness appears to embody some kind of measurement reliant upon an organization’s tendency towards innovation<sup>[1, 2]</sup>. Innovation pertains to the number of successful innovations implemented and innovativeness refers as an organization’s overall capability of introducing new products to the market, or opening up new markets, through combining strategic orientation with innovative behavior and process<sup>[1, 2]</sup>.

One strand of studies has examined firms’ innovativeness in terms of product, process and innovative ways of working<sup>[3, 4]</sup>. Other strand takes into account soft aspects when measuring innovativeness or an innovation orientation. Soft aspects concern with major changes in corporate strategy, management practices, organizational culture and markets.

Recent studies show that the external environment, strategic factors and firm specific characteristics largely affect innovativeness of SMEs<sup>[4, 5]</sup>. Similarly, Keizer et al (2002) divide the factors that drive innovativeness of SMEs into two categories, internal and external, where internal factors refer to the characteristics and policies of SMEs while external factors refer to the opportunities that SMEs can seize from its environment<sup>[6]</sup>.

Owner manager’s commitment to innovation, their actions, strategic commitment to research depending on technological change and their promotion of innovative culture, among the internal factors, strongly determine organizational innovativeness<sup>[7,8]</sup>. Some studies suggest that firm’s absorptive capacity, capabilities, patterns of learning, training, education, growth and performance are related to SME innovativeness<sup>[9, 10]</sup>. Availability of resources, collaboration structures and processes to solve problem are further determined the innovative capacity of the firms. In SME context, financing and skilled workers are more significant. According to the recent literature, absorptive capacity is linked the innovation and indicates that the innovation requires appropriate human capital to raise absorptive capacity of SMEs<sup>[11, 12]</sup>.

In addition to the above mentioned factors internal to the firms, a few studies has considered impact of firm characteristics such as firm age, education of employees and the nature of ownership on firm’s innovativeness. Hausman (2005) shows that younger firms tend more innovative than older firms while human capital is identified as one of the crucial factors in innovation and that absence of necessary skills is a serious impediment to innovation<sup>[13]</sup>.

The most extensively recognized external factors for innovativeness in the literature are collaboration with other firms, linkage with knowledge centers and utilization financial resources<sup>[14, 15, 16]</sup>. Kaminski et al (2008) show that collaboration with suppliers and customers can contribute to innovativeness of SMEs. Customer orientation further impacts on SME innovation since they work closely with their customers on conceptual works<sup>[12]</sup>. Sometimes new ideas may come from the customers themselves<sup>[11]</sup>. Strategic alliances are also shown to be important influencers of innovative efforts when they are integral part of firm’s development plan<sup>[17]</sup>. Networking can lead to positive innovative outcomes since networks create many sources for firms to access new knowledge, skills and information.

There is rich and well developed literature relates to barriers for innovativeness. Generally, SMEs are expected to have more obstacles and hampering factors for innovativeness than large firm due to inadequate resources, lack of expertise knowledge and other cost disadvantages. Recent literature noted different factors as the barriers for the firm innovativeness<sup>[7, 18, 19]</sup>. Those factors can be divided into two categories, internal and external, where internal factors refers difficulties that are related to resources within the firm including human capital, financial and other firm specific characteristics. External obstacles refers the factors relate to supply and demand forces as well as environment related. Keegan et al (1997) identify high cost associate with innovation, too long pay off period for innovations, lack of government support for business, low availability of venture capital, innovations are too easy to be copied by competitors, high rate of income tax and social influence, small size of the domestic market, national tendency towards job with security, an education system that influences people to get a job are as the common barriers for small firms<sup>[19]</sup>. Similarly, Segarran et al (2008) identified access to technical information, lack of external finance, skilled personal and major customers as the external barriers for the firms while identifying lack of funds and members fearing about risk and cost of innovation as the internal barriers<sup>[20]</sup>. Levy (1993) identified lack of technical and policy infrastructure, the low degree of innovativeness, bad location and inappropriate firm size for the market as the barriers specific to SMEs in less developed countries<sup>[21]</sup>.

The literature reviewed the above point out that there is no agreement among the researchers on

which factors influence innovativeness in SMEs. This situation is common for the system where the behavior of the firms differ by the industry sector and geographical location.

### 3 Research Framework

This study adopts the following conceptual framework (Figure 1), which was developed based on the literature review, to identify the driving forces behind the firm innovativeness and the obstacles which diminish the firm innovativeness. In particular, it examines direct affects of internal and external factors on firm innovativeness and indirect influences through obstacles.

**Figure 1 Conceptual Framework of the Study**

Innovativeness is difficult to operationalize since inconsistencies are prevailed in the definitions used by various scholars. This study operationalizes innovativeness with two dimensions, product innovativeness and process innovativeness<sup>[1]</sup>. Following the literature to date, external driving factors for the innovativeness are operationalized with two categories as innovation subsidiaries from external parties and collaboration with other firms and institutions while internal factors are categorized into three types, firm characteristics, strategic and market orientation and structural flexibility. This study uses cost of innovation, inadequate sources for finance, lack of government support, lack of qualified staff, and lack of information about technology and market are as the obstacles for the firm innovativeness.

### 4 Methodology

The relevant population is defined as all independent manufacturing firms with 5 to 25 employees in accordance with the definition used by Department of Census and Statistics in Sri Lanka. A stratified sampling technique was administered to select the study sample. The sample consists of 124 firms which contain 45 firms from food and beverages industry, 34 firms from textile and rest from the other industries.

The study was carried out by means of a questionnaire survey by directing to the owner managers of selected firms. It is generally believed that, in many SMEs, basic operational functions are carried out by the owner manager and thus the survey was carried out rely on the subjective responses from them. All of main study variables were measured by a set of questions on five point Liket Scale.

Data analysis was done in two stages using SPSS 16 version. In the first stage, reliability analysis in SPSS was administered to assure the reliability. Cronbach  $\alpha$ 's confirmed that each of the constructs is acceptable for the present study. In the second stage, in addition to mean and standard deviation, correlation was performed to examine the relationship between the study variables and investigate the factors that drive the innovativeness. The hierarchical regression analysis was further employed to assess direct and indirect impact of the drivers on innovativeness. In a rather supportive way, ANOVA was employed to identify differences of innovativeness on firms' specific characteristics.

### 5 Results

As can be seen in Table 1, the firm characteristics such as age, education back ground of the owner managers and firm size (number of employees) have no direct and significant impact either on product

innovativeness or process innovativeness. However, business age has a positive impact on firm strategic and market orientations and structural flexibility while education background of the owner-managers has a positive impact only on strategic and market orientations. Firm size has no any impact on three of the above firm internal factors. The literature shows that firm size has a significant positive effect on innovativeness in SMEs. Results of present study not supports the above findings and reveal that firm size has no any impact on product innovativeness or process innovativeness in SMEs.

The external environment plays a significant role in influencing innovativeness in SMEs. The correlation results for the factors used to represent the external environment drivers show that collaboration with other firms and research institutes as well as government support have a significant positive impact on both of product and process innovativeness in SMEs. All the correlations are significant at 0.05 level. These results support the finding of previous studies which have been conducted on both of developed and developing countries.

**Table 1 Results of Correlation**

\* measured on 1-3 scale \*\* measured on 1-5 scale 1 - p - Value

Variable	Mean (SD)	B	C	D	E	F	G	H	I	J
Business Age	8.72 (5.93)	-0.03 0.69	0.42 0.01	0.41 0.36	0.31 0.26	0.34 0.00	0.34 0.54	0.37 0.1	0.33 0.00	0.37 0.03
Education *	1.67 (0.68)		-0.17 0.39	0.13 0.06	0.11 0.12	0.41 0.62	0.08 0.37	0.14 0.00	0.23 0.02	0.27 0.76
Number of Employees	25.91 (10.18)			0.02 0.75	0.10 0.25	0.15 0.09	-0.23 0.46	-0.02 0.53	0.12 0.21	-0.17 0.51
Product Innovativeness**	3.65 (0.43)				0.53 0.00	0.16 0.04	0.13 0.00	0.08 0.03	0.17 0.01	0.12 0.04
Process Innovativeness**	3.95 (0.41)					0.15 0.04	0.17 0.02	0.12 0.00	0.29 0.00	0.41 0.00
Network**	2.41 (0.36)						0.20 0.03	0.34 0.00	0.15 0.04	0.48 0.00
Government Support**	2.35 (0.34)							0.42 0.08	0.01 0.87	0.45 0.36
Strategic Orientation**	3.06 (0.31)								0.23 0.00	0.37 0.00
Market Orientation**	3.68 (0.25)									0.09 0.06
Structural Flexibility**	3.80 (0.35)									

Concerning to the internal factors, correlation results in Table 1 show that strategic orientation has a positive impact on both of product innovativeness ( $r = 0.08$ ,  $p = 0.03$ ) and process innovativeness ( $r = 0.12$ ,  $p = 0.00$ ). The results also confirm that market orientation and structural flexibility are two other significant variables which have a significant positive impact on innovativeness in SMEs. In fact, market orientation is positively correlated with product innovativeness by  $r = 0.17$  and process innovativeness by  $r = 0.12$ . Both relationships are significant at 0.05 level. Similarly, structural flexibility has a positive and significant influence on product innovativeness ( $r = 0.12$ ,  $p = 0.04$ ) and process innovativeness ( $r = 0.41$ ,  $p = 0.00$ ).

In order to identify the obstacles for innovativeness in SMEs, six factors were used in the study. The descriptive statistics calculated on them reveal that factors such as high cost associated with innovation, lack of adequate sources for finance are highlighted as the key hampering factors for the firm innovativeness. Further, lack of support from the government as well as internal factors such as lack of qualified staff and lack of information about technology and market also significantly influence the SMEs in discouraging their innovativeness.

Hierarchical regression was performed to assess the moderating role of the obstacles on relationship between driving factors and innovativeness in SMEs. Firm internal characteristics which were found as the insignificant in driving firm innovativeness were omitted in the analysis. As can be seen in Table 2, the coefficients and corresponding p values appeared in step I confirm the correlation results which collaboration with other firms, government support, strategic orientation, market orientation and structural flexibility have significant impact on innovativeness in SMEs. After entering

the variable obstacles in to the model, results in step 2 imply that obstacles have direct negative impact on the innovativeness as well as it influences to reduce the strength of the coefficients for innovative drivers in second step when compared those of the first step. Moreover,  $R^2$  indicates that the second model has higher ability to predict firm innovativeness with obstacles than the first model which contains only the driving forces. Therefore, the obstacles identified in the study have a negative impact not only the firm innovativeness but it weakens the positive effect of drivers on innovativeness as well. After entering the interaction variable drivers and obstacles in to the model, results of step 3, improving  $R^2$  and deteriorating of F value, clearly show that the role of obstacles which lessen the firm innovativeness .

**Table 2 Results of Regression Analysis**

Variable	Step 1		Step 2		Step 3	
	Coeff.	p	Coeff.	p	Coeff.	p
Collaboration with other firms	0.41	0.02	0.31	0.04	1.23	0.41
Government support	0.53	0.01	0.25	0.00	1.35	0.12
Strategic orientation	0.58	0.00	0.33	0.02	1.44	0.08

$R^2$	0.32		0.36		0.42	
F (sig F)	14.5 (0.00)		9.97 (0.00)		8.23 (0.00)	

## 6 Discussion

Examining bi-variate relationships between internal factors as well as external factors and firm innovativeness show that the factors which do not significantly related to innovativeness are firm age, education back ground of owner mangers and firm size. Although some studies have shown that education of the owners and firm's size have a significant impact on firm innovativeness<sup>[3, 10]</sup>. this study shows no evidence to confirm those findings. In line with the findings from the literature<sup>[16]</sup> the results show that collaboration with other firms and organizations has a positive significant impact on product as well as process innovativeness of the firms. However, exiting link they maintain is not well developed and required to develop further for the promoting innovativeness among SMEs. Although existing level of government support is in too minimum when compared with other factors, it makes significant influence in promoting innovativeness of SMEs. Therefore, further government attention is required to pay at promoting innovativeness among SMEs by means of providing subsidies, guidance and other services. Among the internal factors that strategic orientation which reflects firm strategic capabilities, implementation changes over corporate strategy, has a positive impact on product and process innovativeness. These results confirm Salavou et al. (2004) findings which show that strategic choices of owner managers have a positive influence of innovativeness in SMEs<sup>[11]</sup>. A number of studies noted that the significance of market orientation for SMEs to gain competitive advantage in the market which characterized with high competition and global changes. The study results also support the above literature by showing a positive and significant impact of market orientation on firm innovativeness. The key advantages widely noted in the literature relating to innovativeness in SMEs are their internal flexibility and responsiveness to changing circumstances. As par with the literature, the results show that structural flexibility has a positive impact on firm innovativeness. Concern the obstacles, the study confirms the results of previous studies which show that innovation cost and financing and lack of information about technology and markets are key hampering factors in promoting innovativeness in SMEs<sup>[7, 18]</sup>.

## 7 Conclusion

This study attempts to explore innovativeness of SMEs in Sri Lanka. The findings suggest that innovativeness in SMEs is driven by strategic orientation, market orientation and flexible organizational structure as well as factors external to the firms such as collaboration with other firms and organizations and government role in promoting entrepreneurial environment. These results confirm the findings of previous studies which have been conducted in similar settings. However, unlikely developed economies<sup>[6]</sup> the findings show that the education level of owner managers and firm size have no

significant impact on firm innovativeness. Concern to the factors that hamper the innovativeness in SMEs, high innovation cost and inadequate sources for finance are found to be the key obstacles for the firms in way of enhancing their innovative capabilities. These factors are followed by lack of government support and lack of information about technology and market. Since organizational culture plays a significant role in promoting innovativeness, the task for managers is to design and create an organizational culture that stimulates firm competitiveness and innovativeness for ensuring a sustainable growth and development. On the other hand, the existing public policies should be reviewed and modified to create good and better entrepreneurial environment which stimulates the firm competitiveness and innovativeness. The necessary facilities and guidance should be provided to make sound network among the business firms and with research and training institutes. Finally, the empirical evidence of the study could be used nationwide by policy makers to design support programmes and initiatives for promoting innovativeness of SMEs in order to promote sustainable growth and development.

# Study on the Convergence of Three Southeast Coastal Provinces' Industrial Structure of China

Yang Feng, Si Danmin

Changchun University of Technology, Changchun, P.R. China, 130012

(E-mail: yangfeng1965@sina.com, sidanmin@163.com)

**Abstract:** According to three related components into Constant Market Share model, namely, market growth effect, composition effect and competitiveness effect, this essay will use a quantitative approach to analyze 30 types manufacturing industries in Zhejiang, Fujian and Guangdong provinces of China from 2003 to 2010, and then study the convergence of manufacturing industrial structure among three provinces. As the research shows, the convergence of manufacturing industrial structure is existed among three southeast coastal provinces of China. Just the convergence between Zhejiang Province and other provinces is not significant in China; even some manufacturing of Zhejiang Province of China might now begin to shift towards other provinces, while there is serious convergence of manufacturing industrial structure between Fujian Province and Guangdong Province of China.

**Key Words:** CMS Model; Industrial Structure; Convergence

## 1 Introduction

Industrial structure refers to the sum of some relations such as the composition of the various industries in regional economic, proportional distribution of the various industries, and the inner links among the various industries. It is such crucial as a key component of economic structure, that it has a very close relationship with economic growth. Convergence of industrial structure means that proportional relationship of the various industries and various departments within the industry in regional economics and the correlation between technology changes and technology diffusion among industries tend to be similar in the process of economic development. It probably causes a large number of repetitive constructions and waste of resource, which is not conducive to economic development. Consequently, there is some theoretical and practical significance through study on the convergence of industrial structure.

In recent years, many Chinese scholars have undertaken extensive researches on the convergence of industrial structure by different analytical methods, such as similarity coefficient of industrial structure, structure deviation degree and deviation factor of employment industries, conversion speed coefficient and direction coefficient of industrial structure, location quotient and so on (Guo Wen-bo, WAN Qing, 2011). Hong Shi-jian (2004) exercised an empirical analysis on the convergence of regional industrial structure in China through employing the indicators such as the Hauffman's coefficient, the similarity coefficient, and the locational quotient. Jiang Jinhe (2005) made an empirical analysis on industrial structure difference and local specialization of high-tech industry in east, middle, west regions and 11 provinces/municipalities in China based on the two indicators: industrial specialization index and industry entropy, and found that high-tech industrial isomorphism is imperfect, and industrial specialization is more obvious from 1995 to 2002. He Canfei, Liu Zuoli, Wang Liang (2008) found out that Chinese provinces were quite similar in their industrial structures by using the similarity coefficient of industrial structure, but industries contributing to the convergence of industrial structure among Chinese provinces differ in different time periods. In summary, there is a considerable controversy about how to identify the convergence of industrial structure among Chinese province in Chinese academia. However, the reason why these disputes exist is that Chinese researchers take different analysis methods.

The author chooses the model of Constant Market Share (CMS model) which was hardly used in the field of industrial structure, and establishes three variables of the model - market growth effect (M), structure deviation effect (N) and competitiveness effect (P) on the basis of previous literatures. And under the help of the model, we can identify whether there is the convergence of manufacturing industrial structure or not among three southeast coastal provinces of China, and finally put forward the corresponding proposals.

## 2 Data Source and Research Method

### 2.1 Research method-CMS model

Constant Market Share Model (CMS Model) was originally proposed by Tyszynski in 1951. Now it has become one of the important models of international competitiveness after being revised and improved repeatedly by Stern, Jepma and Milana. The author adopts the modified extension model in 1986. In general, we should consider the variables of an industry in a certain region as a dynamic process during a certain period, decompose the variation of total industrial output value of a manufacturing industry into three factors which are market growth effect(M), structure deviation effect(N) and competitiveness effect(P) with reference to its region or the country's economic development, analyze their impacts on regional industrial structure quantitatively, evaluate industrial sectors in this region which have relative competitive advantages, and then makes suggestions on the adjustment of the regional industrial structure(Guan Xi,2008).

$$G = M + N + P = \Delta C_i = r C_{ij0} + \sum_{j=1}^n (\gamma_j - r) C_{ij0} + \sum_{j=1}^n (C_{ijt} - C_{ij0} - r_j C_{ij0}) \quad (1)$$

In the equation,G is the total growth volume of all manufacturing industries' gross output value during the t time in i research area, namely  $\Delta C_i$ .  $C_{it}$  is the gross output value of all manufacturing industries in t time period in i research area,  $C_{jt}$  is the gross output value of j industry in t time period in i research area,  $\gamma_j$  is the ratio of the growth output value of j industry in t time period in three research areas,  $r$  is the ratio of the growth output value of all manufacturing industries in t time period in three research areas.

Expressed by  $rC_{ij0}$ , M refers to the regional market growth volume of output value of j industry in t time period in i research area. It indicates the growth volume of gross output value of j industry in t time period in i research area in accordance with the regional average ratio of the growth.

Expressed by  $\sum_{j=1}^n (\gamma_j - r)C_{ij0}$ , N refers to the regional structure deviation effect index, and is used to analyze the deviation of gross output value of the j industry in i research area from the same j industry in the whole region. The size of  $C_{ij0}$  can show the importance of different industries in i research area. The bigger  $C_{ij0}$  means that j industry plays a more significant role on manufacturing market of i area. And the comparison of  $\gamma_j$  and  $r$  reflects the characteristics of different manufacturing industries development in i area. The relative economic growth level  $\gamma_j$  is bigger than  $r$ , which indicates that the growth rate of j industry in i area is faster than that of the reference industry in reference area. Bigger the structure deviation index is, the greater impact j industry has on i area.

Expressed by  $\sum_{j=1}^n (C_{ijt} - C_{ij0} - \gamma_j C_{ij0})$ , P refers to the regional competitive index, and is used to analyze the relative competitiveness of the j industry in i research area. As known to this formula:  $C_{ijt} - C_{ij0} - \eta C_{ij0} = C_{ij0}(\eta_{fact} - \eta)$ ,  $\eta_{fact}$  is the actual ratio of the growth output value of j industry in t time period in three research areas, so competitiveness effect is actually the comparative result of  $\eta_{fact}$  and  $\eta$ , which can judge the relative competitiveness of the j industry in i research area. The greater variable indicates that this industry has the greater contribution to the output value increment of all manufacturing in i area.

Because market growth effect index does not involve the comparison of the parameters of the j industry in i research area, thus, the author focuses on the research of structure deviation effect and competitiveness effect during the research of the regional industrial structure. And structure deviation effect and competitiveness effect reflect the foundation and the speed of development separately. According to the calculation N and P, this author analyzes their combination, and then makes conclusions of table 1(Sun Hui, Ou Na,2011).

**Table 1 Industrial Classification**

N	P	Industry Classification	Characteristics
(0,+∞)	(0,+∞)	Competitive Industry	The basis is good, and the speed is fast.
(-∞,0)	(0,+∞)	Potential Industry	The basis is poor, but the speed is fast.
(0,+∞)	(-∞,0)	Weak Industry	The basis is poor, and the speed is slow.
(-∞,0)	(-∞,0)	Mature Industry	The basis is good, but the speed is slow.

**2.2 Data source**

According to the statistical yearbook of China, manufacturing is composed of 30 industries,

including non-staple food processing; food manufacturing; beverage manufacturing; tobacco processing; textile industry; garments, shoes and hats manufacturing; leather, furs, down and related products; timber processing, bamboo, cane palm fiber and straw products; furniture manufacturing; papermaking and paper products; printing and record medium reproduction; cultural, educational and sports goods; petroleum processing, cooking and nuclear fuel processing; raw chemical materials and chemical products; medical and Pharmaceutical Products; chemical fiber; rubber products; plastic products; nonmetal mineral products; smelting and pressing of ferrous metals; smelting and pressing of nonferrous metals; metal products; ordinary machinery; for special purpose equipment manufacturing; transportation equipment; electric equipment and machinery; telecommunications equipment, computer and other electronic equipment manufacturing; Instruments, meters, cultural and office machinery; handicraft article and other manufacturing industry; recovery of resource discarded and useless material. In order to make it easy to reference them, the 30 industries are marked as industry 1, industry 2... industry 30 correspondingly. Allowing for the availability of data into account, the author can have reference on Zhejiang, Fujian and Guangdong statistical yearbook of China from 2004 to 2011, select the data every 2 years as current observations to calculate and compare, and improve the feasibility of CMS model.

### 3 Results and Analysis

Based on the above formula, the industrial structure deviation effect index and competitiveness index are measured by the CMS model analyzing the industrial structure of Zhejiang Province, Fujian Province and Guangdong Province of China from 2003 to 2010, and then obtain their industry classification respectively, which are described in the following figure 1, 2, 3.

Figure 1 Industrial Classification of Manufacturing in Zhejiang Province of China

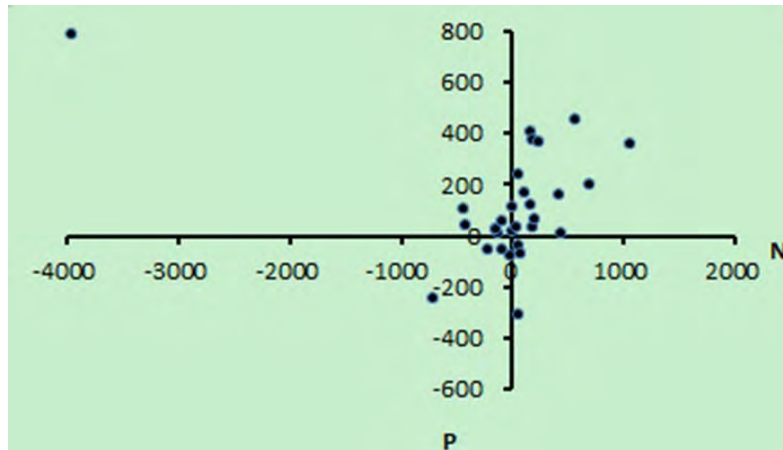

Figure 2 Industrial Classification of Manufacturing in Fujian Province of China

**Figure 3 Industrial Classification of Manufacturing in Guangdong Province of China**

Through the analysis of the calculation results, it can be seen firstly that industry 9 and industry 20 are the common competitive industries of Zhejiang Province and Guangdong Province of China, industry 1, industry 3 and industry 7 are their common mature industries, industry 2 and industry 8 are their common weak industry, but their potential industries are totally different. Thus it is clear that there is some convergence of manufacturing industrial structure in Zhejiang Province and Guangdong Province of China, but not significant. Secondly, there is no common mature industry in Zhejiang Province and Fujian Province of China, but the unique potential industry of Zhejiang Province of China is one of 9 potential industries of Fujian Province of China; industry 7, industry 11 and industry 27 are their common mature industries; industry 18, industry 24, industry 25, industry 26 and industry 29 are their common weak industries. Therefore, the manufacturing industrial structure convergence in Zhejiang Province and Fujian Province of China is significant. In the end, the competitive industry and potential industry of Fujian Province of China coincide with those of Guangdong Province of China highly. For example, 8 of 10 competitive industries of Fujian Province overlap those of Guangdong Province totally, and 6 of 9 potential industries of Fujian account for 3/4 of those of Guangdong Province. So there is serious industrial structure convergence between Fujian Province and Guangdong Province of China.

In the second place, there are 10 competitive industries and 9 potential industries in Fujian Province of China, and 15 competitive industries and 8 potential industries in Guangdong Province of China, which indicating that most of the manufacturing in Fujian Province and Guangdong Province of China has maintained this rapid development trend from 2003 to 2010. Comparing with the two provinces, it is obvious that the development of the manufacturing of Guangdong Province is more prominent, and the industrial structure is more perfect.

#### 4 Conclusions and Suggestions

In brief, the convergence of manufacturing industrial structure is existed among Zhejiang Province, Fujian Province and Guangdong Province of China, but Zhejiang Province has gradually lost its advantages in 30 manufacturing industries, which is catching up by Fujian Province and Guangdong Province. Compared to other provinces, there are just 3 competitive industries in Zhejiang Province of China, including Furniture Manufacturing, Raw Chemical Materials and Chemical Products and Smelting and Pressing of Ferrous Metals. Thereinto, only Raw Chemical Materials and Chemical Products is its unique competitiveness, only Instruments, Meters, Cultural and Office Machinery can be seen as its potential industries, the growth rate of 12 industries is slower than the average level of the same industry in the region, and the mature and potential industries of Zhejiang Province of China is gradually becoming the potential or competitive industries of other provinces of China. Consequently, industrial transfer is taking place from Zhejiang Province to Fujian Province, Guangdong Province in China. Besides, there is fierce competition between Guangdong Province and Fujian Province. The two provinces are seizing resources and markets in the race. If there is no limit to develop, vicious competition may occur, and is not conducive to economic development.

Therefore, the first suggestion to three provinces of China is to set up the regulation of market which integrates with the global market, unify market admittance and withdrawal mechanism, and

achieve the opening up; Secondly, the government should eliminate information blockade, emphasize information publication, strengthen information sharing, reduce social costs, improve the comprehensive competitiveness of the whole region; Finally, district government of China should take the capacity of the whole market and local actual factor endowment into consideration, strengthen coordination and division, achieve the overall regional welfare maximization, and avoid a new round of repeated investment and construction.

Because of the application range of CMS model that is rarely used in the field of industrial structure, and the limitations of the theoretical reserves of the author, as well as lack of corresponding material, there are some shortcomings on some issues although research design and guiding ideology are very clear. Therefore, deeper research and improvement is necessary in the future.

# Innovation, Integration and Improvement of Clothing Industry

Wang Qing

China Foundation for Youth Entrepreneurship and Employment, Beijing, P.R. China, 100051  
(E-mail: wangqing@sohu.net)

**Abstract:** With the international industry transfer and the development of domestic economy, the clothing industry, which experienced 30 years of rapid growth, has become an important part of people's livelihood and export industry. Like other traditional industries and some modern industries, clothing industry enjoys an unprecedented scale, but it is still in the old pattern of extensive operation, in terms of resource allocation, production mode, organization management and industry research. This thesis attempts to establish a new clothing industry concept in accordance with the consumption demand by breaking through the trade division within the product economy mode. Through the growth model analysis, it is pointed out that the development of clothing industry relies on product innovation and design innovation. Based on economic scale, the scope economy theory and management practice, the research method of segmentation and integration can be used to put forward strategy of industry development through the implementation of brand, and can also realize the professional integration of products and services for industry resources from both inside and outside. At last, this thesis gives some suggestions from aspects of manufacturer brand, retailer brands and designer brand management based on values, basic variable, target market definition brand categories.

**Key words:** Technology Innovation; Resources Integration; Industry transformation

## 1 Introduction

### 1.1 Clothing industry

Industry division of clothing industry, Shoes and hats industry and adorn articles industry resulting from long term plan economic environment not only impede the development of clothing branding, but also cause so much resource waste and overlapping investment, which is bad for the transverse and longitudinal integration of industry resource. The aim of consumption production is to meet the production and service need of customers. Clothing productions are including of clothing, hats and shoes, and clothing service includes of clothing aesthetic, pop and style collocation. Single product operation can't satisfy consumer demand, and it also against industry resources integration and the brand development.

Clothing consumption and clothing industry is an integration which provides all kinds of clothing products and service. Clothing service can be shown by brands, including of pop released, style collocation and a series of product, such as jewelry, handbags and cosmetics. The conception of industry improvement model, branding strategy and industry integration in thesis is based on the clothing production conception, which is different with the traditional production and industry conception.

### 1.2 Innovation device of industry growth

Industry improvement rests with price and amount. Amount depends on the market need, and price depends on value, so the industry study should be based on the need and value. We can see that the need is depends on product types and market capacity from the analyses of industry improvement model, so we should not only create new markets through the product innovation to develop new products, but also improve the product functional, reliability, convenience, difference and uniqueness to improve the value of the products. At last, we can get the conclusion that there is much market spacer for design innovation, product innovation can create the new market and industry growth depends on technology drive such as product innovation and design innovation.

### 1.3 Management device of industry growth

#### 1.3.1 Resource integration

There are scale economic and scope economic in clothing industry. Resource specialization and integration in clothing industry can help get scale economic benefit. Resource integration among different industries can help obtain the scope economy effect.

#### 1.3.2 Brand strategy

Brand is the system performance of the industry resources integration, industry in different departments can realize branding development through the resource integration. But since different department resource advantages and competitiveness is different, so choosing different market positioning and the development direction is the brand the foundation of success.

## 2 Industry Technology Innovation

### 2.1 Industry environment

There are many influence factors of outside environment in industry improvement. According to the analysis of clothing industry factors on PEST model, we can learn that the interaction between the pluralism and globalization is driving industry improvement from the design, production and marketing of the profound changes. The most important environment factors are economics, society culture, technology and politics.<sup>[1]</sup>

#### 2.1.1 Intensifying competition of domestic market

With the economic globalization, potential competitors in the domestic market (international brands in China, export enterprises turned to domestic) and alternative goods (imported ready-to-wear)

#### 2.1.2 Instability of international market

Financial crisis and economic recession has led to reduced consumer demands; processing industry has transferred to countries with lower labor costs; exchange rates and export policies are with much uncertainty; trade protectionism ( the employment pressure and trade deficit ) has arisen; cultures and lifestyles have been existing differences ( ideology and international influences ).

#### 2.1.3 Extensive operation of the industry

The long-term segmentation among branches and markets has caused the unshared resources. Export enterprises have entered the international industrial chain while domestic-focused enterprises have been marketing one's own products with vague boundary (big and complete, small and complete), primitive organization (family business), backward operation and management (experience-oriented), and unstable supply; repeated constructions; homogeneous goods in the market; and intensified price competition.

#### 2.1.4 Industry's on-going evolvement

For managers, the main challenge is how to identify what is real opportunity and what is fleeting apparition things in the industry evolution process. On the basis of fully understanding the evolution of specific industry, managers usually make the problem become easy to solve once they established strategies.<sup>[2]</sup> By the framework by Anita mecca of industry evolution research for grace, we can divided clothes industry development track into three phases, cottage industry and machinery industry.

### 2.2 Industry growth models

To begin with, a basic fact should be confirmed: industry growth is contributed by the quantity and price, and quantity is decided by demand, price and value, therefore, industry development research is focused on the two basic variables---demand and value. The point is, magnitude of value is the foundation of price, but supply and demand equilibrium or non-rational factors can also affect the price. In different stages of the industry's life cycle<sup>[1]</sup>, the rise and fall is influenced by the value, but not fully represents the ups and downs of the value. From further analysis, we can identify the driving variables of demand and value. In other words, the demand is produced by product types and the corresponding market space, while value is produced by the functionality, reliability, convenience, diversity and uniqueness of product.

**Table 1 Analysis Chart of Variables in Industry Growth**

Industry Growth	Value		Driving Forces	Market Changes	Environmental Factors	
Demand	Basic products (primary demand)	Function	Protection & aesthetics	Marketing Innovation (Radical mode)	New mode	Level of economy
		Reliability	Textile & Pattern			
		Convenience	Cleaning & storage			
	Trendy products (fashion demand)	Function	Protection & aesthetics	Design Innovation (Progressive mode)	New space	Popular culture & Aesthetic preferences
		Reliability	Textile & Pattern			
		Convenience	Cleaning & storage			
	Diversity	Fashion & style				

Personalized Products (self- realization)	Function	Protection & aesthetics	Product Innovation (Burst mode)	New market	Pursue of Value & Aesthetic preferences
	Reliability	Textile & Pattern			
	Convenience	Cleaning & storage			
	Uniqueness	Ego & Innovation			
Innovative Products (Potential needs)	Function	Protection & aesthetics	Product Innovation (Burst mode)	New market	Science and Technology Progress & Lifestyle
	Reliability	Textile & Pattern			
	...	...			

mainly driven by product innovation and design innovation. In addition, the growth of industry's key point should also be the changes and influence of business model brought by marketing innovation, although the change and influence do not create new growth markets<sup>1)</sup>, they will restructure competition pattern of industry, resulting in the change of competitive position of enterprises.

2.2.1 Product innovation

Product is the basic material supplied by the industry to the market, so we are unable to carry on the exchange without products, let alone industry. Product innovation is the potential consumption demand brought by the development of science and technology and the new lifestyles.

Science and Technology →New Materials & New Environment →Innovative Products(New Fabric and Functional Clothing)→Basic Products

Lifestyle →New Content & New Space →Innovative Products →Trendy Products →Basic Products →Trendy Products

Driving forces for product innovation are the progress of science, technology and lifestyle changes, because on one hand, the progress of science and technology will expand the people's production and scope of life, leading to the new needs of clothing, such as aerospace technology development hastened the birth of spacesuit; on the other hand, technical progress has brought new functional fabrics and new functional products, such as chemical defense suit, radiation proof clothes, and other functional clothing. The development of flame retardant fiber has produced new combat uniforms. And the lifestyle change has brought new life content and life space, and it will inevitably lead to product innovation and the rise of new markets; the rise of sports and leisure life has led to a series of product development of sports products and leisure products. Jeans from the United States is an epoch-making product innovation.

2.2.2 Design innovation

Figure 1 Product and Design Innovation

Design innovation is the improvement and upgrade of given products, so as to promote the progressive development of industry. Design innovation is to continuously meet the consumers' increasing demand. Although there are burst of innovative products like jeans, the long-term industrial development will be mainly focused on progressive innovation. With the help of Hierarchy Mode of Needs by Maslow, innovation gradient of clothing products can be arranged. (see figure 1)

**Functional innovation** mainly targets at products' reliability and convenience. After the rise a brand-new product, the reliability and convenience of use should be improved firstly. Clothing products mainly depend on the continuous improvement and technology of auxiliary fabrics' function, which needs the involvement of upstream supplier and technological breakthroughs, such as warmth, ventilation and cleaning technology.

**Service innovation** is based on social demand of consumers within the aesthetic preference and pop culture. It goes well with the trend of the time, in order to meet consumers' demand for the social attribution. The key to clothing product service innovation is the understanding and performance of cultural tradition and fashion trends.

**Distinctive innovation** is based on the consumers' personalized demand for self-realization and the purpose is to highlight the extraordinariness. After the function and reliability have become perfect, how to directly relate a product to special work of an individual consumer (couture)<sup>[3]</sup> will be a problem. Diversified demand for clothing has brought a broad space for personalized innovation of products and the development of couture industry.

### 2.2.3 Industry innovation growth

Given that demands come from products and market space, we should continuously create new products and then new demands. This is a design process from nothing to being, so called products innovation. At the same time, upgrade function, reliability, convenience, and diversity<sup>[3]</sup> of the existing products, in order to increase their value. This is different from creating new products, but to reform products innovatively, or, design innovation. To conclude, the industry growth is driven by products innovation and design innovation. In addition, the industry growth should also pay attention to the influence of business modes' changes caused by marketing innovation. Those changes do not create new growing markets directly<sup>[3]</sup> but they will lead to the integration of competition within the industry.

## 3 Resource Integration of Industry

The production and marketing of clothing contain scale economy and scope economy<sup>[4]</sup>. Implementation of resource specialization and integration within the industry, the cross-border integration of resources are conducive to giving play to the scale economics and scope economics effect.

### 3.1 Integration of scale

In the clothing industry, there are internal economy of scale and the external economy of scale, namely the factories and enterprises' scale economics and industrial scale economy<sup>[5]</sup>.

#### 3.1.1 Specialized Integration

Under the double pressure of financial crisis and the rising cost of labor, small and medium sized processing enterprises, especially the export enterprises have been in a difficult situation. Timely internal specialized integration is beneficial to the optimization of the industrial structure and reducing the idle resources. Specialized integration, for one thing, strengthens technology and divides labor through merger and reorganization among similar companies or enterprises, so as to improve labor productivity, to reduce energy consumption, to reduce production costs, thereby enhancing the internal scale economics effect; for another, specialized integration leads the development of industrial aggregation, accelerates technological innovation, improves management, enhances infrastructure and professional services, so as to promote the scale economics effect. At the same time, two questions need to be considered: first one is the restriction from production factors and market environment; the second is the risk brought by industrial decline and transfer.

#### 3.1.2 Overall Integration

With 30 years' reform and opening up, the export processing enterprises, which have been fully integrated into international industrial chain, possess higher level of quality control and cost management. However, domestic-focused enterprises are still operated in the "Sell what you make" mode with backward extensive production operation and management. The long-term segmentation among branches and home & abroad markets have led to the difficulties to share resources. Breaking departmental boundaries, setting up brand-driven enterprises and a new industrial chain combining export and domestic markets will not only give full play to the production advantages of export

enterprises, but also conduce to the promotion and development of local brands' competitiveness.

### 3.2 Integration of scope

Clothing products and services have a variety of types. Consequently, costs in such fields as human resources, marketing channels, advertising, sales promotion and others will surely occur, which lays the foundation for the economies of scope.

#### 3.2.1 Integration of products

According to different levels of consumption, the clothing goods can be divided into basic products, matching products and additional products. Clothing is the leading products with shoes, bags as matching products and jewelry, watches, cosmetics and others as additional products. These products have a very strong complement for their similar market positioning, style and consumer groups. Complementary products can produce significant economies of scope in the design, R&D, marketing channels and brand promotion. Many internationally well-known fashion brands are trying to produce their own bags, leather goods, cosmetics and other products lines, such as Dior (C.D) from France and Armani from Italy.

#### 3.2.2 Integration of service

Service industry is becoming the core of industrial value chain. In order to obtain more abundant and economic resource, cross-over design is also gaining more and more attention of fashion industry. Different categories of art provide the foundation for economy of scope. Aesthetic accomplishment, expression techniques, creative inspiration of artists and designers are highly communicative and interconnected. Cross-over design possesses not only the common aesthetic basis but also the economic performance of learning from each other among different art categories. Cross-over marketing is also based on the resource integration of scope economy, but actually, this kind of marketing combination has appeared for a long time, such as sales of souvenir in museums and sales of sporting goods in golf clubs.

### 3.3 Branding strategy

With the continuous improvement of technology, the reliability of production has become a , and fashion and creativity are replacing physical index, becoming the focus of competition. The purpose of enterprises is changing from "what change can we make" to "what can be thought out" and "how to make cognition be easy to understand". In other words, the dominance of the market is shifting from production to design innovation and marketing services.

#### 3.3.1 Brand positioning

Branding is a systematical demonstration of industry's resource integration, and different departments in the industry can realize brand development through integration. But with resource advantages and competitiveness of different branches, the choice of different market positioning and development directions certainly is the foundation for a successful brand.

**Values:** Every enterprise has its own value inter zone, and no brand can cover all the aspects. Because both enterprise resources and social resources are limited, the enterprise must allocate weights on the resources in accordance with their own values. Consumers' preferences and needs vary from each other, therefore, the salient features instead of all aspects of brands should be highlighted, and the simplistic pursuit of perfection will cause high cost and consumers' over satisfaction. Therefore, for no matter the manufacturers, the retailers or designer brands, the key to outstand in competition is the correct selection of target consumer group, maintaining the match between resource ability and consumers' demand, and in one word: serving target customers who share the same values with the brand.

**Basic Variables:** All the consumers have motivation and desire for basic needs, trendy needs and self-realization, but preference and consumption capacity are different. The choice of target market has a lot of detailed variables, and each brand have their own unique choosing dimension. The more specific market classification is, the more important details are, which has been incisively discussed in many marketing theories. People still select the basic variables from the perspective of industry. Compared with the psychological variables and behavior variables of social context, geographic and demographic variables in natural context are more stable<sup>[6]</sup>; gender and age of consumers are among the basic variables. Gender, obviously, does not need to be divided by standards; but age has different interval division, which is directly related to psychological variables and behavioral variables.

**Target Market:** Suppose that the age is taken as a basic variable in branding research, and then age will be divided into different intervals. We do not delimit the consumers' age into specific numbers, because in marketing, consumers' age cannot be verified, but only be divided into children, adolescents, young and senior, according to their experience. Children are not an independent consumer group, so the

focus will be fixed on teenager group, young and middle aged groups and group of seniors.

Teenager group, which has a strong sense of rebellion and strong curiosity and keen perception of fashion, is an avant-garde and offbeat group. They walk in the forefront of fashion, but without sufficient financial capacity to pay, they just create something new and original in order to be different, but do not ask for perfection. Teenager group is fan of products with personality, and the guide of fashion.

Young and middle aged group, which has a strong sense of social belonging and self-consciousness, is a popular mainstream of fashion. They stepped into the society and gradually move toward success with the pursuit of social identity and different lifestyles. They have the financial ability, so they are called the leaders of fashion and suitors of individuality.

With high social status and personal achievements, the senior group has abundant financial capacity, but their perception of fashion is decreasing, their only concern is the pursuit of quality and personalized service. Having a strong sense of nostalgia, the senior group enjoys a stable life and tends to comfort, convenience and economy.

### 3.3.2 Brand management

Next we will take a look at different types of brand resources and abilities, so as to find out matching target markets and business strategies.

**Manufacturer Brand:** With production technology and processing capability, competitive advantage is reflected in product quality and cost control. Manufacturer brand should adhere to "quality first" principle, focusing on the development of consuming market of the senior group. Enterprises should enlarge the development of basic products and personalized technical services, delay the delivery time and frequency of popular products, and reduce the proportion of personalized products. The design of manufacturer brand should pursue the classic and low-key style with product's positioning at the high-end markets; the marketing of manufacturer brand should be based on traditional marketing channels, and establish individualized technical service system; in the production aspect, the cost and quality advantages should be adhered to. In addition, manufacturers brand can also take good advantage of the processing capacity and scale, with a view to initiating a marketing revolution, in which stores selling popular products are open to teenager consumer group.

**Retailer Brand:** With the channel resources and marketing technologies, competitiveness is reflected in the scale and marketing share. Retailer brand generally can be categorized into two kinds: one is department store chains cooperating with the designers to bring about advanced brands, serving the high-end groups of the young and middle-aged; the other is large supermarket chains cooperating with manufacturers to produce general brands, serving the senior group and basic demands.

**Designer Brand:** With the creativity and innovation of design, competitiveness is reflected in trends and uniqueness. Designer brand should highlight characteristics of style, focusing on the development of adolescents' personality or personalized consumer markets. Adolescents' personalized consumer markets should be designed to be bold, bright, without rigidly adherence to one pattern, at the same time it should reduce production costs and sale prices, generally by channels of boutiques or sale mode of storage-type. In the young and middle-aged markets, popular products should be designed as creative as possible, and design of personalized products should be unique and with good quality, generally by using the store chains and customized services. Designer brand also should develop complementary products which are closely related to clothing consumption, so as to give full play to the synergistic effects of the design and marketing in scope economy.

**Couture Service:** With the development of economy and the improvement of living standard, people pay more and more attention to personality and quality. From the real life to literary and artistic works, and as a result, custom demand of clothing products is increasingly growing. Custom demand is mainly from three aspects: one is that body types differ in thousands of ways, sizes cannot completely correspond to individual differences; second is the personalized custom demand of the successful people and special populations who intend to realize self-value, such as formal dresses of movie stars and people from upper circles of business and politics; three is the custom demand of characters in musical and literary works, such as the character shape in opera "Turandot".

Couture service is a kind of high-grade consumption service of clothing products, and it needs the highly interaction between designers and consumers, as well as the integration of marketing, design, and production. Couture brands cannot reuse the traditional handicraft industry pattern. It must use the latest technology and advanced mode of production, as well as explore the new way of industrialization by using computer and Internet technology.

# A Study on the Service Innovation of Regional Telecommunication Operation Enterprises

Chen Wei

Management College, Huazhong University of Science and Technology, Wuhan, P.R.China, 430074

(E-mail: chenweihust123@sohu.com)

**Abstract:** With the development of telecom market, the center of the service innovation competition is the customer relationship management, which will also be the main one in China. Firstly, the thesis analyzes the definition and the necessity of the telecom service innovation. Secondly, the thesis listed some possible means of service innovation as the market develops, and divided the contents of the telecom service innovation into three layers, namely the core services layer, the form services layer and the extension services layer. Finally the thesis gives out the corresponding measures the telecom service innovation needs to take.

**Key words:** Telecom corporations; Competition; Market; Service innovation

## 1 Introduction

After the original China telecom's separation in May 2002, new China telecom and China Netcom were founded officially, and then China's telecom market has formed a coexist and comprehensive competitive situation among six comprehensive telecommunication operation enterprises, which are China telecom, China mobile, China Netcom, China Unicom, China satellite communications and China tie tong. The competition of the fixed telephone, mobile telephone, data services and other business areas can not only be found in the major telecom operators, but also can be found in various regions of the peers. The competition also exists in ways such as language sound and data intends to earn both new and old customers' preemption for the second service income. Since China's telecom market is still an emerging market, the price war is undoubtedly the most direct and effective means of competition using by the operators. The frequent mutual reduction expands both the telecom market and the number of customers. But it gradually makes the telecommunication operators becoming more and more passive in the competitive market. In order to survival and seek the development of enterprises, the telecommunication operation enterprises are in great need of innovative competition means. At the same time, with the continuous development and improvement of the telecommunications market, companies need to shift from pure price competition into customer-centric service competition. Since the 1980s technological innovation, which based on the service innovation, definitely provided a new choice for telecom operators. And it will also bring China's telecom competition to a new stage of development.

## 2 Telecom Service Innovation and Its Necessity

Telecom service innovation is the application of technology innovation in the telecommunication operation enterprises. Telecom service innovation is the telecommunication operation enterprises, which depend on the demand of social communication, using external technology conditions, rearrange and reorganize the enterprises resources (including funds, equipment and personnel), readjust the telecommunication service form and introduce new function telecommunication services and service realization, or improve original telecommunication service efficiency, to enhance the operation efficiency and economic benefit of the communication enterprises. It embodies in the increasing of services types, the strengthen of service function, the improving of service quality and communication network operation efficiency, the reduction of service cost and prices, the expanding of the original market share, the development of new markets, etc. The aim of the service innovation is improving social benefits for telecommunications companies, while seeking greater economic benefits so that they can take the initiatives in the fierce competition. Telecom service innovation generally includes three aspects: the innovation of the new function telecom, the innovation based on the same function of differentiation and the innovation of efficiency improvement and lower prices.

With the regulation of telecommunications market, the numbers of the enterprises involved in the Chinese telecommunication market will increase greatly. The continuously development and improvement of the telecommunications, making China's telecom market become a competitive buyer's market among several of telecom operating companies. Market economy is competitive, and the deeper level of the competition is the competition of the competitor's service cost and service innovation. Pure

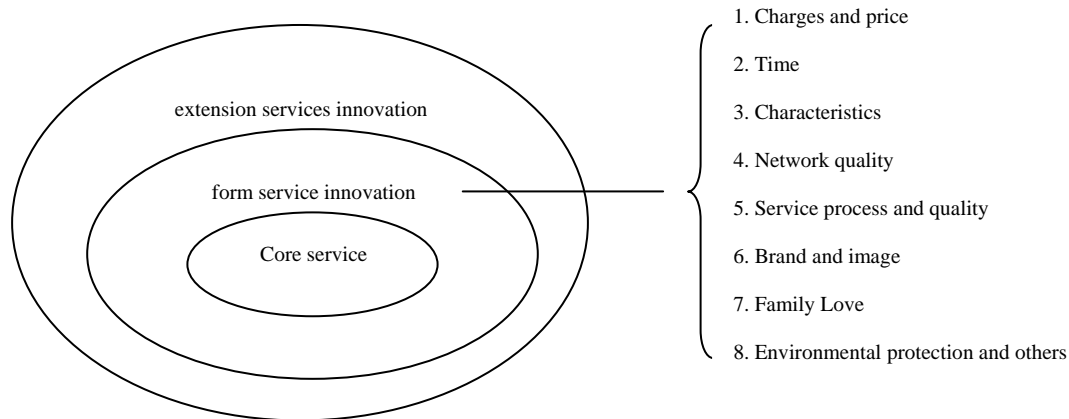

service price competition will be given priority to service innovation competition. The reason is that the price war mainly reflects two aspects. On the one hand, it is telecom enterprises' requirements of rise stage. In order to maximize profit, each operation manufacturer had to do everything possible to reduce costs and make their prices to be the lowest one in order to reap excessive profits. When many manufacturers successively upgrading technology, improving management and working to reduce cost, the old market price will correspondingly reduced, and the original excess profit that manufacturers have will no longer exists. But the companies which are the first to innovate technology and individual management, can make the product price lower than individual new social price, and can still sell them according to the society price so as to achieve the excess profit between social prices and individual prices and become the new excess profit winner. On the other hand, the price war is a short-term behavior that manufacturers take to reduce the backlog of products and upgrade products which is not likely to last long. When the manufacturers' product quality and price level are relatively stable, it will certainly enter a deeper, higher level of competition, and improving the service innovation. Competition is one of the most outstanding requirements. Therefore, it is an inevitable trend that the competition will shift from price competition to service competition for manufacturers' further development. According to the information provided by China Telecom, the first quarter of 2004, both the fixed telephone service traffic and the revenue growth emerged negatively. This is the main business's first negative growth in the history of China's telecom operators. Because of the application of innovation of Personal Access System, the net fixed income does not appear to be net negative. The fact is that offering the same service for a long time, rather than service innovation, will be out of the market. In the future, service innovation based on technical innovation will be the key to all parties' game. So the telecommunication operation enterprises need to attach great importance to service innovation, integrating consciousness and practical into telecom industry value chain.

### **3 Contents and Ways of Telecom Service Innovation**

The development of the telecom market and the increasing competitive pressure of it require the telecommunication operation enterprises to become a comprehensive information service provider. Due to the inseparability in the process of customer's consumption and manufacturers' production, and in accordance with the process and the different intensity of customer contact, the formation process of communication services can be divided into two levels, which contain six process, and they are network service layer (including the network planning design, network construction and installation, network management) and service delivery layer (marketing and business processing, pricing and charging, the customer service). Every innovation in telecommunications services represents the formation process's change in communications services.

China's telecom service innovation is generally based on technology-driven. Taken the coming buyer's market and consumer age into account, in order to enhance the customer consumption (customer number) and win the second consumption (customer communication cost) of the race, telecommunications companies need to shifting innovative ways from technology-based services to market-driven based services. Market driven service innovation, which is based on the demand of the market and production, will focus on market changes and customer needs in order to guide and create a telecommunications consumer trend. Market driven service innovation means taking the customer as the center, and discussing the process of service from different angles, and then improving the economic benefit of enterprises through the change of the enterprises internal resource allocation methods.

An important characteristic of the telecommunications service is the customer's deep participation. In the view of the customers, the services providing by the companies can be divided into three levels: core service layer, form service layer and the extension services layer. Correspondingly, the telecommunications service innovation can be divided into three areas (as shown in figure 1 below).

**Figure 1 Service Innovation Level**

**3.1 Innovation of core services layer**

Core services is benefit that consumers get by using services, namely the information (including voice, data, video and multi-media, graphic, taste, smell and touch and so on many kinds of) transfer. This kind of information which is passed both includes single information, a variety of comprehensive information. From the beginning of the voice to the graphic, then the multimedia will be able to transfer the sense of smell, etc. These are all new communication methods, and relatively speaking, they are also large service innovation. These new modes of services are out of the customers’ needs and technology requirements of the development itself, but the direction of innovation in the telecommunications business services also plays an important role in it. The emergence of new communication method will have a huge impact on the development of the telecommunications industry, so the telecommunication operation of enterprises should maintain a high degree of attention to core services level of innovation.

**3.2 Innovation of form services layer**

Although innovation of core services level has great influence, the innovation of form service layer is what the telecommunication operation enterprises face more often. Form service level is the consideration of consumers' purchasing, using and stopping the service. Combined with the telecom market now, main factors of innovation of form service layer can be divided into eight categories. Correspondingly as follows:

**3.2.1 Charges and price**

Price innovation includes the innovation of the use of price service, a combination of price and payment rates and other aspects. Because consumers' sensitivity of the problem related to price and charges, the innovation will undoubtedly be the focus of service innovation. In order to maximize customers' acquisition, network operating enterprises adopt zero price or free gifts and other benefits network. According to different consumer segmentation of dynamic zone, it divides different packages, IP telephone, flat-rate consumption, one-way charge, fill the lottery, mobile payment, scoring returns and 800 telephone calls and so on.

**3.2.2 Time**

Time innovation includes the time spent on providing services and customer uses and something relates to it. The innovation mainly includes real-time, urgency, the extension of time, billing in details, such as long distance of charging from the former to minutes instead of charging to six seconds billing, instant inquires the words fee, etc.

**3.2.3 Characteristics**

Characteristics innovation of service includes the innovation of service directional and interactive (one-way, two-way alternate, etc), features (a change, standardization, diversity) terminal mobile and so on. This is also the focus of future service innovation, such as Personal Access System comparing to a fixed telephone, mobile phone comparing to pagers, two-way charges, “do not disturb”, three-way calling, conferencing, etc.

**3.2.4 Network quality**

Quality innovation is mainly the innovation of network technology quality. Network technology quality includes the application of new technology, the existing network quality improvement, the

expansion of coverage, the use of regional customers narrowing and positioning, etc, such as ADSL's application, local tong, and so on.

### 3.2.5 Service process and quality

Service process and quality innovation is the innovation of a way to provide services to customers, customer relations contact mode, the process of providing telecommunications services, service establishments, and a reasonable set to change, contact the customer's personnel changes and other aspects. And it also includes the innovation of buying more services, using services, stopping services, transfer services and so on. In the process of the formation of the service, customers have a high degree of participation, and therefore offer good services to customers have a great impact. Promoting standardization and personalized, diversification, differentiation and convenient service, and taking the customer as the center of customer relationship management, these are all the focus of competition of the telecommunication operation enterprises now. And they are both the key and challenging factors to service innovation, such as services throughout a clear, call center of 10000 setting up, telephone marketing, mobile business hall, customer care, a pleasant surprise, the numbers presented in the telecommunications Act to carry, etc.

### 3.2.6 Brand and image

Brand and image innovation include the creation of a new brand, improvement and extension of existing brand, corporate image and changes in affinity. Brand is very significant to clients. The first thing the customer would think of when they buy services is the service brand of telecommunication, so the actions that the telecom operators take to offer their services and branding on their own will promote their own competitive advantage. Therefore, operating companies should consciously develop their own brand reputation, satisfaction and loyalty, such as China mobile's GSM, Shenzhouxing and China Unicom's campus Xinrui are performing well.

### 3.2.7 Family love

Due to our country's telecom market development and its unique social customs and habits, providing services while taking family love, friendship love and mood into account will have a good effect. There is Shenzhouxing family number, MMS, colorful bell in this area.

## 3.3 Environmental protection and others

Although telecom service is invisible, it all depends on the physical hardware carrier, so the local hardware innovation can be conducted. As environmental protection, aesthetics will also be a new luminescent spot after service innovation, like radiation of mobile phones and Personal access System, green consumption, 201 card collection function, etc.

## 3.4 Innovation of extension services layer

Innovation of extension services layer in telecommunications includes telecommunication industry's internal cooperation and television broadcast, finance, education and other industry fusion and cooperation. This is good to the telecom industry's long-term development and the telecommunication operation enterprises itself business, and it also adapts to the requirements of the future development's change trend of the telecommunication service operation.

Along with the development of the telecommunications industry and the formation of new industry value chain of telecommunications which is "equipment suppliers-basic network operator-content collector and producers-business providers-the customer", it requires telecom companies to change the past service business model from the traditional enclosed operation mode to the gradually open one, setting up the new management idea, and gradually establishing service mode of cooperation with other operators, value-added services, other comprehensive industry which adapts to market, like cooperation operation mode, the joint operation mode, the virtual operation mode, the joint operation mode, etc.

## 4 Measures Telecom Service Innovation Needs to Take

Since our country's telecom market is still in the primary stage of development, most the demand of customers are mainly basic voice telecommunications services and the demand for data business value-added telecom service is still in its infancy, so compared to the foreign telecom companies, China's telecom market has a lot of capacity. In this phase, the telecom enterprises service innovation must meet the requirements of customer partly, which means winning a greater market share while fostering the development of service innovation by new customers. Telecom companies should treat service innovation as a system and long-term work, but at this stage, more attention should be paid to the following respects.

### 4.1 Select the appropriate business service innovation strategy

Before the late 1990s, due to the monopoly of the telecommunications market, China's telecom enterprise mainly adopts the imitation innovation strategy. At present, with the international network of communications, our country already has a relatively strong infrastructure, and the demand of customer is shifting from monotony to multiplication, besides, China's telecom companies also have a comprehensive development ability, so the operation enterprises should choose different service innovation strategy according to their conditions and ability. Because of the constraints of the size of the network resources and customers' habitual consumption and brand recognition, instead of selecting the innovation strategy used by the leading telecommunications companies, some new enterprises like China Unicom and China tie tong should take advantage of the independent innovation strategy and the market segmentation, so as to strengthen itself. Competitive enterprises like China telecom and China mobile should prompt some following strategies like imitate innovation, joint innovation which based on market development, seeking to reduce the risk of innovation.

#### **4.2 Change the telecom enterprises leadership and the staff's service innovation concept**

The formation of telecom market competition pattern promotes the telecommunications business leaders and employees recognizing the importance of market competition and its urgency. But at this stage the competition of telecom enterprises focus on some primary respects like price competition. And with the development and perfection of telecommunications market, it needs the new ideas and means. Enterprises as the main body of innovation, its leadership needs to develop innovative tendencies and adventure spirit, in the mean time, employees have to develop the innovative ideas to meet the market demand.

#### **4.3 Train organization innovation in service innovation and enterprises culture**

The lack of service innovation, tissue culture and the corresponding enterprises culture give rise to the lack of enterprises innovation spirit and innovation tendency. At present, organization innovation of China telecom operating companies is mainly designed by the enterprises internal innovation group, and service innovation is still developed by technology research center. Only a small number of innovative enterprises set up a special department to lead the organization and business innovation. Therefore, enterprises should be adjusted according to their actual organizational structure of enterprises.

To make the enterprises innovation organization function effectively, it still needs to blend the innovation into enterprises culture, so that innovation can be integrated into every enterprises employee. Therefore the enterprises should develop employees' master consciousness, focus on the value of the individual, pay attention to the training staff's lifelong learning atmosphere, and the open environment. This will not only develop their creativity and enthusiasm, but also will improve the overall level of knowledge and competitiveness.

#### **4.4 Pay attention to service innovation and resource allocation**

Resources that service innovation needed are capital and the introduction of talent (especially the creative talents), construction of communication networks, and promotion of network marketing and expansion of customer resources. Talent and capital, which are the most important resources for innovation in telecommunications services, lay a good foundation to the telecom service. The later three resources are good to the promotion of service innovation.

#### **4.5 Abide by the service innovation process of standardization**

Telecommunications service innovation process includes market scanning and opportunity analysis, evaluation, selection of the feasibility analysis, service design, testing and commercial development, commercial promotion, service innovation and a summary of feedback. This is a loop and feedback models. Since various enterprises' service innovation items cross mutually, therefore it is also a crossover model. Because the innovation of input and costs is the primary innovation, so the promotion of service innovation should comply with the service standardization, so as to reduce the risk of service innovation.

## **5 Conclusion**

With the continuous improvement of the China's telecommunications market, the business competition becomes more fierce and complex, and the enterprises must get rid of today's price competition and shifting into the high-level competition namely the service innovation competition. Although telecom enterprises service innovation is still at the primary stage, as long as the telecommunication enterprises are good at finding their service innovation, it will be able to compete in a dominant position and obtain the expected benefits.

# Technology Learning of Integration Innovation Through Informal Relationships: The Case of Machine Tool Industry in China

Wang Shiming

School of Business Administration, Liaoning Technical University, Huludao, P.R.China, 125105  
(E-mail: shmingwang@gmail.com)

**Abstract:** Some existing studies of successful development of equipment industry emphasize the need to focus on formal channels of technology acquisition to allow latecomers to catch up. However, this reasoning neglects the fact that in some industries, including traditional equipment industry sectors, much knowledge can be acquired by informal means. Through the study of machine tool industry in China, this paper shows the significance of informal learning activities in the development of traditional industries and the possibility for latecomer firms to climb the technological ladder through exploiting various informal knowledge relationships.

**Key words:** Technological learning; Integration innovation; Machine tool; Equipment industry

## 1 Introduction

The findings from the successful experience of high-tech industries in China have not only seemed to dominate our understanding of the recent development of developing countries, but have also led to the emergence of policy suggestions that emphasize an alleged need to focus on formal means of technology acquisition to drive the technological upgrading of industry in China. However, many scholars have argued that generalizing from such high-tech centered theoretical models and policies has serious limitations. In addition, it is a manufacturing-driven, high-throughput industry where labor costs play a crucial part in competitive advantages. Therefore, that experience might not apply to industry with different characteristics. The dominant science-based policy discourse has also been criticized for neglecting the significance of other dimensions of learning that are taking place in some traditional industries in which technology building may be based largely on apprenticeship, learning by doing, work routines, informal networks, employee training and experiential knowledge<sup>[1]</sup>. etc.

According to that, this paper argues that the existing high-tech industry-centered development models emphasizing formal learning channels should not be generalized to all other industrial sectors in developing countries. For one thing, these models are insufficient to account for the catching-up of traditional equipment industry in some developing countries that do not share the characteristics of the high-tech industries. Furthermore, as opposed to the predominant view that stresses that the industrialization of the developing countries has been stimulated by formal learning mechanisms, I argue that the technological advance of a latecomer equipment industry may actually be nurtured by informal learning mechanisms established and exploited by firms.

By using the case of China's machine tool(MT) industry, this paper deals with issues related to the technological capability building and learning of equipment industry. Although the MT industry has not been studied in the same depth as the electronics industry in recent years, China was the first largest MT producer as indicated table 1 and sixth largest MT exporter in 2010 in the world. Based on the in-depth interviews with technology researchers in MT firms conducted in 2010 and 2011, I empirically investigate the strategies and resources used by Chinese MT firms to build their technological capabilities. On this basis, the article enhances our understanding of the factors contributing to, and the underlying mechanisms and institutional environment behind.

## 2 Special Features of Innovation and Learning in the MT Industry

### 2.1 Innovations in the machinery industry

Innovation differs considerably across sectors. In the so-called knowledge-intensive industries like IT or biotechnology, knowledge inputs are often derived from reviews of existing research, and knowledge generation is often radical in nature and based on the application of widely shared and understood scientific principles and methods through formal R&D activities. Innovations in the machinery industry, however, are often based on the application or novel integration of obtainable knowledge with low levels of R&D<sup>[2]</sup>. They are largely incremental and often arise from the machinery firms persistent efforts to satisfy requests from users.

The most recent and widely recognized technological innovation in the machinery industry is

perhaps the wide adoption of computer numerically controlled (CNC) technology since the 1970s<sup>[3]</sup>, which made machinery more flexible and easier to use through the utilization of programming devices. In the MT industry, the radical technological breakthrough in electronic innovations, however, did not bring about radical changes in industrial structure. Instead, MT firms adapted well to the new technology by using external suppliers for control systems and for the technical assistance needed to incorporate micro-electronic components into their machines.

**Table 1 Machine-tool Production in Millions of U.S. Dollars**

No.	Country	-- Production --		
		2010		
		\$-Millions	% Cut	% Form
1	China, Peoples Rep	19,980.0	73%	27%
2	Japan	11,841.7	89%	11%
3	Germany	9,749.9	70%	30%
4	Italy	5,166.4	53%	47%
5	Korea, Rep. of	4,498.0	69%	31%
6	Taiwan	3,803.3	77%	23%
7	Switzerland	2,185.4	84%	16%
8	United States	2,026.2	72%	28%
9	Austria	908.9	64%	36%
10	Spain	812.0	66%	34%

Source: Gardner Publications, Inc.

With the emergence of CNC technology, the application of electronics has become a critical aspect in the development of advanced machine tools. But the core competencies of MT firms still rest firmly in the mechanical field, as the design principles and technologies embodied in the most advanced machinery still remain largely mechanical. Although the improvement of knowledge in electronics demands more R&D-based learning, the accumulation of mechanical competences that tend to be more art-based still need to be acquired through on-the-job practices in the forms of learning by doing<sup>[4]</sup>.

### 2.2 Learning by imitation

In addition to learning by doing and using, imitation is a widely used way of learning in the MT industry. In fact, even Japan's MT industry began by copying foreign machine tools and gradually absorbed advanced technology as well as developing its capabilities to introduce product innovation based on imported models<sup>[5]</sup>. Imitation is often regarded as the demonstration of a lack of creativity and talent, as well as not being innovative. Japan's success, however, has made people re-evaluate the meaning of imitation in industrial development. Not only is imitation often the first step towards learning to become innovative<sup>[6]</sup>, but firms endeavoring to imitate also require capacities similar to those needed for new product innovation. This capacity calls not only for engineering skills to take an imported machine and produce a simplified and cheaper version of it, but also for a reasonable level of design capability to introduce quality improvements without raising the price.

In the case of China, the original source of design for most MT firms has also come mainly from imitating foreign products through reverse-engineering, in which MT firms scrutinize and analyze all of the technical details and specifications of the target products, such as structures, layouts, parts, components, and materials. Through their involvement in analysis and reproduction, MT firms were gradually able to accumulate technical competence and experience in manufacturing. Later, they tried to make incremental changes to the imitated product, such as incorporating new functions or using different parts or materials, to adapt to local manufacturing conditions or to meet customer requirements. To remodel the machines successfully, they not only had to reconfigure the mechanical elements, but also needed to devise ways to tackle problems resulting from the design changes. In the process of constant redesigning and problem-identifying and solving, the indigenous technological capabilities of Chinese MT firms have been further strengthened.

### 2.3 The role of experienced engineers

Manufacturing experience may have little to do with quality improvement in some industries like IT, but it is a critical source of learning and competence in the machinery sector. Much mechanical technology remains tacit or non-codified in a written form. It is largely developed and cultivated through shop-floor and practical experiences, and embodied mostly in the engineers directly involved in the everyday manufacturing activities.

Experienced engineers play a critical role in enhancing the innovative performance of MT firms. As mentioned earlier, innovation in machine tools, especially in the mechanical portion, relies heavily on recombination and incremental changes. In this context, given their higher absorptive capacity, experienced engineers are likely to be able to handle such tasks faster and more efficiently than inexperienced ones. With prior experience and accumulated knowledge, they are more effective in assimilating the technologies and screening design ideas or components applicable to the new projects from the existing knowledge pool, as well as more skillful in identifying and solving emerging problems, greatly helping their firms to reduce the amount of trial-and-error in developing new machines. Their experience and skills are also of critical importance to MT firms imitation projects.

### **3 Technology Learning through Informal Vertical Relationships**

#### **3.1 Cooperating with the users**

In the development of the MT industry, scholars especially emphasize the important role of technologically sophisticated indigenous users, such as the automotive and automation industries. With the assistance of these advanced users who possess significant problem-solving capabilities in the user-producer interaction process<sup>[7]</sup>, MT builders improve their technological competence. Therefore, it is easy to observe that countries such as Germany, Japan, which currently lead in the global MT industry, also have strong domestic automotive industries or automation sectors, not to mention that these industries are often the largest buyers of machine tools. Yet in the case of China, since domestic automobile companies use mainly imported equipment and most MT firms domestic clients are small machinery workshops with weak technical competence, some MT firms do not seem to expect much in the way of advanced technology inflows through these channels.

##### **3.1.1 The users as innovation stimulators and machine testers**

The role of these relatively technologically backward domestic users, however, should not be neglected the upgrading of MT industry in China. To accommodate the requirements of their indigenous users, Chinese MT makers are spurred to devise ways of improving the functionality of their machines while managing to keep them in an affordable price range for their local clients, who are mostly small machinery workshops with limited capital. For this reason, the current strength of Chinese MT firms in the global market, especially in the segments of low-to-medium-end and multipurpose machine tools, is considered to be largely stimulated by their indigenous users.

When developing new machines, Chinese MT firms also rely on their trusted users to assist them in machine testing. The workers of their user firms would be more experienced in operating machine tools than the MT firms own engineers and therefore could more effectively detect the flaws of new machines. At the same time, in these local users' metalworking shops, the functionality and reliability of a new machine could be tested in situations that cannot be simulated in MT firms' in-house testing. As these Chinese metal working shops are known for operating their machines in harsh conditions, such as working around the clock and using machines to perform various processing procedures, MT firms can expect their new models to receive the strictest testing in their users' workshops, helping to optimize the final products.

##### **3.1.2 The users as technology mediators**

In the past, when undertaking to imitate foreign products, Chinese MT firms might have first imported the machines of interest from foreign makers and then dismantled them for detailed inspection. Today, however, they rarely deploy such strategies, given the high cost of importing these high quality machines as well as the increasing difficulty of purchasing them, as foreign MT makers have become aware of their Chinese counterparts hidden intent in purchasing their products. In this context, the relational networks of Chinese MT firms with indigenous users give them an alternative and more economical way to access advanced technological know-how.

To get instant feedback on machine use, an important input for improving products, MT firms need to send out their staff regularly to visit users. Since some MT users might have purchased foreign advanced machine tools for sophisticated processing, their knowledge and experience of using imported products is useful for product improvement by MT firms. Moreover, this offers Chinese MT makers a chance to have an inside look at these machines by taking advantage of their relationships with the machine owners. In addition to opportunities for physical inspection, machine owners may provide the instruction manuals that contain detailed specifications and guides to operation and trouble-shooting. These manuals also serve as a complementary knowledge source, helping engineers employed by Chinese MT firms to extract and comprehend the know-how embodied in the imported machines.

### **3.2 Know-how diffusion and sharing facilitated by the suppliers**

Chinese MT firms are competing against each other with similar products on the international market. In contrast to the existence of intense vertical interaction between MT makers and their users, horizontal interaction among domestic MT firms has been sparse. Their cut-throat competition in the market has made it hard for them to work together. Except in rare cases in which domestic firms selling different products might help each other out by supplying complementary products for marketing, cooperation between MT makers, especially in terms of technology or product development, has been almost non-existent. Nevertheless, mutual learning by domestic MT makers in the cluster has been surprisingly vigorous.

Suppliers are active facilitators circulating information and know-how among firms in China's MT. These suppliers provide services for multiple MT firms and may very well possess specific information or know-how concerning their respective clients. They therefore serve as a great source for firms wishing to dig out their rivals unrevealed information. For instance, Chinese MT makers sometimes adopt aggressive learning strategies to steal their competitors know-how. These include private inspections of competitors products through the assistance of local suppliers. They would ask suppliers to let them inspect the machine tools that the suppliers just purchased from other domestic MT firms. Sometimes, even without being asked, suppliers actively give their client MT firms the chance to check the components of their competitors' new products.

## **4 Technology Learning through Informal Horizontal Relationships**

There is a consensus that latecomer industrial development especially need non-local knowledge to precipitate further upgrading and higher levels of competitiveness<sup>[8]</sup>. In the case of China's MT industry, however, there are institutional barriers between foreign technology suppliers and MT firms resulting from the existing and potential competition between both parties in the market, the latter's limited resources to induce the former to initiate knowledge transfer, and the latter's intention of pursuing business autonomy. Therefore, the knowledge inflows through formal relationships with foreign technology sources have rarely materialized. Endowed with limited capacity or opportunities to be involved in formal transnational contractual arrangements, Chinese MT firms have to tap foreign scientific and technical competences through alternative channels, which are often informal in nature.

### **4.1 International product exhibitions**

International product exhibitions have been identified as an efficient marketing instrument for Chinese MT firms. They provide low-cost access to new markets that would otherwise be unapproachable. By attending international trade shows, MT firms can gain access to a large number of current and prospective global users in a short span of time. Nevertheless, international product exhibitions serve more than just marketing functions for Chinese MT firms. They also provide a platform on which the learning activities of Chinese MT firms are practiced and some of their extra knowledge linkages are built.

During product exhibitions, MT manufacturers derive ideas for new products and technologies from analyzing their competitors products, gathering data on specifications, prices, related technological and marketing information, etc. This information is of critical value to them in making future products and marketing plans. Besides gathering publicly available information, Chinese MT firms make more aggressive efforts to learn from their technologically advanced competitors. These sorts of learning activities, however, do not actually happen during the exhibition period of an international trade show, but prior to its opening. International product exhibitions are also an important venue to which firms come to search for partners around the world that exhibit interesting products and capabilities. For Chinese MT firms, their collaborative relationships with overseas partners in sales, marketing, production or product development are often established during the shows.

### **4.2 Licensing of technology**

Negotiating directly with the technology owners to transfer the needed technical know-how through license agreements is one way for latecomers to acquire advanced technology as well as to build up endogenous capabilities in a short period of time. Such strategies have been employed by MT industries in countries like Japan, Korea, where MT firms used licensing as a key strategy to acquire all the elements of design and production know-how related to their target products or technologies with the support of their parent conglomerates or their governments<sup>[9]</sup>. In China, however, licensing has rarely been a feasible option for MT firms in need of advanced technology. Most Chinese MT firms do not have sufficient resources to engage in licensing. Due to their smaller production and sales, it is also

hard for them to negotiate favorable deals with technology owners.

Nevertheless, some Chinese MT firms have been involved in licensing arrangements with foreign firms. But, such investment decisions seem to have come largely involuntary. The success of China-made machine tools based on copying products from countries like Germany, Italy, Japan, and the US has threatened the business of some of these advanced MT makers in world markets. To avoid lengthy and costly international lawsuits, foreign firms that have suffered from aggressive imitation may choose a direct approach to Chinese MT makers who they believe are the blind imitation. Such confrontations may end up in strategic alliances between the two rivals through signing formal licensing agreements or becoming production or business partners.

## 5 Conclusion

As opposed to the popular view that the industrial upgrading of latecomers was fostered through formal learning channels, in the evidence of MT industry in China suggests that it is the proliferation of informal learning mechanisms established and exploited by firms that mainly precipitates the learning dynamics in the industry. Just as technological capacity building in machine tools is in general characterized by incremental learning on the shop-floor, MT firms gradually accumulated their technological competence through constant learning by manufacturing and imitation, both of which have been facilitated by integration innovation in China. The production advantages enable Chinese MT makers to ramp up sales quickly in the world market, which brings them abundant opportunities to practice learning by manufacturing. The institutional environment of the integration innovation also nurtures various intra-firm informal learning mechanisms, allowing the firms to source extra-firm knowledge locally.

The technology acquisition of China's MT industry demonstrates not only the significance of informal learning in traditional equipment industries, but also the possibility for a latecomer firm to climb the technology ladder through exploiting various informal learning mechanisms. Even so, I do not suggest that such informal learning by itself is sufficient to support the sustained development of firms in this industry. Nor do I downplay the importance of formal learning channels, such as R&D. On the contrary, I argue that, to keep stimulating further technological advance, Chinese MT firms should recognize that informal learning cannot be a full substitute for formal learning. Instead, the two are complementary. More specifically, to continue to exploit foreign sources of knowledge through informal channels, Chinese MT firms especially need to enhance their absorptive capacity by increasing R&D investments<sup>[10]</sup>, thereby breaking the technological ceiling established by the forerunners, it is particularly crucial for Chinese MT firms to build and explore alternative foreign informal learning channels.

**Abstract:** This paper first introduces the innovation background of Guangxi province of China Manufacturing Industry, and then analyzes the current innovative situation of Guangxi Manufacturing Industry, from the total input and strength of the innovation, the situation of the outputs and the characteristics of innovation. And on this basis, it points that the Problems which is existed in the innovation development of Guangxi Manufacturing Industry, and put forward some strategies and recommendations to improve the innovative capacity of Guangxi Manufacturing Industry.

**Key words:** Manufacturing Industry; Innovation Situation; Statistic Analysis; Innovation Ability

## 1 Introduction

At present, the level of manufacturing industry development in Guangxi is not high, compared with other provinces' manufacturing development, it ranks on the list. Though, with the 'Eleventh Five-Year' efforts Guangxi has made significant progresses in the manufacturing industry, cultivated a number of competitive national brand and well-known enterprises, such as LiuGong Machinery Co., Ltd, Guangxi Yuchai Group and SGMW Co., Ltd. But in our region the total output of manufacturing is not large, with low industrial level, the irrational structure, low-tech and weak innovation, the conclusion is that in the total manufacturing industry of Guangxi, less competitive situation is not change at all<sup>[1]</sup>.

Currently, the most critical issues of Guangxi manufacturing industry is how to upgrade industries and how to create value efficiently. In order to upgrade industrial structure, which provides an rare opportunity for Guangxi international undertake and domestic technology transfer. This is an opportunity to form a massive capacity of international undertake and domestic technology transfer in Guangxi, and a inevitable choice to realize the optimization of resource distribution and upgrade the industrial structure<sup>[2]</sup>.

The State clearly announces that it is important to make efforts to promote industrialization and optimize industrial structure, focus on improving the level of comprehensive utilization of resources and ecological environment protection. Therefore, improving the ability of independent innovation will be the key to upgrade the industrial structure and changes to growth within the Guangxi region. This paper will analyze the current innovative situation of Guangxi Manufacturing Industry from the total input and strength of the innovation, the situation of the outputs and the characteristics of innovation.

## 2 Innovative Situation of Guangxi Province of China Manufacturing Industry

### 2.1 Innovation input of Guangxi province of China manufacturing industry

(1) Total amount of investment in Guangxi manufacturing innovation indicators

The total amount of Guangxi Manufacturing Industry innovation input indicators in the country is in the bottom row (see Table 1). In 2008, Guangxi has the activities of scientific institutions and manufacturing companies in science and technology, respectively accounting for 1.2% and 1.2% of the total manufacturing sector. In Zhejiang Province, scientific institutions and science and technology activities of manufacturing enterprises accounted respectively for 24.3% and 26.5% of the total national manufacturing sector, In Jiangsu Province, respectively, accounted for 14.7% and 18.4%. In 2008, Guangxi science and technology activities manufacturing personnel and R&D personnel accounted for the total number of the country's manufacturing technology R&D activities, personnel 1.0% and 0.7%. While Manufacturing S&T activities in Guangdong and R&D personnel accounted for 13.0% and 17.5%, Jiangsu accounted for 12.8%, respectively, and 11.8%. Guangxi manufacturing industry Innovation can be seen behind. In 2008, Manufacturing science and technology activities in Guangxi R&D funding and expenditure activities, respectively, accounted for the total expenditure of the country's total manufacturing technology R&D funding 1.1% and 0.7%. And other manufacturing industries are far from developed provinces. R&D funding in manufacturing science and technology activities and

expenditures in Jiangsu are accounted for 15.8% and 15.25%. Equipment accounts for the country's total investment in manufacturing microelectronic control equipment 0.9%. Among them, Jiangsu, Guangdong, Zhejiang, microelectronics manufacturing equipment into the country's total control of the proportion was 17.8%, 15.0%, 9.2%.

**Table 1 Gross Indices of Innovative Input in Manufacturing Industry in Guangxi Province of China**

Area in china	The number of technology enterprises / sector	the number of enterprises with technology activities / sector	science and technology activities staff / people	scientists and engineers / people	R&D person / people	funding for science and technology activities / million	funding for R&D / million	micro electronic control equipment / million

(2) The intensity indicators of the input of investment in Guangxi manufacturing innovation

Most of the intensity indicators of the input of investment in Guangxi manufacturing innovation are in the country's middle row, some in the bottom row (see Table 2).

**Table 2 Intensity Indices of Innovative Input in Manufacturing Industry in Guangxi Province of China (%)**

Area	Enterprises with science and technology institutions account for all the companies	enterprises with science and technology activities of the total business	scientific and technological activities of the employees	the proportion of scientists and engineers account for Scientific and Technological Activities	The proportion R&D personnel of the employees	science and technology activities expenditure of the main business income	R&D funding of the main business income	the proportion of microelectronic control equipment of original price of production and operation device
National	5.3	11.6	3.5	64	1.1	1.2	0.6	10.8
Guangxi	5.2	11.6	2.7	62	0.6	1.2	0.5	7.1
Beijing	7.7	25.8	7.6	72.9	2.2	1.4	0.9	12.4
Tianjin	5.4	12.8	5.6	62	1.6	1.8	0.8	4.2

Source: China Science and Technology Statistical Yearbook 2009, and the regional Statistical Yearbook 2009

1) from the view of the establishment density of innovative organizations and the implementation density of innovation activities, in 2008 the manufacturing industry in Guangxi, especially enterprises with science and technology institutions and technology activities accounted for all manufacturing enterprises in Guangxi, 5.2% and 11.6%, Compared to the national manufacturing industries, especially enterprises with science and technology institutions and technology activities accounted for 5.3% and

11.3%, essentially flat.

2)from the view of the input density of the creative talents, in 2008, scientific and technological activities in Guangxi manufacturing industries accounted for 2.7%, including scientists and engineers account for 62.0% of technological activities, while the R&D personnel accounted for 0.6% of total employees.

3)From the view of the intensity of the input of innovation funds, in 2008, in Guangxi manufacturing industries, funding in the scientific and technological activities and R&D expenditure were 1.2% and 0.5% of main business revenue, and compare to the national average, essentially flat.

4)from the view of the input of innovative automation facilities investment, in 2008, in Guangxi manufacturing industries, this indicator was 7.1%, below the national average, and is far behind 17.1% in Jiangsu, 15.0% in Zhejiang, And 14.9% in Guangdong.

## 2.2 The situation of the innovation outputs of Guangxi Province of China manufacturing industries

Innovation output is an important indicator which can reflect the innovation capacity of the enterprises, to some extent, innovation ability of an area is mostly reflected in the innovation output of enterprises, while there are two indicators reflect the innovation output: new products and patent applications.

### (1) Situation of new products of innovation in Guangxi manufacturing industries

In 2008, the situation of new products of innovation of the major provinces' manufacturing industries can see table 3. It can be seen that output value of new products and new product sales in Guangxi manufacturing industries accounted for, respectively, 0.9% and 1.0%, in Guangdong Province, the two indicators reached 13.4% and 13.1%, In Jiangsu Province, both reached respectively 12.5% and 12.7%. In addition, in Guangxi manufacturing industries, the proportion of output value of new products and the total industrial output value is 9.4%, the proportion of total sales of new products and main business income is 11.3%, which is almost the same with the national average, but compared to Beijing and Tianjin, there is a larger distance, the two points marked in Beijing reached 29.1% and 27.1%, are located in the first of the country, and in Tianjin, the two sub-standard proportions were 22.6% and 21.3%, which is located in the second of the country.

**Table 3 New Products Information of Manufacturing Industry Innovation in Guangxi Province of China**

Area	output value of new product / million	Sales of new sales / million	the proportion of output value of new products and total industrial output value /%	the proportion of sales revenue of new product and main business revenue /%
National	585227473	570270986	11.3	11.3
Guangxi	5536319	5941510	9.4	11.3
Beijing	30308746	30589115	29.1	27.1
Tianjin	28187577	27501772	22.6	21.3
Hebei	10572869	10685885	4.6	4.8
Liaoning	19824273	19196748	8	7.9
Jilin	16388333	12104628	19.5	14.9

Guangdong	78621730	74695491	12	11.8

Source: China Science and Technology Statistical Yearbook 2009, and the regional Statistical Yearbook 2009

### (2) Patents information of manufacturing industry innovation in Guangxi

The number of patent applications for Guangxi manufacturing industries is in the bottom row in the country(table 4). In 2008, the number of patent applications in Guangxi is 1074. The number of invention patent application is 306, ranking first is Guangdong, which has 10,882 patent applications, ranking second is Jiangsu, 6502 and ranking third is Zhejiang, 6107, Guangxi falls far apart. In addition, in 2008, Guangxi has a number of 568 patents, the number of projects accounted for 1.3% of the number of technology projects, the number of new product development projects account for 1.1% of the total new product development projects, these data show that the situation of innovation patent in Guangxi

manufacturing industries is bad, and need urgent improvement.

At the same time we should notice that, although the situation of innovation patent in Guangxi manufacturing is not good, but the number of innovation patents in China manufacturing industries is continue to rapidly increased, which provides a good environment for development of innovation patents in Guangxi manufacturing industries, but if we does not improve the quality of patent, we can not change the status of backward.

**Table 4 Patents Information of Manufacturing Industry Innovation in Guangxi**

Area	The number of projects of science and technology	The number of new product development projects	the number of invention patent applications	the number of patent applications	The number of invention patents
National	286209	184859	173573	59254	80252
Guangxi	3631	2124	1072	306	568
Beijing	15093	8312	7124	4256	5618
Tianjin	13045	8567	5227	2754	3050
Hebei	6829	3874	1855	603	1058

### 2.3 The characteristics of the results of innovation of Guangxi manufacturing industries

From the view of national main economic areas, in 2008, in the registration of the results of innovations, the four economic zones have higher levels of outcome evaluations, in which the results of the Yangtze River Delta and Pearl River Delta Evaluation is relatively higher, while Guangxi is located in the western of China, not in the four economic zones, the level of innovation evaluation is relatively lower (see table5).

**Table 5 Evaluation Results on Innovation Achievements in the Main Economic in 2008**

the level of innovation evaluation	The Bohai Sea		The Yangtze River Delta		the Pearl River Delta		The Northeast area	
	Composition %	Increase in the proportion	Composition %	Increase in the proportion	Composition %	Increase in the proportion	Composition %	Increase in the proportion
International Advanced	6.82	0.63	7.03	0.2	5.13	-2.4	6.32	0.41
International Leading	23.53	-0.37	28.49	1.52	15.61	-4.44	22.78	-0.18
Domestic Advanced	52.64	0.09	49.2	-0.97	58.64	4.33	46.56	-0.14

Source: China Science and Technology Statistical Yearbook 2009, the regions' National Annual Statistics report of scientific and technological achievements in 2008.

## 3 Conclusions

### 3.1 Problems of Development in Guangxi Manufacturing Industry

(1) There are a small number of enterprises with scientific institutions and science and technology activities. It accounted for respectively, 5.2% and 11.6% of all enterprises in Guangxi, slightly lower than the national average, it is still very far from Beijing, Jiangsu, Zhejiang and other developed

provinces, these two indicators, Zhejiang Province respectively reached 9.3% and 22.3%, Beijing, is 7.7% and 25.8%.

(2) There is shortage of talent in manufacturing industry innovation. Technological activities only accounted for 2.7% of employees, the number of employed scientists and engineers, accounting for only 1.7%, below the national average 3.5% and 2.2%.

(3) Intensity of investment funds is relatively low, intensity of investment in R&D of Guangxi manufacturing industries, was only 0.5%, lower than Zhejiang, Guangdong and other provinces, these provinces have reached by 0.6% or more, higher than the national average, 0.6%.

(4) The proportion of microelectronic equipment and the original cost of production and operation equipment are low for Guangxi manufacturing industries; it is 7.1%, lower than the national average 10.8%.

(5) The output value of new products of Guangxi manufacturing industries and the total sales income of new product were not much more, but the proportion of the output value of new products and the total industrial value is 9.4%, and the proportion of the total sales income of new product and the main business income is 11.3%, which is close to the national average.

(6) The number of science and technology projects and new product development projects are small; only share 1.3% and 1.1% of the state.

(7) The number of patent application of Guangxi manufacturing industries and invention patents is still low in the country, the situation is not optimistic, the number of patent applications and invention patents respectively owned the country's total share of 0.6% and 0.7%. Data show the number of patent applications in the manufacturing industries in Guangxi and several patents is far behind the domestic developed provinces.

### 3.2 The Strategies of Improving the Innovation Ability of Guangxi Manufacturing Industry

(1) Emancipating the mind, changing the concepts

At first, pay attention on the ideology, secondly, to change their concepts, not only to learn from some domestic provinces with good manufacturing industries, but also to learn from the advanced countries in the world, especially learning the experience and model of the developed countries, and making a solid ideological foundation for Guangxi manufacturing industries innovation<sup>[3]</sup>.

(2) To strengthen the various input in innovation

Human resources have become the company's core resources, and it is also a key to innovation. Financial resources are the protection of innovation. With a solid ideological foundation, coupled with adequate human resources, financial resources, it is better to promote the development of manufacturing methods and accelerate the optimization and upgrading of industrial structure.

(3) Improve the efficiency of government functions, strengthen innovation to the institutional

Support and assist from the government in terms of innovation like the sun on the seeds. Guangxi government not only should fully play its role in providing good innovation environment and good infrastructure for Guangxi manufacturing industries, but also design plans and policies for development of innovation of Guangxi manufacturing industries, coordinate all aspects, truly uniform the government awareness, economic laws and scientific laws.

(4) To adjust the industrial structure, promote industrial upgrading

In the organizational structure of enterprises, we should increase the efforts in industry's integration, through the methods such as mergers, acquisitions, alliances, restructuring, etc., to develop and nurture business advantages, the introduction and mastery of some of the core technology are also necessary. In the economic structure of enterprises, we should vigorously adopt strategies such as advance and retreat, some things to do or poor selling to do to restructure and adjust the state-owned economic structure and state-owned assets<sup>[4]</sup>.

# Study on Innovation Subject Model of Logistics Industry Based on Self-Organization Theory

Gan Weihua, Ding Ru

School of Mechanical & Electronic Engineering, East China Jiaotong University, Nanchang, P.R.China, 330013

(E-mail: weihuagan@163.com, dingru89@126.com)

**Abstract:** Operational efficiency of Logistics industry innovation system has significant functions on industrial innovation and regional economic development. According to the basic connotation of the creative industries, the paper firstly identifies the key bodies of logistics industry innovation system. Then it builds a four-dimensional key body model based on self-organization theory. Finally the paper divides the model into government guiding form, enterprise and universities promoting form and collaborative developing form according to different leading driving elements, thus establishes a modern logistics industry technology innovation system which centers on the four key bodies.

**Key words:** Logistics industry; Innovation system; Four-dimensional model; Self-organization principle

## 1 Introduction

The word “innovation” first comes from J.A. Schumpeter’s book named Theories of economic growth and development<sup>[1]</sup>. Schumpeter proposes that innovation system contains product innovation, technology innovation, market innovation, resources innovation and organizational innovation. Hugo Pinto summarizes the evaluation indexes of regional innovation system as a four-dimensional structure which contains Human capital, technology innovation, labor market conditions and economic structure<sup>[2]</sup>. In Asheim’s opinion, regional innovation system can be regard as a regional cluster which is surrounded by multiple supporting agencies<sup>[3]</sup>.

The industrial innovation ability reflects a certain industry's comprehensive ability of improving production efficiency, forming industrial competitiveness and promoting sustainable development through technical innovation, organization innovation and management innovation.

For many years, nationwide scholars have revealed that technical innovation is significantly important in the processes of economic and social development, and have advocated that all of the market bodies shall locate technical innovation in the primary position of innovation. Zhang Liquan defines technical innovation as the building process of an operation system which is more efficient and saving by first using new products, techniques and processes<sup>[4]</sup>. Liu Lu & Du Zhiping analyze the connotation of logistics industry innovation of knowledge economy age and provides theoretical references for the establishment and implementation of policies of logistics industry innovation by discussing the system's structure, operation mechanism and characteristics from three different levels<sup>[5]</sup>.

Can see as a result from the above research, actually, theoretical studies about Chinese logistics industry innovation system are few, much less researches of applying self-organization theory to logistics industry innovation on macroscopic level. Based on the above statements, this paper clearly proposes a four-dimensional key body model for logistics industry innovation system, then combining China’s national conditions, it aims at seeking breaches of China’s logistics industry through analyzing the innovation system’s evolvement and the relationship between the leading driving element and other ones in different developing stages.

## 2 The Key Bodies of Logistics Industry Innovation System

### 2.1 Subject identification

Logistics industry innovation system can be divided into three layers ( core layer, assistant layer and peripheral layer) and four key bodies(logistics professional enterprises, public service units, logistics demand enterprise and government departments).

### 2.2 Role of the key bodies

#### 2.2.1 Logistics professional enterprises

Logistics professional enterprises locate in the dominant position of logistics industry chain, and the internal innovation ability of logistics professional enterprises cluster determines the overall creativity of logistics industry technological innovation. Logistics professional enterprises' functions on innovation system can be showed in three aspects, one is independent innovation and patent application,

the second one is introduction and simulative innovation, the last one is collaborative innovation. Logistics professional enterprises locate in the core layer of logistics industry technological innovation system.

2.2.2 Public service units

In logistics industry innovation system, public service units is mainly refers to those high learning institutions and science research institutions which are engaged in logistics theory research and looking for opportunities to apply theories into practice, they are the subjects and sources of technological innovation. Public service units locate in the assistant layer.

2.2.3 Logistics demand enterprises

Logistics demand enterprises here are those manufacture companies. On the one hand, large-scale manufacture enterprises will put forward higher requirements for the punctuality and lean sex of logistics service so as to gain a competitive advantage in the face of fierce market competition. On the other hand, the demands from manufacture companies will also aggravate internal competition between logistics professional enterprises, thus to promote these enterprises improving service through continuously adopting advanced technologies for gain market share. Logistics demand enterprises also locate in the assistant layer.

2.2.4 Government departments

Government is the subject of logistics institutional innovation. Policy direction from government has significantly impacts on logistics technology research & development, mainly displaying in the following aspects: creating healthy market environment, promoting mutual trust between key bodies, establishing compensating mechanism of innovation, improving the living quality of the logistics industry. Government departments locate in the peripheral layer of logistics technological innovation system.

### 3 The Four-Dimensional Key Body Model Based on Self-organization Theory

#### 3.1 Self-organization principle in logistics technological innovation system

Logistics industry innovation hierarchy is a dynamic system. It's also a complex system at the same time since its subjects are interdependent and interact with each other in a nonlinear way. Therefore, the process of Logistics industry technological innovation system fits the self-organization theory, and we can study its evolution with self-organization related theory.

Since the relationship between any two innovation subjects is nonlinear, the realization of orderly evolution of the innovation system is mainly determined by subjects' coordinative interaction, competitive interaction, and so on. Fluctuation refers to a certain variables behaves from average value thus causes the system to get out from the original rail or state. When logistics industry innovation ability system is stable, the fluctuation of system can't change its macroscopic state, but when the system is in critical condition, the micro-fluctuation will be amplified by the nonlinear effect and the system will transit from an unsteady state to a newly well-organized one, thus presents a dissipative institution. This is also the self-organization process of the innovation system which caused by the result of quantity influences quality. As showed in figure 1.

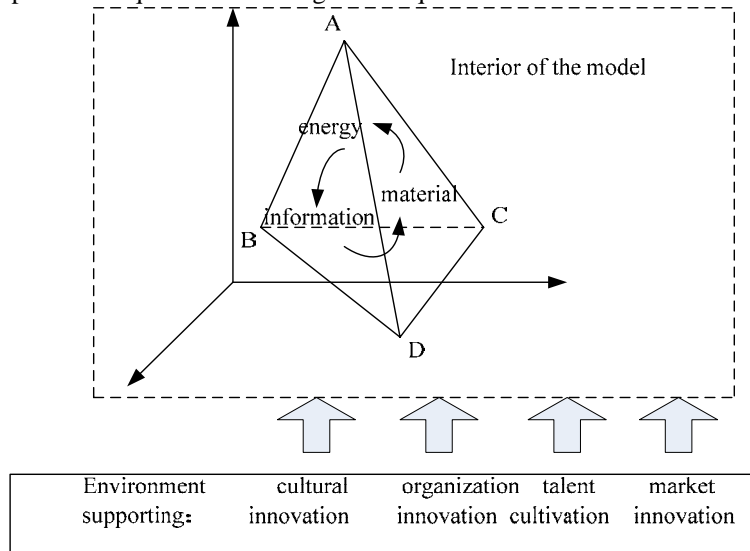

Figure 1 The Evolution of Logistics Innovation System Based on Self-Organization Principle

Figure 1 shows that the micro-fluctuation of the system is dominating the subjects' combining ways, and the stronger the fluctuation, the easier the formation of new combinations. Only when the micro-fluctuation is powerful to surpass a critical value (the minimum level for maintaining the system's original state) will it impact on the old combining pattern, break the balance, and gather energy for a new system. When the fluctuation is strong enough to reach another critical point, old pattern and system then completely disappears and an optimized technological innovation system takes shape, thus completes the leap from the quantitative change to the qualitative one.

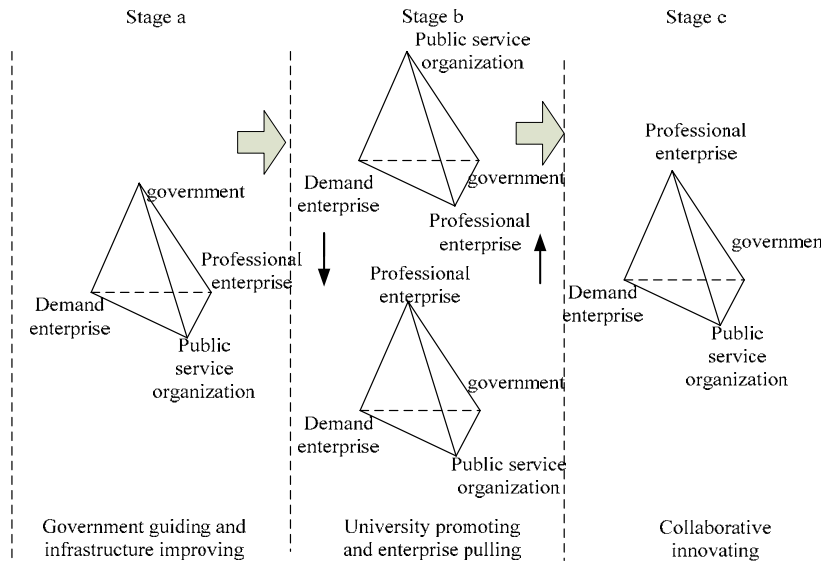

**Figure 2 The Four-Dimensional Key Body Model**

**3.2 The four-dimensional key body model**

Cooperation between subjects of the logistics industry innovation system tends to evolve to optimize the whole organization automatically. Figure 2 shows a four-dimensional key body model which is made up by logistics professional enterprises, public service institutions, logistics demand enterprises and government departments, denoted by A, B, C, D respectively. In the driving of the four bodies, the comprehensive ability of logistics industry technological innovation increases rapidly. In the interior of the model, information, energy and material flow circularly, and outside of it, cultural innovation, organizational innovation, talent innovation and market innovation offer support. In the following model, subject A locates in the top of the tetrahedron, playing the key driving role, B, C and D locate in the bottom, being basis of the tetrahedron, while the four key bodies supporting the formation of the innovation system together through interaction and coordination.

**4 The Model's Evolvement in Different Stages of Logistics Industry**

The four-dimensional key body model can be divided into three developing stages based on the different driving elements, namely as government guiding and infrastructure improving stage, university promoting and enterprise pulling stage, collaborative innovating stage (See Figure 3).

**Figure 3 The Model's Evolvement in Different Stages of Logistics Industry**

In the stage of government guiding and infrastructure improving, logistics professional enterprises, logistics demand enterprises and public institutions(including universities and research institutions) are situated in the bottom of the tetrahedron, and government is located in the top place(see figure 3, stage a). In the initial period of the development of the innovation system, government's main functions are: encouraging investment in science and education; speeding up platform construction of logistics Industry; improving relevant laws and strengthening the protection of intellectual property; deepening the reform of the public services and promoting technological innovation in logistics enterprises; supporting enterprises' R&D with funds, information and policies.

The task of this phase primarily is establishing logistics industry infrastructure and enhancing strength of main bodies. Other assignments like promoting the development of science and technology, encouraging public service organizations' R&D are also necessary.

With the continuous improvement of the innovation mechanism, the four-dimensional key body model progresses accordingly, and the university promoting and enterprise pulling stage comes into being (see figure 3, stage b). In this stage, public institutions gather a lot of talents and advanced lab equipments , and can provide vast quantities of advanced theories and abundant human reserves. During this time, public service institutions should strengthen the configuration of research effort's and human resource building so as to promote the materialization of new knowledge and new technology.

Logistics professional enterprises begin to play their role as a bridge, promoting new technology trade, transfer and common development when the model steps into the collaborative innovation stage (see figure 3, stage c). In this stage, logistics professional enterprises are in the top of the model. The coordination procedures between the key bodies are: manufacturing enterprises update their logistics needs continually; public service institutions develop logistics technology tailored the needs and transfer them to logistics professional enterprises; logistics professional enterprises apply new technology into logistical fields, then feedback the materialized effects to public service institutions. This period, government departments mainly provide guidance, supervision, encouragement and security for the procedures.

To sum up, this evolving mode of logistics industry technological innovation system accords with the basic laws of industry development. When the model is in its best condition, it presents as a tetrahedron, and not only the efficiency but also the stability of the innovation system are all the best.

## 5 Conclusion

Logistics industry innovation system in itself is open and self-organized, it is exchanging information, energy and material with the other systems such as the human society system, industry system and so on. By differentiating the main bodies of logistics industry into three layers, dividing the evolving model into three processes, and using the self-organization theory to study the innovation system as a whole, the paper explains the necessity of logistics industry innovation system evolving

from a low-level formation to a high-level one, and provides theoretical references for the development of China's logistics industry technology system

Logistics industry innovation system is a complex system, and how to quantitatively study logistics industry technological innovation system's maximum profits remains to be thought about.

(E-mail: lppmail@sina.com)

**Abstract:** Conversion mechanism of product life cycle value is the key factor of enterprises' survival and development. Study on the product life cycle theory is such an important topic that has become the basis of enterprise's determining the characteristics of the product in order to meet the needs of the market. This article on the product life cycle theory combines with Apple and Motorola Company product sales analysis in recent years, it concludes the value space conversion mechanism of product life cycle.

**Key words:** Product value; Product life cycle; Product value space; Conversion mechanism.

### 1 Introduction

In a product life period, businesses often need to amend their marketing strategy. This is not only due to the economic environment and market competition factors, it depends on the stage of the product's life cycle. Life cycle concepts do not only serve as basis in assisting product developers understand the dependencies between products and their life cycles, they also help in identifying potential opportunities for improvement in products.<sup>[1]</sup>Therefore, enterprise needs to develop a range of strategy to meet the demands of the product life cycle, to keep pace with the requirements of the purchasers' interest. While many products can not last forever, but manufacturers would always want to extend the duration of their lives. This study combines the product life cycle theories with market, with the analysis of characteristics in different product's life cycle, it focuses on value space conversion mechanism of product life cycle.

Product life cycle theory was proposed by Harvard University professor Vernon in 1966. Father of modern marketing management Philip•Kotler in his book "marketing principle" mentioned about product life cycle (abbreviated as PLC) .<sup>[2]</sup> Product life cycle has five phases: development period, lead-in period, into long-term, maturity period and decline period.

Banwari Mittal and Jagdish N.Sheth put forward the concept of value space in 2001, whose value space consists of performance, price and personalize, which is called "3P".

In the life cycle of product value space, the core value of the product will change with the changeable circumstances. Enterprises through improving the value of the product itself, constantly update and adjust (increase, maintenance, removal and improvement) the core value of the products, to create the formation of new product, and meanwhile take measures to reduce the product or service and operating costs, finally enterprises can win greater profits through more effective business process and operation way.

According to the understanding of the psychological demands of consumers, the investigation of periodic product share of the market , appropriate marketing business strategies can be formulated in a timely manner; Analysis on the market of the product life cycle enables enterprises to eliminate old products and innovate the core values of products to meet consumers' demands, improve the structure of consumption, increase product range and supply , which is helpful to rapid replacement between old and new products in a timely manner, gaining the initiative for business management; According to the sales situation of product life cycle value space, companies can take measures to try to shorten investment period to ensure high economic growth period, extend the maturity as much as possible, delay products' wane , bring more profit opportunities for the enterprise, increase vitality and competitiveness, provide enterprise with more new market share to fully enhance corporate reputation.<sup>[3]</sup>

### 2 Conversion Mechanism of Product Life Cycle Value Space

The dynamics of product life cycle for a family of products presents a complex manufacturing scenario.<sup>[4]</sup>According to economic activities of enterprises, a product cycle of creating it's value is generally divided into a series of distinct but interdependent economic activities such as planning, design, product development, manufacturing, sales, service, and recycling. This economic activity has lay the basis for the management of enterprise product life cycle. According to this, the value of space

conversion mechanism has become external performance of the product life cycle conversion.

The principles for product design planning and the logical process of product design planning process and contents based on Product Value Space was put forward.<sup>[5]</sup> In life cycle process of the product value space, the core value of the product will change with the changing circumstances in the market competitions to some degree, while the basic value in the life cycle changes with the change of the product life cycle, as shown in figure 1.

Figure 1 Product Life Cycle Value Consistency

Transformation of Value space involves in the whole field of business in enterprises, each value cycle makes the different contribution to the creative value of enterprise, which is determined by a variety of different market environment factors, the activities of value space in each cycle becomes the important factor of product life cycle. The product life cycle has its consistent rules in value: in the life cycle of product value space, the core value of the products will change to some degree accordingly as the market competition changes, and the fundamental value of the products will change constantly with the changing life cycle. Thus, it's very necessary to explore conversion standards of the product life cycle space value from the important element: value.

**2.1 Investment period**

Enterprises make scientific forecast combining theory and elements based on the value space of the product's life cycle. With the analysis of the product space value, Enterprises identify the cost of product life cycle, and analyze its value elements, with a large amount of research materials, Enterprises can find out those popular elements in the market, which needs small cost, but grows at a faster pace. On the basis of the element, enterprises can control products' life cycle, and determine the target market, ultimately it is helpful to the product promotion and enlarging reproduction.

**2.2 Growing to maturity**

In growth stage of the life cycle, product sales gradually increase, the product sale price and the product itself competes each other, and it has a certain consumer groups in this stage, meanwhile, the enterprise has a clear understanding of its brand. At this point, the enterprise should pay close attention to innovation and development with the core value of products, improvements should be made in technology, function, appearance and so on, partial product design is supposed to be emphasized, to find new core value of the product, while retaining the product's original good function in the market, thus reducing the product manufacturing cost and make more profit for the enterprise. According to the product core value conversion, enterprises should adapt to a positive attitude, develop a new strategy to attract more consumers to expand sales.

**2.3 Maturity period**

Enterprises in mature stage have achieved greater economic interests, should make a judgment in time to take measures to extend maturity period. Through market research and consumers' information feedback, enterprises make improvements timely, such as: To improve packaging and appearance quality, supported by advertising, then put on the market as soon as possible; to expand product applications, to improve the service, lower the prices, improve performance and enhance product reliability. This can significantly improve the market competition ability and improve market share, which can significantly extend maturity period.

**2.4 Decline stage**

The industrial level increases ceaselessly due to advances in technology, products update more quickly, severe competition in the market causes the product life cycle is shortening constantly. When the old products are in maturity period, enterprises should organize to develop new products, invest more money and technical equipments in a new generation of product development and research. According to conversion mechanism of the product life cycle value space, the continuous upgrading of products are supposed to be guaranteed, in order to ensure the steady growth of enterprise production and management.

Products in different phases of the cycle, hold different characteristics of the sale, therefore, research on conversion mechanism of product life cycle value space is of great significance to the consumer, the market and enterprises.

### **3 Empirical Research: Analysis and Comparison of the Value Space Conversion Between Apple and Motorola Mobile Phone**

After the failure of Apple Macintosh laptop sales, there's a new viewpoint within the company, that is, major reforms were necessary in the organization management modes and operating mechanism. They were not eager to squeeze in the fierce market competition, but took the time to make products more perfect. Apple basic strategy is to rely on their professional technology, to develop the distinctive products for the sake of consumers. These products help enterprises to hold the price advantage, to earn high profit for the company, thus enabling it to put in more money, and continue to create more attractive products. Apple has a unique set of complete system about the product value, firstly, this set of criteria must integrate with the concept of enterprise development and the concept of value.

Secondly, the set of criteria should have their own characteristics, when the criteria are established, the corresponding design standards should also be constructed, including the corresponding design ideas and program, thus the design unity can be guaranteed.

Apple for a new concept of product design tends to provide three assessment documents, that is, a market development document, a project design document and a user experience file. Through the market survey, Apple can understand what consumers need; through engineering design, Apple can explore what to do; through the user experience, Apple can find out about consumers' consumption tendency and preference. If the three files are evaluated and accredited by executive committee, the design group will get a budget and appoint a person in charge of the project.

From then on, the project team is committed to enriching the three assessment documents, that is to focus on how to realize the specific requirements in the market development, engineering design and the user experience, and then the details such as issue date, advertising cycle, price will be taken into consideration.

Simplicity is Apple's pursuit in its products. Jobs said "no", not just because he hated complex things. Apple product profit rate has been very high, saying "no" to new products, new features can help Apple to maintain low production cost, getting rid of certain function is also beneficial for the next generation of products. "The biggest benefit of omitting certain function is that consumers will become more eager to have them when you meet certain requirements of consumers in the new version, which even can make them happier." Former Apple engineer Reed said. Apple has repeatedly played this game, the recent example reflects in iPhone4, it includes the processing function in multiple tasks that consumer has been eager for from 2007. Based on Apple's focus on value function above, therefore, Apple is successful.

As the biggest beneficiaries of the first generation mobile communication, Motorola wanted to extend the life cycle of analog mobile phones as far as possible, and delayed the popularity of digital machine. Motorola overestimated the life cycle of analog mobile phones, when many other competitors launched various compact digital mobile phones, Motorola will find their own slow tempo.

Motorola attempted to build a general-purpose operating system as its development on the same platform for mobile phone in the future. Motorola picked the wrong platform and select Java, Java is insurmountably congenitally deficient, which is too slow. Later for its insufficient performance on the mobile platform Linux, many software from third party unable to load, such as: input method software of mobile phone, video software, and finally Motorola lost the best chance of unifying mobile phone operating platform. Motorola looked down on Nokia and Samsung which tend to "change a case or the color as a new mobile phone", however, users are really happy with that change. When consumers want to design the mobile phone by themselves, Motorola don't follow the tendency.

With the help of Android system, Motorola tried to return to the road of innovation, Motorola

mobile phone embraced its real turning point from V3. At the same time Motorola began to play a role as the guide to the consumer and the user on the basis of technology. In the fierce competition for the market share, Motorola launched a “decisive battle”: try to get back to the leader position of market share through reducing its price. China is one of the main battlefield in the war, many people remain fresh in one's memory: Motorola mobile phone gave consumers a remarkable impression in reducing price, The most classic mobile phone V3 was priced from more than 6000 RMB in 2004 to 1200 RMB in 2006, after several years the number of improved version mobile phone V3 became an ordinary thing.

The first Motorola mobile phone product came out on November 7, 2009 which based on the platform Android. Subsequently, a series of Motorola products called Milestone came out in succession, the Android platform is famous for its powerful function, people tend to call Milestone a milestone. Just as the name, the series of mobile phone called Milestone played a role like a milestone in the development of Android.

At present, Motorola still has some advantages after other enterprises have adopted Android as the platform for intelligent mobile phone, For example, brand influence on users in market, advanced in management experience, improved distribution channels, strong research and development technology, and good cooperation with Google and telecom operators.

But it is still a question for Motorola whether it can continue to go forward, which is determined by the reform in its production and marketing in the whole operation system, whether it can take users the first priority, and manage differently and effectively in different cities.

Poverty stirs people to change, change tends to go with a smooth way, and then going forward for a longer time. With the reform, there is a long way to go for Motorola this time, but Motorola retained the original competitive advantage, on this basis, Motorola revolutionized successfully and got its new beginning through considering the situation carefully, complying with tide, making a positive change, adopting the new technology, combining new mode and a new platform with the original resource properly. At least, Motorola got started again and inspired a new vitality.

#### **4 Conclusion**

With the study of product life cycle, enterprises can know cost status and competitive advantage of products on macroscopic and microcosmic level. According to the product life cycle, enterprises can make reasonable estimation and control reasonably, and thus to make reasonable prediction for enterprises, which offers great help for the profitability.

## Change and Optimization of Henan's Rural Logistics Market in Economic Transition Period\*

Pan Jingqiang

School of Economics & Management, Xuchang University, Xuchang, P.R.China, 461000

(E-mail: frank20090323@126.com)

**Abstract:** Being an agricultural province, the development of Henan's rural logistics has important impulse activity to realize the rise of center China. The paper implies that the research on Henan's rural logistics market's change discipline and optimization in the period of economic transition is more important than before. employs many approaches such as system engineering, regional economy, etc. clarifies the system feature of Henan's rural logistics market, studies dynamic trend on the base of the statistical data from 1996 to 2011, sets up an optimization model which contains six latitudes and eight factors. Meanwhile, the paper takes the preliminary explore about how to further optimize Henan's rural logistics market.

**Key words:** Economic transition period; Rural logistics market; Feature; Dynamic trend; Optimization

### 1 Introduction

Being the main battlefield to reform, vast rural areas depended on household contract responsibility system, rural economy achieved rapid development in China. The statistics shows that agriculture as a proportion of gross domestic product (GDP) moved as high as 33.17 percent<sup>[1]</sup>. rural logistics market is showing a vitality, it was called "the third profit source" of rural economy. A lot of questions which unceasingly propel process of economic transition also causes a profound impact to rural logistics market, such as rural productivity increase slowdown continues.

Transition has been primarily used in medicine application, extended to economics category. Buhalin was the first to propose the economic transition when researched the transition from market economy to planned economy. At present, the theory circle hasn't reached a definitive conclusion, believes it is a radical change that economic structure and economic system of a country or region over a period of time, includes economic system upgrade, change in the main source of economic growth, economic structural promotion, and mainstay industry interchange, also is a process from quantitative changes to qualitative changes.

Any countries or regions will face the economic transition, many developed countries also have a transition process to further optimization economic system and economic structural. China's economic transition started at 1978, its objective model to establish socialist market economy, China has gone through a big transition, finalize the design mode of the development in be market economy country in 2003.

### 2 The Features of Henan's Rural Logistics Market in Economic Transition Period

Up to by 2011, total population of Henan province reaches more than 100 million, particularly less than 60 million rural population. The growth of rural total retail sales of consumer goods, for the first time, exceeded the growth of city, rural logistics market has been increasingly unpopular, becoming the highlight of Henan economy. Bases on more indexes such as the rural total retail sales of consumer goods, the sum of GDP, gross grains, the net per capita income of rural residents and per capita inbound, demonstrates Henan's rural logistics market.

The system involves agriculture product, produce to sell, the life of rural residents and others economic activity, refers to transportation, storage, loading and unloading, package, distribution, message processing in rural areas<sup>[1]</sup>. It is a special type of regional logistics, the target is various types of production, agricultural product, goods for everyday consumption by agricultural industry. At first, rural logistics let agricultural product how to go out, increase farmer's income, try means to acquire all kinds of production, agricultural produce, goods for everyday consumption. From Figure 1, Henan's rural logistics market which reach are not attained by a sudden flight, are not set in stone for the long term, which cross of abstufung and radical, and are growing dynamically. In this paper, it is showed a system,

---

\* This paper is supported by the Natural Science Foundation of the Department of Education of Henan Province of China(2011B630015)

described and illustrated its character from the view of input, output, management, restrict and feedback link.

### 3.1 Input

Including various types of agricultural product, goods for everyday consumption, order, money, labor, material by agricultural industry. It has characteristics of variations of form, the first is seasonal nature<sup>[2]</sup>. The seasonal nature of agricultural produce brings about the seasonal nature of request of product material, consumption is also periodic. the second is imbalance, the different of Henan rural climate and geology leads to various types of rural logistics, refers to the imbalance request which agriculture, Lin, vice, fisheries and other economic to order.

### 3.2 Output

Including the process of transportation, store, sales of agricultural produce. It has characteristics of variations of form, the first is various, the imbalance of input brings about the various of output, breed the core product is the key. The second is particularity of output carrier, leads to more specific requirement to transportation, store, distribution because its various<sup>[2]</sup>.

### 3.3 Management

Management refers to the transition process of Henan rural logistics market from input to output in economic transition period, which includes many factors, is the key to reduce rural logistics cost. It has characteristics of variations of form, the first is logistics infrastructure construction legs rural logistics in developing. The second is low standardization. the third is practical application of logistics modern technology is limited, the idea behind if management. the last is rural logistics employees primary quality on the low side.

### 3.4 Restrict

Restrict refers to the restrain which Henan rural logistics is developing in the economic transition by system internal and external factor. It has characteristics of variations of form, the first is inefficient, many relevant preferential policies did not come true. the second is not strong capability to positively cope with these changed circumstances.

### 3.5 Feedback

Feedback refers to reverse direction of messages in system operation, such as the adjustment about rural logistics policies, modification of agriculture product request, implement of many relevant preferential policies about goods, etc. It has characteristics of variations of form, the first is high macro situation, rural problem was important priorities for China government. The second is big flexible character, must fellow the law of market economy in competing in the domestic and international markets. The third is flexibility, such as the activity of promoting household appliance in countryside is stoking consumption, also satisfying high-level enjoyment of rural residents<sup>[3]</sup>.

## 3 The Dynamic Change Index of Henan's Rural Logistics Market in Economic Transition Period

Listed in Table 1, expressed the rural total retail sales of consumer goods as Henan's rural logistics quantity demanded indirectly, took up the indexes sampled data of correlation such as gross grains, the net per capita income of rural residents and per capita inbound at a time. To facilitate the description, in this paper, we write  $K$  for dynamic index in a period, write  $X_a, X_b$  for the initial index value and final index data in a period, write  $n$  for length of research time, as in (1).

$$K = \frac{X_b - X_a}{X_a} \times \frac{1}{n} \times 100 \quad (1)$$

If dynamic index  $K$  is positive, there is a growing attitude what the larger the dynamic index that the faster growth, the smaller the dynamic index that the slower growth. If dynamic index  $K$  is negative, there is a decreasing attitude what the larger the dynamic index that the slower growth, the smaller the dynamic index that the faster growth. To facilitate the description, in this paper, we expand 100 times the calculated value, China has gone through a big transition, finalized the design mode of the development in be market economy country in 2003. Based on the statistics data from 1996 to 2010, the following conclusions can be drawn.

From 1996 to 2003, the dynamic index of he rural total retail sales of consumer goods is 25.12, the dynamic index of the Henan's GDP is 14.42, the dynamic index of net per capita income of rural residents is 9.05, the dynamic index of the rural total retail sales of consumer goods diversification is 7.83, it follows that it is obvious that Henan's rural logistics boosted GDP growth, it is positive that

Henan's rural logistics impacted net per capita income of rural residents. But we can see lack of momentum of consumption expenditure of rural residents continued, is not suitable for the rapid growth of the rural total retail sales of consumer goods. In this period, it shows radical change because the dynamic index of the rural total retail sales of consumer goods and GDP interchange are more higher, of course, from another view, we can analyze that Henan's rural residents consumption market is potential to mine.

**Table 1 Indicators Data of Henan's Rural Logistics Market(1996-2011)**

Year	Rural Total Retail Sales of Consumer Goods (10 <sup>8</sup> yuan)	The Sum of GDP (10 <sup>8</sup> yuan)	Gross Grains (10 <sup>4</sup> ton)	Net per Capita Income of Rural Residents(yuan)	Per Capita Inbound of Rural Residents (yuan)
1996	223.83	2988.37	3466.50	1231.97	1067
1997	363.07	3634.69	3839.90	1579.19	1313
1998	417.98	4041.09	3894.66	1733.89	1404
1999	463.43	4308.24	4009.61	1864.05	1373
2000	501.39	4517.94	4253.25	1948.36	1339
2001	555.88	5052.99	4101.50	1985.82	1551
2002	613.82	5533.01	4119.88	2097.86	1647
2003	668.78	6035.48	4209.98	2215.74	1734
2004	729.90	6867.70	3569.47	2235.68	1819
2006	806.84	8553.79	4260	2553.15	2156
2007	895.80	10587.42	4582	2870.58	2372
2008	1007.04	12362.79	5112.30	3261.03	2556
2009	1161.40	15012.46	5245.20	3851.60	2833
2010	1307.26	18407.78	5370.00	4454.24	3208
2011	1487.69	27232.04	5510.09	5019.76	3709

From 2004 to 2011, the dynamic index of the rural total retail sales of consumer goods is 13.18, the dynamic index of the Henan's GDP is 28.00, the dynamic index of net per capita income of rural residents is 16.54, the dynamic index of the rural total retail sales of consumer goods diversification is 12.73. It is suitable for we recalled that rural productivity increase slowdown continues. In particular, when the dynamic index of GDP turnover almost tripled, the role of agriculture may be attenuated during the economic transition period. The data suggests that the promoter action of the design mode of the development in be market economy country to the rural logistics market after the transition period is obvious, there is a "rapid rise" of Henan's net per capita income of rural residents and per capita inbound, has huge market prospect.

## 4 The Optimization Model and Path of Henan's Rural Logistics Market in Economic Transition Period

### 4.1 Optimization model

How to coordinate "effective anti-back" of Henan's rural logistics market system, correctly handle the issue of "going out" and "bringing in", it is particularly critical to deal with these problems for optimizing Henan's rural logistics market. To better solve these problems, in this paper, we established optimization model, the model is divided into six latitude and two facets of eight elements from the frame, as seen Figure 1.

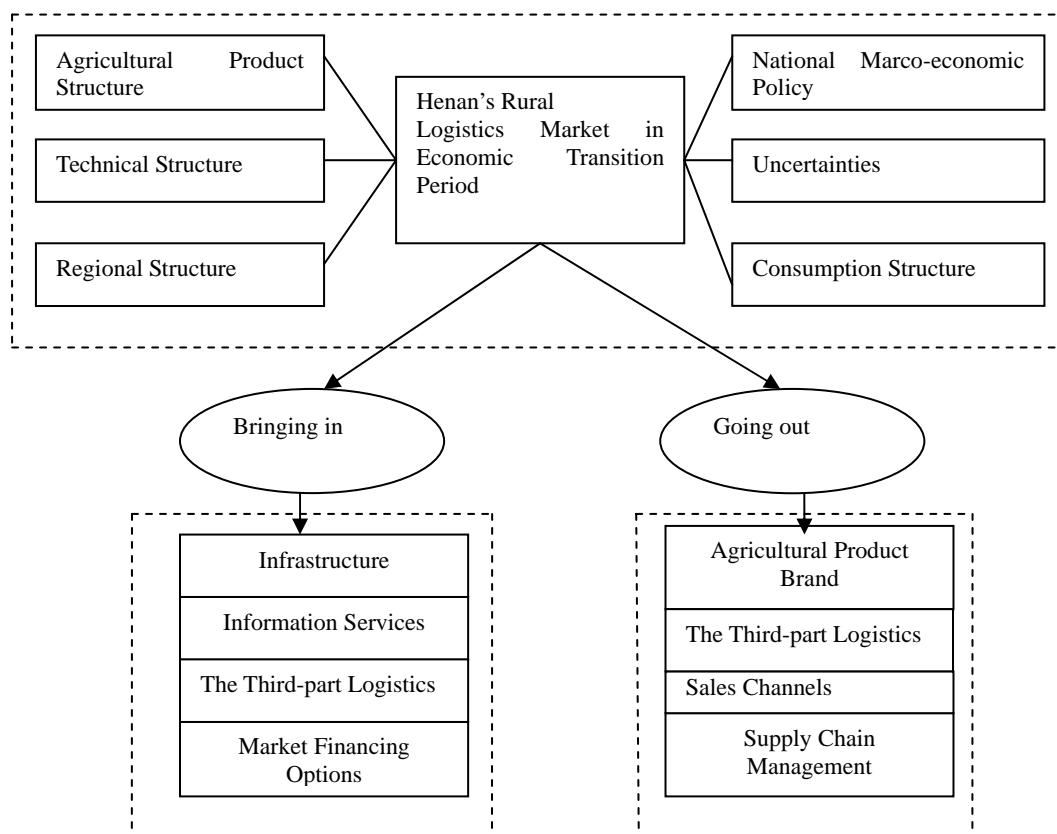

There are six latitude that including the national macro-economic policy, agricultural product structure, technological structure, regional structure, consumption structure and uncertainties. Two facets is the optimal goal, specifically, the previously described "going out" and "bringing in", there are four elements such as infrastructure, information services, the third-part logistics and market financing options in "bringing in", on the other hand, there are four elements such as agriculture product brand building, supply chain management, the third-part logistics and sales channels in "going out".

### 4.2 Optimization path

(1) Continue to accelerate the construction of rural logistics infrastructure, decrease effectively the cost of rural logistics

Due to the specificity of a situation, rural logistics market are facing development bottleneck

because poor rural logistics infrastructure, in order to decrease the cost of rural logistics, we must strengthen facilities. This paper says that mainly to improve transportation condition, build information platform and agricultural products storage (including cold storage), distribution centers, etc. With the facts, give the recommendation that attempt to be led by the government, organize qualified enterprises, farmers, research institutions, continue to accelerate the construction of Henan’s rural logistics infrastructure.

**Figure 1 Optimization Model of Henan’ Rural Logistics Market in Economic Transition Period**

(2) Paying close attention to brand building, unblocking sales channels<sup>[4]</sup>

It has own characteristics of agriculture products in Henan, must follow the road of scientific planning and overall management. Specifically, particular regions maybe cultivate brand product, adhere to the road of brand. Moreover, using information platform, planning ahead, best-selling sales channels.

(3) Guiding farmers to change the consumer attitudes

The statistics on the number of early 1990s shows that the rate of agricultural post-harvest nature value and the ratio of logistics. Developed countries like United States is 3.8, Japan is 2.2, while China is only 0.38. In other words, the circulation of agricultural products in China is a course of mass decreasing and value reducing. For example, package, the start of produce, the origin of logistics, we must reject the idea of outmoded, explore new material, new technology. Just like this, we can protect the agricultural products for not be polluted, be decay, further enhance additional value.

(4) Strengthening cooperation with the third-part logistics company

The third-part logistics company plays a big role in the area of logistics, but there’s much shortcoming compare with mature market. At present, rural post logistics is the important component of rural logistics system, but has many problems such as post office is weak, the qualification of selling seeds and pesticides is not unified, business types and service offerings is rich enough. To look forward to two-win relationship, rural logistics market needs more third-part logistics companies to join.

(5) Promoting logistics technology standardization<sup>[5]</sup>

Standardization is a tool, a way of achieving logistics rationalization, as part of many logistics

system in rural areas, among both the connection and mutual restraint. The logistics costs and benefits have a major impact, must be uniform technical standards and job standards in order to coordinate, reduce friction, improve competitiveness of agricultural product. Specifically, we should reform the construction of logistics infrastructure in whole rural areas, should set up logistics information platform<sup>[4]</sup>, as much as possible to promote standardization of technology.

## 5 Conclusion

Henan's rural logistics market shows better development momentum in economic transition period, should explore sub-regional and phases optimal path based on market research. How to balance the integrate of persistence and stage, the overlap of progressive and radical, the interaction of government behavior and company action, the combine of regional and international, the differences between the individualisms of rural regions, still will obviously require further investigation.

## Research on the Brand Upgrade of Embed Outsourcing System's Industry Cluster\*

Yan Jingdong, Hu Hui, Jiang Junmin

School of Management, Wuhan University of Science and Technology, Wuhan, P.R. China, 430070  
(E-mail:yjdong02@163.com,huhui8024@163.com,jjm690@sina.com)

**Abstract:** Brand operation is in the highest value added link of the global outsourcing industry chain, so creating brand is the inevitable way to get rid of low level competition and form competition in the industry cluster, it is not only a important step to high-end the outsourcing industry chain, but also a key element of promoting the cluster upgrade. This paper firstly analyzes the necessity of upgrading industry cluster brand, then puts forward the collaborative brand upgrade mode based on the local enterprises and the industry cluster, and the local enterprise brand upgrade operation mechanism and industry cluster brand upgrade problems are also discussed on the basis of the above foundation.

**Key words:** International outsourcing; Industry cluster; Brand upgrade; Strategy

### 1 Introduction

Foreign articles about the research of industry cluster start from the study of the earliest “regional brand”, and gradually expanded to areas of industry cluster as the carrier of industry cluster brand research. The meaning of "regional brand" refers to collectively naming of public brand in a specific geographical in public brand, it is a national brand, local brand cover, geographical brand and cluster brand of the concept of many brand type.

In the year 2000, the Guang Dong province of China is the first creating the concept of “professional town”, professional town is the Guang Dong province of China economic development characteristic and advantage, it is the Guang Dong province of China “card”, it indicates the brand bud of the whole industry cluster. One year later, Beijing university professor and the research team WangJici in relevant industry cluster and its series research work, the first industrial cluster whole attention brand phenomenon, creatively puts forward “overall brand”, “regional brand”, "location brand concepts such as the term. The later years, the brand about industry cluster springs up and gradually develops, Zhe Jiang province of China and the government of Guang Dong province of China mainly of industry cluster of the construction of the most aggressive push brand in practice.

In this paper the industry cluster of embed outsourcing system is defined as follows: local industry cluster that relying on spontaneous economic powers of the industry cluster and endogenous driven at first by introducing foreign industry, specialization and resources in the optimization of the allocation of that drive to thrive local industry cluster, they formed competitive advantage with low cost and strong production ability, and the enterprise gathered with the main purpose to reduce production cost and transaction cost through specialization division of labor and cooperation, also share industry supporting, infrastructure and the labour market, and eventually process, assemble, OEM for multinational companies and foreign brand manufacturers. Such as China Zhe Jiang province of China, Fu Jian province of China, Guang Dong of China coastal area of textile clothing, shoes and hats, leather, house electric appliance, IT industry and so on.

Industry cluster brand is relying on the regional that has certain core business with competitive advantage and becomes the main source of some products, then gradually expands the influence scope, and finally forms the regional industry's popularity, reputation and strong market influence. Concerned our regional industry cluster of embed outsourcing system, despite more than 20 years of development and expansion, due to the double scope and control of the international big buyers or the multinational company in the developed countries, they still wander in the low end of the global value chain, and the brand value is not high, which becomes the main problem. Therefore, one of the effective option of promoting industry upgrade is to construct influential cluster brand, and promote the status of our embed outsourcing system's industry cluster.

### 2 Necessity of Brand Upgrade

First, the cluster brand upgrade is an important means and way of the industry cluster upgrade.

---

\* The project of National Social Science Foundation of China(NO.11BJY022)

After the formation of cluster brand, it will have a positive role in the produce of the famous brand enterprises, and the cluster brand is intangible asset owned together by the cluster enterprise and organization, and it will play a key role in driving the promoting of the cluster brand upgrade.

Second, cluster brand upgrade is the important link for industry cluster into the high-end value chain. The important means of the international competition is the brand competition, constructing brand with international standard , changing the simple processing, OEM production mode of the cluster, and creating conditions achieved by OEM to ODM and OBM change, this is the process of industry cluster upgrade process.

Third, cluster brand upgrade is an important source of getting market competitive advantage for the industry cluster. Like the enterprise or the product brand, the cluster brand is also based on cognitive a particular region of the purchaser product image and value dimension, it is the value provided for buyers by cluster products. So once established the cluster brand of wide popularity and reputation, that can be good to the product identification by buyers, and cluster brand products can expand the market depending on good brand recognition, so as to achieve the goal of the industry cluster upgrade.

### 3 Collaborative Mode of Brand Upgrade

The basic composition of cluster unit is enterprise, logically, enterprise upgrade is the premise of cluster upgrade, and the cluster upgrade happens after enterprise upgrade. And if the enterprise gets upgrade, that doesn't mean cluster must be able to get promoted, because of the cluster upgrade also influenced by other factors, such as industry, different characteristics of local policy, etc. Similarly, not any of the cluster enterprises has been upgraded can happen the cluster upgrade. Cluster upgrade itself is a dynamic process, the ideal situation is that the cluster ascension is took as a whole system and receiving directional, and each enterprise and unit corresponding ascension. Therefore, the combination of local enterprises and the industry cluster upgrade is the brand upgrade strategy of embed outsourcing system's industry cluster, the following figure 1 shows.

Figure 1 The Collaborative Mode of Brand Upgrade

The basic model of collaborative brand upgrade: one is the product brand rising to the cluster brand, that means firstly developing the well-known product brand, then through the product brand constructing the cluster brand; the other is to promote product brand after cluster brand, namely firstly through the regional economic management, planning, management, then improving the optimization of the industry development area environment, and finally to promote the regional economy development and shape cluster brand with good brand image of the industry. The strategy of cluster brand upgrade should base on the existing brand resources, foot on the international, technically support by the industry quality, raw materials management, production management, sales and service, image logo and the training of personnel comprehensive standard, treat the historical culture as the important content, optimize resources integration as the important means, choose the operation of the market as the basic pattern and overall promotion planning as the main promotion methods, also the unauthorized use and paid as the main way for trading, then create an international famous cluster comprehensive brand in the end. In addition, to do well in the trademark design and trademark registration work at home and abroad, and strive to promote and protect the whole image of the cluster brand, make best use of the resource allocation in optimization and cluster effect.

### 4 Operation Mechanism of the Local Enterprise Brand Upgrade

The high input and market turbulence of creating brand, bring high risk to the enterprise and brand activities, plus many enterprises, especially small and medium enterprises, have the common problem of

insufficient resources and capabilities, and individual enterprise is hard to take effectively brand activities. Therefore, the local enterprise can use the geographical position and industry association, through the resource sharing, complementary advantages and invest together and risks for collaborative brand, which can overcome the difficulties of insufficient resources and capabilities, but also spread risk, and make both parties achieve a "win-win".

#### **4.1 Brand guide mechanism**

In promoting local enterprise brand upgrade process, local government and related functional departments should correct the orientation, strengthen the guidance, outstand the service, strive for building famous brand and good environment for the enterprise. And for the enterprise with brand plan and the intent of brand, they should make a tracking management, move forward the services, grab from basic management, cut down from quality, regulate the enterprise internal management, solidify the enterprise brand foundation, establish enterprise brand platform, and promote enterprise's management quality and overall image, improve product quality and connotation market percentage of coverage, make the enterprise and the process of brand enterprise development ,expansion and connotation, ascend practice process of economic development in higher level.

#### **4.2 Brand learning mechanism**

Brand learning is mainly refers to the interactive process of the local enterprise who acquires knowledge, promotes the brand of technology, management and marketing ability with other brands and institutions .From the brand value chain perspective, the enterprise can effectively improve the product quality, improve brand awareness and reputation, create higher brand value in product supply, technical innovation and marketing synergy of strengthening the cooperation.

Brand learning mainly through two ways: one is the local enterprises study between each other in the regional industry cluster. It is an important way for small and medium-sized enterprises to promote the brand by imitation from other brand, they can quickly imitate another brand products, management, marketing methods, so formal learning between the local enterprises are particularly important for the brand upgrade. The other is a brand of learning in university research institutes of the industry cluster. As to the creation of knowledge, university research institutes are important in "bridge" role of promoting the complex relationship within a cluster of tacit knowledge transfer process.

#### **4.3 Brand knowledge spillover mechanism**

In the cluster internal brand study, the local enterprises and OBM international brands "participatory cooperation" contributes to global outsourcing of knowledge spillovers within the system, it produces spillover effect. In addition to formal learning outside, there still exists unique brand knowledge spillover of learning advantage inside a cluster. In the internal of the cluster, a large part of the enterprise knowledge spills out, and become public knowledge of the enterprises in the area of industry cluster. Brand knowledge spillovers within the enterprise include groups between overflow and group of university research institutions (including technology service center, the government research department, agency service agencies) to the group of enterprise in the spill. Brand knowledge spillovers through the following main ways: one is the cluster informal exchange. Informal exchange is an important way of tacit knowledge transfer, mainly through the two channels of social networks and the personal relationship network in the cluster. The other is a flow of enterprise employees. Employees with a certain skill will accelerate the flow in the cluster of the tacit knowledge transfer.

#### **4.4 Incentive mechanism**

Incentive mechanism is very important for local enterprise brand construction. First of all, the local government can motivate local enterprises in constructing and maintaining the brand upgrade investment behavior through the financial, tax and financial policies variables. Secondly, introduce the incentive mechanism of innovation for entrepreneurs. Because entrepreneurs with rich adventurous and innovative consciousness are generally the strong advocates of building brand, through the design of a risk and innovation of both the coefficient of incentive mechanism, it will promote entrepreneurs realize that once they take the lead in brand participation in the construction, it is possible to get a degree of first-mover advantages and get a high return, and have a strong development of innovation incentives for the entrepreneurs.

## **5 Countermeasures of the Industry Cluster Brand Upgrade**

### **5.1 Improve the awareness of the cluster brand**

Brand as "invisible hand", which has strong power and influence, can not only hold up a product, but also drive regional rapid economic development, and promote industry cluster upgrade. The success

experience of the cluster brand development shows that lacking of a strong product brand of cluster, there is no sustainable development impetus, no strong product brand of local cluster, and there may not be the real competitiveness. The cluster brand upgrade is not a single enterprise thing, especially needs the government to advocate and effective, sustainable boost. Therefore, the upgrade of cluster brand as regional economic important contents should be put into the agenda.

### **5.2 Improve the access mechanism of the cluster brand**

Access mechanism is the primary system guarantee of the effective operation for the regional industry cluster brand upgrade. The local government should fully communicate with the cluster enterprise, and industry associations, and other action of the main body, and establish strict access mechanism for the use of the brand cluster.

First, the enterprise is allowed to enter the cluster and be authorized to use appropriate cluster brand only after the product quality authentication and achieve the industry standard, so as to set a certain threshold to put out some bad qualification which may harm the brand image of the enterprise ruled. Second, the value of the cluster brand depends on effective regulatory and maintenance, and the product quality authentication and quality supervision is particularly important. In addition to general product quality authentication, a product authentication and origin fidelity authentication still should be noticed, for this is the basic means of the cluster brand. Finally, the property right of the brand cluster should be cleared, without the proper property protection system, access mechanism also cannot survive. Different from the individual enterprise brand, the ownership of the cluster brand is not obvious attributes, therefore, the problem of cluster brand owners can be solved through the government or industry association as regional cluster brand registrant, to the state administration for industry and commerce to apply for registration of a trademark, by registering cluster the brand trademark, clear the ownership of the property rights cluster brand.

### **5.3 Build good atmosphere for the cluster brand construction**

System innovation is the key of the cluster brand strategy. In the construction process of the cluster brand, the local government need provide support for the establishment and development of the condition for the cluster brand through the system innovation, concentration of necessary policy resources. One is to take the enterprise cluster development and cluster brands, as the breakthrough of transforming and build a good brand cultivation of the policy environment, market environment and the service environment. Second, it is to put the power of the relevant government departments and resources effectively to organize and promote the construction of cluster formation brand resultant force, because of the government departments involved more in the process of brand strategy. Third, it is to strengthen the government investment. Such as setting up the strategy of famous brand development fund, holding special funds that support cluster brand development, encouraging and guiding more enterprise actively to establish free brand. Making Efforts in the product positioning, function orientation and market positioning, driving the enterprise to develop in the market, increase investment on brand, and lay solid foundation for creating famous brand.

### **5.4 Cultivate cultural environment for the cluster brand construction**

The foundation of the enterprise is the local industry culture and entrepreneurial atmosphere, so great efforts should be made to build comfortable, free, open, just humanistic environment. The important standard of judging the cluster brand is that the region economic relations and social relations have highly inner relationship, namely enterprise in an area adjacent and nets, then produce the desire of the trust and cooperation. However, for a long time our country with a bad market mechanism, lack of social capital, low level of trust, highly transaction cost, all these make some areas in China and the enterprise only pay attention to use internal resources, and focus on improving enterprise within the adaptability and flexibility, and does not pay attention to seek enterprise external resources, thus it is difficult to develop effective cluster brand. Therefore, we should focus on cultivating area to create brand entrepreneurs and the system of the cultural atmosphere, in order to strengthen the enterprise culture construction and industry culture construction, and to cultivate honesty culture, collaborative culture and innovative culture, strengthen the ecological environment and management, perfect the social construction and management. Cracking down on fake behavior within the cluster, making sure that the technical innovation achievements, protecting their honest, forming orderly market and good innovation atmosphere.

## **6 Conclusion**

The cluster brand is a collective action of the integrated embodiment of many enterprises in the

regional cluster, it is a kind of public resource, which forming a higher industry or product profile reputation on a wide range of this region. For example, Paris perfume, Italy leather, Swiss watch, Hollywood movies in the United States, silicon valley in the IT products and Wen Zhou province of China lighters in our country, etc. The brand upgrade of the industry cluster can not only benefit to the improvement of the enterprise bargaining power, and develop domestic and international market, but also promote the whole area of the image, create favorable conditions for investment promotion and future development.

(E-mail: maohao@whut.edu.cn, cb200999@163.com)

**Abstract:** As the most important carrier of information in advertisements, advertising language is the core of the advertising phenomenon. The paper aims to discuss the characteristics of advertising language and it generalizes the fundamental knowledge of the advertising including its definition, functions and characteristics of advertising language. Based on a corpus of 200 advertising English, the study makes an analytical study of innovations in advertising language at the lexical and syntactic levels from linguistic perspective.

**Key words:** Advertising language; Innovation; Characteristics; Linguistic perspective

### 1 Introduction

Penetrating into every aspect of consumption life, advertising has become one indispensable part of daily human life. Advertising is something that we are all exposed to everyday. It is something that is likely to affect us in a number of different spheres of our lives. Advertisement has become so common a social phenomenon in modern society that a French advertising critic once said that the air we live in was composed of hydrogen, oxygen and advertising.

Advertisements are presented with a type of language that is persuasive in nature, namely, advertising language. As the most important carrier of information in advertisements, advertising language is the core of the advertising phenomenon. Language has a powerful influence over people and their behavior, This is especially true in the field of advertising. "Advertising takes many forms, but in most of them language is of crucial importance." (Vestergaard and Schroder, 1985: Editor's preface by Peter Trudgill) Though visual content and design in advertising have very great impacts on consumers, it is language that helps people to identify a product and remember it, thus the choice of language to convey specific messages with the intention of influencing people is of prime importance in advertisements.

Because language serves as a major carrier of advertisements, the study of innovations in advertisements is, in most cases, the study of innovations of language in advertisements. Creative advertising language is an important part of innovation of advertisements and a decisive factor in the success of advertisements. The key to the realization of the advertisement effect is to provide people the promises of interest or the conception of consumption, but all these mainly rely on language. 50% to 70% of the advertising effect comes from its language. The wording of advertisements is especially crafted to meet the purpose of informing, persuading and influencing.

The large number of examples quoted in this paper is based on advertising material from British, American and Chinese publications at various times.

### 2 Innovation Creates Success

#### 2.1 Innovation and advertising

Innovation creates success and it is defined as the successful implementation of a creation (Heunks & Roos, 1992). Innovation is the introduction of new processes, new ways of doing things and revolutionizing how things have been accomplished previously.

The word "advertise" has its origin "advertere" in Latin, meaning "to inform somebody of something", or "to draw attention to something". The father of modern advertising, Albert Lasker defines advertising as "salesmanship in print". Media now encompass more than print with the advent of radio, television and internet. Nowadays Bovee's definition is widely quoted and it is accepted by the Definition Committee of American Marketing Association. It goes as follows: Advertising is the non-personal communication of information usually paid for and usually persuasive in nature about products, services or ideas by identified sponsors through the various media. (Bovee, 1992)

The ANNA (America National Association of Advertisement) sums up the purposes of advertising as: awareness, comprehension, conviction and action. What is advertising language? When defining advertising language, Geis states, "the language of advertising is aimed to affect people in many ways:

such as persuading or seducing people to purchase products or services, voting for particular political candidates and so on.”(Geis, 1994)The language is the most important part of advertising. The advertising language is almost brief and incisive in nature. It helps to make the advertisement more impressive and easier to remember. Featured with the value of memory and attention, successful advertising language meets the audience’s aesthetic criteria as well as social value. Advertising language has its distinguishing features in vocabulary, syntactic and rhetorical structures. It represents the images of the companies and spreads culture.

## 2.2 Impact of innovation and advertising on sales

Through innovation Coca-Cola transform into the world’s largest beverage company and a lead in market. In 1886, a carbonated soft drink Coca-Cola was born in Atlanta. 125 years later, it has been one of the world’s famous trademarks and more than 500 nonalcoholic beverage brands, primarily sparkling beverages but also a variety of still beverages such as waters, enhanced waters, juices and juice drinks, ready-to-drink teas and coffees, and energy and sports drinks sold in the stores, restaurants, and vending machines of more than 200 countries. Now, Coca-Col’s sales outlet has already achieved 87 percent in the world and the consumers enjoy 1.8 billion servings of Coca-Cola products daily. Muhtar Kent, Chairman of the Board of Directors and CEO of Coca-Cola company, convinced that their most important business breakthroughs will come at the intersection of sustainability and innovation.

Began with the first advertisement“Drink Coca--Cola”, it is said that the founder Dr. John Smith Pemberton grossed \$50 on Coca-Cola having spent \$73.96 on advertising; by 1872 advertising expenditures had reached \$ 1100; by 1920 they reached \$2 million. The research indicates that 82.2% of consumers for Coca-Cola brand cognitive is obtained through advertising. In 2007 Coca-Cola global advertising investment maintains nearly 20% of its global business income 24.088 billion dollars.

**Table 1 Company Shares of Soft Drinks (RTD) by Total Volume 2004-2008**

Company /% total rtd volume	2004	2005	2006	2007	2008
Coca-Cola China Ltd	12.3	13.4	13.8	14.5	14.8
Ting Hsin International Group	3.2	4.8	6.8	8.7	9.1
Hangzhou Wahaha Group	7.5	7.2	7.4	7.4	7.2
PepsiCo China Ltd	6.8	6.7	6.6	6.4	6.7

*Data source: Nielson report (updated toY08)*

Coca-Cola maintains high advertising investment compare with other soft drink brands. The undeniable fact is that the amount of advertisement and company shares of soft drink is directly proportional. The lower brand advertising contact leads to the decreased permeability of the brand. It can be clearly found: keep higher advertising contact rate is the key to success in the market. In the world, Coca-cola vied with Pepsi for more sales. If anyone of them wants to break balance, it should take some updates. In a formed market, innovation in product and advertisement is essential to any enterprises to possess positive market share, as all the products in this market are similar. Therefore, innovation in advertising is a key to make a breakthrough. The first one who makes innovations would be the one who owns more market share.

## 2.3 Innovation in advertisement

Advertising is any of various methods used by a company to increase the sales of its products or to promote a brand name. Innovation in advertisement is, kind of method, doing same things a new way, also productive compared to product innovation. It is the key determinant of success. Raymond Rubicam, once noted, “The only purpose of advertising is to sell. It has no other justification worth mentioning”. The function of advertising is to influence the purchase behavior of customers by providing a persuasive selling message about products and services.

This point can be illustrated with the example of Coca-Cola. In addition to its quality and taste, the advertising of the company has its specific characteristics and plays an important role in the marketing. The concept of innovation involves creating new things and bringing new ideas which are essential to the business success. Being best in business is just same as being innovative. All the key factors of innovation, product, service and business model, foster the growth of enterprises and stimulate productivity as well. With the awareness of importance of innovation, it has been consolidating its status as the business success.

From 1886 to 2011 Coca-Cola has created more than 60 advertisements which mainly utilize 11 rhetorical devices, including, pun, personification, oxymoron, etc. The figures of speech in Coca-Cola advertisements increase advertising effect and achieve good publicity effect, Such as:

- 1) Ice-cold sunshine. (1932, Oxymoron)
- 2) Where there's Coke there's hospitality. (1948, Parody)
- 3) Coke ... after Coke ... after Coke. (1966, Repetition)
- 4) Catch the Wave (for New Coke). (1986, Pun)
- 5) Coca-Cola Open Happiness (2011, personification)

Example (2) in the above is a parody which comes from the proverb "Where there's a will, there's a way". This advertisement, novel and unique, is easy to cause the audience's interest and associations. "Where there's Coke there's hospitality", shorten the distance between manufacturers, distributors and the consumers, achieve the expected effect of advertisement. It is the flexible use of rhetoric devices in Coca-Cola advertising that create the Coca-Cola unique brand. Therefore, the innovation of language in advertising plays a very important role.

### 3 Characteristics of Advertising Language

The innovation of language is the most efficient way to arouse consumers' curiosity and interest and attract them to purchase the products. The correlation between the novelty and the degree of spreading is a strongly positive one. Consumers are surrounded by advertisements in modern commercial society and in most cases, it is the visual content and design of advertisements that make the initial impact and cause them to take note of it.

When the advertising language of a product is full of novelty and easy to remember, it will be popular. Generally speaking advertising conducts the communication of information in three modes: audio, visual, and language. Comparatively advertising language in a way provides more exact, detailed and dependable information than music and pictures which act as supplementary means in advertising. Advertising language has developed its own features.

#### 3.1 Informative function

Three functions of advertising language--the informative function, the persuasive function and the reflective function are put forward by Vestergaard and Schronder in 1985. The informative function is absolutely vital in advertising. People will not buy products without information about them. Advertisements are successful or not depend on whether they persuade consumers to buy the product.

#### 3.2 Persuasive function

The basic purpose of advertising is to identify and differentiate one product from another in order to persuade consumers to buy that product in preference to another. Persuasive advertisements are thus the instruments used by the advertisers who "have defined their target audiences and determined the effect they hope to achieve through persuasive advertisements in the media"(Cook,1992). And a persuasive advertisement persuades the potential consumers to buy the product. The persuasive function is not only limited to attracting the potential consumers into buying a certain product, but also including the selling of services, values, ideas, and norms.

#### 3.3 Reflective function

As for the reflective function, advertising is not just a marketing tool but also a cultural exchange and a social actor. For these functions, the advertising language is of great importance.

It is undoubtedly true that advertising language is a kind of text that does its best to get the attention of the consumers, to make them turn towards it (Goddard,1998).

#### 3.4 Characteristics of advertising language

There are three distinct general characteristics, taken together, leading to advertising power:

Firstly, advertising language is purposeful. Advertising is a form of communication and language is the most important vehicle of communication. The purpose of advertising is to sell products or services. Therefore, advertising should tell its audiences the benefits of a product or a service, that is, the advertising should state, implicitly or explicitly, why the product or service is good for the consumers, why the consumers should buy it, or what the consumers can expect from it. In the case of advertising, space and time are costly, thus the wording is carefully crafted to meet particular ends in most cases.

Secondly, advertising language is rich and striking. In order to sell products or services, the first task of copywriters is to make their advertisements eye-catching. Once the audience's attention has been caught, the advertisement should hold consumers' attention and it should convince them that the subject of this particular advertisement is of interest to them. Furthermore, it ought to convince the consumers that the product will satisfy some need--or create a need which they have not felt before. The advertisement should convince them that the advertised brand has some qualities which make it superior to other similar brands. In order to achieve these goals, it is doubtless that advertising language should

be rich and striking. In addition, advertising language involves audience. Therefore, copywriters try to associate audience with the innovations of language which are efficient, pervasive and powerful. Advertising language is different from other languages because audience participates in it. The audience shares the knowledge about their total situation and their culture.

Last but not least, advertising language is a simple language. Copywriters cannot impress someone with their wide vocabulary in an advertisement and complex sentences will not encourage people to read the advertisement. People will also tend to believe advertising messages that are presented to them in simple words or expressions. When such words are used, audiences readily grasp the meaning without losing time in guessing. Many excellent advertisements are famous for their simple but powerful language, such as Marlboro, Coca-Cola, Nestle, etc. Difficult words are edited out and replaced by simple ones. With time passing by, advertising language has frequently changed. But these three distinct general characteristics have made it different from other languages. And they are taken together to lead advertising to its persuasive power.

#### 4 Innovative Strategies of Advertising Language

Advertising language, as the communicative vehicle of advertising, has its own specific linguistic features and functions. The structure, the content and the words used in an advertisement, all of them serve the purpose of attracting the potential consumers to purchase products or services.

Good advertisement should be unforgettable, competitive, novel, smart, compact and authentic. They endow active feelings for the brand and help people to distinguish the brand from others. With the purpose of drawing consumers' attention, advertisements are always designed to be special, outstanding and out of the ordinary.

Based on a corpus of 200 advertising English, the study makes an analytical study of the innovations in advertising language at the lexical and syntactic levels from linguistic perspective.

##### 4.1 Use of coinages for novelty

The creation of new and tricky words is necessarily the source of originality in advertising. Advertisements are always designed to be special and out of the ordinary. The use of coinages makes advertising languages special and unique. For example,

1) *We know eggsactly how to sell eggs.*

The word 'eggsactly' is wrongly spelt on purpose for 'exactly', making consumers take notice of it again. Some advertisements always say something deviant to arouse curiosity. New words or phrases created by means of imitation are occasionally seen. Such newly coined words and phrases suggest that the advertised product possesses peculiar qualities as well as the value of novelty, as in the yogurt advertisement below:

2) *First of all, because now Yoplait is thicker.*

*Second of all, because it's creamier.*

*Third of all, because it's still 100% natural and really very good for you.*

*Fourth of all, because to me Yoplait tastes better than all the Yogurts.*

*And fifth of all, because... well, just because...*

This advertisement of yogurt owes its success to the rhetorical devices and the particular creative style as well. The designer coined 'second of all... third of all... fourth of all... fifth of all' modeling on the set phrase 'first of all', and ellipsis is placed after 'because' following 'fifth of all', meaning the yogurt bears a quality that is so amazing, unable to be put in words.

3) *Drinka*

*Pinta*

*Milka*

*Day*

This is an advertisement for milk. In conformity with grammatical rules, the standard sentence should be "Drink a pint of Milk a Day". However, the word *of* is usually pronounced unaccented /f/, and the word *milk* has the capital consonant letter 'm' in this advertisement, causing *of* to be pronounced /ə/, which has the same sound with the letter *a*. Hence the article *a* here serves as a suffix of *Drink*, *Pint*, and *milk* to attain the sense of beauty in rhythm, thus arousing the consumers' curiosity and drawing their attention. It is crucial for advertisers to appeal to the audiences.

##### 4.2 Pun

Pun is one of the linguistic devices most frequently exploited to the end of novelty. A pun is a humorous play on words, sometimes on different senses of the same word and sometimes on the similar

sense or sound of different words.

4) *Ask for More--More cigarette*

The above is the advertisement for *More* cigarette in which *more* remind us of the double meanings of the word. The first *more* is the comparative form of the word *much* or *many* while the second is in fact a proper noun--the cigarette brand. The consumers are likely to be informed that *More* cigarette is good. If you smoke, you demand *more*.

In some cases it is advantageous to purposely choose a brand with a name that can be utilized in this fashion, especially if the product being advertised is difficult to distinguish from competitor products, much like the cigarettes in the above example. Puns involving brand names are very common in advertisements. It is a very effective means to achieve the ends to attractive the audience. The following are some advertisements with puns involving brand names:

- Be sharp.(Sharp AQUOS LCD)
- Right for everyone.(Pringles Right Crisps)
- I'd walk a mile for a Camel. (Camel Cigarettes)
- Better gas mileage. A Civic responsibility.(Honda Civic)

#### 4.3 Parallelism

Parallelism is a balance of two or more similar words, phrases or clauses. Known as parallel structure or parallel construction, it helps achieve emphasis and make the expression more rhythmical, forceful and passionate. Advertisers are very conscious of the importance of parallelism which makes the advertisement beautiful to listen to and easy to remember, thus tempting the consumers to buy their products. It frequently appears in the headline of an advertisement.

5) *A promise to respect your sense of style, most of the time.*

*A promise to provide for you, no matter what.*

This is the headline of the advertising offered by MassMutual life-insurance company. In this headline, the consecutive words *promise* appear twice representing honesty of the company, which is easily trusted.

Besides, parallelism in advertising saves space, which is used to list many other properties, normally with repetition of key words to put the product brand and its property together for the deep impression on consumers.

6) *Perfection in the wink of an eye*

*Perfection in its formula*

*Perfection in its brush*

*Perfection in a look*

This is an advertisement for EYELASH made by Christian Dior. In this advertisement, the same noun-phrases with word of *perfection* appear four times helping consumers to memorize the outstanding function of the eyelash product in one's eyelash's formula, brush and look, forming the perfection in the wink of an eye.

## 5 Conclusion

In brief, we should be fully aware of the importance of innovations of advertisement, in particular, the innovations of advertising language. The advertising language, cultural and psychological factors should be taken into consideration when we make advertisements. Only in this way can the good advertisements full of innovation be made.

# Study on the Innovation Strength of Industrial Enterprises in Harbin City of China \*

Liu Yang, Ding Yunlong

School of Management, Harbin Institute of Technology, Harbin, P.R.China, 150001

(E-mail: ly19800219@163.com, dingyunlong@hit.edu.cn)

**Abstract:** The definition of innovation strength has two levels, it covers all factors directly related to technological inputs and outputs in the narrow sense, while in the broad sense, economic and social development driven by technology promotion is included additionally. Guided by the broad definition, this paper build an evaluation index system which is composed by four sub-modules, namely technology resource, technology input, technology diffusion and technology output. Based on this index system, a comparative study of technology innovation strength between Harbin and other vice-provincial cities is conducted with economic census data from 2005 to 2010. The results show that all 19th vice-provincial cities can be categorized into three levels in accordance with their entrepreneurial innovation strength, and Harbin is listed in the lowest category, although the innovation strength of most industries, especially manufacturing sector, have been improved in the past years. Verifying the driving forces of entrepreneurial innovation strength of Harbin, countermeasures have been put forwarded to promote innovation strength in the following aspects: promoting manufacturing sector, increasing investments, issuing preferential policy, improving awareness of patent preservation as well as speeding application of key and advanced technology.

**Key words:** Innovation strength; Industrial enterprises; Evaluation index systems; Index analysis

## 1 Introduction

Innovation strength actually is a dynamic and evaluative concept. Hence, there is no definition about it because it covers technology and the factors influencing technology, such as economy, society and culture. Nowadays, the definition is limited to the contribution and influence in military and economy of technology and its related activities. However, this definition does not have a good understanding of the power of technology. Braguinsky found that the innovation strength of one area should reflect its overall technical development state and level, especially the ability of technology application, and its potentiality<sup>[1]</sup>.

Malerba found that the definition of innovation strength has two different levels from narrow sense and broad sense. Narrowly speaking, innovation strength means the discovery, invention, and creation capacity reflected by the national or area technological resource investment and activities; while in a broad sense, innovation strength is the capacity to obtain output, promote social, overall economic development with the existing manpower, financial, knowledge and information resources in the productivity system of a certain nation or area<sup>[2]</sup>. Achilladelis's research shows that, in the narrow sense, innovation strength includes the directly related factors of technology inputs and outputs, while in the broad sense, it also includes the facilitation of technology for economy and society development in addition to the innovation strength in the narrow sense<sup>[3]</sup>. Since 1996, China's implementation of "Invigorating the Country Through Science and Education" strategy, the nation and all provinces have carried out a wide range of statistical monitoring of technological progress. Zhou Li and Wu Yuming's research shows that the national and provincial technologic progress evaluation index basically covers technological infrastructure, scientific and technological input, scientific and technological output, science and technology usage for economic and social development, which is similar to the study perspective of the innovation strength of the broad sense<sup>[4]</sup>. Thus, this report chooses the definition of the narrow sense to analyze the influencing factors deeply, detailedly, and comprehensively.

## 2 Data and Methodology

### 2.1 Factors influencing innovation strength

The current innovation strength constitutes technological potentiality; hence, innovation strength is a dynamic concept, and the evaluation of innovation strength should focus on its whole formation. The

comprehensive and systematic evaluation mainly covers the following aspects: technological resource basis, technological input, diffusion and output. Technological resource basis refers to the necessary technological resource reservation for its long term continuous development; technological input refers to all the resources invested in technological activities including human resources and financial investment; technological diffusion is the bridge connected technological input and output, including technological introduction and diffusion; technological output refers to the direct output generated by technological activities and high-tech industrialization.

## 2.2 Identification of innovation strength evaluation system

The evaluation system is constituted of 4 first level index, 8 second level index and 24 third level index according to its definition and influencing factors(see Table 1).

**Table 1 Enterprise Innovation Strength Evaluation Index System**

First level index	Second level index	Third level index
Technological resource basis	Technological human resource	Number of professional people of 10000 people
		Number of people with college or higher education of 10000 people
		Number of engineers and scientists of 10000 employees
	Technological material condition	Funding of per capita for scientific activities
		Fixed assets of per capita
		Proportion of new fixed assets for research and comprehensive technique services
Technological input capacity	Technological manpower input	Number of R&D scientists and engineers of 10000 people
		Proportion of enterprise R&D personnel in the whole society R&D personnel
	Technological financial input	Proportion of R&D expenditure in GDP
		Proportion of R&D expenditure in technological input
		Proportion of local technological allocation in financial expenditure
		Proportion of enterprise R&D funds expenditure in products sale income
Technological diffusion capacity	Technology introduced capacity	Ratio of enterprise introduced technology assimilation
		Ratio of technology fee in the contract of introduced technology
	Technology diffusion ability	Technological achievement volume of transaction of per capita
		Ratio of technology transfer contract
Technological output capacity	Technological achievement	Number of 10000 R&D personnel technological paper
		The national science and technology achievement award coefficient
		Number of granted invention patent of 10000 employees
	High-tech industrialization	Proportion of hi-tech growth of overall industrial growth
		Proportion of hi-tech product export value of overall products export value
		Proportion of hi-tech new products sale income of product sale income
		Contribution of hi-tech enterprise growth to economic growth

## 3 Results

Firstly, collect the actual value of the vice-provincial and above cities according to the technological strength index that has been referred before (The absent data of 2004 economic census has referred 2002 R&D inventory data). Secondly, set the index of Beijing as 100, and calculate the index of other cities compared to Beijing, then sum all the single index and, calculate the average index, and finally, make the order of the technological comprehensive index according to the data (see Table 2). According to the order of the technological comprehensive strength, the innovation strength of the 19

cities can be classified to three matrixes.

**Table 2 Enterprise Innovation Strength of 19 Vice-Provincial and above Cities of China**

City of China	Index	City of China	Index
Beijing	100	Ningbo	25.4
Shanghai	96.8	Chongqing	23.8
Shenzhen	54.4	Xi'an	23.4
Guangzhou	49.5	Hangzhou	21.6
Nanjing	31.4	Shenyang	18.6
Qingdao	29	Harbin	13.6
Wuhan	27.4	Jinan	11.8
Tianjin	26.4	Xiamen	11.5
Chengdu	26.4	Dalian	9.4
		Changchun	8

### 3.1 The first matrix

The first matrix: Beijing, Shanghai, Shenzhen and Guangzhou.

The enterprise innovation strength comprehensive index of Beijing and Shanghai is 100 and 96.8 respectively, which is much higher than any other cities. Beijing is the largest technological center of China, and more personnel and funds are invested in enterprise technological activities; as for technological achievements, Beijing has the most invention patent, which shows that Beijing has the strongest enterprise independent innovation capacity; although the quantity of published technological paper is less than Guangzhou, it is still far more than other cities. Shanghai is the largest economic center, indexes of technological activities personnel, funding and applied patent rank the first in the list; however, the index of invention patents and published technological paper ranks the third, and has a large gap to Beijing, which is only half of Beijing. Hence, the technology strength index is 96.8, and ranks second.

Enterprise innovation strength comprehensive index of Shenzhen and Guangzhou is 54.4 and 49.5 respectively, which equals to half of Beijing and Shanghai, but far higher than other cities. Due to the reform and open policy and the location advantage, adjacent to Hong Kong, Shenzhen rise in China first. Although the power of scientific research institutions is relatively weak, it has a good innovation environment and mature market mechanism, which attracts the nations best talents and technological achievements. Meanwhile, Shenzhen puts many personnel and funds in technological activities, which made great achievements. Hence, the technology funds ranks the third and applied patents and invention patent ranks the second. Meanwhile, Guangzhou is also the pioneer of china's reform and opening, and its enterprise technology comprehensive strength ranks fourth. However, its published technology paper ranks the first, which shows that when create huge material wealth, Guangzhou has focused on theoretical research and creates a rich spiritual wealth.

Enterprise is the entity which directly creates material wealth. Generally, enterprise innovation strength is positively correlated with economic strength. In the first matrix, Beijing, Shanghai, Shenzhen, Guangzhou enterprise innovation strength rank 1, 2, 3, and 4, and their innovation strength matches their economic status.

### 3.2 The second matrix

The second matrix: Nanjing, Qingdao, Tianjin, Chengdu, Wuhan, Ningbo, Chongqing, Xi'an, Hangzhou, and Shenyang.

The enterprise innovation strength index of the 10 cities in the second matrix is between 18.6 and 31.4, which is 70 to 80 less than Beijing and Shanghai, and about 20 less than Shenzhen and Guangzhou, which is really a big gap; meanwhile, it is only 5 more than the fourth matrix, which is a quite small gap. The 10 cities in the second matrix all have their own characteristics in innovation strength. Nanjing has more enterprise technology activities personnel, and published paper, which ranks the fourth; Qingdao has more applied patents, which ranks the fourth; Wuhan has more technology funds and invention patents, which ranks the fifth and sixth respectively; index of Chengdu and Tianjin is very balanced; Xi'an has more enterprise technology activities personnel, and published paper, both of which ranks the fifth; and Shenyang has more invention patents, which ranks the fifth.

In the second matrix, Hangzhou phenomenon is special. Hangzhou enterprise technology comprehensive strength ranks 13th, which shows that it has a weaker technology strength. However, its

total GDP ranks the 7th, which shows that it has a stronger economic strength, and GDP of per capita ranks 5th, which means that it has a higher economic performance. To conclude, it is unusual for a city has a high economic performance and strong economic strength with a weak innovation strength. The innovation strength of Hangzhou mainly caused by its few enterprise technological activities personnel and funds, which ranks 14th and 12th respectively. However, Hangzhou has many technological achievements, applied patents and invention patents ranks the 8th and the 7th. With fewer personnel and funds, Hangzhou has created more achievements and economic benefits. China's reform and opening starts from the southeast coast to the inland gradually. The more foreign investment absorbed, the more foreign advanced technology transferred and the more quickly the economic grew. For example, in 2001, the foreign investment made use by Chinese cities are as following: Shanghai is \$7.41 billion, Shenzhen is \$3.60 billion, Guangzhou is \$3.603 billion, Tianjin is \$3.297 billion, Beijing is \$1.77 billion, Qingdao is \$598 million, and Dalian is \$1.48 billion. These cities have more foreign investments, hence their economic grow quickly with a high economic performance, and the GDP per capita ranks the top.

Hangzhou's foreign investment ranks the 14th, with only \$503 billion. Hangzhou's economic great-leap-forward development was achieved mainly by its enterprise reform deepening, enterprise mechanism innovation, and private economy development. The reason to analyze Hangzhou is not to say few technological investment and foreign investment is a good thing, but to say that economical development has different modes. The underdeveloped Midwestern cities should not only learn from Shenzhen's "export oriented" mode, to increase the strength of the opening, but also learn from Hangzhou's "technological skills" mode, to deepen reform and change mechanism.

### 3.3 The third matrix

The third matrix: Harbin, Jinan, Xiamen, Dalian, and Changchun.

The five cities in the third matrix has a weaker enterprise innovation strength, and the index is between 8 and 13.6, which is far less than other cities. Meanwhile, their overall economic strength is weaker, and their GDP ranks between twelfth and nineteenth. For Harbin, it is Chinese old industrial base, and it has faced equipment aging, mechanism rigidifying, and heavy burden under the reform and open policy, meanwhile, it did not pay attention to technological investment and innovation, all these has caused its low index.

## 4 The Innovation Strength Evaluation and Comparison of Different Industries in Harbin (2004-2008)

### 4.1 Innovation strength evaluation of different industries in Harbin (2004-2008)

Based on the economic census data of Harbin in 2005 and 2010, this part will make an evaluation and comparison of the innovative strength of enterprises in different industries. When index is calculated, it is on the basis of the index system on Table 1, but leaves out some data which are inappropriate for analysis according to different industries. The results of the calculation can be seen in Table 3.

**Table 3 Index of the Innovative Strength of Different Industries in Harbin**

Industries	Index of enterprises' innovation strength (2004)	Index of enterprises' innovation strength (2008)
Oil and natural gas exploitation industry	0.15	0.19
Ferrous metals mining and dressing	0.00	0.00
Non-ferrous metal mining and dressing	0.00	0.00
Nonmetal minerals mining and dressing	0.00	0.00
Other mining industries	0.00	0.00
Agricultural food processing industry	0.97	1.05
Food manufacturing	2.27	2.32
Beverage manufacturing	0.14	0.18
Tobacco products industry	0.45	0.52
Textile industry	0.18	0.25
Textile clothing, shoes and hats manufacturing	0.00	0.00
Leather, fur, and feathers (fine hair) and its products industry	0.00	0.00

Wood processing and wood, bamboo, cane, palm, straw products industry	0.00	0.00
Furniture manufacturing	0.19	0.21
Paper and paper products industry	0.00	0.00
Printing and the record medium reproduction	0.33	0.42
Cultural, educational and athletic product industry	0.00	0.00
Oil processing, coking and nuclear fuel processing industry	0.23	0.32
Chemical raw materials and chemical products manufacturing	0.37	0.42
Pharmaceuticals manufacturing industry	17.51	17.54
Chemical fiber industry	0.00	0.00
Rubber products industry	0.00	0.00
Plastic products industry	0.00	0.00
Nonmetallic mineral products industry	0.38	0.48
Ferrous metal smelting and rolling processing industry	0.88	0.93
Non-ferrous metal smelting and rolling processing industry	0.84	0.87
Metal product industry	2.38	2.42
General equipment manufacturing industry	1.94	1.95
Special equipment manufacturing industry	19.80	19.88
Transportation equipment manufacturing industry	2.35	2.43
Electrical apparatus and equipment manufacturing industry	28.41	28.46
Communication equipment, computer and other electronic equipment manufacturing industry	12.77	12.83
Instrumentation and machine building industry for culture and office use	1.63	1.70
Handicrafts and other manufacturing industries	7.14	7.18
Resources and materials recycle processing industry	0.18	0.25
The electric power and heat power production and supply industry	0.90	0.94
Gas production and supply industry	0.00	0.00
Water production and supply industry	0.22	0.29

#### 4.2 Innovation strength comparison of different industries in Harbin (2004-2008)

From Table 3, we can see that: firstly, the innovative strength of enterprises in Harbin has been increasing. From 2004 to 2008, all the industries has significantly improved their innovative strength except some which do not need much innovation in their technical development; secondly manufacturing industries own the strongest innovative strength among the enterprises in Harbin, especially electrical apparatus and equipment manufacturing industry (28.14), special equipment manufacturing industry (19.80), pharmaceuticals manufacturing industry (17.51), communication equipment, computer and other electronic equipment manufacturing industry (12.77) etc.. It shows the characteristic of industry structure in Harbin that equipment manufacturing industry is its pillar industry and has strong competition.

## 5 The Driving Forces for the Innovative Strength of Enterprises in Harbin

### 5.1 Opening to the outside world to participate in the globalization of economy and technology

The improvement of the innovative strength of enterprises in Harbin requires favorable objective and subjective factors. In the times of economic globalization and knowledge globalization, all the countries in Asia rise rapidly. Besides, political stability and rapid economic development and social progress in China now also provide an unprecedented period of strategic opportunities for the

improvement of the innovative strength of enterprises in Harbin. However, at the same time, the science and technology development model has to be changed from the traditional “self development” to the new “introduce development”, from “isolation” to “technology opening”, from “technonationalism” to “technology globalism”. Opening to the outside world is the main source of world technology innovation. Multi-channel and direct access to international advanced technology allows the enterprises to share the achievements of world science and technology revolution, therefore it is possible for them to realize the “technological catch-up”, so as to promote the “economic catchup”.

### **5.2 Enterprises and market-led development**

This factor turns the technological innovation activities from government-dominant model to market-dominant model and technological innovation subject from state-owned research institutions to enterprises in the competitive market. First, enterprises should become the subject of the investment in R&D. Then enterprises should also be the subject of the output of R&D. Finally, enterprises will become the subject of the needs of science and technology. Thus, the area innovation system with market as the subject will be formed.

### **5.3 Government’s guidance and promotion**

In a more and more competitive world, the innovation strength is the “mirror” of the competitiveness of an area. Most countries have introduced market economy, but only a few with significant state power can be really powerful in science and technology. The improvement of innovative strength of China is not only the result of market mechanism but also reflects that China, as a developing country, has a clear goal for national development and enough ability to realize the phased objectives. This is an unique and important advantage for science and technology development in China.

The government plays three important roles in the improvement of innovative strength of enterprises in Harbin. The first is to guide long-term development of science and technology, and gradually form strategic orientation mechanism. In a more open and increasingly competitive international environment, the government continuously puts forward phased strategic goals for the science and technology development, based on its trend in China and overseas, regional economic development and social progress.

The second is to create a good environment for science and technology innovation and gradually form incentive mechanism with supporting policies. A good economic and social environment includes safe investment environment, stable macro-economic environment, favorable environments for establishing business and for public opinion. This kind of environment is good for the growth and development of innovative and entrepreneur's spirits, good for the rapid spread and application of scientific and technological achievement, and good for international communication and cooperation in science and technology. To support scientific and technological development, government needs to make supporting policies involving finance, taxation, government procurement, international cooperation, talents team, intellectual property, conditions platform, etc. and thus directs scientific and technological power to the strategic orientation goals with incentive mechanism.

The third is to continuously offer more fund in research and development and form investment guidance mechanism. The investment in science and technology in Harbin has been increasing because investment in great technological activity directly promote the growth of strength in innovation of local enterprises. More importantly, it leads the whole society to invest in science and technology. Local government’s investment in science and technology will encourage enterprises to increase their investment.

### **5.4 Sustained and rapid economic growth in Harbin**

The sustained and rapid economic growth in Harbin is not only the demand side which will produce great technological demand but also the supply side which can offer great technological supply. The number of innovative patent application and GDP has a good index growth curve, which indicates the interaction between economic strength and innovative strength. Economic strength provides foundation for innovative strength and in turn innovative strength will continuously promote rapid growth of economy, therefore both strengths are enhanced by depending on and complementing each other.

## **6 Conclusion**

The existing researches show that the innovative strength of an area is related to levels of economic development. However, there is a large regional difference of innovative strength and economic development level in cities in China. The areas with strong innovative strength have a high level of

economic development, and vice versa, which means innovative strength plays a significant role in economic development. In other words, innovative strength is promoted rapidly in those areas which value technological development, so the level and speed of economic development are better than those in other areas. Therefore, if enterprises in Harbin want to promote their innovative strength rapidly, they have to develop science and technology by taking needs of economic development in Harbin into consideration, and develop economic rapidly with the help of science and technology. Based on the analysis above, specific measures are as follows:

The first, expanding electrical apparatus and equipment manufacturing industry, special equipment manufacturing industry and pharmaceuticals manufacturing industry. These industries in Harbin have great advantages in output, fund raised and expenditure of scientific and technological activities etc.. These traditional advantageous industries in Harbin are competitive in the market and the proportion of output value in GDP is gradually increased. In scientific and technological development plans, promotion of pharmaceuticals manufacturing industry should be clearly proposed with specific goals and supporting measures. Therefore, Harbin owns the foundation and strength to expand the above three industries.

The second, increasing the fund raised and expenditure of scientific and technological activities and appropriation expenditure of new product development. The fund raised and expenditure of scientific and technological activities in Harbin increase rapidly with 20% or more annual growth averagely. However, the speed is too slow compared with other big cities. Therefore, they need to be increased from multi-channels. The proportion of fund rose for scientific and technological activities in fund from enterprises, the government and loans of banking institution should be increased. The expenditure of equipment investment is increased rapidly, but when advanced equipment and technology are introduced in Harbin, enterprises need to strengthen their ability to absorb the advanced technology and create new product and technology of their own as soon as possible. A certain proportion of capital could be drawn from the income of new products as fund for other new products development to make sure funds for new product development can be increased rapidly and continuously.

The third, making more specific preferential policies to attract more and more talents to the high-tech industry. High-tech employees in Harbin increase slowly and the percentage of high level talents is lower than most sub-provincial cities. Though policies have been made to attract high level talents, it is still difficult to attract and keep them. One of the important reasons for this is lack of specific preferential policies. Policies which have been made are too macroscopical but lack of specific rules to make sure high level talents can enjoy the preferential policies. Therefore, the various kinds of preferential policies should be put into effect in order to attract more and more talents to the high technology industry.

The fourth, enhancing enterprises' patent protection awareness and turn them into subject of technological innovation. With the reform of scientific and technological system, enterprises become the subject of science and technology; most research institutions are engaged in research and market development directly facing the market; technological management system of institution of higher education gradually adapt themselves to market economy, so technological market gains more and more attention. In such circumstance, Harbin also proposes to build enterprises' technological innovation system in order to turn enterprises into the subject of innovation and to set up and perfect development institution. Enterprises is encouraged to cooperate with scientific research institutes, institutions of higher education, and even multinational company to build research and development institution in order to tackle key problems and research together. Thus, industrialization process is promoted. When applied research institutions change into technological enterprises or become part of enterprises or intermediary organization serving enterprises, they must enhance enterprises' patent protection awareness so that independent intellectual property rights can be protected and technology can be applied to new product soon.

The fifth, promoting key and advanced technology with commonness to make full use of effect of industrial cluster. Due to the commonness in areas of economic and social development, industrial cluster has been formed in Harbin. There is also some commonness in scientific and social development, such as weak R&D strength, lower patent output, less fund for new product development. The industries of electrical apparatus and equipment manufacturing, special equipment manufacturing, and pharmaceuticals manufacturing in Harbin have been developing fast and have strong competitiveness. Industrial cluster is becoming an effective way to promote Harbin's innovative strength and playing an important role in involving in industrial division, improving international competitiveness and promoting industrialization. Industrial cluster has gained worldwide recognition of government and

industrial circle for its leading and supporting roles. Knowledge and technology cluster are beneficial to interaction between disciplines and the transfer and distribution of technology, thus new breakthrough in high-tech and its industries can be made. Besides, regional technological cooperation enhancement and innovative system establishment are important parts of the regional innovation system under the national innovative system. To set up industrial technology and service system, mechanism and institutional environment should be formed for the integration and interaction of the innovative subjects such as enterprises, colleges and universities, research institutions and government, with the goal of improving regional innovative strength and the focus on trans-regional knowledge flow and distribution. Thus, the overall competitiveness of Harbin can be strengthened. By setting up the industrial technology center, platform and network, the industrial technology system is formed with enterprises as the subject to help with the breakthrough in enterprises' key technology. Therefore, to optimize resources of science and technology, to enhance regional technological cooperation and to strengthen technological competitiveness, Harbin should promote key and advanced technology with commonness to make full use of effects of industrial cluster.
