# Analysis of Interactive Relevance Between Manufacturing Industry and Service

Hu Shuhua, Liu Yong, Wang Lijun

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hourenyong@126.com, wljah@foxmail.com)

**Abstract:** The paper studies the interactive relevance of service and manufacturing industry and finds that it falls into four types, namely, parallel transfer model, supportive driving model, collaborative symbiosis model and industry integration model. The four models possess unique contents and features. The paper tries to predict the cooperation of service and manufacturing industry in the future based on relevance analysis.

**Key words:** Service; Manufacturing industry; Industry relevance model

## 1 Introduction

With the continuous development of world economy and the accelerated upgrading of science and technology, the service and the manufacturing industry gradually developed into a symbiotic stage with high relevance and complementary relationship from independent states as before. From only involved in the workshop, manufacturing industry gradually covers each links, such as market research, research and design, purchase and quality inspection, marketing management and after-sale service, etc. Meanwhile, through a long-time development, service fully turns into an intermediate supplying department from an independent economic activity that has nothing to do with physical product. Based on commodity economy system, it can support the technical progress, handicraft development, in-depth division of labor and management transformation. With the deepening interactive effect on both manufacturing industry and service, their relationship continues goes to strength and depth with a diversification trend appeared in their cooperation model.

## 2 Literature Review

Since the second half of 20th century, service which led by western developed countries has developed rapidly. The academic researches about service attract wide attention, especially on the relationship between service and manufacturing, one of the key research problems. On this point, the academia has many different views. But it can be summarized to four types: requirement compliance, supply-oriented, interacting theory, and reconciliation theory.

The requirement compliance theory considers that service is a kind of process-type industry<sup>[1]</sup>. It plays the role of glue in the economic activity, thus to drive the development of industry by stimulating the commodity production. The supply-oriented theory emphasizes that the effect and meaning of service to manufacturing industry. It considers that service is the premises and basis of boosting the productivity. Without developed service, it is hard to form a competitive manufacturing department. The interacting theory concerns that the productive innovation of manufacturing enterprises can lead the process innovation of producer service. And the producer service requirement causes the production innovation. These two are inseparable<sup>[2]</sup>. The reconciliation theory reflects the influence of modern information technology and economic globalization to industry competition and cooperation. In order to promote the competitiveness of manufacturing value chain, it starts to realize an infiltration in each link between producer service and manufacturing. The boundary between these two is gradually blurred and interacted<sup>[3]</sup>.

For the description about the relationship between service and manufacturing, the above four points are complementary and boosting instead of conflict. The requirement compliance theory and supply-oriented theory argue the influences between service and manufacturing from two different sides. And the differences of these influences are the ways of effect. However, the interacting theory concludes these two points. It is accordant with the current practical situation to discuss the interacting effect from the internal relation between the service and manufacturing. The reconciliation theory basically reveals the leading effect of the modern producer service led by information and knowledge to manufacturing and the tendency of constant interaction in the two industries. This point also reveals the future tendency of the two industries.

### 3 Interactive Relevance Model of Manufacturing Industry and Service

Based on the available views of scholars and the development history of the two major industries, the paper analyzes the four types of the manufacturing and the service industries linkage development from the their aspect of relevance, namely, parallel transfer relevance model, supportive driving relevance model, collaborative symbiosis relevance model and industry integration relevance model (as shown in Fig 1).

Figure 1 Analysis of Relevance and Interaction Level of Manufacturing Industry and Service

Among the four types, the first one emphasizes the weak implicative collaborative approach by which the two industries make the one-way transfer of resources based on the division of labor principle; while the second reflects the strong cooperation model of the two industries relied on the formation of principal and subordinate; the third place an extra emphasis on the two industries' equal and synchronization of the strong relevance interaction model; the last one, however, refines the comprehensive emerging industry with interoperability and harmony of these two industries on the basis of the third model, and harmonizes both industries' development with its strong industrial relevance. In the process of four rising models, relationship between manufacturing and service is continuously deepened, industry border is weakening and hidden, and finally form the type of industrial symbiosis which has the two industries' characteristics.

#### 3.1 Parallel transfer relevance model

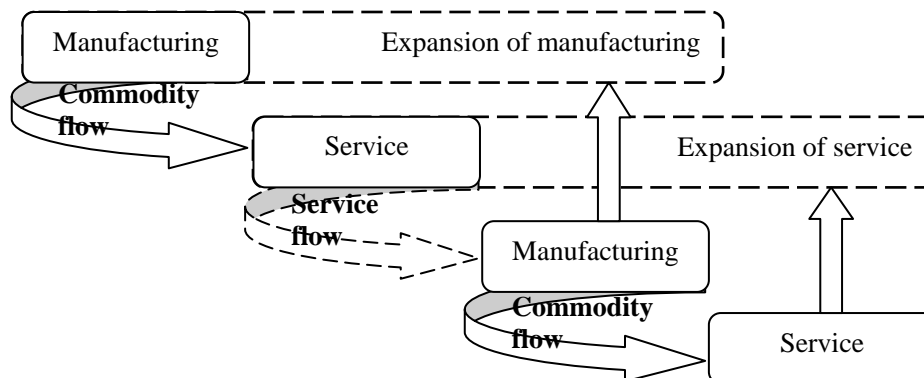

Figure 2 Parallel Transfer Relevance Model of Manufacturing Industry and Service

With the emerging and development of service, it's promoting function to economic development and the synergy function to those industries become increasingly obvious, the manufacturing and the service industries also gradually formed the interaction model which transform resources dividedly,

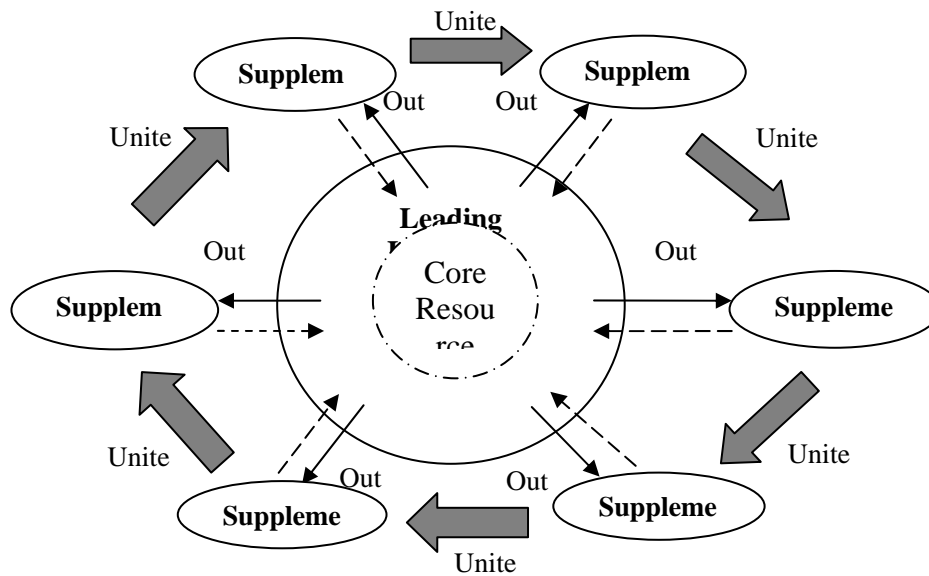

parallel transfer relevance mode thus comes into being in this background. With the division of labor on the basis of specialization, this mode relates the resources of service and manufacturing industry, makes the single path resources circulation to track through forward and backward, promotes industrial optimization and upgrading, thus expands the extending range of their industrial chains, and eventually realizes both industries' win-win developing mode (as shown in Fig. 2).

It is shown in this figure as well that service and manufacturing industry realize resource transfer and penetration by the cooperation model of unidirectional flow, which includes service flow and commodity flow based on the characteristics of division of labor in society, it meets the demand of industry as well as constantly extends new market demand to push the development of related industries, it also lays the foundation of the their deepened industrial relevance in the follow-up development.

**3.2 Supportive driving relevance model**

Supportive driving relevance model is put forward on the basis of "industrial centre theory" raised by scholars in domestic and overseas about the manufacturing and the service industries cooperation model. It symbolizes the two major industries to shift to the interaction of two-way resource transfer from the unilateral resources. In this theory, scholars have given two points, the "manufacturing center" and "services center". Both of them emphasize the master-slave relationship in such a model of cooperation. Based on the ideas, this paper summed up the supportive driving relevance model. The model emphasizes that in the process of cooperation between service and manufacturing industry, one of them is in a dominant position, it adsorbs auxiliary industries around to continuously conveying the required resources by the form of non-core resources outsourcing (as shown in Fig. 3).

Based upon this model, the leading industry gathers core resources inside, while the non-core ancillary resources are outsourced in the form of outsourcing to other industries so as to realize benefit-sharing and industry consolidation through strategic cooperation, resources in the optimization of the restructuring reenter the leading industry is conducive for leading industry to maximize its competitiveness in order to obtain a broader market space and longer-term prospects for the industry. And auxiliary industries, in the grasp of the leading industry's industrial outsourcing opportunities, in the completion of the established needs of the leading industry, will combine the resources of the leading industry output, integrate resources to focus on improving its own strength, so as to keep up with the leading industries of developing market capacity.

**Figure 3 Supportive Driving Relevance Model of Manufacturing Industry and Service**

**3.3 Collaborative symbiosis relevance model**

With the arrival of knowledge economy times, technology innovation and the renewal of thinking gradually become the priorities in each industry. On this point, the relation between the manufacturing industry, who leads the technology innovative revolution, and the service, who heads the innovation of thinking, is growing deeply connected. Their relationship transforms from primary-secondary

relationship to equal coexistent partnership. Considering the present demand of market, collaborative symbiosis relevance model becomes more and more popular, and continually expands its coverage and strength. Collaborative symbiosis model mainly refers to the fact that the manufacturing industry and the service would share the resources with equal interaction and then connect each other as a whole. By means of the collaborative integration strength with more featured products and industrial advantages, the industrial influence will stretch and expand, and the competitive edge should be maintained and promoted meanwhile (as shown in Fig. 4).

Figure 4 Collaborative Symbiosis Relevance Model of Service and Manufacturing Industry

As the figure shows, first a sharing platform for resource interaction and transformation between industries should be settled between manufacturing industry and service. By means of building a professional collaborative team or department, the important resource can be absorbed and integrated for the coordinated development of the two main industries. It is the preparation for better use of the follow-up resources. Once such resources are used in industries again, it can not only make up one's shortages through taking other industries' advantages, but also can stabilize and even expand its market share. Meanwhile, it also can introduce new resource to produce new features to the industry, thus to create a new profit point.

### 3.4 Industry integration relevance model

With the rapid development of high and new technology, which focuses on the information and the communication aspects, manufacturing and service industries are no longer clearly divided, but the degrees of infiltration and integration among those industries are getting deeper. Gradually, the coupling phenomenon is emerging between the two major industries. Currently there is a clear phenomenon of industrial convergence of manufacturing and service appearing among some industries, such as computer industry, telecommunications industry and the broadcasting and TV industry. Considering this integration relevance trend, the paper names it as an industry integration relevance model, which requires the manufacturing and the service industries, with high and new technology and concepts to form an integrated and symbiotic industrial unity, based on the mutual benefits and mutual trust principle. Through the production of integrated products, which should be featured by the characteristics of manufacturing and service, emerging market can be continuously excavated and explored. On the other hand, it also can support the relevance development of manufacturing and service (as shown in Fig. 5).

Figure 5 Industry Integration Relevance Model of Service and Manufacturing Industries

Under the guidance of this model, the core resource of manufacturing and service industries can be highly integrated, and the integrated resources featured by both of the industries are springing up too. It not only supports the emergence of new industries, but effectively adjusts the both major industries in the follow-up development. Thus, it can facilitate the industrial restructuring, optimization and upgrading. Meanwhile, when getting efficient information resource, the relevant industries will properly adjust the industrial chain to get relevant information as their support. Finally, the relevant industrial chains will be promoted into interactive developments.

## 4 Conclusion

With the continually compact relationship between the commodity and the service flows of both the manufacturing and the service industries, the rapidly developed scale of information, and the highly integrated information knowledge, invisibly shortens the gap between each industry. Their relationship gets closer, and cooperation is featured more dynamics. Apart from that, the integrative symbiotic relevant model of the two major industries is growing deeper, which will be reflected in the continuous renovation of traditional industries and the spring-up of new industries.

### 4.1 Traditional industry renovation

The renovation of traditional industry is mainly reflected in the speed-up introduction of service to traditional manufacturing industry, thus to stimulate the product updating and the industry upgrading. Currently, faced with the expanding demands in the market and the growing control power of economy, manufacturing industry can no longer satisfy the public alone. As a result, more manufacturing enterprises take service to promote the industrial vitality. For an instance, Ford Motor Co., whose primary service is no longer the production of motor vehicles alone, the rental car, the vehicle maintenance and other service businesses are the pillars of its economy as well. Through the combination of products and services, Ford attracts a lot of customers. Another example, General Electric Company, the traditional manufacturing enterprise in the past, now has an revenue from service businesses accounting for more than 40% of the same year's general income. It is obviously found that the edge of manufacturing industry and service is getting vague, while their interactive development is deepened.

### 4.2 New industry emergence

In order to satisfy the requirement of market for both the manufacturing and the service, entrepreneurs have to update and improve the old industrial model and management method. By means of innovative technology and management thought, they can promote the relevant industries developing in an order, thus to explore a sort of new industrial models. Therefore, the derived new industries, after resource recombination and upgrading, can not only satisfy the dual demands both from manufacturing market and service market, but also can accelerate their reaction speed to the transformation of public demands, thus to adapt to satisfy the marketing demands continually.

Based on the development history and relevant degree between service and manufacturing industry, the paper finds out four major interactive relevance models. It not only theoretically supports the research of interactive relevance between the two major industries, but also provides a certain reference when an appropriate cooperation model should be chose for the future development of Chinese manufacturing industry and the service.

# Research on Integration Management of Government-Oriented Enterprise Restructuring\*

Xu Jiangping

Luoyang Institute of Science and Technology, Luoyang, P.R.China, 471023

(E-mail: chengbeixugong@126.com)

**Abstract:** Government-oriented enterprise restructuring has its own specialty because it is an enterprise restructuring activity of government-oriented. On the basis of analysis the differences and similarities between government-oriented enterprise restructuring and market-oriented enterprise restructuring, this paper studies the main problems of government-oriented enterprise restructuring involved in the process of integration management. And then the main measures about government-oriented enterprise integration management have been proposed.

**Key word:** Enterprise restructuring; Government-oriented; Integration management

## 1 Introduction

Successful enterprise restructuring can improve the quality of the assets, optimize the allocation of resources, improve enterprise operating performance, and positively change the way enterprise develops. However, there will be many problems in the fusion process of both sides in the enterprise restructuring after enterprise restructuring. At this time, formulating a reasonable integration strategy to integrate the restructured enterprise is significant for the success of enterprise restructuring. Enterprise restructuring mainly divided into two kinds, the market-oriented and the government-oriented, this paper mainly focuses on researching the integration management of government-oriented enterprise restructuring.

## 2 Differences and Similarities Between Government-oriented Enterprise Restructuring and Market-oriented Enterprise Restructuring

According to different roles that government and market play in the process of enterprise restructuring, we divide state-owned enterprise restructuring into government-oriented and market-oriented. The common points of this two types of enterprise restructuring are that, the objects of this two types of enterprise restructuring are all enterprises, the effect of market is respected and brought into play in the process of this two types of enterprise restructuring, coordination problem between government and market is exist in the two types.

However, because of the different leadership, one is the government and another is market, in the process of the enterprise restructuring, these two types have significant differences between them in role playing of government, restructuring target selection, restructuring integration management and so on.

The leadership of the market-oriented enterprise restructuring is market, which plays a regulatory leading role in the restructuring activities. Therefore, the market-oriented enterprise restructuring, which motivated by internal pursuit based on the dissatisfaction of current situation in the process of development of the enterprise, is endogenous. The goal of enterprise restructuring is to enter the emerging industry which is growing up, or to obtain stable supplies of raw materials or product sales channels, or to gain financing ability in capital market through the back-door, or to reduce business risk through business diversification (Xu Jiangping, 2011). In short, the goal of market-oriented enterprise restructuring mainly reflects in strategic development, producing and operating, financial management, risk prevention, etc.

The leadership of the government-oriented enterprise restructuring is government, which plays leading and promoting roles in enterprise restructuring activities. Therefore, the starting point of the enterprise restructuring, which is the more the needs of macro economic development and the market regulation, the specific performance of external demand of enterprise development, a kind of gravity and pressure generated by the change of external environment, is exogenous. The motivations of government-oriented enterprise restructuring are: 1) the optimization and upgrade of the industrial structure. The enterprise restructuring eliminates backward productivity and technology, accelerates the use of high and new technology, encouraging and supporting strategic new industries; 2) to enhance the

---

\* This paper is supported by "2010 year henan province government decision-making bidding project: study of henan enterprise strategic restructuring in the restructuring of research (C469)".

influence and control of state-owned economic on national economy development. The restructuring between state-owned enterprises, between the state-owned enterprise and private enterprise, between the state-owned enterprise and foreign enterprise, strengthens the state-owned economy; 3) to gain the right to speak on development of industries in the process of economic globalization. Through the state-owned enterprise restructuring activities, enterprises, especially the resources-based enterprises, improve industrial concentration and competition force and expand influence in international market (Henan province government, 2010). The three kinds of restructuring motivation, of which the exogenous feature is very outstanding, is more the needs of central government based on macro economic development.

### **3 Main Problems of Government-oriented Enterprise Restructuring in the Process of Integration Management**

Having the restructuring transaction completed, the enterprise, which steps into the phase of integration management, will launch the integration of business, culture, finance, human resources and management, with the enterprise strategy carried out and measures putted into effect (Xu Jiangping, 2002). In the current, the main problems government-oriented enterprise restructuring have met in the process integration:

#### **3.1 Link up integration strategy with enterprise development strategy**

Strategic integration is an important prerequisite for other integration activities. An accurate located general development strategy for enterprise can express the future development vision of the new enterprise exactly, depicts a clear development vision for the integration of new enterprise, and pointed out the direction of the integration management. Therefore, after eemerging one or several enterprises, the restructuring party must formulate an integration strategy which comply with the requirements of the enterprise overall strategy as soon as possible, making the assets, business and staffs of the restructured enterprise integrate into overall development track of new enterprise as soon as possible.

In general, there are three kinds of strategies to choose after government-oriented enterprise restructuring: 1) the vertical integration strategy, which makes the existing large enterprise in the industry as restructuring party, implements strategic restructuring forward and backward along the industry chain, and finally forms large enterprise or enterprise groups; 2) establishing strategic alliance. Enterprise positively develops strategic cooperation with similar enterprises, scientific research institutions, and trade units, upstream and downstream related enterprises inside and outside the region; 3) diversified development strategy. Under the support of government, the restructuring enterprise enters into local pillar industry or eemerging strategic industry (The state council, 2010).

Therefore, after determining the restructuring strategy, the new enterprise should focus the work on formulating integration strategy which accord with the actual of enterprise, to ensure that the requirements of the overall strategy can be implemented. However, there are two problems in the previous enterprises which have completed the integration transactions. 1) Deflected understanding of the strategic restructuring of the state-owned enterprise. Some executives regard the strategic restructuring work just as completing political task arranged by government, or simply interpreted as emerging more enterprise; 2) Insufficient attention payed to the integration management after strategic restructuring lead to the poor link between integration strategy and overall development strategy.

#### **3.2 Conflict from different enterprise values in culture restructuring**

The success of enterprise culture integration is directly related to the forming of strong cohesive force after enterprise restructuring, making rapid fusion and rising competitive advantage. At present, the strategic restructuring of state-owned enterprises are mainly developed between enterprises in the same industry. However, it also involves enterprises in different system of ownership, different management system, different scale and different region, after which it occurs very complicated phenomenon of cultural conflict performing obviously in enterprise values, management concept, management mode, inertial culture. Through comparison, enterprise culture conflict is particularly outstanding in the process of integration management after restructuring by introducing strategic investors, restructuring between state-owned enterprise and private enterprise crossing different system of ownership.

In recent years, the culture conflict, of which the intensity and adverse consequences are beyond the expectation of government, has happened many times in restructured enterprises. The most tragically heroic one is the restructuring between state-owned enterprise called tonghua iron and steel group and private enterprises called built dragon group in August 2009, because of not paying sufficient attention

to the huge enterprise value difference, the general manager sent by build dragon group to tonghua iron and steel group was beat to death by staffs and the restructuring activities was ended under strong intervention the government.

### **3.3 Problems of setting top managers and displacing identity of enterprise staffs in personal integration**

Top managers are superior resources of enterprise. In the integration of restructuring, how to set the former top managers of enterprise directly impact the psychological states and expectations of staffs especially restructured staffs in enterprise, and furthermore influence the restructuring identity of staffs. At present, state-owned enterprise strategic restructuring is mainly by the way of emerging small enterprises and medium-sized enterprises, or "incorporating" disadvantage enterprises. Restructuring enterprises are usually very mighty, that only retain extremely individuals of the top managers in restructured enterprises, making most executives especially middle managers in restructured enterprise laid-off. This part of fired managers suffers huge loss in general. In October 2005, as a project of "the eleventh five-year plan" combining with relocating ShouGang and adjusting the steel industry of TangShan, the JingTang integrated iron and steel Co., LTD which was registered in TangShan by ShouGang and TangShan iron and steel Co., LTD respectively accounting for 51% and 49% of the shares, might be expected. However, by the end of 2010, TangShan iron and steel Co., LTD decided to get out of the JingTang integrated iron and steel Co., LTD. One of the important reasons is that the "a hand" positions like general manager, minister, director of JingTang integrated iron and steel Co., LTD were assigned by ShouGang and the deputies were assigned by Tangsteel, what made the personnel integration difficult to reach the place(Deng Yao, 2011).

Another outstanding problem in restructuring enterprise personnel integration is displacing the identity of original enterprises' staffs. For historical reasons, the state-owned enterprises, especially small and medium-sized state-owned enterprises and the state-owned enterprises in bad condition, have huge debt in social insurance for the staffs. When the staffs once lose their state-owned identity, the new restructuring enterprise needs to completely assume the responsibility of repaying the historical debt, which makes the new enterprise difficult to accept; The sense of support and identity of staffs for enterprise restructuring will inevitably fall and the feeling of inconsistent will be produced without solving this problem.

### **3.4 Problem of reengineering organization of new enterprise**

Analysis from the strategic level, to realize the coordination effect of enterprise restructuring, we must make necessary adjustment for the organization structure of new enterprise. The process of the adjustment is long and complex and the task of it will be difficult. Mainly current problems in this aspect: 1) how to set up a normative governance structure for the new enterprise. That means to establish shareholders' meeting, the board of directors, the board of supervisors according to the requirements of the company law, and implement the system of appointing general manager by the board of directors, establish modern enterprise system as soon as possible, perfect the operation mechanism of new enterprise; 2) how to deal with internal control problem of border-crossing large enterprise. As large-scale enterprises, or even "No. 1" in their industries, restructured enterprises usually distribute in many administrative areas and internal control there may be weakened. At present, the new enterprises mainly reinforce the control to enterprises to be restructured by mastering the appointment of the senior executive, with little effort in level of system and operation mechanism. The third one is to prevent "big enterprise disease". Economic theory says, because of small pressure from external competition, mass levels of internal organization, large institutions, complex relationship, large enterprise formed by restructuring can lead to the reduction of internal resources using efficiency, there is a "X (not) efficiency" possibility, commonly known as "big enterprise disease".

## **4 The Main Measures to Improve the Government-Oriented Enterprise in Integration Management Performance**

The government-oriented state-owned enterprise strategic restructuring involves many industries, and the industrial characteristics are obviously different, so the specific measures of integration management will not completely the same. According to the analysis of the above common problems, the integration management of government-oriented state-owned enterprise strategic restructuring should take the following measures:

### **4.1 Pay attention to the processing of the property right relationship**

The processing of the property right relationship of the government-oriented state-owned enterprise

restructuring, is not only related to the vital interests of both restructuring parties, has also a direct impact on the interests of the local government. Therefore, before signing the restructuring agreement, it is necessary to understand the main body of property right of both sides and their restructuring relationship; after the restructuring agreement was signed, it is needed to speed up the standardization work for property right relations. If the new enterprise lacks clear standard property right relations, there can be no relationship management standardization, and the difficulty of the integration management will increase, then it is hard to make the new enterprise management be professional and scientific(Zhang Haizhong, 2009).

Considering state-owned enterprise restructuring wave in "the eleventh five-year plan" period is dominated by the government, and that involves the interests cutting of several administrative regions, province and city level have established the work units for enterprise strategic restructuring advancement, their main responsibility is to carry out investigation and research, policy measures, to coordinately solve great problems of the strategic restructuring. Looking from the current implementation, work efficiency is significant. However, on guiding integration management after the restructuring of the enterprise, this work agency is hard to play professional guiding function (such as assets evaluation, property transactions, legal guidance and services), the restructuring enterprise also need to pay attention to and play the role of professional intermediary institutions, to guarantee the processing of the property right relations to be accurate and exhausted, and to promote the integration management restructuring smoothly.

#### **4.2 Pay high attention to linking up the enterprise integration management strategy with the overall strategy**

The starting point of implementing the government-oriented state-owned enterprise restructuring may well be based on the consideration of the adjustment of development strategy, therefore, the realization of the strategic intent or not after the restructuring of the enterprise is one of the key factors to measure the success or failure of the restructuring activities. In the integration management stage, the enterprise must judges and analysis changes of professional characteristic, industrial competition environment, business philosophy, and management model based on the new way of thinking. At the same time of evaluating and revising strategic foresight and orientation, increase flexibility combining with the practical situation of the restructuring; At the same time, the restructuring enterprise must identify core resources and core ability of enterprise again, around the construction of core resources and core ability of enterprise, make integration management strategy in time, discover and correct the deviation between planning and implementation in process of strategic integration in time, to ensure the convergence between enterprise integrated management strategy and overall strategic and improve the efficiency of strategic management.

#### **4.3 Choose the right way into culture, effectively reduce the risk of the integration process**

In the government-oriented state-owned enterprise cultural integration, especially the restructuring of enterprises in the same original scale, market and level, which enterprise culture can rise for the mainstream culture, and by what kind of way to conform other enterprise, all these relate to the success of integration of new enterprises, have to choose carefully.

In the culture construction of government-oriented state-owned enterprise, the new enterprise often shows obvious exclusiveness and antagonism to foreign culture and cultural change. Therefore, the enterprise culture integration must choose corresponding integration mode according to the specific situation of enterprise restructuring strategy, enterprise culture type and degree of cultural differences, the different cultural need to integrate through the different mode. At present, the government-oriented state-owned enterprise strategic restructuring often use the absorption (or says spoon-feed) cultural integration mode, namely compulsively instill the culture of restructuring enterprises to the restructured enterprises, with little consideration on the acceptance and agreement degree of restructured enterprises, and little attention to positive and special culture of the restructured enterprise. In the short time, this way may form a kind of "unity" enterprise culture, and make restructuring integration activities looks peaceful on the surface, but is easy to produce accumulate conflict by repressing the restructured enterprise culture. Especially when the restructured enterprise is internally unity or has strong qualified but not to be recognized or used culture, it is easy to bring deep crisis lurk to the new enterprise behind the stable surface (Liu Wei, 2009).

#### **4.4 Establish and perfect the management control system**

In the government-oriented state-owned enterprise, restructuring of integrated management, establishing and perfecting the enterprise management control system is a top priority. Effective management control system construction, is not only for enterprise to improve the cost control ability,

lay the foundation of the risk control ability, also for enterprise to further optimize the industry structure, and realize the impetus to provide sustainable development of strategic objectives (Zhao Yujian, 2010). In the process of establishing a management control system, the starting point and the foothold of the enterprise is the new enterprise's overall development strategy. Under the guidance of the restructuring strategy, the new enterprise must first, according to the requirements of the science division, optimize various functions activities and enhance the cooperation level; the next, to choose the right management control mode. At present, in order to adapt to the enterprise scale and regional scattered need, a lot of restructuring of the enterprise chose the flat organization structure. This choice is appropriate. But the problem is that flat organization structure operation is the effective key to deal with the "centralization" and "decentralized" relationship. Enterprise management team should pay much attention to it; Again, to strengthen enterprise process comb. We must strengthen the business process comb, and pay more attention to the management process of the comb. At the same time, we should establish and perfect the system, standardize the enterprise and workers' behavior, for the implementation of the new process can provide system guarantee and increase the enterprise organization strength, improve the operation efficiency of the enterprise; on this basis, the control system will be built into the new core competitiveness of the enterprise.

#### **4.5 Solve placement problem based on business restructuring**

At present, one of the goals of carrying out the strategic restructuring in the government-oriented state-owned enterprises is to fully play their respective advantages of the industry, promote the optimization of the industrial structure and upgrade. Under this kind of request, the basic idea to carry on the business restructuring is: 1) the implementation of the business enterprise leading technical transformation and upgrade, improving the leading product manufacturing level; 2) to accelerate the auxiliary business detachment, and focus on using enterprise resources; 3) to strengthen the leading business marketing activities, such as to determine the dominant business brand, readjust marketing strategy, strengthen the marketing investment, etc.

The business restructuring will have two fatal shock to the original employees, one is for age, illness, and reducing reason by enterprise post who fired them into the unemployment line; the other is the technical unemployment, because mastery of the technology can not meet the new enterprise business development needs to back at work, also is the machine crowd out workers analysis of Marx phenomenon. If they also face the replacement identity, it will be added to the staff and workers of the enterprise. The fundamental way to solve this problem, is reflected not only in the new enterprise business restructuring speed and effectiveness, but also embodied in leading business development and growth. Because, the dominant business once determined, the resources will be configured in wider range and more effective use of platform, so as to realize the value of resource and the maximization of enterprise management benefit, because the society can create more employment opportunities, and job placement of the original employees should not be difficult to solve.

## **5 Conclusion**

To sum up, the government-oriented enterprise restructuring has its particularity. From the enterprise internal analysis, problems existing in restructuring management of the enterprise is still root in whether adopting the specific restructuring management measures, for example, in view of China's state-owned enterprise property status, the state-owned enterprise should attach great importance to straighten out the property right relations, even among the first question is, In addition, to speed up the strategic adjustment especially the formulation of restructuring strategy, choose the suitable way of enterprise actual cultural fusion, strengthen the management control system construction, focus resources to expand dominant business of enterprises, is also priority in enterprise integrated management. Only when increasing the implementation of these measures, can we accelerate the realization of the restructuring coordination effect.

**Abstract:** The goal of this paper is to analyze the constituent elements of service innovation, the connotation of services competitiveness, and the countermeasures and strategies for the Formation of services competitiveness. Firstly, we make an analysis about the service innovation, and present a four dimensional model to discuss the interrelationship between the four elements of service innovation. Secondly, we make an introduction of the connotation and relative research on services competitiveness. Finally, we put forward the strategic routes and corresponding suggestions for the Formation of services competitiveness in China.

**Key words:** Service innovation; Services competitiveness; Four dimensional model; Suggestions

### I Introduction

The process of economic globalization is speeding up gradually and has become the mainstream of world economic development. The global service industry developed rapidly driven by the knowledge, technology and the forces of globalization. The service industry occupies an increasingly important position in the economy of a country. It becomes an important criterion as a measure of a country's international competitiveness. The service industry play an important role for economic development, its essence is a modern service industry. There is important significance to accelerate the development of modern service industry for improving the quality and comprehensiveness of our country's economic competitiveness, industrial restructuring, change the mode of economic growth, alleviate employment pressures, improve living standards, cultivate new growth points and promote sound and fast economic development. Currently, the service sector gradually become the dominate part in economic activities, and the services market has become the strategic high ground in international economic competition. Since reform and opening, China has enhanced the basic position of agriculture industry and promoted the development of secondary industry, and also attaches great importance to the development of service industry. But with the international advanced level, the development of China's service sector is still lagging behind, the competitiveness of services need to be further improved.

### 2 Analysis on the Four Dimensional Model of Service Innovation

Just like any product, service innovation is seldom limited to a change in the characteristics of the service product itself. Mostly, innovation coincides with new patterns of product distribution, client interaction, quality control and assurance, etc. However, service innovations show huge differences in the kinds of patterns: what is important for introducing one new product onto the market might be totally irrelevant for other products. Offering a completely new service may differ considerably from offering an existing service using a new distribution channel. Similarly, some innovations are mainly the result of co-production of an innovator and his client while others are clearly the result of applying a certain technology.

Below, we will present four dimensions which we believe are helpful in describing and analyzing service innovations (see figure 1). This model is not statistically tested, but should be interpreted as tool to map and characterize various service innovations. The individual dimensions impact upon each other in both directions. Below we will present the four dimensions discerned.

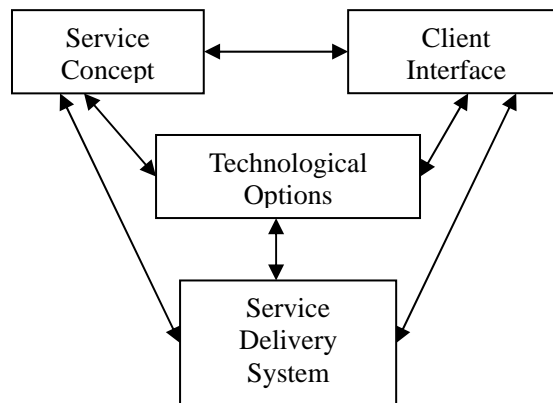

Figure 1 The Four Dimensional Model of Service Innovation

### 2.1 Dimension 1: the service concept

In manufacturing innovation, new products (and processes) are typically highly tangible and visible. This is often not the case with services. Some service innovations are highly visible, especially where delivery of the product is involved (ATMs, etc.). However, frequently it is not so much a physical product but a much more intangible characteristic of a new service, like a new idea or concept how to organize a solution to a problem. Although a particular service concept may already be familiar in other markets, the key thing is that it is novel in its application within a particular market. As usual in innovation research, there are thorny problems concerning when a product, function or concept is really new. Judgments can vary according to whether and when it is new to the providing firm, new to the client, to the regional, national or global market and whether it involves new logic or scientific knowledge. Although not all service innovations have such a strong conceptual element, conceptual innovations are much more likely to be found in service firms (or better service functions) than in pure manufacturing firms. Such innovations are usually highly intangible - meaning that while in some cases the service itself may have quite tangible elements, the new features are less to do with material artifacts, etc.

### 2.2 Dimension 2: the client interface

A second element of service innovations is the design of the interface between the service provider and its clients. These interfaces are the focus of a good deal of service innovations. Innovation studies with a focus on mass manufacturing usually tend to overlook in particular the changes occurring in these interfaces. Nonetheless, the communication between service suppliers and clients forms a major area for service innovation. As a quite general phenomenon across a wide span of services, product offerings are increasingly marketed and even produced in a client-specific way (even with client-specific pricing) and delivered electronically as far as they have informational components. In business services in particular, clients are often also part and parcel of the production of the service product. The way the service provider interacts with the client can be a source of innovation. Increasingly there is no clearly identifiable point where the producer's activity stops and the user's activity begins. This is of course particularly true where the business service itself is offering support for innovation, like e.g. in R&D and design services. With the high degree of co-design and co-production of service products, it may be difficult to locate the innovation within service supplier or client: it is not unusual, for instance, for service firms to site their staff within client organizations for periods of time.

### 2.3 Dimension 3: the service delivery system

The third dimension involving service delivery system and organization is often directly related to the previously discussed dimension referring to the linkage between the service provider and its client (the client interface). The delivery is one specific type of interaction across the client interface (others including financial transactions, design inputs, after sales, and so on). However, dimension 3 is different. It refers to the internal organizational arrangements that have to be managed to allow service workers to perform their job properly, and to develop and offer innovative services. It is closely related to the question of how to empower employees, to facilitate them so that they can perform their jobs and deliver service products adequately. On the one hand, new services may require new organizational forms, personal capabilities, and skills. On the other hand, an organization can be designed, and employees can be trained, so as to leave room for innovations and non-conventional solutions to practical problems.

#### **2.4 Dimension 4: technological options**

The fourth dimension is the centre of much analysis and debate, especially concerning the degree to which service firms themselves in practice are giving shape to technology development. Clearly, service innovation is possible without technological innovation; technology is not always a dimension. Nonetheless, in practice there is a wide range of relationships between technology and service innovation, varying from technology mainly playing a role as a facilitating or enabling factor, to something much closer to supply-push, technology-driven innovation. Service firms also differ in their awareness of relevant available technological options, the degree to which they dispose of the necessary technology themselves or have access to the necessary knowledge and the degree to which they consequently can act as demanding customers and articulate their technological needs. Many innovations are driven by downstream service sectors and can surely be considered user-dominated. In fact, users may play a crucial role in developing and implementing new services, although some of the required technologies may come from suppliers.

### **3 The Connotation of Services Competitiveness**

Industrial competitiveness is the ability for industry to access and to use of resources, and the level of a certain embodiment of integrated technology. From the current studies, the content of the service industry competitiveness is not much research as defined in the western academic competitiveness on services are services related to the competitiveness of the eight elements of the theory and the four stages of competitive services theory. The services competitiveness can be reflected from the eight elements. The four stage theory of services competitiveness divided the development of service industry into four stages based on service delivery aspects, namely the stage of providing services, stage of apprenticeship, stage of accessing to superior ability, and stage of supplying world-class service.

At different stages, the manifestation of services competitive is different. Domestic research is also rare, mainly Wang Xiaoping in its book "competitive service" make certain discussion. He thinks that the services sector includes both the service industries competitiveness and internal service enterprises competitiveness. The service enterprises competitiveness is the basis, and the competitiveness of service industry is the comprehensive competitiveness of service enterprises. Thus, the services competitiveness involved in service itself, many relevant aspects of relationships and behavior. The competitiveness of a region's service sector in the region reflects the comprehensive ability, in certain of its political, economic, technological, cultural, and human environment and conditions, relative to other regions has shown the capacity for viable and sustainable development. This service competitiveness studied in this paper is areas of industrial competitiveness. Industrial competitiveness is a country's specific industry through the sale of products in the international market as reflected in productivity.

### **4 The Countermeasures and Strategies for the Formation of Services Competitiveness**

#### **4.1 We should develop and improve the relative elements of services competitiveness**

The construction of international competitive advantage of service industry need to rely on knowledge, technology and other advanced production factors and professional factors of production more and more. Therefore, on the one hand, competitive strategy should be built on the advanced services elements of training and professional factors, and improve the service industry research and infrastructure investment. At present, the developed countries of the substantial increase in the services sector input into the services sector, average annual growth rate of R&D expenditures are rapidly growing in double digits. Our R&D investment is lower than the developed countries in the relevant way, and the gap becomes larger and larger. On the other hand, the state should provide adequate areas of basic research and research funding, increase scientific and technological achievements to market transformation, emphasis on education investment, increasing investment in education, R&D investment to develop education and training industries, and actively establish a scientific, a reasonable formation mechanism of high-level elements. We should improve its quality testing and monitoring mechanism, vigorously develop and introduce globalization talent for the development of service industry, and improve the quality of employees.

#### **4.2 We should actively optimize the industrial structure of service industry**

The overall international competitiveness of China's service sector is weak. Therefore, we should constitute the development plan of service industry based on the new situation of opening up and the

characteristics of the services development. We should give full play to the advantage of traditional service industries; focus limited resources to develop knowledge and technology-intensive service industries and new services to enhance the competitiveness. We should develop countermeasures for different regions, such as eastern region's economic development and good conditions for industrial development should focus on the development of information and knowledge-based high-tech knowledge-intensive modern services using service industry with international standards world standards continue to the end to international economic conditions. The scientific and technological capacity is relatively backward in central and western regions. The service industry, especially the modern service industry developed very slowly. We should combine the manufacturing industry and modern service industry together; improve the basic power of modern services industry.

#### **4.3 We should further enhance the market level of modern service industry**

Although competition in the industry by expanding the scale of change management and other ways to continue to grow and develop, but to enhance the brand value-based content-type development and alliances through a multi-format, cross-industry approach is complementary to the formation of healthy competitive environment of modern service industry, and thus enhance competitiveness in order to achieve a win-win objective effective way. Competitors can copy products, services, technologies and processes, but can not copy a great brand. An excellent long-term brand means competition. With the development of information society, each industry will face interaction between competition and cooperation, namely how to effectively solve the upstream and downstream supply chain, industry groups within the business relationship between competition and cooperation with each other. Modern service industry competition between the business and its essence is not only a value-creating process, but also both cooperation and competition between enterprises in the process. Therefore, China must implement a strategy for both competition and co-operate in order to reduce transaction cost and competitiveness cost, enhance the company's overall competitive strength.

#### **4.4 We should expand the opening up of modern service industry**

We should accelerate the development of services and implementation of the urbanization strategies, actively and steadily promote urbanization, rationalization of urban scale structure, and expand urban services consumer groups. Institutions should gradually speed up the process of outsourcing, changes in enterprises and institutions "large, small and complete" the organization, increase the intensity of government outsourcing services, public purchase of information management, research and consulting, business training, business etiquette, etc. services, accelerate the establishment of service characteristics consistent with the price formation mechanism and management system to distinguish between different clients, the establishment of classification fees regulatory mechanism. The banks should increase credit support for consumer products, to expand financial leasing, financial derivatives and other new formats logistics, and enhance the consumption capacity of residents and businesses. At the same time, we should make effective implementation of policies to enrich and increase disposable income, enhance the ability of residents in current consumption, system of annual leave for employees, encouraging tourism, stimulating consumption and enliven the holiday's consumer market and the night consumer market.

## **5 Conclusion**

The development of modern service industry has become increasingly important in the economy and is the key to promote industrial upgrading and embed the global value chains in developing countries. In the International service competitiveness level, China's service trade scale and international market shares significantly higher than in India, Brazil and Russia and other emerging economies. The advantage departments of service industry are mainly concentrated in the dominant sector in the traditional labor-intensive or resource-intensive industries, but the knowledge and technology-intensive services exports competitive advantage is not obvious or lack of competitiveness, these departments are the key markets deciding whether we can dominant international competition. Thus, in the coming period, China's service industry is not simply increasing the proportion of services in the economy, but how to maintain the traditional comparative advantage in services. At the same time, we have to optimize the internal structure of services to enhance the international status of trade in services and competitiveness, and accelerate the development of modern service industry through the deepening of service control system, relaxing market access initiatives.

# Analysis and Application of Load Forecasting in the Urban Gas System Planning

Sui Yaoguang

Jiaozuo Zhongyu Gas Co., LTD, Jiaozuo, P.R.China,454002

(E-mail: yaoguang\_s6562@163.com)

**Abstract:** Load forecasting is essential to the gas system planning and the operation scheduling with much economic benefit. Common methods and features of the load forecasting are summarized in this research. The load forecasting of the gas pipeline network plays an important role in managements of manufacturing, pipeline network, daily business, official information etc., and it is also an important access to the improvement of the security system.

**Key words:** Gas pipeline network; Gas system planning; Load forecasting of pipeline network; Forecasting methods

## 1 Introduction

To meet requirements of the global information technology, the Chinese gas industry has devoted to the enterprise information management since the 1990s. Due to the particularity of the gas industry, the security underlies the enterprises' survive in the market. The load forecasting, as an essential part of the gas enterprises, has received much attention with labor, resource and finance investments in recent years. With the construction of the "West-East Gas Transmission Project", "Digital Gas Supply", and "Security Construction of Society Information" etc., the load forecasting has become a significant subject in the gas system scheduling, the real-time control, the operation planning and the development project etc. How to improve the detection level of the pipeline network load and to establish a proper system for the operation planning as well as detection has been the chief task for the scheduling department and the planning department. This brings not only much economic benefit, but also good social benefit.

The load forecasting of the gas pipeline network mainly consists of two technologies, one is the forecasting technology of the future demand beforehand, and another is the forecasting technology of the future gas consumption afterward. In the load forecasting, properties of the system operation, compatibility strategies, natural conditions and social influences should be considered. Besides, by the analysis and study on the gas load values in history, the current and the future gas load values of the system are ascertained. The forecasting technology of the pipeline network load in China began in about the 1950s, and has achieved great success by the 1980s. The modern information technology, especially the computer technology improves the speed and the accuracy of the load forecasting. This research firstly puts forward some forecasting methods such as time series method, grey theory forecasting method, aggression analysis, expert system method and artificial neural network method; then analyzes and summarizes the working principles and the scheduling thoughts. In this way, we hope to have a discussion with the profession for a better improvement on the load forecasting<sup>[1]</sup>.

## 2 Methods and Features of the Load Forecasting of the Gas Pipeline Network

### 2.1 Time series method

The time series method utilizes the time to replace factors affecting the pipeline network load. By the statistical analysis with related load records, we made a curve quantization and evaluation to the past pipeline network load. Besides, a forecasting model for the pipeline network was established by some model designs and parameters. The time series method usually includes two parts, specific type and random type. According to the statistical analysis, we obtained the load parameters of the pipeline network at a future moment by corresponding models.

The specific type of the time series method usually includes the moving average method and the exponential smoothing method. The random type of the time series method usually includes the aggression model (AR (p)), moving average model (MA (q)) and aggression-moving average model (ARMA (p, q)) etc. Although the changing features, the changing trend and the development rules of the pipeline network load in a particular period can be deduced by the data that are arranged through the time sequence, uncertainty of the analysis results often occurs due to the influence on the time series from many factors. On the contrary, the random type of the time series method regards the time series as the random process, considering the uncertainty of the random factors comprehensively and offering

more valuable information. The typical representative is the ARMA model.

The mathematical model of ARMA is:

$$x_t = \theta_1 x_{t-1} + \theta_2 x_{t-2} + \dots + \theta_f x_{t-f} + e_f \quad (1)$$

$$x_f = (1 - w_1 B - w_2 B^2 - \dots - w_q B^q) e_f \quad (2)$$

$$x_i (1 - \theta_1 B - \theta_2 B^2 - \dots - \theta_p B^p) = (1 - w_1 B - w_2 B^2 - \dots - w_q B^q) e^i \quad (3)$$

Where:  $\theta_i (i = 1, 2, \dots, p)$ ,  $w_i (i = 1, 2, \dots, q)$  is the uncertain coefficient; the mean value  $e_f$  is the random disturbance whose variance is not zero;  $p$  and  $q$  are the order numbers;  $\{x_t\} (t = 1, 2, \dots, n)$  is the uncertain coefficient of the model;  $B$  is the retraction operator, and  $Bx_i = x_{i-1}$ ,  $B^i x_i = x_{i-i}$ .

Formula (1) is the AR ( $q$ ) model; formula (2) is the MA ( $q$ ) model and formula the ARMA ( $p, q$ ) model. These three models can make forecasting when the order and parameters of the models are ascertained. Since the changes of the gas load is a non-stationary random process with a certain increasing trend and periodicity, the difference operator should be defined to obtain a stationary random process<sup>[2]</sup>.

Meanwhile, the time series method also has some shortages:

- 1) Requirements for the data are high;
- 2) Expressing the nonlinear relation of loads by the linear model has some limitations;
- 3) Only feasible to the short term load forecasting in which the load changes are uniform; not sensitive to important factors that affect the load such as the weather changes; the management on the principle changes are weak; limited by the history data.

## 2.2 Grey theory forecasting

The grey forecasting technology based on the grey theory system is to make the systematical modeling of the factors that affect the load when the judging evidence is not enough. It is not a strict system method. Seen from the differential equations, the grey system model should make an exponential distribution of the original load data of the gas pipeline network, that is, the series should fulfill the exponential increasing requirements when the original data are accumulated. By doing this, the needed modeling sequence for the differential equation is obtained. The common grey theory model is the single variable one-order GM(1, 1) model; the differential equation is as following:

$$\frac{dx}{dt} = \alpha x - \mu \quad (4)$$

Features of the grey theory forecasting are as following:

- 1) The modeling is simple with few load data; efficient when the data is lacking;
- 2) No requirement for the changing trend and the distribution rules;
- 3) The calculation is simple, easy for detection, high accuracy for the short term forecasting. The grey theory forecasting can construct various forecasting models according to different features of the original data.<sup>[3]</sup>

By now, there is not yet a most common model in the concrete load forecasting technologies. Therefore, we should choose the proper improvement methods or combinations of the methods to improve the forecasting accuracy.

## 2.3 Aggression analysis

The aggression analysis firstly focuses on the correlation between the pipeline network load and the relative factors to study and analyze the changing rules of the history data; then finds the aggression equation of the independent variable and the dependent variable. Second, the aggression model is established through the aggression analysis, and the load records caused by the randomness are processed by the aggression analysis; then a curve record is obtained. Next, this curve is stretched to a certain future moment and the load forecasting value at this moment is yielded finally.

The aggression forecasting analysis usually includes the simple linear aggression model, the multiple-linear aggression model and the nonlinear aggression model etc.

The aggression forecasting model is:

$$q = f(x_1, x_2, \dots, x_p) \quad (5)$$

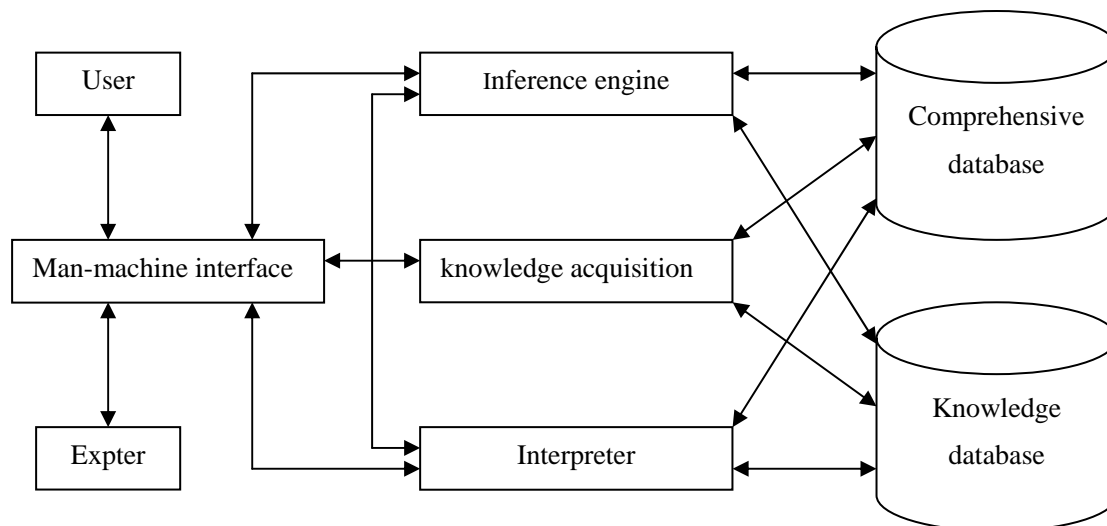

Where:  $q$  is the random variable, implying that there may be some specific and random variables in the independent variables  $x_1, x_2, \dots, x_p$ . The aggression relation  $f$  is either linear or nonlinear,

representing the correlations between the gas load and the main influencing factor. We can obtain the forecasting value of the gas load  $q$  by the future values of  $x_1, x_2, \dots, x_p$ .

The aggression analysis makes the selection and the forecasting accuracy of the independent variables as the calculation basis; it is a common causality-type forecasting model. As changes of the gas data are great and conditions are complex, this method is suitable for the long-term forecasting with a high forecasting accuracy.

**2.4 Expert System**

Expert system is to re-aggregate the experience and transform it to be a good result. According to the need of expert system, it's mainly composed of knowledge database, comprehensive database, inference engine, interpreter and knowledge acquisition, as shown in Figure 1.

**Figure 1 Expert System Structure Diagram**

Based on the data record for decades from database, expert system analyzes the gas pipeline load factors, especially compiles the forecasting results from the experts and authoritative organizations. In the predictions of gas pipeline load, expert system mainly solves various knowledge of gas pipeline load, including different mathematical models. Comprehensive database stores facts in the reasoning process and original data and generating information in the operation of the system, including meteorological data, the gas load and the data under the special circumstances in the past years, as well as the data with the forecasting results. Inference engine, controlling the reasoning process, will solve, revise, supply the data in the knowledge database and make the solving of the problems consistent and complete. The expert system can utilize the experts' judgment and decision-making skills to a maximum extent; meanwhile, it can get right theories and results by analysis of large datum and information; at last, it also can avoid the errors made by personal factors, so it is with more reference.

**2.5 Artificial Neural Network**

Artificial Neural Network (ANN) is a net system simulating human's behaviors and is connected by many neurons. It is an information processing tool which is different from other traditional calculation methods. It maps many complicated nonlinear relationships by the artificial neural network. It gets proper instant parameters by choosing and collecting weight and threshold value based on the certain models. In a short period of time, the pipeline load is in a process of stable randomness, so ANN is more feasible for the short term load testing. But for long term detection errors caused by political and economic factors, ANN has advantages of reference as following:

- 1) It can simulate human brain intelligence to deal with complex and varied data parameters;
- 2) It has the adaptive function by a lot of non-structured and non-accreted laws.
- 3) With the help of memory and self-learning of varied information, the features of knowledge reasoning and optimization calculation improve a lot.<sup>[4]</sup>

In the view of the excellent performance in some fields or systems, ANN can't be applied rigidly. If a good design and operation of ANN structure is applied directly to another system, the potential performance is not obvious, and even worse. Therefore, as for the specific rechecking detection, after

the long-term accumulation of original data and revision of models, it only confirms the relationship between the load and relative factors. By the study and comparison of artificial neural network, according to the load law in the special fields and special conditions, selecting different characteristic parameters, different data processing methods, different ANN models and structures makes the allowable range and gets satisfactory results.<sup>[5]</sup>

### 3 Analysis and Application of Various Forecasting Method

It is impossible to compare the above methods at the same level due to a variety of forecasting methods which differ in the research perspective, modeling method and applicable conditions. Therefore, we can take the comparison or analysis and application from five aspects.

#### 3.1 Research perspective and applicable conditions

In the description of statistical law of Time series method and Regression analysis, we find that they are more applicable in long-term and big-sample forecasting, while grey model method is more applicable in Gray system method showed by small package of statistics, and therefore it is more proper to use to analyze and forecast where it lacks information. Owing to many experts' knowledge and experience, expert system is more applicable in medium and long term Load forecasting. Being capable in learning, neural network method is proper in time series issue, especially in stably random forecasting.

#### 3.2 Statistical style

Time series method can directly forecast future value through the exponential weighting combination of the future value, in the process of forecasting, original statistics' modeling is adopted, such as Regression analysis is by statistics' collection and modeling, Grey system theory modeling by Generating sequence. Expert system method getting success on the basis of model set and various experiences and sense of judgment, neural network method by normalization of related factors.

#### 3.3 Calculating complexing degree

Regression analysis and Grey system theory are easier relatively and Regression analysis can be achieved by excel.

#### 3.4 Forecast the development of method

The time series method is applied most widely and maturely, while expert system method, Grey system theory and neural network method need further improvement.

#### 3.5 Length of applicable time

Time series method and Grey system theory and neural network method is appropriate in short-period forecasting, while Regression analysis and expert system method are proper in medium and long term Load forecasting.<sup>[6]</sup>

### 4 Conclusion

Gas Load forecasting has been a main factor to gain the modernization of the gas system management. Through the analysis and application comparison, we know that every forecasting method has its own advantages, disadvantages and applicable limits, so it is necessary to choose appropriate methods and models, according to actual conditions so as to get the accuracy within the permission of forecasting cost.

# Inland Shipping Goods Externalities and Their Correction

Wan Hong<sup>1</sup>, Tao Dexin<sup>2</sup>

1School of Navigation, Wuhan University of Technology, Wuhan 430063, P.R.China,

2School of Logistics Engineering, Wuhan University of Technology, Wuhan 430063, P.R.China

**Abstract:** Firstly this paper classifies inland shipping goods into three kinds: public goods, quasi-public goods and private goods. Then mathematical mode of externalities is established. Thirdly externality influences on externality bearer and producer are carefully analyzed respectively. Finally correction methods for positive and negative externalities of different shipping goods are put forward.

**Key words:** Inland; Shipping; Goods; Externality; Externalities; Correction; Efficiency

## 1 Introduction

The Inland shipping goods is a complex of public goods, quasi-public goods and private goods, the externalities of which influences heavily the characteristics of themselves and resource allocation efficiency. At present inland shipping is valued greatly for its ecofriendly, low cost and safety. Although there is much research on the externalities of common social good, research on that of inland shipping goods is rare.

In this paper, firstly inland shipping goods is carefully categorized. Then mathematical mode of externalities is established. Thirdly externality influences on externality bearer and producer are carefully analyzed respectively. Finally correction methods for externalities of different shipping goods are put forward.

## 2 Composition of Inland Shipping Goods

According to classification criterion of non-competitiveness and non-exclusiveness, all inland shipping goods could be categorized as three kinds: public goods, quasi-public goods and private goods. See Table 1.

**Table 1 Shipping Goods Classification**

Goods Category		Goods Name
Public goods		Fairway (including anchorage), Shiplock, Harbour navigation & safety facilities (Dock, Harbour basin, Inlet & outlet fairway, Revetment, Navigational facilities), before congested; Navigation mark (including signal station, indicator); Shipping control(Shipping administration, Safety control, Ship inspection, Customs supervision, Quarantine inspection etc.); Special shipping (used in salvage, emergency & war requisition),Fairway information service
quasi-public goods	Common resources	Congestion goods Fairway (including anchorage), Shiplock, Harbour navigation & safety facilities (Dock, Harbour basin, Inlet & outlet fairway, Revetment, Navigational facilities), before congested; Bridge hole
		Externality goods Salvage operation
	Club goods	Electronic chart; Pilotage
Private goods		Cargo operation facilities & service in harbor; Common shipping ;Shipping agency;finance & insurance;Information net

## 3 Essences of Externalities

Externalities refers to beneficial or harmful effects generated by the activities of an economic individual on the other and that the individual that produces the effects does not gain corresponding rewards or burden corresponding obligations, i.e. the variables contained in an economic individual's objective function, such as manufacturer's production function and cost function or consumer's utility function, are under the control of another economic individual. The essence of externalities could be described in a mathematical formula:

$$O_j = O_j(X_{1j}, X_{2j}, \dots, X_{nj}, X_{mk}), j \neq k \tag{1}$$

In formula (1), suppose  $j$  and  $k$  are different economic individuals. When the target function

$O_j$  of  $j$  depends not only on variables  $X_{ij}$  controlled by itself, but also on certain variable  $X_{mk}$  controlled not by itself, there exists the externalities that unit  $k$  brings to  $j$ .

If  $\frac{\partial O_j}{\partial X_{mk}} > 0$ , it shows  $k$  produces positive externalities to  $j$ . If  $\frac{\partial O_j}{\partial X_{mk}} = 0$ , it shows  $k$  does not produce externalities to  $j$ . If  $\frac{\partial O_j}{\partial X_{mk}} < 0$ , it shows  $k$  produces negative externalities to  $j$ .

## 4 Influence of Externalities on Resource Allocation

### 4.1 Influence on externality bearer

In formula (1), the budget constraint of  $j$  is:  $Y_j - \sum_{i=1}^n P_i X_{ij} \geq 0$ . Here,  $Y_j$  is the income of  $j$ ,  $P_i$  is the price of  $i$ . As  $j$  does not influence the level of  $X_{mk}$ ,  $X_{mk}$  does not appear in the budget constraint of  $j$  and the price of the result produced by  $X_{mk}$ , i.e.  $f(X_{mk})$ , is zero in effect.

Obviously, to realize utility maximization of  $j$  (i.e. Pareto optimality) under its budget constraint, the primary condition is goods marginal rate of substitution (RCS) between any two consumption activities is equal to the the price ratio of these two activities. As for any pair of consumption activities among  $X_{1j}, X_{2j}, \dots, X_{nj}$ , there is no problem to meet this condition, as the marginal utility of any of these activities, like the price of each activity, is a positive. But there is problem for RCS between any consumption activity  $X_{ij}$  and externality  $f(X_{mk})$ . As the marginal utility of  $X_{ij}$  is positive, but the marginal utility of  $f(X_{mk})$  could be positive or negative, and again  $P_i$  is positive, the optimal conditions meeting consumption efficiency is:

$$RCS\{X_{ij}, f(X_{mk})\} = \frac{P_i}{P_{f(X_{mk})}} \tag{2}$$

Formula (1) only holds when the price  $P_{f(X_{mk})}$  of  $f(X_{mk})$  to  $j$  is positive or negative. But as the price of  $f(X_{mk})$  is zero, the condition meeting efficiency maximization is destroyed, thus producing the low efficiency of resource allocation.

### 4.2 Influence on externality producer

Negative or positive externalities would cause excessive or insufficient production, which leads to social welfare loss. So for shipping goods which presents positive externalities, such as fairway, navigation mark, salvage operation and fairway information service, they are normally in undersupply state. But for shipping goods which sometimes presents positive externalities and sometimes presents negative externalities, such as shiplock, harbour, shipping and shipping control, they should be treated carefully: when they presents positive externalities, they are normally in undersupply state; when they presents negative externalities, they are normally in oversupply state.

#### 4.2.1 Negative externalities causing excessive production

See figure 1. At point E, MSB=MPC, but E is not the equilibrium point meeting efficiency requirements, as supply line S represents only private marginal costs and does not count in external marginal cost (MEC). So the line actually reflecting social marginal cost (MSC) should be line S', which intersects with demand line D at equilibrium point E'. And E' decides the equilibrium price P' and equilibrium output Q', which meets resource allocation efficiency requirements. Obviously P < P', Q > Q', which shows that negative externalities make actual production quantity bigger than production quantity meeting Pareto standards and causes excessive production, which leads to net social welfare loss ΔEFE'.

Figure 1 Negative Externalities And Excessive Production

4.2.2 Positive externalities causing insufficient production

See figure 2. Point  $E (P, Q)$  intersecting by supply line  $S$  and demand line  $D$  is not equilibrium point meeting resource allocation efficiency requirements as line  $D$  reflects only private marginal benefits ( $MPB$ ) and does not take count in external marginal benefits ( $MEB$ ). Point  $E' (P', Q')$  intersecting by supply line  $S$  and demand line  $D'$  (social marginal benefit) is the equilibrium point meeting resource allocation efficiency requirements. Obviously  $P > P'$ ,  $Q < Q'$ , which shows that positive externalities make actual production quantity smaller than production quantity meeting Pareto standards and causes insufficient production, which leads to net social welfare loss  $\Delta EFE'$ .

Figure 2 Positive Externality And Insufficient Production

Some shipping goods' external benefits may decrease with the increase of shipping goods quantity, such as fairway information service. The more the quantity of fairway information and vessels that can receive that information, the less the improvement room for traffic safety and smooth. When the quantity of fairway information and vessels that can receive information reach a specific level, the external marginal benefits will be close to zero.

In addition, a special condition should be pay attention to. As shown in figure 3, before production quantity reaches point  $Q$ , with the existence of external marginal benefits ( $MEB$ ), there are two demand lines, namely  $MPB$  and  $MSB$ . With decreasing of  $MEB$ , distance between the two demand lines will be more and smaller, and finally  $MEB$  reaches zero at point  $B$ , when the two demand lines intersect together. If supply line is  $S_1$ , as there exists  $MEB$ , positive externalities will make resources allocation in a distorted state. When supply line  $S_1$  moves to  $S_2$ , as  $MEB$  is zero, social marginal benefit and social marginal cost reaches equal, consequently externalities disappearing.

Figure 3 MEB Decreasing and Externalities Disappearing

4.3 Externalities contents and correction methods

As the externalities of each inland shipping goods are different, it is necessary to adopt different single or combined method adaptive to their characteristics to eliminate or ease externalities. And even for the same kind of method, the using degree and contents for different shipping goods should be carefully be decided to achieve the best resource allocation efficiency. See Table 2.

Table 2 Externality Contents and Correction Methods of Shipping Goods

Goods Name	Externality Contents	Externality Correction Methods
Fairway	Mainly positive externalities: green transportation, agriculture irrigation, flood discharging and water adjustment, industrial cluster, environment beautification, land value-added	Positive externalities: financial subsidies
Navigation Mark	Mainly positive externalities: water safety, visual enjoyment	Positive externalities: financial subsidies
Shiplock	Positive externality: fairway continuity Negative externality: shipping congestion & blocked	Positive & negative externalities: property right demarcation, organization integration
Harbour	Positive externality: public service, land value-added, easing pressure of other transportation modes, regional economic development Negative externalities: environment pollution, ecological destruction, traffic congestion, traffic accidents, river bank occupation	Positive externalities: financial subsidies, organization integration Negative externalities: moral restraint, taxation, policy and regulation control and pollution emission trading system
Shipping	Positive externalities (but not obvious): producers and consumers' surplus, consumption pattern change, life space development, specialization of production and land use, the growth of the economy size, optimization of economic structure, technical progress Negative externalities: environment pollution, ecological destruction, traffic congestion, traffic accidents	Positive externalities: financial subsidies, organization Negative externalities: moral restraint, taxation, policy and regulation control, pollution emission trading system
Shipping Control	Mainly system externalities, that is, bringing vice externalities to victims, and bringing positive externalities to beneficiaries.	Positive externalities: policy and regulation control Negative externalities: moral restraint, policy and regulation control
Salvage Operation	Mainly positive externalities: shipping unblocked and safety A few negative externalities: navigation obstruction when in construction	Positive externalities: financial subsidies Negative externalities: moral restraint, policy and regulation control
Fairway Information Service	Mainly positive externalities: navigation efficiency and safety	Positive externalities: financial subsidies

## 5 Conclusion

The Inland shipping goods is a complex of private goods, public goods and quasi-public goods. Their externalities always make them in a sub-efficiency resource allocation state: excessive production caused by negative externalities and insufficient production caused by positive externalities. Correction for externalities is essentially the adjustment of the goods' private marginal costs or private marginal benefits to be consistent with its social marginal cost or social marginal gains. The correction methods could be through market mechanism, government intervention, or the combination of them, each of which has different advantages and disadvantages and should be used separately or jointly with appropriate degree and contents to maximize the resources allocation efficiency.

# An Analysis on the Differences of CPI among All Provinces and Cities in China: Based on the Analysis of Cross-Sectional Data<sup>\*</sup>

Hu Yunyun, Sun Zehou

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: hyy1989@yeah.net, szh-63@163.com)

**Abstract:** As the influence of the "double festival", China's consumer price index(CPI) increased 4.5 percent in January 2012. Price term still in high, not only affect the healthy development of the national economy ,but also affect the normal life of residents, especially the low-income groups, therefore, continue to control prices rising too fast remains a tremendous task. In this paper, the principal component analysis (PCA) method is applied to analyze the data of China's monthly CPI by Category of 2011 among the country's 31 provinces. Three components are selected according to the PCA result, and then all provinces by the score of component are sorted on and the scores of different regions for comparison are observed. At the end, the 31 provinces are classified into 5 categories by using hierarchical cluster method. After the above research, some counter measures for inflation-controlling will be put forward.

**Key words:** CPI; Inflation; Principal component analysis; Hierarchical clustering analysis

## 1 Introduction

The latest data published by the National Bureau of Statistics shows that China's consumer price index(CPI) increased 4.5 percent in January ,2012. Among it: food rose 10.5%, wine and cigarette, gone up 3.7%, while clothing, family facilities and maintenance service , medical care and personal items, traffic and communication, entertainment and education and inhabitancy increased 3.3% ,2.6%,2.6%,0.2%,0.7% and 1.9% respectively.

Figure 1 The CPI Tendency Chart from September of 2009 to March of 2011

CPI is often used to measure the inflation degree or life cost level. Generally speaking, when CPI > 3% ,the inflation forms. While When CPI > 5%, we call it the serious inflation.

In terms of low-income people, their wage growth rate is not able to catch up with the speed of inflation when it's short-term inflation. The faster the speed of inflation is , the quicker the actual income will decline .Whether in China or other countries, decision-making departments particularly concerned about that rising inflation may lead to social instability. Controlling prices remains a tremendous task.

## 2 Relevant literature Review

In recent years, the CPI is always the focus of scholars at home and abroad, concerning the compilation of the CPI index, trend forecasting model and empirical analysis on the factors of effect on the CPI.

### 2.1 CPI compilation problems

<sup>\*</sup> This paper is supported by Education Single Project at the Foundation of the National Social Science of "research on the central region new generation farmer human resource capacity construction (GrantNo.BKA100098)". This paper is the substantive result

Gao Xu (2008) is a combination of macro and micro-economic level, system analysis of the CPI in that price statistics standards<sup>[1]</sup>. Xu Dilong, Xie Min (2008) will be our country of CPI international comparison, put forward to the CPI from consumption of classification, the survey method, own housing treatments suggestion for improvement<sup>[2]</sup>. Gao Yanyun (2009) to the CPI published in international comparison calls on improving the transparency of statistical data<sup>[3]</sup>. Xu Qiyuan (2010) starting from the CPI data and subjective differences, CPI data accuracy question raised much debate<sup>[4]</sup>.

At present, our country used to calculate the CPI goods and services project, by the state statistics bureau and local statistical departments determine classification. National Bureau of statistics according to the country's 120,000 household sample survey on the unified urban and rural households' consumption expenditures determine the categories of goods and services, setting the food, tobacco, alcohol, and supplies, clothing, household equipment products and services, health care and personal products, transport and communications, entertainment, education and cultural products and services, eight categories of residence 262 basic classification, covers all consumption of urban and rural residents.

### 2.2 changes in the CPI trend prediction model

Liu Zhenwei (2009) using ARMA model of our country in 1996 to 2007 annual average CPI for empirical analysis, establishment of prediction model, draw of our country economy will be resumed in 2010, also faces inflation risk<sup>[5]</sup>. Zhou Ruifang (2008) based on the CPI characteristics of time series data, by comparing the Autoregressive model of the CPI and one to three order ARCH model parameters, be CPI short-term prediction of the optimal first-order ARCH models to Autoregressive model<sup>[6]</sup>. Zhang Yuanzhang and Wang Shumin (2010) on the consumer price index and retail price index of commodities in Henan province, the agricultural production index, industrial price indices and indices of prices of raw materials, fuel and power purchased fixed assets investment price indices and Multivariate regression model building, analyze the model goodness to be high which can be used for prediction of CPI in Henan province<sup>[7]</sup>. Ren Xiaotao, Teng chun and Liu Da (2010) through the introduction of hidden Markov models to analyze the fluctuation of CPI, came to the CPI forecast value and probability distributions<sup>[8]</sup>.

### 2.3 CPI empirical analysis of influence factors

Zhu Li (2007) using grey correlation analysis method to analysis of the food price index in China and which is related to the price of goods, and in the extent to which the effects of CPI rose shows rising food prices will not lead to overall inflation's outbreaks<sup>[9]</sup>. Tan Benyan and Liu Jianping (2009) according to January 2001 to April CPI basket of eight categories in the consumer price index of the classification monthly data, using test Association whole system medium-and long-term drive power and short-term drive force method, from CPI classification index Angle to prove our country with structural CPI fluctuations, food, transportation and communication and entertainment education cultural goods and services 3 classification index is also influence short-term fluctuations and long wave factors<sup>[10]</sup>.

Liu Haibing, and Liu Li (2009) in the VAR (Vector auto-regression) model based on using impulse response functions and variance decomposition method of empirical analysis of influencing factors of the CPI, come to the money supply, fixed asset investment scale and effect on the CPI of the ex-factory price of industrial products significantly<sup>[11]</sup>. Xia Yulian and Zeng Fusheng (2010) using the above method examines the relationship between CPI and prices of major agricultural products, that fluctuations in the prices of major agricultural products is unlikely to impact on the CPI<sup>[12]</sup>.

### 2.4 Other related research

Zhou Qingjie(2008) from the Angle of economics qualitative analysis the self-owned housing in the CPI processing<sup>[13]</sup>. Wang Shuangzheng (2010) based on 2003-2008 31 provincial-level Panel data model for panel data, analysis of economic growth in different regions, urban residents income differences and the relationship between the CPI and the ex-factory price of industrial products<sup>[14]</sup>.

## 3 Methodology

Most of the studies on CPI at home and abroad are about setting up time series analysis models according to the time series data.

This article divides the CPI evaluation indexes into eight categories based on the purposes of the investigated contents, including food, alcohol and tobacco, clothing, family facilities and maintenance service, medical care and personal items, traffic and communication, entertainment and education and

inhabitancy.

In this paper, the data of China’s monthly CPI by Category of 2011 among the country's 31 provinces is collected and the principal component analysis (PCA) method is applied to analyze the panel data. Three components are selected according to the PCA result, and then sort on all provinces by the score of component and observe the scores of different regions for comparison. At the end, we use hierarchical cluster method to classify the 31 provinces into 5 categories. By the above research, some counter measures for inflation-controlling will be put forward.

**4 The selection and preprocessing of the variable data**

This paper collects the data of China’s monthly CPI by Category of 2011 among the country's 31 provinces from national statistical database(<http://219.235.129.58/welcome.do>), then the monthly data is reduced to the annual data. Using the eight categories of CPI as variables and 31 provinces as sample, we carried out analyses.

Different indexes have different dimensions. In order to eliminate variables differences in the order of magnitude and enhance the comparability between data, data should be standardized. Excel can be used to carry out the standardization of original data. As follows:

$$Z - X_i = \frac{X_i - \bar{X}_i}{\sqrt{D(X_i)}} \quad (i = 1, 2, 3, \dots, 20) \tag{1}$$

Among them,  $X_i$  is original observation.  $\bar{X}_i$  is the mean value of initial data at position i.  $D(X_i)$  is the variance of initial data at position i. After standardization, the standard deviation of new variables become one and the mean values become zero.

**5 Analysis**

In order to understand the status of China’s CPI in 2011 more fully, the data of China’s monthly CPI by Category of 2011 among the country's 31 provinces will be analyzed quantitatively by using principal component analysis and hierarchical clustering analysis.

The principal component analysis (PCA) method is applied to analyze the original data by using the statistical software of SPSS and the total variance explained (as table 1) and the component matrix (as table 2) are output.

**Table 1 Total Variance Explained**

Component	Initial eigenvalues			Extraction sums of squared loading		
	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %
1	2.068	25.852	25.852	2.068	25.852	25.852
2	1.723	21.540	47.391	1.723	21.540	47.391
3	1.158	14.469	61.860	1.158	14.469	61.860
4	.933	11.658	73.517			
5	.896	11.201	84.720			
6	.580	7.245	91.965			
7	.330	4.119	96.084			
8	.313	3.916	100.000			

According to the principle of determining the number of principal component, that is the number of eigenvalues greater than 1, determine to extract three principal components.

**Table 2 Component Matrix**

	Component		
	1	2	3
X1	-.742	-.275	.339
X2	-.297	.329	-.397
X3	.459	.495	.383
X4	.245	.793	.249
X5	.647	-.167	.433
X6	.338	-.397	.180
X7	.494	-.687	-.058
X8	.618	.088	-.673

According to the component matrix,eigenvectors can be computed(as the following table):

**Table 3 Matrix of Eigenvectors**

	Z1	Z2	Z3
X1	-.52	-.21	.32
X2	-.21	.25	-.37
X3	.32	.38	.36
X4	.17	.60	.23
X5	.45	-.13	.40
X6	.24	-.30	.17
X7	.34	-.52	-.05
X8	.43	.07	-.63

According to the above table,the expression of principle components can be written down,as follows:

$$F_1 = -0.52X_1 - 0.21X_2 + 0.32X_3 + 0.17X_4 + 0.45X_5 + 0.24X_6 + 0.34X_7 + 0.43X_8$$

$$F_2 = -0.21X_1 + 0.25X_2 + 0.38X_3 + 0.6X_4 - 0.13X_5 - 0.3X_6 - 0.52X_7 + 0.07X_8$$

$$F_3 = 0.32X_1 - 0.37X_2 + 0.36X_3 + 0.23X_4 + 0.4X_5 + 0.17X_6 - 0.05X_7 - 0.63X_8$$

The computational formula of comprehensive score of Y is as listed below:

$$Y = \frac{\lambda_1 Y_1 + \lambda_2 Y_2 + \lambda_3 Y_3}{\lambda_1 + \lambda_2 + \lambda_3} \tag{2}$$

The total score calculation and ranking is as following table:

**Table 4 Scores and Ranking**

	F1	F2	F3	F	ranking
1 Beijing	2.33	1.33	-0.71	1.43	2
2 Tianjin	-1.57	3.20	-0.86	0.07	17
3 Hebei	-0.54	-0.19	-1.38	-0.59	24
4 Shanxi	-0.12	-0.63	0.62	-0.14	18
5 InnerMongolia	-1.67	-1.26	-0.11	-1.24	29
6 Liaoning	0.28	0.70	-0.21	0.32	12
7 Jilin	0.76	0.25	0.16	0.49	9
8 Heilongjiang	-0.95	0.81	-0.64	-0.34	22
9 Shanghai	1.58	3.39	1.92	2.22	1
10 Jiangsu	0.14	1.39	0.70	0.64	7
11 Zhejiang	0.62	0.60	1.12	0.71	5
12 Anhui	-0.40	0.85	0.59	0.18	14
13 Fujian	0.30	0.11	-0.18	0.15	15

14 Jiangxi	0.47	-0.19	0.71	0.31	13
15 Shandong	-0.60	-0.16	-1.57	-0.65	25
16 Henan	0.25	-0.26	-1.15	-0.18	20
17 Hubei	1.05	0.69	0.15	0.76	4
18 Hunan	1.21	-1.93	-0.79	-0.17	19
19 Guangdong	0.16	0.00	0.31	0.14	16
20 Guangxi	-1.66	-1.04	1.96	-0.77	26
21 Hainan	-1.10	-1.77	0.25	-1.05	27
22 Chongqing	-4.22	1.35	-0.25	-1.70	30
23 Sichuan	-0.95	-1.00	-1.61	-1.09	28
24 Guizhou	-3.06	-1.19	0.31	-1.83	31
25 Yunnan	-0.86	-0.58	0.22	-0.57	23
26 Tibet	2.44	-0.15	-0.96	0.97	3
27 Shaanxi	0.64	-0.22	0.73	0.38	11
28 Gansu	2.94	-2.98	0.85	0.68	6
29 Qinghai	1.71	0.28	-2.61	0.43	10
30 Ningxia	0.73	-0.68	2.40	0.60	8
31 Sinkiang	0.10	-0.84	0.03	-0.21	21

The hierarchical clustering analysis (HCA) method is applied to analyze the data by using the statistical software of SPSS and the outcome is obtained( as below):

Figure 2 Variables Cluster Tree Structures

According to the above figure, 31 provinces of China are divided into the following 5 classes:

The first class: Beijing, Qinghai, Tibet. The medical service prices and clothes prices are higher in these provinces.

The second class: Hunan, Gansu. Their medical care and personal items, entertainment and education and inhabitancy prices are higher.

The third class: Hebei, Shanxi, Inner Mongolia, Liaoning, Heilongjiang, Hubei, Jilin, Jiangsu, Jiangxi, Liaoning, Shaanxi, Yunnan, Zhejiang, Anhui, Fujian, Shandong, Henan, Guangdong, Guangxi, Hainan, Sichuan, Guizhou, Yunnan, Shaanxi, Ningxia, Xinjiang. As an example, Hubei province in the basic survival material consumption and development material consumption is in the middle level.

The fourth class: Tianjin, Chongqing. In these provinces, the prices of food, alcohol and tobacco, family facilities and maintenance service and entertainment and education are higher.

The fifth class: Shanghai. Both the price of medical care and personal items and the price of entertainment and education are higher in Shanghai.

## 6 Summary

In this paper, the principal component analysis (PCA) method is applied to analyze the data of China's monthly CPI by Category of 2011 among the country's 31 provinces. And the dynamic year-on-year data is simplified into principal component scores in static state. It simplifies the evaluation standard and the relative positions of provinces on the main shaft is obvious. This makes it great convenient to compare the situation of CPI in different provinces.

Then this article uses hierarchical clustering analysis (HCA) method divided 31 provinces in the country into 5 kinds by treating 3 main component scores as variables. The results of the classification is in line with the basic level of economic development and the consumption structures in every province.

In a word, it is easy to find the gaps between the provinces and find out the key points, then take corresponding measures to narrow gaps.

## 7 Conclusion

Price is the comprehensive reflection of economy operation, so controlling the commodity prices plays an active role in controlling society. In terms of narrowing the gaps between provinces, several suggestions are listed, as follows:

### 7.1 The CPI should be compiled and published more accurately, efficiently and reasonably

As an economic index reflecting the extent of inflation or deflation of our country and the basis that the central bank judges whether increases interest rates, the objectivity and authenticity of CPI play very important roles. In terms of technical level, the concerned departments should timely adjust a basket of specification product and the corresponding weights with the change of the living standards and the upgrades of consumption structure of residents. The durable consumer goods such as inhabitancy should be redefined. The case of out of the market prices by virtual rent should be corrected. When determining the weight, this article suggested adopting the combination of the sampling survey method and the method that choose the typical cases by classification to determine a number of key subjects. In the establishment of index system, a single CPI is not able to fully reflect all aspects of the overall complex economic phenomena, therefore it is needed to combine specific purpose, adding more rich connotation of relevant index, and to pay attention to the combination of the total index and the group indicators, and of the absolute index and the relative index. In the information system, it is needed to establish organization system composed of officials, schools, research institutions, professional statistical information companies and so on, for promoting the development of the non-governmental statistical industry, for correcting the situations of providing data for the politics, and for maintaining the statistical data accuracy.

### 7.2 Distinguishing the gap between the regions and industries, timely and precisely controlling prices

From the above to the CPI three-dimensional data research It is not difficult to find that the consumption levels of residents in the country's 31 provinces are different. All provinces should take measures according to their own characteristics.

First, the fuel of water and electricity is the highest weight in the category of living, and influences the living prices greatly. At present, the water and electricity fuel prices are mostly the prices mandated by the government or guided prices, therefore there are certain price controls. But the governments of

some provinces where the living prices are higher should pay much attention to scheduling and conducting of coal, electricity, and gas, in order to prevent from the cost aspect pushing the increase of downstream products prices, then promoting the increase of CPI.

Second, the sequential increase of downstream products prices pulled by the increase of food prices is one of the main driving forces pushing the CPI up. Although smoking prices is under the certain regulation of government, due to that the rise of food prices will occupy the tobacco plantation area, that is to say that the smoke products also may have the pressure of the refiners. So, in the agriculture developed provinces, we should continue to carry out the policy of agricultural support, prevent natural disasters such as floods, and guarantee the supply of main agricultural products and important agricultural production materials. On the other hand, we should as well perfect the reserve system, reasonably reduce circulation cost such as the transportation cost, which can reduce the prices of food, cigarettes and supplies in some provinces.

Third, in terms of the provinces where the prices of medical care and personal items, traffic and communication and entertainment and education are higher, local governments should control the price adjustment rhythm and strength of service prices effectively, strengthen the supervision and management of service prices, strictly control the standards of tuition, medical fees, transport costs and so on, reinforce the infrastructure construction of traffic, electric power, communications and the program of raising prices should be open, reasonable and transparent, and sometimes it should strictly carry out the price system of hearing. What's more, raise in price of lift should be prevented strictly.

Forth, it is needed to maintenance market normal business activities, strike price offenses. The illegal activities of colluding in price rising, disguised price increases and hoarding hype and so on by give priority to economic means and legal means, assisted by the necessary administrative means.

Fifth, social security system and subsidy system should be perfected. It is needed to establish and perfect the lowest life guarantee, unemployment insurance standards and so on, so that income expectation and prices bearing ability of residents in different provinces can be enhanced.

Sixth, the price regulation of the new period should be with international vision and strengthen international coordination.

# On the Construction of Quality Evaluation Index System for Innovation and Entrepreneurship Education in Research-oriented Universities\*

Feng Yanfei<sup>1</sup>, Tong Xiaoling<sup>2</sup>

1 School of management, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 School of mechanical and electrical engineering, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: tongxllove@163.com, yffeng@163.com)

**Abstract:** With the development of innovation and entrepreneurship education in Chinese universities, setting up a quality evaluation has become a topic of concern. The paper combines the goals and features of innovation and entrepreneurship education in research-oriented university, analyses the main elements of education quality and, accordingly, constructs a quality evaluation index system for innovation and entrepreneurship education. It employs analytic hierarchy method to determine index weights at all levels, for a comprehensive scientific research innovation and entrepreneurship at research-oriented universities to provide a basis for evaluating the quality of education.

**Key words:** Innovation and entrepreneurship education; Quality evaluation; Index system; AHP

## 1 Introduction

Pursuant to the development strategy of "improving independent innovation ability to build an innovative country" and "creating jobs by encouraging entrepreneurship" proposed by the 17<sup>th</sup> National Congress of the Communist Party of China, Chinese Ministry of Education explicitly set out to promote innovation and entrepreneurship education in universities in its published document "Promoting Innovation and Entrepreneurship Education in Universities and Encouraging Students' Business Initiatives", and "The National Medium and Long-term Educational Reform and Development Planning (2010-2020)".

As an adaptation to economic, social and national development strategy needs, the education concept and mode, i.e. innovation entrepreneurship education, through related courses activities, can exert education and effects on students through unification of education, research, simulation and exercises, develop students' awareness of innovation entrepreneurship spirit, autonomous pioneering spirit and hands-on skills. It is an important initiative to enhance university core competitiveness, and the need to talent training strategy<sup>[1]</sup>. Unfortunately innovation entrepreneurship education in our country is in its pilot stage, and related research results are few, mostly confined to discussion on the necessity of evaluation, not to mention the study on evaluation index system, particularly, in research-oriented universities, there are no established scientific quality assessment and control system of perfecting the system of modes, lacking in overall supervision of the process of innovation and entrepreneurship education and performance<sup>[2]</sup>, therefore, it is of great theoretical and practical significance to build an innovation and entrepreneurship education quality evaluation index system in research-oriented universities with higher application value.

## 2 Content of Quality Evaluation Index System for Innovation and Entrepreneurship Education

Given the complexity of university innovation entrepreneurship education work itself, it is quite difficult to evaluate its quality with a sole dimension for objective precise comprehensive summary and reckoning, thus many of the contents and objects need to be evaluated as system integrant part value realization form which is connected with one another. By constructing a comprehensive evaluation index system, with "elements + relationship", the form carries on objective, practical, easy-to-control presentation<sup>[3]</sup>. This article mainly adheres to the following principles in construction of indicator system: strategic target orientation, system coordination, comprehensive completeness, objective scientific nature, dynamic flexibility, manipulation and so on<sup>[4]</sup>. and a comprehensive analysis of

---

\* This paper is supported by the Humanities and Social Science foundation of Chinese Ministry of Education(No:09YJA880101)and Provincial Teaching and Research Project of Hubei Province(No:2011008) and Teaching Research Project of Wuhan University of Technology(No:2012023)

research-oriented University education levels, features, objectives, contents, structure, etc, while taking into account students' personality and family background and school innovation and entrepreneurship influence of environments on the quality of education to determine index design and evaluation methods, from the perspectives of innovation and entrepreneurship education results evaluation and process inputs identify the such five evaluation contents as entrepreneurship education environment in colleges and universities, teaching staff, the quality of teaching, students, social reputation<sup>[5]</sup>:

### **2.1 University environment**

The environment has manifested research-oriented university organization support and resources investment for the innovation education, mainly including hard environment and soft environment: the former refers to various safeguard measures in innovation entrepreneurship funding and infrastructure aspects, like establishing entrepreneurship center; the latter refers to academic and cultural atmosphere for innovation entrepreneurship education, respecting entrepreneurship, and tolerance of failure and the intrinsic substance guarantee to stimulate students' entrepreneurial spirit and passion through relevant policies and measures

### **2.2 Teaching**

Teaching is the education implementation link of innovation education, its main appraisal aspect lies in correlated theories and the design and the arrangement of curricula: discipline construction, namely: entrepreneurship consciousness, knowledge, strategy, ability, quality and so on; Teaching methods, in addition to traditional classrooms, teachers, textbook teaching, also should increase social survey, case studies, lecture interaction, entrepreneurial simulation and real business practice mode to enhance the innovation capability of students.

### **2.3 Faculty**

Innovation entrepreneurship education of research type university eventually is to implement through teachers, thus faculty is an important factor in education quality evaluation, and it mainly contains such basic conditions as teacher background, i.e. academic titles university teachers should possess for innovation entrepreneurship education, expertise, quality skills and work experience; teachers' innovation entrepreneurship capacity, i.e. teachers' research innovation consciousness, capacity and related achievements; teachers' innovation entrepreneurship capacity, i.e. the mastery of innovation entrepreneurship education theories and teaching methods.

### **2.4 Student evaluation**

Student Evaluation consists primarily of students' evaluation of their background, performance and satisfaction. Student background refers to family background for innovation and entrepreneurship, education experience, ideas, personality traits, abilities and qualities and other information; student performance refers to achievements in innovation and entrepreneurship learning, practice; student satisfaction is, namely, their sense of identity, initiative and participation in university innovation and entrepreneurship education courses.

### **2.5 Social reputation**

Social reputation mainly refers to the social impact of colleges and universities in the fields of innovation and entrepreneurship, academic status; a series of academic contacts and achievements in the outside academic innovation as well as evaluation of the effectiveness of graduates' innovation and entrepreneurship.

This article takes the above appraisal content as a master line, constructs a set of innovation and entrepreneurship education quality evaluation index system after screening by using expert investigation method, including 5 level-2 indicators, 13 level-3 indicators, as shown in Table 2<sup>[6]</sup>.

## **3 Evaluation Criteria and Weight Determination**

In view of the diversity and complexity of innovation and entrepreneurship education index in research-oriented University, this article uses analytical hierarchy process (AHP) for the determination of weight in dominant indicators.

First, establish hierarchical structure (A-B-C), and defines corresponding relations between target and variable according to index system; Then, using Delphi method, several experts carry on the allocation to each target, add up their allocation, then divide it by population, and finally obtain the triangle fuzzy judgment matrix and the general judgment matrix. Due to space limitation, only level indicator B judgment matrix is listed, as shown in Table 1:

**Table 1 Level Indicator (B ) Judgment Matrix**

A	B1	B2	B3	B4	B5
B1	(1,1,1)	(4/5,1,3/2)	(4/3,2,7/2)	(1,3/2,5/2)	(3,4,6)
B2		(1,1,1)	(1/6,1/4,1/3)	(3/4,1,5/4)	(4/3,2,8/3)
B3			(1,1,1)	(5/2,10/3,5)	(3,5,8)
B4				(1,1,1)	(5/3,2,10/3)
B5					(1,1,1)

According to triangular fuzzy judgment matrix in table 2, the weight can be calculated in between dominant and non-dominant indicators and weights under non-dominant one, calculations are as follows<sup>[7][8]</sup>:

(1) The integrated fuzzy value of first object *i* is as follows:

$$S_i = \sum_{j=1}^m M_{gi}^j \otimes \left[ \sum_{i=1}^n \sum_{j=1}^m M_{gi}^j \right]^{-1} \quad (i = 1, 2, \dots, n) \tag{1}$$

$M_{gi}^j$  refers to the degree value of object *i*'s objective *j*

$$\sum_{j=1}^5 M_{g1}^j = \left[ \left( 1 + \frac{4}{5} + \frac{4}{3} + 1 + 3 \right), \left( 1 + 1 + 2 + \frac{3}{2} + 4 \right), \left( 1 + \frac{3}{2} + \frac{7}{2} + \frac{5}{2} + 6 \right) \right] = (7.13, 9.5, 14.5)$$

$$\text{likewise: } \sum_{j=1}^5 M_{g2}^j = (10.83, 15.33, 23.5); \quad \sum_{j=1}^5 M_{g3}^j = (5.96, 8, 11.5)$$

$$\sum_{j=1}^5 M_{g4}^j = (4.07, 4.97, 7.06); \quad \sum_{j=1}^5 M_{g5}^j = (1.97, 2.45, 3.01)$$

$$\sum_{i=1}^5 \sum_{j=1}^5 M_{gi}^j = \left[ (7.13 + 10.83 + 5.96 + 4.07 + 1.97), (9.5 + 15.33 + 8 + 4.97 + 2.45), (14.5 + 23.5 + 11.5 + 7.06 + 3.01) \right]$$

$$= (29.96, 40.25, 59.57)$$

$$\left[ \sum_{i=1}^5 \sum_{j=1}^5 M_{gi}^j \right]^{-1} = (29.96, 40.25, 59.57)^{-1} = \left( \frac{1}{59.57}, \frac{1}{40.25}, \frac{1}{29.96} \right)$$

(2) Based on formula 1, the following can be obtained

$$S_1 = (7.13, 9.5, 14.5) \left( \frac{1}{59.57}, \frac{1}{40.25}, \frac{1}{29.96} \right) = (0.1197, 0.2360, 0.4840)$$

Likewise, it may result in:

$$S_2 = (0.1818, 0.3809, 0.7844); \quad S_3 = (0.1001, 0.1988, 0.3838)$$

$$S_4 = (0.0683, 0.1235, 0.2356); \quad S_5 = (0.0331, 0.0609, 0.1005)$$

If  $M_1 = (l_1, m, u)$ ,  $M_2 = (l_2, m_2, u_2)$ , then the possibility of  $M_1 \geq M_2$  is:

$$V(M_1 \geq M_2) = \text{hgt}(M_2 \cap M_1) = \frac{l_1 - u_2}{(m_2 - u_2) - (m_1 - l_1)} \tag{2}$$

$$\text{Then: } V(S_2 \geq S_1) = \frac{0.1818 - 0.484}{(0.2360 - 0.484) - (0.3809 - 0.1818)} = 0.6759$$

Likewise:  $V(S_1 \geq S_2) = 1$ ;  $V(S_1 \geq S_3) = 0.8765$ ;  $V(S_1 \geq S_4) = 0.5074$ ;  $V(S_1 \geq S_5) = 0.1232$ ; others like  $V(S_i \geq S_k)$   $k \neq i$  won't be listed here.

(3) Weight vector is:

If  $d'(B_k) = \min V(S_i \geq S_k), k = 1, 2, \dots, 5, k \neq i$ , then the weight is:

$$w' = [d'(B_1), d'(B_2), \dots, d'(B_5)]^T = [0.5074, 1, 0.5065, 0.3985, 0.2369]^T$$

After normalization, we get:

$$W = [d(B_1), d(B_2), \dots, d(B_5)]^T = [0.1915, 0.3775, 0.1912, 0.1504, 0.0894]^T$$

Similarly, an approximation of level three sub-index weight can be calculated based on the fuzzy judgment matrix of level three sub-indicators

4) Consistency testing:

When the judgment matrix deviates the uniformity, the above computation relative weight vector method has certain unreliability, therefore a consistency testing must be carried on, the concrete step as follows shows:

1)The coincident indicator of parameter -- C.I.:  $C.I. = \frac{\lambda_{\max} - n}{n - 1}$  ; (3)

Where  $\lambda$  Max is the maximum eigenvalue of the matrix, you can take a common calculation of eigenvalue method or formula 4:

$$\lambda_{\max} = \sum_{i=1}^n \frac{(AW)_i}{n \omega_i} = \frac{1}{n} \sum_{i=1}^n \frac{\sum_{j=1}^n a_{ij} \omega_j}{\omega_i}$$
 (4)

2)Find the corresponding mean random consistency index R.I. in accordance with table,;

3)The coincident indicator of parameter --C.R.:  $CR = \frac{CI}{RI}$  (5)

If C.R.<0.1, then through the consistency of judgment matrix testing; if C.R. ≥ 0.1, the judgment matrix should be suitably amended.

4)Calculate total order weight of elements for the target layer-by-layer . Calculate each single weight under guidelines top- down after synthesis, then layer-by-layer overall consistency judgment and testing.

If  $W^{(k-1)} = (\omega_1^{(k-1)}, \omega_2^{(k-1)}, \dots, \omega_{n_{k-1}}^{(k-1)})^T$  stands for the sort weight vectors of  $nk-1$  on the  $k-1$  level relative to the general objective, and  $P_j^{(k)} = (p_{1j}^{(k)}, p_{2j}^{(k)}, \dots, p_{n_k}^{(k)})^T$  stands for the sort weight vectors of  $nk$  on the  $k$  level relative to the element  $j$  on the  $k-1$  level, which also is matrix of  $n_k \times n_{k-1}$  step, in which the elements have no influence from element  $j$  get 0 weight vectors; then, the general sort of elements  $W(k)$  on the  $k$  level relative to the objective is:

$$W^{(k)} = (\omega_1^{(k)}, \omega_2^{(k)}, \dots, \omega_{n_k}^{(k)})^T = P^{(k)} \bullet W^{(k-1)}$$
 (6)

Or:

$$\omega_i^{(k)} = \sum_{j=1}^{n_{k-1}} p_{ij}^{(k)} \omega_j^{(k-1)}$$
 (7)

And the general formula is:  $W^{(k)} = P^{(k)} P^{(k-1)} \dots W^{(2)}$  (8)

Meanwhile, according to formula 3, the coincident indicator  $CI_j^{(k)}$  of element  $j$  on  $k-1$  level can be obtained, and then, coincident indicator  $RI_j^{(k)}$  obtained from the table can be used with formula 5 to get the coincident indicator  $CR_j^{(k)}$  ( $j=1, 2, \dots, nk-1$ ). Then, according to the following formula, we can get the overall indicator of  $k$  level:

$$CI^{(k)} = (CI_1^{(k)}, \dots, CI_{n_{k-1}}^{(k)}) \bullet W^{(k-1)}$$
 (9)

$$RI^{(k)} = (RI_1^{(k)}, \dots, RI_{n_{k-1}}^{(k)}) \bullet W^{(k-1)}$$
 (10)

If the CR (k) < 0.1, you can view the index system of the  $k$  hierarchical structure through consistency test for all judgment matrix, with full satisfaction. If all weights are made through consistency test, all levels of target weights can be obtained in the innovation imbarck education quality appraisal target system. Concrete results are shown in table 2:

**Table 2 Innovation and Entrepreneurship Education Quality Evaluation Index System of Research-type University**

## 4 Conclusion

Quality evaluation is the core of innovation and entrepreneurship education in research-oriented University, so it needs to systematically collect, collate relevant information through improved scientific evaluation index system and judge from investment and benefit, subsequently obtains an objective and comprehensive quality appraisal results from the angles of reliability and validity. This article draws on innovation and entrepreneurship education quality evaluation index of research results at home and abroad, takes into consideration the impact of input and effects of innovation and entrepreneurship education environment in colleges and universities, teachers, teaching and learning environments, student evaluation and social reputation, builds innovation and entrepreneurship education quality evaluation system of research-oriented universities in China. In practical applications, appropriate changes and adjustments can be made according to academic strengths, innovation and entrepreneurship and its own characteristics.

# The Analysis of Influence Factors on China Clothing Export

Huang Jie<sup>1</sup>, Jiang Fuyan<sup>2</sup>

1 Faculty of Management and Economics, Kunming University of Science and Technology, P.R. China, 650093

2 International Business School, Shanghai Institute of Foreign Trade, P.R. China, 201620  
(E-mail:huang-jie-29@163.com, jiangfuyan2007@yahoo.cn)

**Abstract:** Taking China clothing export as the research object, this paper mainly analyses the impact that some factors such as GDP of foreign countries and China, exchange rate, export rebate rate, technical barriers to trade impose on China clothing export by using augmented gravity model and the panel data from 1995 to 2009. The model results reveal that the GDP in foreign countries and China imposes great positive influence on China clothing export while the exchange rate and technical barriers to trade have negative effect on it. Finally the paper puts forward some suggestions based on the empirical result. It is expected to be of important reference value in promoting China clothing export.

**Key words:** Clothing export; Augmented gravity model; Exchange rate; Export rebate rate; Technical barriers to trade

## 1 Introduction

Since 2000, China has become the largest exporter of clothing, reaching 36.1 billion dollars. With its accession to WTO and the end of textile quotas, China clothing export volume has kept growing at more than 15% speed per year. The export value has broken 120 billion dollars in 2010. America, Japan, Europe and Hong Kong have become the most important markets, whose total import value accounts for over 60% of all export volume in China. In addition, as the pace of national industrial upgrade speeds up, China clothing export trade method has improved. The proportion of export with general trade pattern has significantly higher than that with processing trade pattern and the increase range of export with general trade pattern has exceeded that with processing trade pattern recently.

However with the increasing of production cost, appreciation of the RMB and the popularity of technical barriers to trade, China clothing export is encountering increasingly severe challenges. Export growth declines and the share in the world main market tends to decrease in recent years. Thus it is urgent and crucial to find out the factors that influence China clothing export under the new international environment and put forward development countermeasures. This article attempts from the empirical perspective to discuss this problem and related solution.

## 2 Model Establishment and Data Processing

### 2.1 Introduction of the model

Gravity Model was firstly proposed by Tinbergen, Netherland econometrician. It suggests that bilateral trade value is directly proportional to the economic scale measured by GDP and inversely proportional to the geographic distance. The expression of model is  $T_{ij}=A(Y_i Y_j / D_{ij})$ .

$T_{ij}$  stands for total trade value,  $Y_i$  is the GDP of country  $i$ , while  $Y_j$  is the GDP of country  $j$ .  $D_{ij}$  stands for the geographic distance between two countries.  $A$  is constant.

As the data of this model is high availability and credibility, the application has become more and more wide. Based on the research need, many scholars add several variables, which become augmented gravity model. New variables can be divided into two types, i.e. dummy variable such as common language and system index variable such as preferential trade agreement (PFR).

### 2.2 Establishment of augmented gravity model

In order to figure out the factors that affect Chinese clothing export, this paper draws on precious experience and establishes the following augmented gravity model:

$$\ln(EX_{it}) = \alpha_i + \beta_1 \ln(GDP_{it}) + \beta_2 \ln(GDPCH_t) + \beta_3 \ln(RE_{it}) + \beta_4 \ln(T_t) + \beta_5 i TBT_{it} + \mu$$

Where  $EX_{it}$  is the clothing export volume from China to country  $i$ ,  $GDP_{it}$  is real gross domestic product in country  $i$ ,  $GDPCH_t$  is real gross domestic product in China.  $RE_{it}$  is bilateral real exchange rate,  $T_t$  is Export Rebate Rate of clothing in China.  $TBT_{it}$  is dummy variable, standing for the report amount of TBT in country  $i$ . If there is no report before the year of  $t$ , the value is 0; if there is any report, then the value is 1. However, if there is any report after the year of  $t$ , the record becomes 2, etc. Because the distance is almost constant and the distance of two capitals does not equal to the transportation

distance, the variable of distance is deleted.

**2.3 Data sources**

Compared with series data, panel data can reduce the heterogeneity of different importers and the multicollinearity. In addition, it can enhance the degrees of freedom and validity of parameter estimation. Therefore, this paper uses panel data from 1995 to 2009. The associates are USA, Japan, Hong Kong, German, England, Russia, Canada, Italy, France and Australia. The data of GDP comes from UN database, while the export value is collected from the United Nations Commodity Trade Statistics Database. Export Rebate Rate is classified by the author and the reports of TBT are from the web of the State Bureau of Quality and Technical Supervision. Exchange Rate is from United Nations FAO Database.

**2.4 Estimation and test of the model**

**2.4.1 Unit Root Test and Co-integration Test**

In order to avoid the spurious regression, which means that several series data change in the similar tendency though they are not related directly, unit root test is performed. The result is as follows:

**Table 1 Unit Root Test Result**

Variables	LLC	Fisher-ADF	Fisher-PP

Note:\*\*\* denotes rejection of the null hypothesis at 1% level.

As is showed in the table, at 1% level of significance all series are found to be I(1), though they are not stationary at levels. Thus, it will be essential to proceed to co-integration test to check for the existence of long-run relationships among series. The result is showed in the table 2. From it, we can conclude that there are co-integrating relationships between explanatory variables and explained variable.

**Table 2 Co-integrating Test**

	Panel ADF	Group ADF
value	-3.999250***	-6.510418***

Note:\*\*\* denotes rejection of the null hypothesis at 1% level.

Since there is evidence of co-integration, estimation of export is performed to examine the impact of GDP, Exchange Rate, Export Rebate Rate, and Technical Barriers to Trade on Chinese Real Clothing Export.

**2.4.2 Model Form**

There are three forms of panel model, whose expressions are as follows:

- A: Varying -Coefficient Models  $Y_{it} = \alpha_i + \beta_i X_{it} + \mu_{it}$
- B: Variable Intercept Model  $Y_{it} = \alpha_i + \beta X_{it} + \mu_{it}$
- C: Constant Coefficient Model  $Y_{it} = \alpha + \beta X_{it} + \mu_{it}$

To decide the form of panel model, analysis of covariance is applied. If the null H2 Hypothesis is rejected, Constant Coefficient Model is applied.

$$H_2: \alpha_1=\alpha_2=\dots=\alpha_N \quad \beta_1=\beta_2=\dots=\beta_N$$

$$F_2 = \frac{(S_3 - S_1) / [(N - 1)(K + 1)]}{S_1 / [NT - N(K + 1)]}$$

Where  $S_3$  is the sum of squared residuals in Constant coefficient model,  $S_1$  is the sum of squared residuals in Constant coefficient model.  $N$  is the number of cross-section members.  $T$  is sample period and  $K$  is the number of explanatory variables except the constants.

The calculation shows that  $F_2$  equals 0.348, while the critical value is 1.486. So the null hypothesis is accepted and constant coefficient model is adopted.

The model expression is:  $\ln(EX_{it}) = \alpha + \beta_1 \ln(GDP_{it}) + \beta_2 \ln(GDPCH_{it}) + \beta_3 \ln(RE_{it}) + \beta_4 \ln(T_{it}) + \beta_5 TBT_{it}$

#### 2.4.3 Regression Analysis

By means of Eviews6.0, econometric result is as follows:

$$\ln(EX_{it}) = 0.521 + 0.371 * \ln(GDP_{it}) + 1.438 * \ln(GDPCH_{it}) - 0.397 * \ln(RE_{it}) - 0.237 * \ln(T_{it}) + 0.123 * TBT_{it}$$

(7.232)            (12.715)            (-17.172)            (-1.770)            (3.082)

$R^2 = 0.860057$              $D.W. = 0.193914$              $F = 176.9975$

The t value of all variable except Export Rebate Rate is greater than the critical value, namely 2.131. That is to say that all the other variables are significant. However, the coefficient symbol of  $T$  and  $TBT$  disagrees with the theory analysis, which implies the existence of serial auto-correlation. Therefore,  $AR(1)$  is introduced and the new model is formed.

$$\ln(EX_{it}) = \alpha + \beta_1 \ln(GDP_{it}) + \beta_2 \ln(GDPCH_{it}) + \beta_3 \ln(RE_{it}) + \beta_4 \ln(T_{it}) + \beta_5 TBT_{it} + \beta_6 AR(1)$$

With the help of static software, econometric result is:

$$\ln(EX_{it}) = -8.772 + 1.852 * \ln(GDP_{it}) + 1.069 * \ln(GDPCH_{it}) + 0.700 * \ln(RE_{it}) - 0.092 * \ln(T_{it}) - 0.026 * TBT_{it} + 0.950 * AR(1)$$

(5.738)            (3.353)            (11.285)            (-2.535)            (-1.962)

$R^2 = 0.9902$              $D.W. = 2.14$              $F = 834.6571$

The goodness-of-fit is improved evidently and the t-test shows that significance of all variables is at 95%. Besides the value of  $D.W.$  is greater than 2, which means that serial auto-correlation has removed. And the symbol of all explanatory variables except the variable of export rebate rate coincides with theoretical results.

#### 2.5 Findings

Economically, the symbols of explanatory variables stand for elasticity in the double logarithm model. The GDP elasticity coefficient of export is 1.852, which means that when GDP in foreign countries increases by 1%, the clothing export will increase correspondingly by 1.852%. The elasticity of GDP in China is 1.069, while that of exchange rate is 0.7. Technical Barriers to Trade will exert negative effect on clothing export in China. The hysteresis quality of Export Rebate Rate is the main reason that the sign of coefficient is inconsistent with theoretical analysis.

### 3 Conclusions

The regression analysis result shows that the GDP in foreign countries and China imposes great positive influence on China clothing export, while the exchange rate and technical barriers to trade have negative effect on it. Therefore, on the basic of cementing traditional market, clothing industry in China should actively develop new markets to disperse risks. In addition, they should proceed from product and increase added-value by means of discrepancy and brand strategy. Only in this way, can the influence of exchange rate, Technical Barriers to Trade and export rebate rate be reduced. High quality, unique culture connotation and excellent service are the guarantee of brand establishment. The dream of clothing great power can be realized if all these factors can be improved.

**Abstract:** Economic globalization makes market-oriented operation of the television industry imperative. But the income structure of China's television industry is irrational. The form of making profits is narrow. External financing is an important choice for the television media industry in China to keep up with advances in information technology. However, there are a lot of risks because of the particularity of China's television industry external financing. Based on the perspective of risk management, this article uses the Cobb-Douglas production function as the return on investment functions, measures the risk of state assets losing and the risk of control over the decentralized in the television media industry in China by comparing the external investment return on investment function and not. Finally, based on the results of qualitative analysis and quantitative research, this article points out that the improvement of technical strength, making managers work harder, treated with caution on gambling agreement are effective countermeasures to deal with financing risks.

**Key words:** Financing Risks; Risk Assessment Model; Manage Countermeasure; Television Media Industry

### 1 Introduction

With the rapid development of Internet technology, the TV media industries market operation has shown a diversified, modern trend over the world. Economic globalization makes market-oriented operation of the television industry is imperative. However, China's TV media industry is gradually out of line with the development of information technology. The income of China's television industry structure is irrational. The form of making profits, which mainly comes from the earnings in ads, is narrow. Because of strong political colour of the television media industry in China, the financing of industry mainly depends on government funding, internal financing and policy loans, did not take full advantage of the capital markets for external financing.

Given the basic status quo, in order to carry out effective market-oriented operation China's television industry must enrich the profit model, expanding financing channels. There are many ways to achieve this aim, but the external financing becomes a good solution of the funds required to the television media industry technical update and improve overall operational efficiency. Meanwhile, it will also bring some risks, one of the most important thing is that the risk of loss of state assets and control of risk diversification. Therefore, it is important to study and make appropriate management strategies of financing risks before external financing. This is also the purpose of writing this article.

The researches of the media industry financing risks focus on the following aspects. In the world, the researchers analysed Media Economics from the economics perspective. The relationship between consumers and producers in the media market, media and capital markets, media ownership, government and the media industry and other researches were done<sup>[1][2]</sup>. Pieard (1989) analysed the media phenomenon from the view of economic. He combined economics theory and the special phenomenon of the media market, analysed the decision-making process of market entities (producers, consumers and government), media cases and media economic phenomena, introduce the particularity of the general principles of market economy and the media market<sup>[3]</sup>. Harold L Vogel (2002) carried out a detailed analysis of the capital operation, operational efficiency and other issues of the entertainment industry (mainly including the media industry)<sup>[4]</sup>. In China, the studies of the media industry are mostly concentrated in the motivation of capital operation, the feasibility of capital operation, capital operations, and government decision-making on the financing strategy of the media industry, etc.<sup>[5]</sup>. Zhou (2004) chose the most difficult and most complex TV operators as a case in-depth analysis of the inevitability of the media capital operation, the way they operate, venture capital, strategy, and the government position in the media capital operation, and also presents some specific approaches of some media entity in the process of implementation of the capital operation. Chen (2005) introduced the inevitability of the media industry to bring in outside investors by Game Theory, constructed a game model for the

allocation of funds in different investment entities, and gave some suggestion about the Chinese media industry investment and financing policy decision<sup>[6]</sup>.

Through the above analysis, we can see that theoretical explanations for the financing risk of the television media research has focused on the perspective from the economics, there are small number of financing risks quantitative research, and these researches did not offer the appropriate risk management strategies. Therefore, based on risk financing perspective, this paper analyse the financing risks of television industry firstly, then use the efficient production function for quantitative analysis of the television media industry financing risks, and finally combine with qualitative analysis and quantitative research, proposed management measures.

## **2 Financing Risk Characteristics of TV Media Industry**

### **2.1 An overview of the television media industry financing risks**

Special social and historical development process, as well as the presence of government factors, China's television industry has its own specialty, both with strong political overtones, but also plays the role of business in a market economy, the specific performance as following points. Firstly, the main function of the TV media is the function of cultural propaganda, but also to shoulder with the corporate responsibility of profitability. Secondly, China's TV media exist in provincial units, media enterprise quantity is many, and scale is small, regional monopoly is strong, due to the level of economic development in different provinces large difference, there is a big gap in the comprehensive strength of the television media.

It is precisely because the government actually controls the television media, and therefore in the choice of financing channels, the Government will carefully consider the risks of external financing for the television media industry. External financing risks associated with the television industry mainly include three aspects. The first is undervalued risk. External investment entities will carry out the market value assessment when they are ready to invest in the television industry. Due to political factors, external investment entities would suspect of TV media which with a strong political overtones can operate in a market economy and sustained profitability, and thus underestimate the market value of the television media. The second is the losing control risk. After television media brought in outside equity investors and with the signing of an agreement on gambling, poor management can induce outside investors to increase the stake at a low price based on a gambling agreement. This is bound to dilute the control of the Government of the television media industry, may eventually lead to the television media are fully market-oriented, the loss of cultural transmission function. The third is losing state assets and brand values risks. The state-owned assets in China's television industry are in the leading position, the particularity of the television industry created a huge brand value. The television media failed efficient operation in a market economy after the introduction of outside investment and continue to profit, considering their own interests, outside investors may sell its equity in order to minimize losses. This will result in the loss of state-owned assets and brand value in the television industry.

### **2.2 Financing risk characteristics**

As mentioned above, the television industry has its particularity; its financing risks have certain characteristics. Firstly, TV media industry financing risk has persistence. Once the external equity or venture capitals were introduced into television industry, it will cause equity to master the different investment entities, and the decline in the proportion of state-owned asset holding. Even some outside investors will enter the television media industry's management, and make investment decisions unfavorable cultural propaganda benefit of the television media. Therefore, the risk of loss of state assets, the risk of loss of brand value, and control over the decentralized risk will always exist which caused by poor management or investment in a different direction.

Secondly, the television media industry financing risk has linkage. External financing of TV media industry is to achieve the goal of cultural and economic benefits of a win-win situation, while external investor's investment objective is to achieve maximum economic efficiency, the two have some differences in interest-driven. TV media industry assets are divided into tangible assets and intangible assets from morphology. Tangible assets mainly refers to the media business assets, including transmission equipment, distribution equipment, network equipment; intangible assets mainly refers to the brand value of the television media, the operating mechanism, the relationship between pipeline and marketing network. Both of which are complementary and inseparable in the process of television media achieving cultural and economic benefits. Therefore, in order to obtain the benefits of the TV media in the dissemination of culture, investment selection will be a part of the capital investment of intangible

assets maintenance. External investors will think more about the television media value of tangible assets when they were in a television media investment value evaluation, and think less about the television media value of intangible assets even ignore them. In addition, the television media to pursue the effectiveness of cultural propaganda, while sacrificing part of the economic benefits. But external investors hope that the capital operation of the television media could achieve maximum economic efficiency. Therefore, the external investors to one-sided pursuit of economic benefit maximization of the investment orientation but ignore the intangible assets investment. This ultimately is bound to have adverse effects for cultural propaganda benefit of the television media industry.

### 3 Assessment Model for Financing Risk in the TV Media Industry

The investment validity by using its own asset should be taken into account before assessing the financing risk of TV media industry. This article takes Cobb-Douglas production function as the basic benefit function.

Suppose the total investment amount of self-owned assets as  $I$

Suppose the factors of production put by the TV media as  $C$  (capital) and  $L$  (labour)

Under the realization of the dual goals, namely the culture propaganda benefit and economic benefit, the overall target that TV media utilizes its own assets to invest is as following:

$$T = T(1) + T(2) = m(C + L) + nf(C, L) \quad (1)$$

$T$  stands for the overall goal of TV media investment;  $T(1)$ , the goal of culture propaganda;  $T(2)$ , economic benefit;  $C$ , scale of investment;  $L$ , labour input;  $f(C, L)$ , the benefit function of investment. Therefore, by using Cobb-Douglas production function, this function can be represented as  $f(C, L) = AC^a L^b$ .  $m$  is the coefficient that investment contributes to the overall target,  $n$  is the coefficient that investment benefit contributes to the overall goal.  $m, n > 0$ . Provide the overall target as the maximum, it can be obtained,  $\max T = \max[m(C + L) + nf(C, L)]$ . Regardless of labour, provide the first derivative as zero for extreme value,  $m + nf'_C(C, L) = 0, f'_C(C, L) = -m/n < 0$

The extreme conditions for profit maximization on investment is  $f'_C(C_0, L) = 0$ , because of the decrease of the marginal benefit caused by scale of investment,

$$f'_C(C, L) = -m/n < f'_C(C_0, L) = 0, C > C_0 \quad (2)$$

Therefore, it can be seen that scale of investment only consideration of economic benefit is less than that of under the consideration of the dual goals, culture propaganda benefit and economic benefit. It also shows that TV media investment risk is less under the double drive of culture propaganda benefit and economic benefit, but the efficiency of state-owned investment is lower and it fails to achieve the effective allocation of capital. As a result, the introduction of external investment is an importance choice for state-owned assets to widen the governance scope of state-owned capital, improve capital structure and enhance the overall competitiveness.

Assuming an external investor is for equity investment. The following assumptions are required to assess TV media financing risk.

Suppose the external financing amount as  $K_1$ , the share of external investor as  $b$ , the minimum required capital return as  $a$ , the input of the owned capital of TV media as  $K_2$  and its share as  $c$

The two parties sign VAM (valuation adjustment mechanism). There are three kinds of decisions for investment effect made by external investors. Firstly, the successful investment which means TV media successfully appears on the market and external investor sells his owned share in the capital market. Secondly, rate of return on investment don't reach the lowest rate of return during observation period and external investors are entitled to increase their shareholding ratio  $d$  at  $P$  per share (lower than the initial outlay  $K_1/b$  per share). Thirdly, the investment didn't work out. And investors apply for liquidation and exit.

In the first case, it is the best state that external capital is sought by this media. The financier can not only repurchase stock but also choose to circulate capital in the market. In the second case, it will bring huge risk to this media: the risk of state-owned assets lost and the risk of decentralized control. In the third case, it causes maximum loss which is the investors and financiers most unwilling to see.

Because of value underestimate risk, happening in the investment negotiation, has low effect on external investment capital operation attracted by this media. And due to that it unable to make appropriate measurement to the brand value loss risk, this paper is mainly to assess the second case. Because, to a great extent, managers' effort degree determines the investment performance, the effort degree of manager, which includes organizing ability, leadership skills, decision-making ability and control ability, should be taken into consideration when payoff function is measured. Combining with Cobb-Douglas generating function, the expected investment profit function of this media can be written into:

$$f(e, K_1, K_2) = A(K_1 + K_2)^a L^b U(e) \quad (3)$$

$A$  stands for the coefficient that the technical strength of TV media contributes to investment returns,  $K_1 + K_2$  is the total capital input,  $L$  stands for labour;  $U(e)$  the coefficient that directors' endeavour to contributes to investment. Thus the overall target function can be described as:

$$T' = m(L + K_1 + K_2) + nf(e, K_1, K_2) = m(L + K_1 + K_2) + nA(K_1 + K_2)^a L^b U(e) \quad (4)$$

As mentioned above,  $m$  stands for the coefficient that investment contributes to overall target;  $n$ , the coefficient that investment returns contribute to the overall target. By comparing the payoff function of TV media before and after acquiring external investments this article studies TV media financing risk based on two situations.

First of all, analyse the function from the perspective of the total revenue regardless of rate of return on investment. If  $T' ? c / (b - c) < T$ , namely the total revenue after TV media acquires external investment is less than that of utilizing its own investment, the financing risk occurs. That is because the external investment causes the loss of national assets and disperses the right of control instead of increasing the total revenue. Here, the loss of the national assets is  $[T' ? c / (b - c) + K_1] ? b / (b - c)$ , the dispersing ratio of control right is  $b / (b + c)$ .

Secondly, from the prospective of investment return rate, when  $[T' - (K_1 + K_2 + L)] / (K_1 + K_2 + L) < a$ , it means that rate of return on investment doesn't reach the minimum capital return rate, financing risk also occurs. VAM signed by TV media and external investors provides that external investors are entitled to increase shareholding ratio  $d$  at  $K_1 / b$  per share if the rate of return on investment is less than the minimum capital return rate. Therefore, the loss of the national assets is  $[T' ? c / (b - c) + K_1] ? (b - d) / (b + c)$ , the risk of control right dispersing is  $(b + d) / (b + c)$ .

#### 4 Management Strategies for Financing Risk in TV Media Industry

According to the total revenue function the TV media gained, we know if the TV media wants to reduce financing risk, they must improve the investment income; however, apart from capital input and labour input, technical force  $A$  and managers' effort  $e$  also have a great influence on the investment income. Therefore, we can make strategies for financing risk from the view of improving technology and the managers' effort.

First of all, TV media should invest sufficient capital to improve its own technical force. With the rapid development of the science and technology and the invention of all kinds of new media, the TV media industries of China must improve their own technical force to meet the demand of the development of the world, if they want improve all-round strength and compete with advanced world TV media industries. Technical force includes delivery equipment, publish equipment and network devices. Investing sufficient capital for improving delivery equipment and efficiency of issuing equipment, and optimizing network system, which can greatly improves investment income for TV media industry and reduces financing risk.

Secondly, the TV media industry should improve the managers' efforts. Managers' efforts mainly consist of management changes and the ability of organization, leadership, control and decision-making after acquiring the external investments. TV media industry should actively change the management to adapt to the fierce market competition, guide managers to learn operation experience from the advanced media group in the world and help managers to improve their organizational ability, leadership ability, ability to control and decision-making ability. The improvements of managers' efforts can make a positive impact to the return of the investment in TV media industry.

Thirdly, TV media industry should be careful with signing VAM (Valuation Adjustment Mechanism) with external investors. China's TV media industry is coated strong political overtones and thus it has an advantage over the advanced media group in the world on the relational network and marketing channel. As a result, TV media industry should take full advantage of this strength to avoid the signing of harsh VAM, the loss of national assets and the dispersing of control right.

## 5 Conclusions

The trend of economic globalization makes the market-oriented operation of China's TV media industry imperative. Venture capital, as one of an effective ways of marketability operation, can update the antique pattern of China's TV media industry, such as the uni-model of profit and multiple financial channels. Some kind of market risk maybe emerges along with the introduction of external venture capital, especially the risk state-owned assets losing and diversification of control. This paper, based on the Chinese current situation and the aspect of risk financing, has constructed the financing risk assessment model of Chinese television media industry from the aspects of validity of innate property investment as well as external venture capital. This model evaluates the financing risks of TV media industry from two aspects. First, when it comes to the point of Investment revenue only, the loss of state-owned assets is  $[T'c/(b-c)+K_1]b/(b-c)$ , and the ratio of control diversity is  $b/(b+c)$ . Second, when taking the aspect of rate of return on investment into consideration in which the rate of return on investment fails the least rate of return on capital requested, the loss of State-owned assets is  $[T'c/(b-c)+K_1](b-d)/(b+c)$ , and the ratio of control diversity is  $(b+d)/(b+c)$ . A financing risk management countermeasure of China's TV media industry is proposed according to the results of qualitative and quantitative research. Other issues involved into this model such as the internal relations between the total revenue before and after acquiring the external investment and the corresponding rate of return on investment, the impact of external investment on the investment efficiency in TV media industry and the impact of managers' efforts on the financing risk will be discussed and studied professionally in the future.

# Research on Assessment of Agricultural Products Cold Chain Logistics Vulnerability from the Perspective of Social Responsibility \*

Liu Mingfei, Li Jun, Gong Yue

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: liumingfei5223@163.com, lijun1923@126.com, gongyue0723@163.com)

**Abstract:** The agricultural products cold chain of China starts later, and being vulnerable to logistics risk resulting of various factors. It lacks relevant standards of vulnerability assessment. This article takes the social responsibility as the research perspective, and chooses the economic contribution, legal compliance, ethics and morality, public charity as four dimensions to build vulnerability evaluation index system of agricultural products cold chain logistics, and using the principal component analysis to evaluate agricultural products cold chain logistics vulnerability of the six provinces in Central China. The results show that the vulnerability degree from low to high ranking are: Anhui, Jiangxi, Hubei, Shanxi, Hunan, Henan. Through studying on the agricultural products cold chain in this article, the the vulnerability of the system and the frame were added, and it provides a reference.to the reduction of agricultural cold chain logistics vulnerability in China.

**Key word:** Social responsibility; Agricultural products cold chain logistics; Logistics vulnerability; Principal component analysis

## 1 Introduction

The data show that 30%-40% of the total cost of agricultural products is the logistics costs, fresh agricultural products to reach more than 60%, far less than the level of around 10% in developed countries. Loss rate of fresh agricultural products is controlled below 5% in developed countries, but the loss rate is 25%-30% in the harvesting, transport, storage and other logistics chain in our country. In addition to low efficiency, high cost, waste and other factors, poor risk resistance of the cold-chain logistics system of agricultural products is also a huge obstacle in the process of agricultural industrialization in China and the circulation of agricultural products and industrial development. At present, there is a lack of evaluation studies of the anti-interference ability of the agricultural products cold-chain system, and it can't effectively measure and prevent the vulnerability of the logistics.

The beginning study of the vulnerability concentrated in the field of Ecology, Disaster Management and Climate Change. With the continuous expansion of the study scope, the discussion of the vulnerability rang from Natural Science to Humanities and Social Sciences including Political, Economics, Management and Sociology. Weiyang Yu(2012)<sup>[1]</sup> analysis vulnerability factors which affect the regional socio-economic system, based on the conception of the regional socio-economic system. Using five dimensions of population, resources, environment, social, economic build the comprehensive evaluation index system. Using of gray clustering method to evaluate the regional socio-economic vulnerability. Fenxian Yan(2012)<sup>[2]</sup>, starting from the microscopic point view of farmers, in the foundation of Hoovering model, establish the comprehensive evaluation index system and evaluation model of the agricultural drought vulnerability based on the entropy method and the Analytic Hierarchy Process. Dao Chen & Lian Yu(2007)<sup>[3]</sup> studied the security of urban logistics, analyzed the evolution process of the urban logistics vulnerability, and putted forward the vulnerability conception model, built the vulnerability assessment index system of urban logistics from four levels including network topology, infrastructure, operating subject and service assurance. Junmiao Deng(2008)<sup>[4]</sup> analyzed the relationship of the farmers risk and vulnerability of the supply chain of agricultural products from the trading point view. Thought unclose link between the upstream and downstream of the decentralized management of the farmers and supply chain could bring the farmers greater transaction risk, let the degree of vulnerability of the supply chain increased. Yanping Liu(2009)<sup>[5]</sup> linked the vulnerability of supply chain risks and uncertainties, pointing out that implementation of early supplier involvement and strengthen the logistics outsourcing risk management can help reduce the vulnerability of the supply chain. Changbin Chen & Lixin Miu(2009)<sup>[6]</sup> thought vulnerability factors of supply chain including the emphasis on efficiency, outsourcing trends, the impact of globalization, the focus on production and sales, the reduction of the number of suppliers,

\* This paper is supported by science research project in Hubei Logistics Development Research

frequent changes in demand, the lack of visibility and lack of confidence.

A lot of literature has discussion on vulnerability deeply, but few scholars study on the agricultural products cold chain logistics vulnerability. The cold-chain of agricultural products as the high energy consumption industries, have an important responsibility for the protection of the environment. Also the operation quality of the system related to public health and social order. As a result, this paper stands on the social responsibility perspective, and uses the principal component analysis method from four dimensions including economic contribution, legal compliance, ethics and morality, public charity. It analyzes the agricultural products cold chain logistics vulnerability of the six provinces in central China, and provides advices and references for the construction of regional agricultural products of the cold-chain.

## **2 Impact of Social Responsibility on Agricultural Products Cold Chain Logistics Vulnerability**

As the society pay more attention to the harmonious development. The public is increasingly concerned about whether the enterprise obeyed the law, protected the environment and participated in public when they pursuit the economic interests. The development of cold-chain enterprises of agricultural products needs a stable and reliable environment. Finishing the social responsibility is the basic conditions to access to social support and recognition. This paper from the four levels of social responsibility to analyze the impact of the agricultural products cold chain logistics vulnerability.

### **1) Economic contribution**

The exist foundation of the cold-chain logistics of the agricultural products system is the farmer's labor, customer support and operations of operators. The purpose of the system to exist is to achieve maximum economic efficiency. If the most basic of these stakeholders' economic contribution are not implemented, bounding to affect the profitability of the agricultural products cold-chain logistics system. Even leading to the dissatisfaction of those stakeholders and producing a variety of conflict, seriously affected the agricultural product cold-chain logistics system stability.

### **2) Legal compliance**

The normal operation of the farm produce cold-chain logistics system must be bound to comply with laws and regulations, various acts of the companies within the system must be within the scope of legal constraints. Stakeholders of the system can not simply the pursuit of economic interests to the neglect of all relevant laws and regulations, tax evasion, tax evasion or illegal tax avoidance, breach of contract the contractual relationship. Once exposed, these acts will affect the reputation and profitability of these stakeholders, resulting in incalculable loss.

### **3) Ethics and morality**

The behavior of the various stakeholders in the cold chain logistics system of agricultural products to comply with business ethics, which is an important condition for the survival. It is to foster healthy social trends, and standardizes the economic order of the inevitable choice. In Agricultural products cold chain logistics system, each stakeholder can exercise self-discipline, we can guarantee an orderly market healthy operation, people assured safe consumption, fundamentally put an end to the illegal behavior.

### **4) Public charity**

Action of charity is the responsibility of a non-compulsory, under the simple kindness driven move, true charitable action is not unrequited. Therefore, if the stakeholders of the agricultural products cold chain logistics system does not perform charitable action and will not be condemned by society. However, the vulnerability of the charity may be in comparison with other industries or enterprises indirectly affect the stability of the system of the entire agricultural product cold chain logistics.

## **3 Construction of Index System on Agricultural Products Cold Chain Logistics Vulnerability**

### **3.1 Principles of vulnerability assessment of cold chain logistics of agricultural products index**

Construction of cold chain logistics of agricultural products vulnerability assessment index system is a complex process, scientific and rational index system is the key to evaluate the research. In the index system should follow the following basic principles:

1) Scientific agricultural cold chain logistics vulnerability assessment index system must reflect the system of science , and accurate positioning system level, identifying potential problems at the same time to satisfy the comparison between the different agricultural products of cold-chain logistics system.

2) Representative. In cold chain logistics system of agricultural products, we must select factors that accurately reflect the status and characteristics of agricultural products cold chain logistics system and component systems for the indicator system from a number of factors. And the index can accurately reflect the vulnerability of the system of scientific computing.

3) Operability. The index of agricultural products cold chain logistics system must be able to not only be a true reflection of the vulnerability of the system, but also access to scientific data. We must also consider the indicators to quantify the degree of difficulty, and try to use the existing statistical data to improve the index system operability.

### 3.2 Assessment index system of agricultural products cold chain logistics vulnerability

Based on the above discussion, this paper selected the GDP of First Industry, Per Capita Annual Disposable Income of Rural Residents, Freight Traffic, General Consumption Price Index of these four indicators to measure the dimension of economic contribution; The dimension of legal compliance is measured by Proportion of Total Fiscal Revenue, Number of Traffic Accidents, Number of Disputes Mediated; The dimension of ethics and morality is measured by Number of Clients, Total Volume of Waste Gas Discharged, Comprehensive Energy Consumption Transport, Storage and Post; The dimension of charity is measured by Number of Social Welfare Institutions, Social Welfare Enterprises and the Number of Social Donations. The specific index system is shown in table 1:

**Table 1 Index System of Agricultural Products Cold Chain Logistics Vulnerability**

Dimension	Number	Index
Economic Contribution	V1	GDP of First Industry
	V2	Per Capita Annual Disposable Income of Rural Residents
	V3	Freight Traffic
	V4	General Consumption Price Index
Legal Compliance	V5	Proportion of Total Fiscal Revenue
	V6	Number of Traffic Accidents
	V7	Number of Disputes Mediated
Ethics and Morality	V8	Number of Clients
	V9	Total Volume of Waste Gas Discharged
	V10	Comprehensive Energy Consumption Transport, Storage and Post
Public Charity	V11	Number of Social Welfare Institutions
	V12	Number of Social Welfare Enterprises
	V13	Social Donations

## 4 Vulnerability Assessment of Agricultural Products Cold Chain Logistics in the Central of China

### 4.1 Data collection and processing

With the implementation of the strategy of central China, the central provinces compete fiercely. As an important fulcrum of central China, Hubei should also make full use of the advantages of a big agricultural province, and clear position in the industry, coordinated and complementary with the central provinces. It should identify the agricultural products cold chain logistics vulnerability to improve the strategies and objectives. According to the above, this paper establishes the vulnerability evaluation index system of agricultural products cold-chain logistics system, the relevant data are collected from the 2011 Statistical Yearbook of the six central provinces. Proportion of total fiscal revenue is accounted for a total revenue of local finance and GDP ratio; Social donation measures by the value of the donated money to the Yushu earthquake before the date of April 23, 2010. Data gets from the Internet and newspapers.

For simple calculation, we collect the raw data to mathematical treatment. V1, V6, V7, V8, V9, V10, six indicators were positively correlated, that is, the greater the value and vulnerability of the stronger, so take the formula:  $X_i = X_i' / X_{imax}$  processing; the vulnerability of the agricultural products cold chain and other indicators were negatively correlated with the vulnerability of agricultural products cold chain, ways to deal with is:  $X_i = 1 - X_i' / X_{imax}$ , where  $X_i'$  said the number of columns of each factor in each, after such treatment, the 13 factors and agricultural cold chain vulnerability relations remained the same.

### 4.2 Model test

Using the factor analysis through the software of SPSS17.0, it gets variance contribution values of each factor variable(eigenvalues), variance contribution rate and the main components of the load, the results show in table 2.

**Table 2 Total Variance Explained**

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	6.706	51.586	51.586	6.706	51.586	51.586	4.907	37.747	37.747
2	2.815	21.651	73.236	2.815	21.651	73.236	3.850	29.613	67.360
3	2.360	18.153	91.389	2.360	18.153	91.389	3.124	24.030	91.389
4	.636	4.893	96.282						
5	.483	3.718	100.000						
6	3.951E-16	3.039E-15	100.000						
7	1.927E-16	1.483E-15	100.000						
8	1.319E-16	1.014E-15	100.000						
9	2.871E-17	2.208E-16	100.000						
10	-4.073E-17	-3.133E-16	100.000						
11	-1.288E-16	-9.910E-16	100.000						
12	-2.161E-16	-1.662E-15	100.000						
13	-3.726E-16	-2.866E-15	100.000						

Extraction Method: Principal Component Analysis.

It can be seen from the table that the cumulative variance contribution rate of the first 3 principal components can reach 91.389%. The first 3 principal components (F1, F2, F3) can represent the original 13 indicators to evaluate the vulnerability factors of influencing the agricultural products cold chain logistics, and also can express the most parts of the index information. At the same time, factors are reduced from 20 to 3, which can simplify the difficulty of analysis, and 3 principal components are not mutually related, and so the issues on the reiteration of the evaluation index information can be avoided.

In order to get of the influencing factors of each principal component factor, to obtain the data of expressing the influence degree of factors, and to make it more clear, the context uses the method of maximum variance orthogonal rotation method to rotate the factor load matrix. Under the help of the SPSS17.0 software, the orthogonal rotation results of the previous principal component load coefficient matrix after 25 iterations are shown in the column 2-4 of Table 3.

**Table 3 Rotated Component Matrix**

	Component		
	1	2	3
V1	.186	.900	-.132
V2	-.536	-.593	.585
V3	-.058	.137	.979
V4	.047	-.909	-.182
V5	.439	.399	-.714
V6	.603	.565	.359
V7	.818	.395	-.199
V8	.220	.924	-.264
V9	.144	-.069	.964

V10	.969	-.218	-.048
V11	-.942	-.007	-.124
V12	-.808	-.445	.260
V13	-.898	-.323	.094

Extraction Method: Principal Component Analysis.  
 Rotation Method: Varimax with Kaiser Normalization.  
 a. Rotation converged in 5 iterations.

In order to get the key indicators, we select 10 indicators whose load of principal component factor is more than 0.8, and they are show in bold. Multiplying the absolute value of Index load and the contribution rate of corresponding principal component factor variance to get vulnerability load of agricultural products cold chain logistics. Ranking the data from high to low is the load ranking of agricultural products cold chain logistics vulnerability , as shown in column 6 and 7 of Table 4,

**Table 4 Rotated Component Matrix and Load of Main Influence Factors**

Index	F1	F2	F3	Contribution Rate β	Load  F β	Load Ranking
V1	0.186	<b>0.9</b>	-0.132	0.21651	0.194859	8
V2	-0.536	-0.593	0.585			
V3	-0.058	0.137	<b>0.979</b>	0.18153	0.177718	9
V4	0.047	<b>-0.909</b>	-0.182	0.21651	0.196808	7
V5	0.439	0.399	-0.714			
V6	0.603	0.565	0.359			
V7	<b>0.818</b>	0.395	-0.199	0.51586	0.421973	4
V8	0.22	<b>0.924</b>	-0.264	0.21651	0.200055	6
V9	0.144	-0.069	<b>0.964</b>	0.18153	0.174995	10
V10	<b>0.969</b>	-0.218	-0.048	0.51586	0.499868	1
V11	<b>-0.942</b>	-0.007	-0.124	0.51586	0.48594	2
V12	<b>-0.808</b>	-0.445	0.26	0.51586	0.41681	5
V13	<b>-0.898</b>	-0.323	0.094	0.51586	0.463242	3

As shown in the table above, the key factors which affect agricultural cold chain logistics vulnerability from the Lord to the times is: Comprehensive Energy Consumption Transport, Storage and Post, Number of Social Welfare Institution, Number of Social Donation, Number of Disputes Mediated, Number of Social Welfare Enterprise, Number of Clients, General Consumption Price Index, GDP of First Industry, Freight Traffic, Total Volume of Waste Gas Discharged.

In which, Comprehensive Energy Consumption Transport, Storage and Post, Number of Clients, Total Volume of Waste Gas Discharged reflect the influence of ethical to agricultural products cold chain logistics vulnerability; Number of Social Welfare Institution, Number of Social Donation, Number of Social Welfare Enterprise reflect the influence of charity; Number of Disputes Mediated reflect the influence of legal compliance; General Consumption Price Index, GDP of First Industry, Freight Traffic reflect the influence of economic contribution to agricultural products cold chain logistics vulnerability.

From the component score coefficient matrix in Table 5, factor score function can be get below:

$$F1 = -0.065 * V1 - 0.045 * V2 + 0.005 * V3 + 0.115 * V4 + 0.039 * V5 + 0.1 * V6 + 0.155 * V7 - 0.064 * V8 + 0.08 * V9 + 0.273 * V10 - 0.245 * V11 - 0.144 * V12 - 0.188 * V13 \tag{1}$$

$$F2 = 0.268 * V1 - 0.102 * V2 + 0.101 * V3 - 0.314 * V4 + 0.043 * V5 + 0.132 * V6 + 0.022 * V7 + 0.265 * V8 + 0.009 * V9 - 0.191 * V10 + 0.105 * V11 - 0.037 * V12 + 0.006 * V13 \tag{2}$$

$$F3 = 0.007 * V1 + 0.151 * V2 + 0.34 * V3 - 0.106 * V4 - 0.208 * V5 + 0.173 * V6 - 0.018 * V7 - 0.036 * V8 + 0.332 * V9 + 0.008 * V10 - 0.077 * V11 + 0.037 * V12 - 0.017 * V13 \tag{3}$$

**Table 5 Component Score Coefficient Matrix**

	Component		
	1	2	3
V1	-.065	.268	.007
V2	-.045	-.102	.151
V3	.005	.101	.340
V4	.115	-.314	-.106
V5	.039	.043	-.208
V6	.100	.132	.173
V7	.155	.022	-.018
V8	-.064	.265	-.036
V9	.080	.009	.332
V10	.273	-.191	.008
V11	-.245	.105	-.077
V12	-.144	-.037	.037
V13	-.188	.006	-.017

Extraction Method: Principal Component Analysis.  
 Rotation Method: Varimax with Kaiser Normalization.  
 Component Scores

According to the score of three principal component , using formula( $W=0.56447F1+ 0.23691F2+ 0.19863F3$ ) to calculate the comprehensive scores and vulnerability ranking of six provinces in central, refer to Table 6:

**Table 6 Comprehensive Vulnerability Scores of Six Provinces in Central of China**

	F1	F2	F3	W	Vulnerability Ranking
Hubei	1.08218	-1.26901	-0.55726	0.199528	4
Hunan	0.55487	0.24903	-0.44055	0.284699	2
Jiangxi	-1.54531	-0.62346	-0.91616	-1.20196	5
Henan	0.66251	1.43112	-0.40453	0.632662	1
Shanxi	0.07545	-0.55273	1.79354	0.267893	3
Anhui	-0.8297	0.76504	0.52496	-0.18282	6

The topper of the vulnerability ranking, the more susceptible to interference from external factors which result in system instability. It can be shown from the data analysis that the Anhui Province agricultural products cold chain logistics system is the best, and the capacity of resisting social and economic losses is the most powerful. In contrast, the Henan Province agricultural products cold chain logistics vulnerability degree ranks the highest, the ability of fighting against risks is the lowest. While Hubei ranks the fourth position, which also can guarantee the smooth implementation of the regional agricultural products cold chain logistics. The vulnerability ranking from low to high is: Anhui, Jiangxi, Hubei, Shanxi, Hunan, Henan.

## 5 Conclusion

Reducing the agricultural cold chain logistics vulnerability need the help of the government, the enterprise, and the public three together to make reasonable development planning of the cold chain logistics, to promote the development of cold chain enterprises, and to expand economic contribution degree; when the legal case are improved by the government, the public actively supervise the enterprise

behavior, to promote morality construction; cold chain enterprises should establish good enterprise culture, accelerate the technology updates, pay attention to social ethics, and take part in the public welfare charity, when to improve the ability to resist risks, uniting the whole society force to reduce the harm to the lowest.

As a complex huge system, the agricultural products cold chain logistics system is very complex, involving all respects of stakeholders. In the perspective of social responsibility, the system must assume responsibility for different stakeholders. On that basis ,this paper scientifically divide the vulnerability of the agricultural products cold chain logistics ,and then determine the reasonable and effective evaluation index according to the features of the different dimensions, finally, take the six provinces in Central China as the research objects to make a scientific evaluation on the vulnerability of agricultural cold chain logistics.

(E-mail: sheke1@mail.nedu.edu.cn, xiangwensun@yahoo.com.cn)

**Abstract:** Regional innovation capability can reflect a region's future development of the core competitiveness. This essay absorbs the advanced experience of index system and pattern established by domestic scholars to establish the systematic evaluation index. Based on factor analysis, the essay analyzes and explains the regional innovation capability of 25 regions in our country and has carried out further analysis and discussion.

**Key words:** Regional innovation capability; Factor analysis; Index system; Core competitiveness

## 1 Introduction

Regional innovation capability refers to the capability that a specific region transfers knowledge into new products, new techniques and new services, applying various reasonable means and resources such as scientific and technological manpower, information, technology, capital, and technological infrastructure<sup>[1]</sup>. Its core is to promote the interaction and mutual connection between innovative institutions, which are reflected as the capability of the contribution to the regional social economic system. The regional innovation capability is one of the decisive factors of the regional competitiveness and has reflected the technological innovation efficiency in a specific region. The evaluation index system of regional innovation capability has experienced the development process from the single index system to the comprehensive index system; especially the application of systematic engineering on regional innovation capability, which has improved the evaluation system of the regional innovation capability.

## 2 Index Establishment

Establishing a reasonable index system is the foundation of the assessment of regional innovation capability. Therefore, different perspectives of index system should have different choices<sup>[2]</sup>. At present, domestic scholars have put up different evaluation indexes of regional innovation abilities, while they have their relative rationality. Li Junhua has constructed the index evaluation system with six primary indexes of the knowledge creation capability, knowledge flow capability, enterprise technology innovation capability, innovation output capability, science and technology innovation investment, science and technological innovation environments and 25 secondary indexes<sup>[3]</sup>. Ceng Qian and Li Fugang have constructed the index evaluation system based on the five aspects of regional innovation environment, knowledge creation and acquisition, regional innovation investment capability, enterprise innovation capability, and innovation profits<sup>[4]</sup>. Wan Yong and Wen Hao have constructed the index evaluation system contain 21 secondary indexes based on the four aspects of region innovation investment, region innovation output, technology diffusion, region innovation environments<sup>[5]</sup>. This essay constructs the index evaluation system with three primary indexes of the innovation investment, innovation output, innovation environments and 18 secondary indexes.

**Table 1 Regional Innovation Evaluation Index System**

Regional innovation evaluation index system	
Primary indexes	Secondary indexes
<b>Innovation investment</b>	Number of region R&D institutions ( $X_1$ )
	Total number of region R&D personnel ( $X_2$ )
	Full-time equivalent of region R&D personnel ( $X_3$ )
	Internal expenditures of region R&D funds ( $X_4$ )

\* This paper is supported by Youth Fund Project of Humanities and Social Sciences Study of China's Education Ministry under Grant no.11YJC630079. The project name is Study on Control Mode of Single-System Manufacturing Enterprises in Northeast China.

	Total number of university R&D personnel (X <sub>5</sub> )
	Number of university researchers (X <sub>6</sub> )
	Expenditures of technical renovation of high-technological industry (X <sub>7</sub> )
<b>Innovation output</b>	Number of published research papers (X <sub>8</sub> )
	Number of effective invention patent (X <sub>9</sub> )
	Number of forming the state or industry standard (X <sub>10</sub> )
	Number of published science and technology works (X <sub>11</sub> )
	Percentage of output value of high-technological industries in GDP (X <sub>12</sub> )
	Output value of new products in high-technological industry (X <sub>13</sub> )
<b>Innovation environments</b>	Ratio of high-technological industry import and export trade volume in the total volume of the country (X <sub>14</sub> )
	Index of GDP growth (X <sub>15</sub> )
	Percentage of motor way mileage in the total mileage of the country (X <sub>16</sub> )
	Percentage of railway mileage in the total mileage of the country (X <sub>17</sub> )
	Transaction volume of technology market (X <sub>18</sub> )

### 3 Factor analysis model construction

The name of the factor analysis was firstly put out by Thurstone in 1931. By applying the idea of dimensionality reduction, the factor analysis is a multivariate statistical analysis method that concludes several comprehensive factors from the variables with the complex relationships based the study of the related matrix of original variables

The basic idea of the factor analysis is to find out the real related variables by examining the internal dependent relationships among the numerous variables under the principle of ensuring the least loss of data information and classifies the variables with the relatively strong correlation as one category to form several types of illusion variables, among which different types of variables have weak correlation<sup>[6]</sup>.

The general model of factor analysis is shown in the following formula.

$$\begin{cases} x_1 = a_{11}f_1 + a_{12}f_2 + \dots + a_{1m}f_m + \varepsilon_1 \\ x_2 = a_{21}f_1 + a_{22}f_2 + \dots + a_{2m}f_m + \varepsilon_2 \\ \vdots \\ x_p = a_{p1}f_1 + a_{p2}f_2 + \dots + a_{pm}f_m + \varepsilon_p \end{cases} \quad (1)$$

In the formula,  $f_2, f_1, \dots, f_m$ , ( $m \leq p$ ) are called common factors;  $a_{ij}$  is called factor loading, which reflects the correlation between  $x_i$  and  $f_i$ ;  $\varepsilon_i$  is called special factors, which is the part that can not contained by the previous public factors with the number of  $m$  parts and represents the influence of other factors rather than common factors

## 4 Empirical analysis

### 4.1 Data selection

This essay chooses the relevant data of the innovation abilities in China's 25 provinces to conduct the empirical analysis; the data is taken from China Science and Technology Statistics Yearbook 2011 and China Statistics Yearbook 2011, so the data content is real and reliable. The essay also applies statistical software SPSS17.0 to analyze selected data<sup>[7]</sup>.

### 4.2 Model test

First of all, the model has been tested by KMO and Bartlett, and the result is  $0.712 > 7$ , the result of inspection tests of model are  $0.712 > 7$ , which shows the selected indexes are basically suitable for conducting factor analysis; and the model significance level  $< 0.01$  shows the model inoculation is very good.

**Table 2 Inspection of KMO and Bartlett**  
**Inspection of KMO and Bartlett**

Bartlett sphericity inspection	Sampling sufficient degree of the Kaiser-Meyer-Olkin measure	.712
	Approximate Chi-square	853.405
	df	153
	Sig.	.000

**4.3 Common factors extractions**

By the rotating component matrix and gravel figures, we can know there are three eigenvalues. Therefore, the sample is divided into three components, among which the contribution rates of three factors are 58.578%, 15.347% and 8.976% respectively[8].

**Table 3 Total Variance Explained**  
**Total variance explained**

Compositions	Initial Eigenvalues			Loading extraction squares	
	Total	Variance %	Accumulation %	Total	Variance %
1	10.544	58.578	58.578	10.544	58.578
2	2.762	15.347	73.925	2.762	15.347
3	1.616	8.976	82.901	1.616	8.976
4	.852	4.732	87.633		
5	.630	3.502	91.135		
6	.503	2.793	93.929		
7	.443	2.458	96.387		
8	.325	1.803	98.190		
9	.165	.917	99.108		
10	.079	.437	99.545		
11	.050	.276	99.821		
12	.014	.081	99.902

## 5 Conclusion

From the result analysis, we can know that the development factors have huge influence on regional innovation capability; for this kind of factors include many hardware conditions for regional innovation, such as personnel, capitals, patented technology, etc. From the scores, due to many high teaching-quality universities and their human resource factors, Beijing has constructed the strong foundation of regional innovation, which is not only the national innovation leader, but also the core strength of national innovation.

Scores of technology factors in Jiangsu province and Guangdong provinces are similar, in the leading position in China. Because of the establishment and development of these high-tech industrial parks in these regions, the promotion of the innovation capability of high-tech enterprises will definitely drive the development of regional innovation, which will create benign circulation and promote the training and increase of regional innovation.

Generally speaking, China regional innovation capability is still strong in the east region and weak in the west, which distributes from the eastern coastal areas to the west inland areas and from high to low as a ladder. Although the regional innovation capability in the western region has improved with the pace of developing the western region, the regional innovation capability still maintain the obvious negative position compared with that in the east area. Therefore, the development of western region should be focused on optimizing economic structures and developing Characterized Industry so as to enhance the effective demand of regional innovation from the social and economic development. Based on the advantage of the regional innovation system, we can narrow the gap between east and west, which could improve our country's whole innovation capability.

# Impact of Financial Support on Economic Development of Export-Oriented Entities: A Case of Xinjiang Horgos Economic Development

He Wei

The Export-Import Bank of China Xinjiang Uygur Autonomous Region Branch, Xinjiang,  
P.R.China, 830002

(E-mail: hewei800503@126.com)

**Abstract:** This paper uses the inductive analysis and comparison analysis method, from the support of Economic Development Zone Horgos export-oriented economic development entities significance to begin, analysis of the economic development zone finance development present situation, put forward extroversion economy to develop the problem of existence, combining with the problems such as how to support financial export-oriented economic development entities, using the method of theory analysis, the financial support of Horgos extroversion economy development policy recommendations.

**Key words:** Finance; Innovation; Export-oriented real economy; Development

## 1 Introduction

Horgos Economic Development Zone lies on the intersection of the two economic belts, that is, the Asian-Pacific region under rapid development and the Single European Market, gifting it the important passage on the European-Asian land transportation, meanwhile neighboring the Mid-Asian region with abundant resources and huge market potential. The studies carried out by the foreign academic and research institutions focus on the operation condition of the Sino-Kazak Horgos International Economic Cooperation Center and the regional economic cooperation under the Shanghai Cooperation Organization, etc<sup>[1]</sup>, especially on the running of the Sino-Kazak Horgos International Economic Cooperation Center; most research institutions consider that the strengthening of economic cooperation between Xinjiang and Mid-Asian countries is the need for double-winning development. The huge resources and wide consumption market space of the Mid-Asian countries are eager for exploration, while the jointly-developed kernel projects between the Parties make their cooperation prospect wider and wider.

While the domestic academic and research institutions pay attention to the self construction and development of Horgos Economic Development Zone after permitted to implement special policies, and special researching attentions are paid to the construction of Horgos exported products assembly and processing base, imported and exported products distributing center, logistic passage and international commercial and trading center; meanwhile relevant researches are undertaken on the advantages and future development orientation of the Horgos Economic Development Zone; while the studies on the Horgos' export-oriented economy under the support of finance are much fewer.

The dissertation will utilize the inductive analysis and comparative analysis to problems existing in the export-oriented real economy development of the Horgos Economic Development Zone in details so as to find out the policy advices on the Horgos' export-oriented real economy development supported by finance. Innovative researches are implemented to support the export-oriented real economy development in the development zones from such aspects as financial organization system, promotion of Renminbi internationalization, multi-channel financing, financial products and services innovation, talent introduction.

## 2 Meanings to support export-oriented real economy development of Horgos Economic Development Zone

Horgos Economic Development Zone lies on the west end of the 312th National Highway, Lianyungang-Horgos Highway, Longhai-Lanxi Railway, neighboring the Mid-Asian region with abundant resources and huge market potential; it is the important passage for the European-Asian land transportation, also the international passage and bridgehead of the economic and cultural exchange between China and Mid-Asian countries, even Europe.

The Central Working Conference on Xinjiang held in 2010 pointed out, "making full use of unique location advantage of the European-Asian Land Bridge, establishing an economic development zone at

Kashi and Horgos respectively, implementing special economic policies, so as to build it into the window of the China's westward opening and the new growth point of the Xinjiang economy", moreover, the Horgos Economic Zone is positioned as exported product assembly and processing base, imported and exported product distributing center, logistic passage and international commercial and trading center. "Advices On Supporting The Construction of Horgos Economic Zone" (GUOFA[2011] No. 33) issued by the State Council on September 30, 2011 makes the strategic disposition of the development zone construction from seven aspects, that is, strategic positioning, general requirements, fundamental rules, regional scope, industrial layout, supporting policies, organization and leadership. All of these gift the Horgos' construction and development with the golden opportunity. Facing the uncommon historical opportunity, it poses important meanings towards the great-leap-forward development of the development zone to speed up the development of financial industry at the Horgos Economic Development Zone, to support the export-oriented real economy development.

1) Sino-Kazak International Border Cooperation Center, an cross-border economic cooperation zone jointly-constructed by China and Kazakhstan, is the first cross-border economic and trading cooperation center in China established in 2006 permitted by the State Council; since its commencement in 2007, 880 million yuan of accumulative infrastructure investments from China has been achieved. The first six commercial projects in the cooperation center constructed by China were commenced formally on May 25, 2011, total investment arrives at 10.8 billion yuan. The Sino-Kazak Horgos International Border Cooperation Center was put into synchronous operation between China and Kazakhstan on July 1, 2011. As the demonstration zone of regional cooperation under the framework of the Shanghai Cooperation Organization, the Cooperation Center will become the important supporter of China's westward opening strategy<sup>[2]</sup>.

2) Horgos is the passage of the Line 2 of "Natural Gas Transmission from West To East", Mid-Asian Natural Gas Pipeline Project; currently a 30 billion cubic meter of annual natural gas supply agreement has been signed between Turkmenistan and China, and the first phase Sino-Turkmenistan natural gas pipeline project began to operation in 2009, double-line was put into operation in 2010, and 30 billion cubic meters natural gas will be provided formally; the continuous strengthening and extension of these agreement and cooperation projects make Horgos' special geographic position rise to a key strategic position. In 2009, natural gas from Mid-Asia entered China from Horgos successfully, pushing the development of export and import trades of Horgos firmly.

3) As a development zone implementing special economic policies, Horgos will become the international transportation junction facing the Mid Asia, even Europe, and another bridgehead in the Western China, with the completion of Jinghe-Yining-Horgos Railway, the connection of Sino-Kazak highways and the completion of the Mid-Asian natural gas pipelines; it will play more and more important role in the process of connecting the east and west<sup>[3]</sup>.

Horgos has become the third international trading passage of China facing the Mid Asia and Europe with over ten million tons of goods passage following Manzhouli and Alashankou. Supporting export-oriented real economy development of the Horgos Economic Development Zone will highlight its roles of bridgehead, big junction and big passage, which poses important meanings to speed up the steps of outwards opening of development zone, to speed up the development of road economy<sup>[4][5]</sup>. to blend into Mid-Asian regional economic cooperation gradually and to promote economic growth of Xinjiang province of China.

### **3 Economic and Financial Development Status of Horgos Economic Development Zone**

In 2010, Horgos Economic Development Zone has realized 3.0 billion yuan of regional GDP, increased by 33.6% than the last year; 10.50 million tons of import and export goods, increased by 242%; 7.0 billion dollars of import and export trade volume, increased by 135%, thereinto, total export is 2.5 billion dollars, increased by 25.9%; total import is 4.5 billion dollars, increased by 334.8%; port's entry-exit personnel arrives at 0.82 million person.time, increased by 50%.

Currently there are six financial institutions, that is, Industrial & Commercial Bank of China, Agricultural Bank of China, Bank of China, China Construction Bank, Postal Savings Bank Horgos Branch and Horgos Rural Credit Cooperative, establishing its branches at the development zone. The four state-owned commercial banks have opened international businesses one after another in the development zone, even provided foreign-exchange deposits, foreign exchange loans, foreign currency exchange, international settlement, forex sale and purchase business and several other foreign exchange

financial services for firms and individuals in accordance with the development of foreign trades. Main trading settlement types include cash settlement of exchange, telegraphic transfer, letter of credit, letter of guarantee, etc. Financial institutions in banking business in development zone have handled 887 billion dollars of various cross-border settlement businesses in 2011, including 676 million dollars of cash settlement in dollar under border export trade items. With the rapid increase in Renminbi settlements, the inflow of Tenge, the currency of a neighboring country, continues increasing, however, no banks in the development zone have not carried out exchange business between Renminbi and Tenge, so only folk Tenge cash exchange occurs.

#### **4 Problems Existing in Serving Export-Oriented Real Economy Development**

(1) Whether financial service function can meet the need of export-oriented real economy development. Currently the serve system of financial institutions in development zone is relatively single, state-owned commercial banks dominate the financial institutions, and all of banking branches are county or even below levels of institutions, resulting in narrower business and operation scope, limited operation and management authority, fewer financial service types, simple service forms, and limited ability in financial services for export-oriented real economy development. Currently the setting of financial institutions in development zone, along with their service ability, fails meeting the financial requirements for long-term development in export-oriented real economy from the aspect of financial supply.

(2) Lack of risk sharing mechanism in export-oriented real economy. It reflects mainly in the following aspects: firstly, lack of financing assurance service system, no financing assurance institution established in the development zone, becoming the bottleneck of bank supporting enterprise's development; secondly, lack of export credit insurance system; thirdly, no "green passage" custom supervision assurance system established by the third party financial institutions in the form of credit insurance.

(3) Lots of factors constraining the development of Renminbi settlement business in cross-border trades. Currently the recognition of Kazak firms and citizens towards Renminbi is still much lower, resulting in not too stronger depositing willingness, along with not enough Renminbi deposits in Kazakhstan. There is no Tenge settlement business occurred under Sino-Kazak trading items, neither Chinese nor Kazak firms open Tenge settlement accounts at the banks in the development zone. Meanwhile, since there is no platform and clearing system for local currency trades between Chinese and Kazak banks, and no direct settlement occurs between Renminbi and Tenge; USD is still used for forex crossing and forex buying or selling business in actual operation. Normal bidirectional cross-border cycling mechanism cannot be established in short term for Renminbi capital, constraining the development of Renminbi cross-border business in much wider fields in development zone.

(4) Not too smooth financial exchange channels in Sino-Kazak bordering area. There is no efficient communication and exchange channels between financial institutions in the connecting area between the development zone and Kazak borders, China's financial institutions cannot grasp the Kazak financial policies, along with custom supervision policies relevant to cash cross-border transit, meanwhile lack disseminating and introducing China's channels of local currency settlement, inter-bank account opening, banking funds settlement and currency exchange as stipulated by policies to the Kazak financial institutions timely, that is, efficient communication and exchange mechanism has not yet established, so no efficient communication and negotiation are implemented in financial cooperation affairs between the Parties, causing difficulties in connection with relevant business.

#### **5 Advices on Supporting Export-oriented Real Economy Development**

Making full use of finance's serving, safeguarding and guiding functions towards economic development, formulating financial industry development programming for the development zone as soon as possible, taking the financial industry as an important industry standing on the functional positioning of the development zone so as to supporting it to become bigger and stronger. Firstly, issuing fiscal supporting policies towards financial industry, organization costs allowance and tax exemption will be gifted to various financial institutions introduced newly into the development zone; secondly, transformation of current state-owned commercial banks from single-point branch to comprehensive subsidiary should be realized to perfect branch layout and to improve functional layer and integral servicing ability, loan examination and business innovation authority should be delegated to lower levels to establish authorization system suitable for the development of the development zone;

thirdly, lowering entry criteria to support the new organization of Sino-foreign joint-funded banks, rural banks, loans corporation, trust and investment banks, financial leasing companies, financial companies, securities companies and insurance companies, etc. in the development zone so as to form the financial institution organization system with complete varieties, reasonable function division, complementary functions, complete competition and standardized actions to improve the capital allocation ability and financial service ability of the development zone.

Promoting the ability of finance supporting export-oriented real economy development fundamentally to form a financial service pattern with diversified financing channels. Firstly, implementing differentiated loan management methods. Promoting each headquarter and branch of all commercial banks to formulate special loan policies and financial service policies actively, and formulating loan marketing strategies and cultivating efficient loan demand surrounding the development strategies of the development zone combined with the development zone's industrial policies. Key inclination on loan scale should be gift to the development zone, along with "division" examination and assessment implemented separately. Meanwhile credit approval authority should be extended to the banks in the development zone, along with the widening of requirements for bad loan assessment indexes for the banking institutions in the development zone, efficient increase in loan investment in development zone, and strengthening of loan's support towards key industries, industrial transfer and acceptance, industrial layout, etc. in the development zone; secondly, establishing perfect multi-layer financing guarantee service system, endeavoring the state funding to establish policy financing guarantee companies actively, encouraging the development of commercial financing guarantee institutions and inter-firm mutual financing guarantee organizations so as to form good bank-guarantee firm cooperation relationship and to solve the bottleneck of financing; thirdly, extending financing channels actively, making full use of inter-bank markets, capital markets and insurance markets to extend direct financing business, realizing multi-channel financing by issuing corporate bonds, short-term financing bills, mid-term notes, stocks and other financial market instruments. Encouraging listed companies inside and outside Xinjiang invest their financed funds into the projects in the development zone. Encouraging and supporting the securities institutions, stock holding investment firms, etc. inside and outside Xinjiang to enter the development zone to carry out businesses, creating service environment helpful for the healthy development of venture investments and intermediary institutions.

Carrying out reform testing points in the development zone regarding goods trades, service trades and forex management under capital items actively, promoting Renminbi's exchangeability under capital items, trying best to early testing and implementation of forex-related financial policies in the development zone. Advising the banks to open the settlement accounts between Renminbi, Tenge and exchangeable currencies for foreign firms and individuals engaged in foreign trades, and handling their account collection and paying, forex purchasing and selling in accordance with relevant stipulations. Strengthening the promotion force of Renminbi cross-border business by the firms in the development zone even further. Improving Renminbi settlement volume in export and import trades, and investment in transaction with the Mid-Asian countries, promoting Renminbi's localization at Kazakhstan and other Mid-Asian countries so as to realize the healthy cross-border recycling of Renminbi funds. Encouraging foreign firms to use Renminbi in direct investments in the development zone, encouraging the firms in this area to use Renminbi in direct foreign investment.

The financial institutions in the development zone should improve their product competitiveness and overall financial service level, so as to provide good financial services for the export-oriented real economy. Firstly, much force should be made to the development of new products, special and directional financial product innovation and regionalized financial product development should be made, and regionalized and individualized financial products should be promoted in accordance with the condition of regional markets and similar businesses; attentions to be paid to the increase of safe, convenient, and cheap credit product and service, so as to lower firms' financing and trading costs; secondly, providing consultation services, such as, macroeconomic policies analyses, international economic position changes, industrial trend and latest market information to the firms actively. Improving firms' financial management consciousness through publicity and training, helping firms to choose proper financial products and to lower funding costs; thirdly, guiding exporting firms to avoid forex risk actively, guiding them to strengthen risk management consciousness, establishing risk management cost ideas, helping firms to choose foreign trade settlement currency reasonably so as to lower the losses from forex changes; fourthly, providing close financial consultation services for the firms, guiding the firms to be engaged in swaps, hedging, value maintenance and cost locking operations

for monetary funds, product export and raw material import, helping firms to make good use of financial instruments to lower financial risks.

Export-oriented real economy development requires not only perfection of relevant systems, implementation of product innovation, introduction of funds and technologies, but, more important, the cultivation and introduction of high-end financial talents. Therefore, to adapt the demand for financial talents from the Horgos export-oriented real economy development, firstly, the financial talents' training mechanism of all financial institutions at locality must be perfected, guiding all financial institutions in the development zone to strengthen the cooperation with professional training institutions and colleges, to implement various and diversified re-education training so as to improve the professional quality of local financial employees continuously; secondly, establishing long-term high-end financial talent introduction mechanism with the correspondently-aiding-Xinjiang provinces and cities in the new round of corresponding aiding Xinjiang works, introducing talents from the corresponding provinces and cities; thirdly, introducing and selecting excellent financial talents from home and abroad, creating good working, studying and living conditions for the financial talents seeking for development opportunities in the development zone; fourthly, formulating detailed and feasible talent stimulation mechanism to prevent talent losses, exploiting the high-end talent abstraction strategy in the form of technological investment so as to promote them rooting in this area.

With the relevant economic and financial preferential policies of the economic development zone as the absorption force, strengthening the logistical infrastructure construction and investment force, encouraging the relevant investors and firms home and abroad to invest in logistical infrastructures; building export product assembly and processing base, import and export product distribution center, great logistical passage and international commercial and trading center in the near future: processing base must connect with the industrial transfer in the eastern area, therefore to transfer the eastern advanced technology and introduce talent and labors; the development of the import and export product distribution center can bring opportunities for the port logistical development, bringing along the development of transportation and the productive services, meanwhile playing radiation role to stimulate the economic development in the surrounding countries; while the commercial and trade center can increase the opportunities of goods choice for the consumers so as to absorb more and more export-oriented entities to participate the commercial activities in the development zone. Meanwhile, much attention must be paid to the logistical information resource sharing to improve the logistical information management level and logistical service level<sup>[6]</sup>. The completion of these infrastructures can bring abundant capital flow, information flow, commercial flow and technological flow for the development zone, so as to provide a healthy operation and development environment for the export-oriented economy development in the development zone.

Xinjiang has the ingrown geographic advantages because its surrounding countries are most the members or the observer states of the Shanghai Cooperation Organization. Among the members of the SCO, Kazakhstan and China share 1782 km bordering line; in economy, Kazakhstan positions the leading position in the Mid-Asian region, with much higher economic opening degree and stronger regional cooperation consciousness. Horgos Economic Development Zone must make full use of the neighboring relation with Kazakhstan and the opportunity of running of Sino-Kazak Horgos International Border Cooperation Center to establish Sino-Kazak bordering financial communication and meeting mechanism under the framework of the Shanghai Cooperation Organization so as to provide better development opportunity for the development zone's export-oriented economy development. Firstly, from the macro aspect, establishing financial communication and exchange mechanism between the national, Autonomous Region governments and the Kazakhstan, carrying out timely negotiation and discussions on financial cooperation, strengthening mutual confidence and exchange, promoting smooth running of trades; secondly, from the micro aspect, the special custom administration institutions should strengthen the exchanges with the special Kazak institutions, establish electronic information platform facing the Mid-Asian markets to reduce or avoid trade conflicts; thirdly, establishing the financial regular joint-meeting mechanism under the Sino-Kazak Cooperation Center participated by the financial office under the local government, the People's Bank of China, banking bureau, custom and frontier inspection department, discussing the problems existing in the trade settlement and financial cooperation, negotiating the solution methods so as to arrive at common advices then reported to each country for approval then implementation.

## 6 Conclusions:

The research of the dissertation concludes the main advices on the Horgos' export-oriented real economy development supported by finance, that is, firstly, perfecting financial supporting policies and financial organization system; secondly, forming multi-channel financing financial service framework; thirdly, promoting Renminbi trade and investment settlement actively; fourthly, focusing on developing financial products and service innovation; fifthly, cultivating and introducing high-end financial talents actively; sixthly, speeding up the construction of Horgos Macro-Logistical Center, commercial and trading center; seventhly, establishing financial communication and meeting mechanism under the SCO cooperation framework.

(E-mail: werper@163.com, fengteam@163.com)

**Abstract:** Innovation and entrepreneurship education is an important way to train a large number of high-quality talents with innovative and entrepreneurship capability in the new era, so there is important significance to evaluate the Innovation and entrepreneurship education quality of higher education institution scientifically, which can help to promote the healthy development of Innovation and entrepreneurship education in China. This paper expounds the definition of Innovation and entrepreneurship education at first, structures the index system and gives a evaluating method based on Fuzzy Analytical Hierarchy Process (FAHP), and carries out a case analysis finally, which can offer theoretical and practical guidance for the development of Innovation and entrepreneurship education of higher education institution in China.

**Key words:** Innovation education; Entrepreneurship education; College; Fuzzy comprehensive evaluation; Analytic hierarchy process

## 1 Introduction

As an educational pattern in knowledge economy era, innovation and entrepreneurship education refers to a kind of new-type educational idea and mode, with the goal of training the high-quality talents with innovative consciousness, innovative thinking, innovative ability and innovative personality in the new era, which helps college students to establish the innovative consciousness, excite innovative spirit, grasp the innovative knowledge and improve innovative ability through various channels such as school, government and enterprise. Innovation and entrepreneurship education originated from U.S.A. at first, which developed innovative education energetically through the measures such as opening the courses of innovation and entrepreneurship education covering the middle and high school, university and graduate, setting up innovative research center etc.. As to the innovation and entrepreneurship education in China, it is still at starting and trial stage, which has not formed a systematic pattern and evaluating system of innovation and entrepreneurship education. Therefore, this paper regards innovation and entrepreneurship education as the target, structures a scientific evaluation index system of innovation and entrepreneurship education, and gives a evaluating method based on Fuzzy Analytical Hierarchy Process, which offers a scientific evaluating method to perfecting the innovation and entrepreneurship education system and pushing the development of innovation and entrepreneurship education in China.

## 2 The Framework of Index System

As an educational systematic project operated cooperatively by various organizations such as a government, school and society, etc., innovation and entrepreneurship education involves the contents of education and teaching, practice platform, teachers' team, social supporting etc., so there are numerous factors influencing innovation and entrepreneurship education. On the basis of analyzing the definition of innovation and entrepreneurship education and the results of previous studies in an all-round way, this paper proposes the framework of index system of evaluating the innovation and entrepreneurship education quality, which includes four dimensions of government, university, society and student, as shown in Table. 1.

---

<sup>\*</sup> This paper is supported by Humanities and Social Science Fund of Education e Ministry of China (NO. 09YJA880101).

**Table 1 The Index System of College Innovation and Entrepreneurship Education Evaluation**

Target	First-class Indexes	Second-class Indexes
Evaluation of College Innovation and Entrepreneurship Education (A)	Government dimension ( $B_1$ )	Fund input $B_{11}$
		Management organization and system $B_{12}$
		Policies and preferential measures $B_{13}$
	University dimension ( $B_2$ )	School-running concept and planning $B_{21}$
		Curriculum system establishment $B_{22}$
		Teachers team $B_{23}$
		Campus cultural environment $B_{24}$
		Educational facilities and practice base $B_{25}$
	Social dimension ( $B_3$ )	Social reputation $B_{31}$
		Social atmosphere $B_{32}$
		Enterprise group $B_{33}$
	Student dimension ( $B_4$ )	Scientific research ability $B_{41}$
		Innovation achievement $B_{42}$
		Entrepreneurship rates $B_{43}$
		Practice activities $B_{44}$

### 2.1 Government dimension

The government plays an increasingly important role of leading and supporting in innovative education. The government dimension mainly includes such factors as leading students to innovate actively by increasing the fund input, issuing the relevant policies and preferential measures, establishing special educational management organization and making the corresponding management system measures, for instance issuing tax allowance or credit financing policies.

### 2.2 University dimension

As the subject of implementing the innovation and entrepreneurship education, higher education institutions are the main organizations and place to implement the innovation and entrepreneurship education, so the universities are the main strengths of innovation and entrepreneurship education. University dimension mainly includes that the school makes positive school-running concept and planning of innovation and entrepreneurship education, establishes the special management organization and management system of innovation and entrepreneurship education, fosters the outstanding teachers team of innovation and entrepreneurship education, sets up the rational course system and content, increase input to build educational facilities and practice base, builds a good atmosphere of innovation and entrepreneurship education in the whole school and even the whole society.

### 2.3 Social dimension

The society is the strong support of innovation and entrepreneurship education, it includes social reputation and social atmosphere mainly, namely the identification of the society on innovation and entrepreneurship education, and the good innovation atmosphere built by the whole society. In addition, public organizations and enterprises should support university students to innovate actively, and offer energetical service and support for them, for instance they can offer practice base to the students.

### 2.4 Student dimension

Students are the target of innovation and entrepreneurship education. Innovation and entrepreneurship education aims at improving students' innovation ability and fostering the high quality talents meeting the development of knowledge-driven economy era, so students' behavior is a direct expression of the innovation and entrepreneurship education quality. The student dimension includes students' scientific research ability, innovative achievement, entrepreneurship rates, and the performance participating in practice activities of the innovative education, such as scientific research number, the number of times, scientific findings, innovative work, performance participated and rewarded in the contests etc..

## 3 Evaluation Model of FAHP

Both Analytic Hierarchy Process (AHP) and Fuzzy Comprehensive Evaluation (FCE) has its own pros and cons(Guo, 2005; Yang, 2000), this paper uses two methods of AHP and FCE synthetically to

propose a new method of Fuzzy Analytic Hierarchy Process (FAHP) ( McCaffrey, 2007), We adopt the method of Fuzzy Analytic Hierarchy Process (FAHP) to carry on the evaluation of innovation and entrepreneurship education evaluation quality of higher education institution, the procedures are as follows:

**3.1 Establish the evaluation index system**

We should establish the evaluation index system of innovation and entrepreneurship education at first. According to the analysis of the evaluating target, we set up a rational and scientific evaluation index set of innovation and entrepreneurship education as shown in Table1.

**3.2 Confirm the weight of the index**

Now we use the Analytic Hierarchy Process (AHP) to confirm the weight of each index. Firstly, construct the judging matrix according to T.L.satty graduation theory ( Saaty, 2008). Secondly, confirm the weight of every layer of indexes.

**3.3 Confirm the comment set**

We carry on the grade judgment to the index according to the quality level of the target, namely the comment set  $V = (v_1, v_2, \dots, v_5)$ , it can be defined five grades,  $V =$ ( good , little good , medium , little bad , bad).

**3.4 Set up the fuzzy matrix**

We set up the fuzzy evaluating matrix  $R$  as follows:

$$R = \begin{bmatrix} R_{11} & R_{12} & \dots & R_{1n} \\ R_{21} & R_{22} & \dots & R_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ R_{m1} & R_{m2} & \dots & R_{mn} \end{bmatrix} \tag{1}$$

Among them,  $R_{ij}=(i=1,2,\dots,m;j=1,2,\dots,n)$  means the subordinate degree of index  $R_i$  to the  $V_j$  comment.

**3.5 Construct the fuzzy comprehensive evaluation model**

According to the synthetic operation rule of fuzzy matrix, the comprehensive evaluation model  $A$  is:

$$A = W' \cdot R = (A_1, A_2, \dots, A_n) \tag{2}$$

If  $\sum A_i \neq 1, A' = (A'_1, A'_2, \dots, A'_n), A'_j = A_j / \sum A_j, (j = 1, 2, \dots, n)$

**3.6 Confirm the score set**

Suppose  $K = (K_1, K_2, \dots, K_n)^T, N$  means the series of comment set,  $K_i$  refers to the score of  $i$  comment , regard 100 as the full marks,  $K_i = i \times 100 / n (i = 1, 2, \dots, n) .$

**3.7 Calculate and evaluate the results**

$B = A \times K$  or  $B = A' \times K$ , which is the score of the appraising target. Then we can appraise the quality of innovative education according to the value of  $B$ . The evaluation may be divided into five levels, as shown in table 2.

**Table 2 Result evaluation of the quality of innovative education**

$B$ value	[0~60)	[60,70)	[70,80)	[80,90)	[90,100]
comment set	Bad	little bad	medium	little good	Good

**4 Examples**

**4.1 The choice of the example**

As one of high educational institutions in China, Wuhan University of Technology pays great attention to the cultivation of student's innovation ability and the construction of the innovative education system. This research will use the above method of Fuzzy Analytic Hierarchy Process (FAHP) to carry on the evaluation of innovation and entrepreneurship education evaluation quality of Wuhan University of Technology.

**4.2 The evaluation procedure of the example**

The concrete procedure is as follows:

- 1) Establish the evaluation index system of innovation and entrepreneurship education as shown in Table 1.
- 2) Confirm the weight of every index with AHP. Firstly, construct the judgment matrix of the

indexes in *B* layer, as shown in Table 3.

**Table 3 Judgment matrix of the indexes in *B* layer**

A	<i>B</i> <sub>1</sub>	<i>B</i> <sub>2</sub>	<i>B</i> <sub>3</sub>	<i>B</i> <sub>4</sub>
<i>B</i> <sub>1</sub>	1	1/3	5	3
<i>B</i> <sub>2</sub>	3	1	7	5
<i>B</i> <sub>3</sub>	1/5	1/7	1	1/3
<i>B</i> <sub>4</sub>	1/3	1/5	3	1

Secondly, confirm the weight of all the indexes in *B* layer:

$$W_B = (0.2634, 0.5638, 0.0550, 0.1178)^T$$

In a similar way, we can get the weight of secondary index layer:

$$W_{B_{1j}} = (0.6370, 0.1047, 0.2583)^T$$

$$W_{B_{2j}} = (0.0421, 0.2606, 0.5015, 0.0649, 0.1309)^T$$

$$W_{B_{3j}} = (0.6370, 0.2583, 0.1047)^T$$

$$W_{B_{4j}} = (0.1175, 0.5650, 0.2622, 0.0553)^T$$

3) Confirm the comment set. It is divided into five grades, *V* = {good (>90), little good (80~90), medium (70~80), little bad (60~70), bad (<60)}.

4) Set up fuzzy evaluating matrix. According to the investigation and mark of 10 experts, we get the calculation sheet of fuzzy evaluation of secondary index layers as shown in Table 4.

**Table 4 The calculation sheet of fuzzy evaluation**

Factor layer			Secondary factor layer			Evaluating grade				
<i>i</i>	<i>B</i> <sub><i>i</i></sub>	<i>W</i> <sub><i>i</i></sub>	<i>j</i>	<i>B</i> <sub><i>ij</i></sub>	<i>W</i> <sub><i>ij</i></sub>	<i>V</i> <sub>1</sub>	<i>V</i> <sub>2</sub>	<i>V</i> <sub>3</sub>	<i>V</i> <sub>4</sub>	<i>V</i> <sub>5</sub>
						Fuzzy matrix				
						good	little good	medium	little bad	bad
1	<i>B</i> <sub>1</sub>	0.2634	1	<i>B</i> <sub>11</sub>	0.6370	0	0	0.4	0.6	0
			2	<i>B</i> <sub>12</sub>	0.2583	0	0.6	0.4	0	0
			3	<i>B</i> <sub>13</sub>	0.1047	0	0.4	0.4	0.2	0
2	<i>B</i> <sub>2</sub>	0.5638	1	<i>B</i> <sub>21</sub>	0.1309	0	0.4	0.6	0	0
			2	<i>B</i> <sub>22</sub>	0.5015	0	0.2	0.6	0.2	0
			3	<i>B</i> <sub>23</sub>	0.0649	0	0.4	0.6	0	0
			4	<i>B</i> <sub>24</sub>	0.2606	0	0	0	0.4	0.6
			5	<i>B</i> <sub>25</sub>	0.0421	0	0.6	0.4	0	0
3	<i>B</i> <sub>3</sub>	0.0550	1	<i>B</i> <sub>31</sub>	0.0194	0	0	0	0.8	0.2
			2	<i>B</i> <sub>32</sub>	0.0277	0	0	0	0.4	0.6
			3	<i>B</i> <sub>33</sub>	0.0450	0	0.4	0.6	0	0
4	<i>B</i> <sub>4</sub>	0.1178	1	<i>B</i> <sub>41</sub>	0.1175	0.2	0.2	0.4	0.2	0
			2	<i>B</i> <sub>42</sub>	0.5650	0.2	0.4	0.4	0	0
			3	<i>B</i> <sub>43</sub>	0.2622	0	0.6	0.4	0	0
			4	<i>B</i> <sub>44</sub>	0.0553	0	0	0.6	0.4	0

5) Construct the fuzzy comprehensive evaluation model. According to  $A = W^T \cdot R$ , the result is normalized as follows:

$$A_{B_{1j}} = W_{B_{1j}}^T \cdot R_{B_{1j}} = (0.2914, 0.3967, 0.1936, 0.1183, 0)$$

$$A_{B_{2j}} = (0.0736, 0.2556, 0.3564, 0.2144, 0.1000)$$

$$A_{B_{3j}} = (0.0681, 0.1682, 0.2291, 0.3501, 0.1845)$$

$$A_{B_{4j}} = (0.1105, 0.2846, 0.3637, 0.2412, 0)$$

So the subordinated vector of *B* is as follows:

$$R_B = \begin{bmatrix} A_{B_{1j}} \\ A_{B_{2j}} \\ A_{B_{3j}} \\ A_{B_{4j}} \end{bmatrix} = \begin{bmatrix} 0 & 0.1969 & 0.4000 & 0.4031 & 0 \\ 0 & 0.2039 & 0.4352 & 0.2045 & 0.1564 \\ 0 & 0.0180 & 0.0270 & 0.0266 & 0.0205 \\ 0.1365 & 0.4068 & 0.4111 & 0.0456 & 0 \end{bmatrix}$$

The comprehensive evaluation model:

$$A = W_B^T \times R_B = (0.0161, 0.02157, 0.4006, 0.2283, 0.0893)$$

The normalized result is:  $A' = (0.0169, 0.2271, 0.4217, 0.2403, 0.0940)$ .

(6) Confirm the score set:  $K_1=20, K_2=40, K_3=60, K_4=80, K_5=100$ , so  $K=(20,40,60,80,100)^T$ .

(7) Calculate and evaluate the results. According to  $B = A' \times K$ , we can get the calculation results is:  $B=63.348$ .

### 4.3 Analysis of the results

The above-mentioned result indicates that Wuhan University of Technology is relatively poor in the quality of innovation and entrepreneurship education. As a suggestion, Wuhan University of Technology should increase the input and support into innovation and entrepreneurship education and strengthen the cooperation with various aspects, in order to improve the quality level of innovation and entrepreneurship education.

## 5 Conclusion

On the basis of expounding the definition of innovation and entrepreneurship education, this research structures the index system from four dimensions of government, university, society and student at first, and then gives a evaluating method based on Fuzzy Analytical Hierarchy Process, finally takes Wuhan University of Technology for an example to test the above method. This research can offer theoretical and practical guidance for the development of innovation and entrepreneurship education of higher education institution in China. However, there are still several places needing to be improved in this research, and the index system still need to be revised constantly in the future work.

## Research on Radiation Scope of Service Industry in Main China Cities

Wang Lijun, Li Huitao

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: wljah@foxmail.com, 362683062@163.com)

**Abstract:** With the higher and higher proportion of service industry in the national economy, it is becoming an important industry in support of the city's regional radiation effect. This paper, based on "Breaking point" model in city radiation theory, selected 19 major cities in China as the research object, built the service industry comprehensive strength index system, analyzes the differences in service industry comprehensive strength of these cities, drew weight Voronoi diagram of these cities' service industry radiation scope, concluded that the size of city's service industry radiating scope does not conform to its radiation capacity, due to difference in location.

**Key words:** Service industry; Radiation capacity; Radiation scope; Main cities

### 1 Introduction

Industry is the source of urban radiation. Since 1960s the services has gradually become an important engine of economic growth, the world showing a trend of transformation of the industrial economy to a service-oriented economy (the so-called service economy refers to the services accounted for more than 60% in GDP). Value added services has reached 69.4 percent share of global GDP, in 2009. United States, Britain, Germany and Japan and other developed countries have entered into service economy. Changes in industrial structure, also lead to changes in the composition of the urban radiation. Service industry is becoming the future core support of the city's radiation force. With the upgrade of industrial structure in China, the radiation capacity of Chinese city is more and more determined by the services.

Zhang Yun<sup>[1]</sup> (2010) studied the radiation capacity of Beijing's producer services. Pang Yi<sup>[2]</sup> (2010) studied the radiation of distribution services in Beijing. Zhang Hui<sup>[3]</sup> (2010) studied the radiation of Beijing's financial service industry. However, at present, only few researches are on services radiation or radiation scope of the other cities in China. This paper will draw on the radiation model, comparative study on the composition and size of the service industry radiation of China's major cities, and the cities' radiation scope. This study will be conducive to depth understanding of the regional economy radiation capacity constitute, it is also conducive to the find the hinterland or service area of service industry.

### 2 Radiation Model

The division of the urban hinterland is an important part of the study of urban geography. Initially, according to five indicators including the flow direction of the rail commuters, newspaper publishers range, phone swap direction, as well as to office locations of the person in charge in companies and banks, H L Green (1989) estimates the average boundary between New York and Boston, and then integrated the theoretical boundary between the two cities. After investigation of a large number of U.S. cities during 1929-1931, and learn from the physics of Newton "gravity" theorem, W J Reilly proposed the "law of retail gravitation" (also known as "Reilly's law") to determine the scope of the retail area. "Reilly's law" gradually be applied to the measure of the mutual attraction between the city, the law says that the attraction between two cities is proportional to the scale of the two, and is inversely proportional to the distance between them. Developed the theory of Reilly, P D Converse put forward the concept of "Breaking Point" and gives the calculation method in 1949. "Breaking Point" has been defined as the point between adjacent cities, where the attractions of these two cities have reached the balance, and calculated as follows:

$$d_A = D_{AB} / (1 + \sqrt{P_B / P_A}) \quad \text{or} \quad d_B = D_{AB} / (1 + \sqrt{P_A / P_B})$$

In the formula,  $A$  and  $B$  represents a different city,  $D$  refers to the distance between city  $A$  and  $B$ ,  $d$  is the distance of the "Breaking Point" to each city,  $P$  means the population of each city. According to the basic formula of the theoretical breaking point, you can get the following three inferences.

Corollary 1: the sum of the distance of "Breaking Point" to the two adjacent cities equals to The Euclidean distance between the two cities. The formula is:

$$d_A + d_B = D_{AB}$$

Corollary 2: the distance of “Breaking Point” to the city, is proportional to the square root of the city’s center intensity values. The formula is:

$$\frac{d_A}{d_B} = \frac{\sqrt{P_A}}{\sqrt{P_B}}$$

Corollary 2: in homogeneous flat region, the expansion rate of city’s radiation is proportional to the square root of the city’s center intensity values. The formula is:

$$\frac{v_A}{v_B} = \frac{\sqrt{P_A}}{\sqrt{P_B}}$$

In practical use, breaking point theory can well determine city's radiation area, but there are still some flaws, mainly in: First, in the theory of the breaking point, the city radiation determined only by the urban population, which does not fully reflect all aspects of the city’s radiation capacity; Second, the breaking point theory can only be used to calculate a breaking point of two adjacent cities, but the reality is that the breaking point of the two cities should be a curve constituted by countless breaking point, and the reality of urban space distribution is complex, the breaking point can not accurately determine the true scope of radiation cities.

For the first shortcomings of “Breaking Point” theory, scholars at home and abroad are trying to build the city's comprehensive strength evaluation system involved in a variety of indicators, instead of a single indicator of population. For the second shortcomings of “Breaking Point” theory, scholars use the Voronoi diagram to draw the map of urban radiation range.

Voronoi diagram is one way of space subdivision. It was invented in 1908 by the Russian mathematician Voronoi. In regular Voronoi diagram, given control points  $P_i (i = 1, 2, \dots)$  in homogeneous plane is the growth nuclear, the growth nuclear expand outwards at the same rate until no gap constitutes in the space, the expansion area of all the control points are polygons some except external control points. An important property of the Voronoi diagram is that the distance from each point of the Voronoi grid to the grid’s control point is shorter than to any other grid’s control points. So Voronoi diagram can be used in the division of urban radiation by this feature.

Weighted Voronoi diagram is a commonly used form of Voronoi diagram. Different from regular Voronoi diagram, in weighted Voronoi diagram, the outward expansion rates of each point are not equal, but equal to the weight of each point. That is  $v_A/v_B = \lambda_A/\lambda_B$ ,  $v$  is the expansion speed,  $\lambda$  is the weight of each control point. Give each control point the same weight  $\lambda_A = \lambda_B$ , then  $v_A = v_B$ , so we get normal Voronoi diagram. In reality, weighted Voronoi diagram has been widely used, and can determines the urban radiation range more objectively.

A. Normal Voronoi diagram      B. Weighted Voronoi diagram  
**Figure 1      Voronoi Diagram**

Scholars have used “Breaking Point” and Voronoi diagram to study the radiation range of the city or of the city’s service industry. Boots & South<sup>[4]</sup> (1997), used higher order multiplicatively weighted Voronoi polygons to determine the mall service area and service area of the bus station. Pearce<sup>[5]</sup> (2000) used ordinary Voronoi diagram and weighted Voronoi diagram to determine service area of schools. Japanese scholars Okabe<sup>[6]</sup> (1997) and Suzuki<sup>[7]</sup> (1997) used Voronoi diagram to study facility location optimization problems on different levels in continuous flat space, and verify Chris Taylor’s city center theory in Urban Geography. Wang Xinsheng<sup>[8]</sup> (2000) explored the application of the Voronoi diagram to define the impact scope of economic object space in Hubei Province. LU Yuqi<sup>[9]</sup> (2001) constructed the index system, to calculate each city's comprehensive strength, and determined the impact area of 11 cities in Hebei Province. Wang Guiyuan<sup>[10]</sup> (2004) used “Breaking point” model, field strength model

and the Voronoi diagram to explore the city forces circles based on GIS.

### 3 Service Industry Comprehensive Strength Evaluation

#### 3.1 Index system and data

The service industry output value cannot represent its comprehensive strength, so we evaluate service industry comprehensive strength from aspects of consolidated basis, industrial scale, industrial structure and development potential. Consolidated basis can reflect the market size (urban scale), the economic base (economic level) for service industry development. Industrial scale is evaluated from the absolute value and proportion of the production and employment scale. Industrial structure, as industrial high-end level is evaluated by the state of development of the logistics and financial industries. Development potential refers to the expected future of service industry, can be evaluated mainly by the level of the city's human resources, technology and capital. Then we constructed the index system of 22 indicators.

As China has so many cities, we have chosen 19 major cities as a research object, they are sub-provincial cities or municipalities, which plays an important role in national economic development. This data are from the 2011 Statistical Yearbooks of each city, with reference to the provinces' Statistical Yearbooks, China Statistical Yearbook, Yearbook of China's urban in 2011. Of particular note, the data is in 2010, except R & D in 2009. Standardizing data through maximum - minimum value method, empowered 22 indicators through entropy method, then we can get the following table 1.

**Table 1 Indicators and Weights**

A	B	C
Consolidated basis (0.220)	Urban scale (0.083)	Population (0.042)
		Jurisdiction area (0.041)
	Economic level (0.137)	GDP(0.044)
		Industrial added value (0.042)
		Per capita GDP (0.050)
Industrial scale (0.255)	Production scale (0.173)	Services added value (0.048)
		Service industry of GDP (0.038)
		Services added value of per capita (0.045)
		Services value added of unit land (0.042)
	Employment scale(0.083)	Services employees (0.045)
		Services employees proportion (0.038)
Industrial structure (0.305)	Financial industry (0.139)	Balance of deposits (0.044)
		Balance of deposits/loans (0.048)
		Premium income (0.048)
	Logistics industry (0.166)	Total cargo (0.050)
		Total passenger (0.056)
		Mail service (0.060)
Development potential (0.220)	Human resources (0.087)	Number of college and university(0.048)
		Number of students in college and university (0.040)
	Technology (0.088)	R&D (0.041)
		Year patent applications (0.046)
Capital(0.045)	Fixed investments to service industry(0.045)	

#### 3.2 Evaluation and comparison

On standardizing the data and calculate the score of each index, we can get the score and ranking of these cities in services strength in the following table 2.

As can be seen from table 2, all indicators show a great difference in different cities. 4 cities ranked very front in all indicators, they are Beijing, Shanghai, Guangzhou and Tianjin. This shows that the basis, size, structure, and potential of the city's service industry are all very high. For a long time in the future, other cities cannot go beyond them. Some cities in the top surface, has one indicator ranked behind, such as Shenzhen, Chongqing, Chengdu, Wuhan, Hangzhou and Nanjing. This means that, a short board exist, which is the key factor in the further development of urban services. One indicator of Dalian, Ningbo

and Xi'an ranked front, as overall score ranked far behind. This means they have good potential in the development of service industry, but the potential has not yet translated into strength. Shenyang, Qingdao, Jinan, Harbin, Xiamen, Changchun ranked very behind in all indicators. These cities are all distributed in the northern region, except Xiamen, showing that service industry of north China is lagging behind South China.

**Table 2 Score and Ranking of 19 Major Cities' Service Industry Comprehensive Strength**

City	Consolidated basis		Industrial scale		Industrial structure		Development potential		Overall	
	score	ranking	score	ranking	score	ranking	score	ranking	score	ranking
Beijing	0.120	3	0.224	1	0.261	1	0.211	1	0.815	1
Shanghai	0.157	1	0.178	2	0.226	2	0.163	2	0.725	2
Guangzhou	0.109	4	0.144	4	0.151	5	0.091	3	0.495	3
Shenzhen	0.109	5	0.146	3	0.170	3	0.055	12	0.480	4
Chongqing	0.121	2	0.042	17	0.156	4	0.076	6	0.394	5
Tianjin	0.102	6	0.086	5	0.078	7	0.086	5	0.351	6
Chengdu	0.051	14	0.065	9	0.111	6	0.074	7	0.301	7
Wuhan	0.055	12	0.075	7	0.052	10	0.086	4	0.269	8
Hangzhou	0.084	7	0.068	8	0.054	8	0.059	10	0.265	9
Nanjing	0.054	13	0.076	6	0.053	9	0.062	9	0.244	10
Dalian	0.068	9	0.049	15	0.033	13	0.051	14	0.202	11
Shenyang	0.058	11	0.056	12	0.030	14	0.054	13	0.199	12
Ningbo	0.080	8	0.039	18	0.045	11	0.031	17	0.195	13
Xi'an	0.025	18	0.051	14	0.037	12	0.070	8	0.183	14

#### 4 Service Industry Radiation Scope

Radiation scope of each city's services industry is not only determined by its comprehensive strength, but also related to factors such as distribution, transportation, topography and administrative jurisdiction of the city. So, we use the weighted Voronoi diagram to analyze actual situation of radiation scope of each city's services, and assuming that the city is located in the homogeneous plane. The weight of each city is the square root of service industry comprehensive strength score.

**Figure 2 Radiation Scope of 19 Major Cities' Service Industry in China**

According to figure 2, we can directly compare the size of the service industry radiation of the cities. We adjusted the radiation area as the city is the smallest unit. If the city on the border, most of its administrative jurisdiction is in the radiation area of city A, then it belongs to A's radiation. When different cities take the same proportion of the border city's administrative jurisdiction, we think that the border city belongs to the radiation area where the administrative center in.

**Table 3 Area of 19 Major Cities' Service Industry Radiation Scope Unit:  $10^3 \text{ km}^2$**

City	Area	City	Area	City	Area	City	Area
Beijing	3855.4	Tianjin	62.8	Dalian	13.2	Jinan	131.8
Shanghai	137.1	Chengdu	2138.4	Shenyang	163.2	Harbin	456.9
Guangzhou	549.3	Wuhan	360.7	Ningbo	19.2	Xiamen	84.3
Shenzhen	62.8	Hangzhou	134.9	Xi'an	325.9	Changchun	84.4
Chongqing	769.8	Nanjing	143.4	Qingdao	51.6		

From table 3 may safely draw some conclusions. First, Beijing is the national services center. Beijing's services radiating area covers vast regions from the northeast to the northwest, north to central China's. This is consistent with the National Center for Beijing. Second, Shanghai is under intense competition. Although Shanghai's service industry has a strong comprehensive competitiveness, its radiation area is small, thanks to the competitive effect of neighboring cities. Third, Chengdu, Chongqing, Guangzhou are regional services center cities. Services range of radiation of these cities is most extensive after Beijing. Forth, radiation of most cities' service industry is only in their province or territory, such as Tianjin, Hangzhou, Nanjing, Ningbo, Shenzhen, Wuhan, Xi'an, Jinan, Qingdao, Shenyang and Harbin. Fifth, the radiation area of some cities is very small, such as Tianjin, Dalian, Changchun, Ningbo and Xiamen.

## 5 Conclusion

There is a big gap between China's major cities in the development of service industry. City in economically developed areas, such as Beijing, Shanghai, Guangzhou and Shenzhen, its service industry is more developed than of the city in centre and west China. As its different locations, radiation scope of the its services industry is not only determined by comprehensive strength. The size of its radiating area does not conform to its radiation capacity. The city in east China is strong in service industry comprehensive strength, small in radiation area. The city in west China is limited in service industry comprehensive strength, but broad in radiation areas. The city in central and northeast China is relatively balanced in these two areas. This also indicates that, east China has higher services radiation intensity, as west China has lower services radiation intensity.

# An Empirical Study on the Regional Competitiveness of the Xijiang Economic Belt

Zhu Jiefei, Ma Lu, Zhou Wei

School of Management, Guangxi University of Science and Technology, Liuzhou, P.R.China,545006

(E-mail: zhujiefei1985@163.com; malu6655@163.com;zw6630@126.com)

**Abstract:** Now, the subject of the economic competition has been transferred from a single city to a combination of multi-city. Xijiang economic belt as a focus on building the economic region of Guang Xi, its development is undoubtedly plays a very important role in autonomous regions' development, therefore, to promote a better development of Xijiang economic belt, It is necessary to carry out the evaluation of regional competitiveness. This paper uses the AHP to analyze the relative regional competitive elements. Design a rational regional competitiveness evaluation index system according to the actual situation of the Xijiang economic belt. Finally, according to the Institute of the conclusions, Put forward concrete proposals to enhance the competitiveness of Xijiang economic belt, and accelerate the achievement of the goal of the Xijiang economic belt rising from the west.

**Key words:** Regional competitiveness; Xijiang economic belt; Analytic hierarchy process; Index system

## 1 Introduction

"Xijiang economic belt" is the concept of regional economic blocks, including some areas in Guangxi, Guangdong, Yunnan and Guizhou provinces of China, Guangxi holds whole economic with 80% of the area. According to 《Xijiang economic belt development plan》, Guangxi Xijiang economic belt including 8 Cities: Nanning, Guilin, Liuzhou, Wuzhou, Guigang, Laibin, Baise, Chongzuo.

The Xijiang shipping trunk and the Yangtze River Known as the "golden water way", It is an important part of southwest China Water way passage to the other counties. As a national strategy with the development of Guangxi Beibu Gulf Economic Zone, Guangxi Zhuang Autonomous Region Party Committee and the government have made a major decision "to build the West River golden water way" strategy. Its core task is to adjust and optimize the economic structure and industrial layout, to promote regional economic be more coordinated and sustainable. After the State Council approved the Guangxi Beibu Gulf Economic Zone Development Plan, The Xijiang has been taken as a coordinating economic development strategic decision in Guangxi region in the new era.

October 28, 2009, The State Council executive meeting discussed and adopted the report of "a number of views on further promoting economic and social development in Guangxi ". And this report point out that The economic and social development in Guangxi in the future strategic task is to cultivate Guangxi Beibu Gulf Economic Zone and the Xijiang Economic Belt as the leading role, to improve the industrial layout and logistics base, advanced manufacturing base, special agriculture base and information exchange center, Fully reflects the development and construction of the Xijiang economic belt has entered national decision-making horizons.

## 2 Methodology

### 2.1 Index selection principle

Factors affect the development of regional competitiveness are different. Thus, the selected indicators are relatively complicated. In order to be more accurately and reasonably reflect the development of regional competitiveness, the selection of indicators must follow some certain principles.

#### 1) The integrity principle

Regional competitiveness is a holistic concept, we must to compare the entire region rather than one aspect, so, the selected indicators must reflect the overall regional competitiveness.

#### 2) The operability principles

In the process of designing regional competitiveness evaluation index system, specific index selection is restricted by many factors. In the index system, there may be some indicators can not be included in. Therefore, in the index selection process, It must take full account of the data operability principles, to give up the data indicates which are unable to obtain. Alternative or choose an easily accessible data indicators with similar indicators.

3)The representative principle

There are numerous actors that affect regional competitiveness, all the elements have been selected as study factors can be more accurate to draw conclusions absolutely, but this will undoubtedly increase the difficulty of the study, and therefore we select only in the choice of indicators can be to a greater extent behalf of the host indicators of regional competitiveness.

**2.2 Index selection and hierarchical structure**

According to the competitiveness evaluation index system which commonly used in IMD and WEF, and combined with the actual situation of the Xijiang economic belt to build competitiveness evaluation index system of the Xijiang economic belt, the system including six regional competitiveness factors, select the representative 33 specific indicators, as shown in table 1.

**Table 1 The main competitiveness indicator**

		The first grade indicator	The second grade indicator		
Regional Competitiveness	A1 Economic Strength (0.2284)		A11 GDP		
			A12 Investment in fixed assets		
			A13 Revenue		
			A14 GDP growth rate		
			A15 Revenue growth rate		
			A16 Growth rate of investment in fixed assets		
			A17 The growth rate of per capita GDP		
			A11 GDP		
			A12 Investment in fixed assets		
			B1 Industrial Competitiveness (0.1870)		B11 Proportion of the two industry value
					B12 Key enterprises
					B13 Proportion of the three industry value
			C1 International Competitiveness (0.1531)		C11 Total value of import and export commodities
					C12 Import and export growth rate
					C13 Actual utilization of foreign investment
					C14 Growth of the actual utilization of foreign capital
					C15 Foreign direct investment
	C16 The number of international passengers				
	D1 Infrastructure&Environmental management (0.1531)		D11 Graded highway mileage		
			D12 Postal and Telecommunication Services		
			D13 Highway freight volume		
			D14 Waterway Freight volume		
			D15 Telephone penetration rate		
			D16 Number of Internet users		
			D17 Waste water treatment facility		
			D18 Domestic sewage discharge		
	E1 Human Resource competitiveness (0.1531)		E11 The number of health institutions staff		
			E12 Number of hospital beds		
			E13 Institutions of Higher Education		
			E14 College level population ratio		
			E15 Number of College Students		
			E16 Total population		
	F1 Science &Technology competitiveness (0.1253)		F11 Number of science and technology person		
F12 Science and technology market turnover					
F13 Number of Enterprises of the national high-tech industries					

### 2.3 Empirical Study on Regional Competitiveness

#### 1) Data source and the calculation of evaluation index weights

Considering the Authority and availability of information, take the data of the "Guangxi statistical yearbook", "Guangdong statistical yearbook", "Liaoning statistical yearbook" and "Chinese urban statistical yearbook" in 2010 as a foundation, mining the individual data from the China Economic and Social Development Statistical. The ultimate target data come from the sum of all cities' data in economical belt, and have been normalized to get the standard data.

According to the Statistical Yearbook data and the expert survey results, paired comparisons are made with judgments using numerical values taken from the AHP absolute fundamental scale of 1 to 9, then, construct the evaluation index judgment matrix, however, in the process of constructing the judgment matrix, the judgment matrix does not always meet the consistency test, also, the rough estimate with a certain blindness, when the number of N (Evaluation indicators) becomes larger, this cross judge would lead to contradictions, in order to improve the consistency of judgment matrix and reduce the work, this article using the following algorithm:

Set any one judgment matrix  $A=(a_{ij})_{n \times n}$ , the first row elements of A matrix :  $a_{11}, a_{12} \dots a_{1n}$ , Relatively importance of row elements were given by the experts, and then to determine the links between the elements. In order to avoid cross judgments between the various elements, the following algorithm can prevent the emergence of contradictions. Set the Transformation matrix  $B=(b_{ij})_{n \times n}$ , Assuming there are any two elements in the first row of A matrix  $a_{ij}$  and  $a_{ik}$  ( $j=1, 2, 3 \dots n-1; k=3, 4, 5 \dots n, j < k$ ), then  $a_{jk}$  determination algorithm is as follows:

Step 1: Compute the two elements of transformation matrix B which corresponds with  $a_{1j}$ , and  $a_{1k}$ , that is, if  $a_{1j} > 1$ , then the  $b_{1j} = a_{1j}$ ; otherwise  $a_{1j} < 1$ ,  $b_{1j} = 2-1 / a_{1j}$ . If  $a_{1k} > 1$ , then the  $b_{1k} = a_{1k}$ ; otherwise  $a_{1k} < 1$   $b_{1k} = 2-1 / a_{1k}$ .

Step 2: compute the transformation matrix B  $b_{jk} = b_{1j} \cdot b_{1k}$ .

Step 3: Calculate the elements  $a_{jk}$  of judgment matrix A , if  $b_{jk} > 0$ , then  $a_{jk} = 1 / (1 + b_{jk})$ ; otherwise the  $b_{jk} < 0$ , the  $a_{jk} = 1 + |b_{jk}|$ .

Generally speaking, the smaller of CR (consistency test indicators), the better of the consistency of judgment matrix, if the CR  $< 0.1$ , judgment matrix has satisfied consistency, in accordance with the above algorithm to construct the judgment matrix and solving the weight W of each index ,as shown in Table 2, Table 3.

**Table 2 Level indicators weights**

	A1	B1	C1	D1	E1	F1	weights
A1	1	2	3	3	3	4	0.2284
B1	1/2	1	2	2	2	3	0.1870
C1	1/3	1/2	1	1	1	2	0.1531
D1	1/3	1/2	1	1	1	2	0.1531

(XEB:Xijiang economic belt; LEB:Liaoning economic belt; PRD:Pearl River Delta)

### (2) Regional competitiveness evaluation and results

After determining each index weights and removing the indicator data dimensionless, taking a comprehensive evaluation and calculating the final score of the three economic regions. The weighted sum of multi-index comprehensive evaluation model is based on the actual situation of the Xijiang economic belt. During the comprehensive evaluations, the calculation of Target strata, criterion layer and the index layer would compose the weighted summation model. The formula is as follows.

$$Q = \sum_{m=1}^l I_m W_i$$

Where  $I_i$  and  $W_i$ , respectively, Represent the next level of evaluation of the index values and the corresponding weight.

## 3 Results

Under the above way, comparing the region competitiveness among the Xijiang economic belt, Liaoning's economy belt and the Pearl River Delta region, calculating the evaluation results as follow in Table 4.

**Table 4 Regional competitiveness evaluation results**

Evaluation index	XEB	LEB	PRD
A1	0.3104	0.3104	0.3792
B1	0.2494	0.3256	0.4251
C1	0.2279	0.2976	0.4745
D1	0.3114	0.3328	0.3558
E1	0.3104	0.3104	0.3792
F1	0.2693	0.3289	0.4018
Regional competitiveness	0.2802	0.3176	0.4022

Because the population, economy, culture, location conditions in the three regions are quite different, resulting in the three regions are obvious advantages and disadvantages of each sub factor. We can be seen through the above analysis and the final score: Pearl River Delta Regional with

competitiveness score of 0.4022, the highest score in three regions; Liaoning economic belt with regional competitiveness score of 0.3176, ranked second in the three regions; Xijiang economic belt with regional competitiveness score of 0.2802, the weakest among the three. The analysis is divided into the following aspects from the individual factors.

## 4 Conclusion and countermeasures

### 4.1 Result analysis

#### 1) Comprehensive economic strength.

From the analysis, we can know that the Xijiang economic belt and the Liaoning economic belt developed in a same step, the Pearl River Delta obtain the highest scores. In fact, the actual situation of the Pearl River Delta based on the total economic base in the PRD, which in the AHP analysis will weaken its actual competitiveness. On the other hand, the Xijiang economic belt and the Liaoning Economic Belt has the advantage compared to the Pearl River Delta.

#### 2) Industrial competitiveness.

Pearl River Delta in industrial competitiveness factor have a distinct advantage, In the sub factors of industrial competitiveness can be seen that the PRD can keep a huge advantage is benefited by it's higher proportion of tertiary industry as well as in the large number of key enterprises and a relatively good business environment.

#### 3) International competitiveness.

From the table in the comparison of international competitiveness, can be seen that the Xijiang economic belt and the Liaoning economic belt at the same level, Liaoning's major international trading partner are South Korea, Japan and other developed countries, the international competitiveness of Xijiang economic belt is more rely on the trade with the ASEAN countries. Nevertheless, Xijiang economic belt still have a huge gap between the Liaoning and the Pearl River Delta. Pearl River Delta, with its traditional port and coastal advantages in the international arena are more competitive.

#### 4) Technological competitiveness.

At the point of the technological competitiveness, the Xijiang economic belt owns an obvious gap from the PRD, Because there is a large scale of 211 Universities in the Pearl River Delta region, what is more, the number of universities and the highly educated persons in the PRD are more than the Xijiang economic belt, while the well known university in the Xijiang economic belt is only one, at the same time, the economic strength and the attractive wages would be recognized as the major causes to attract talents in the Coastal cities. So, the West economic belt to build its own excellent comprehensive university and improve staff wages is a major method to enhance its scientific and technological competitiveness.

#### 5) The environment and infrastructure.

In the environment and infrastructure construction, the Xijiang economic belt's water emissions is the least in three regions, only one third of the Pearl River Delta, half of Liaoning, This shows two problems: First, The industry of the Pearl River Delta is much larger than the Xijiang economic belt and the economy of Liaoning. Secondly, Xijiang economic belt of the Environmental Protection, natural resources persecution is significantly less than the other two places.

#### 6) Competitiveness of human resources.

Comparison of the human resources, the population of the Xijiang economic belt is more than the Liaoning economic zone, below the Pearl River Delta, but the per capita wage of the Xijiang economic belt is more affordable compared to other two places, this allows companies to reduce labor costs in the Xijiang economic belt, improve regional competitiveness of enterprises. However, the Xijiang economic belt is still far lagged behind the Pearl River Delta in demand for high-end talent.

### 4.2 Countermeasures

According to the competitiveness evaluation results and the affective factors in this article, some recommendations they would be made as the follows:

( ) The government should improve the investment environment and streamline the verification process, at the same time, to improve the transparency of government decision-making. First of all, Because of the capacity of attracting foreign investment in the Xijiang economic belts is weak, so, it is necessary to strive to get rid of market entry barriers, streamlining unnecessary verification link and improve the transparency of government decision-making, what is more, strengthen the open market discipline, create a fair, transparent and efficient public manage environment and enhance the investment confidence of enterprises should be take as the important measures to be carried out;

Secondly, In order to further improving the infrastructure construction in Guangxi, the key point is to take the Xijiang as the basis, develop a regional hub port, formatting an easily accessible, complete facilities of water and land transportation network, and further establish the sea's export status in the southwest of China

( ) Encourage exports, develop the market of international demand. The cities of Xijiang have coastal location advantage, under the premise of strengthening complementarities of cooperation with ASEAN countries, industry should continue to participate in the ASEAN market and make efforts to strengthen their competition. Further increasing the Guangxi product market share with Vietnam, Thailand, Indonesia, Singapore and other neighboring countries, at the same time, we must try to reverse the export market for the distribution of concentration, avoid regional risk situation ,open up new market areas and promote the layout export market by unitary steering diversified. Use of international standards to guide the industry's innovation in a wide range of international competition, and enhance the international competitiveness of industry.

3) Vigorously develop tourism and port services in Guangxi rich tourist resources and natural advantages are the basis for the development of tourism in Xijiang economic belt, which to bring a effective change about the overall competitiveness of the Xijiang economic belt, But we should also see the Xijiang economic belt is rich in tourist resources, but does not translate into actual tourism product. What is more, district development is highly uneven, ranging from the tourism industry is highly developed and high profile tourist city Guilin to there are many rich tourism resources, but has not yet been developed city Wuzhou. This is not only a waste of the rich tourism resources and the national culture, but also restricts the depth of the region's tourism development. Therefore, the Xijiang should take tourism as a whole region characteristic industry to operate.

4) Establish a flexible and effective personnel training mechanisms. Further increasing investment in education and reinforcing the foundation of education to encourage a variety of market demand for vocational education, so as to improve the overall quality of labor. Strengthening the introduction of professional scientific and technical personnel, especially the introduction of the academic leaders of the regional industrial development; Active contact with the coastal developed area, like Hong Kong, MaCao and other developed countries, to carry out technical exchanges and personnel training, introduce regional competitive industries required high-level personnel around the world, and continuously improve the quality of local professionals, promote the construction of science and technology team.

5) Building a just, vibrant and sustainable regional science and technology policy, actively introduce high-tech and technical personnel to effectively guide capital flows, the government also should pay more efforts to develop high value-added products. Gradually make Guangxi's large and medium sized enterprises set up technology development center, And developed with independent intellectual property rights of technology and products. Taking the technology as the center, at the same time, considering the organization of technical development as the main body, to build technical innovation development system. Take the tertiary institutions and research institutes as the main technical support, promote the combination of production, education and research. Further to improve the multi channels and levels science and technology investment system to ensure that science and technology funding steady growth. Establishing science and technology development fund to support the transformation of the major scientific and technological achievements. Adopt preferential policies to encourage and guide enterprises to increase investment in science and technology. Finally, to enable enterprises to become the main body of investment of science and technology.

**Abstract:** With the economic development, industrial structure continues to evolve, it has become a hot issue of macroeconomic research what causal relationship between them. Based the 1978-2010 macroeconomic datum, use the unit root test, cointegration test and Granger causality test, to analyze the relationship between China's industrial structure and economic growth. From the Study, we find that long-run equilibrium cointegration relationship exists between the China's industrial structure and economic growth, and shows an obvious stage characteristics and trends, the first industry is more dependent on economic growth, which is nurturing role in promoting process, the secondary industry has always maintain a close relationship with economic growth, the tertiary industry has gradually become an important engine for future economic growth.

**Key words:** Industrial structure; Economic growth; Cointegration analysis; Granger causality test

## 1 Introduction

Based on the traditional competitive equilibrium economic growth theory that the market competition can maintain the balance between supply and demand in the long run, so the production has been "Pareto optimality", which means that the marginal revenue of the same factors of production of the various branches of production are equal, so the study of economic growth, there is no need to consider the flow and transfer of resources between the departments. In this case, the factors that cause economic growth are confined to the capital accumulation and labor growth and technological progress. Until the 1960s, scholars have adopted the statistical analysis of historical data for many countries with economic growth and industrial structure, and pointed out that the economic structure is one of the variables that affect economic growth.

Kuznets<sup>[1]</sup>(1957) compared with empirical data of 50 countries, the number of the manufacturing sector will increase to be accompanied by the growth of per capita income.Chenery<sup>[2]</sup>(1960)used the empirical data of 51 countries with the elements of decision analysis sector growth shows that when a country's economic scale change, service industries and agriculture changes minimally, and manufacturing growth, which made the pattern of industrial growth and that this industrialization model enables resources to be the optimal configuration.Pasinetti<sup>[3]</sup>(1981) saw an economic system as a series of vertically integrated sector, and results of the analysis is the most economic growth is caused by structural changes.

Domestic scholars also explore the industrial structure and economic growth relationship: Zhou Zhenhua<sup>[4]</sup> (1995) based the industrial structure perspective analyzed the mechanism of economic growth ,and saw the economic structure is an important factor in determining economic growth point theoretical basis.Guo Jinlong and Zhang Xuying<sup>[5]</sup>(1998) used regression analysis to analyze economic growth from China's economic structural change, summarized industrial structure optimization plays an important role for sustainable and healthy development of China's economic.Chen Changbing and Xu Haiyan (2001) educed China's industrial structure contribution to the GDP growth rate is 7.04% with Empirical regression Analysis.

Scholars have proved that the industrial structure is an important factor affecting economic growth, but with the different study area and period of the conclusions of the study relationship is different, as China's new round of the arrival of the industrial structure, a large adjustment of the combination since the reform and opening up the economy quickly grow, structure significantly with changes in the historical development trajectory, analysis of the current of industrial structure and economic growth in the relationship between the new changes and new trends will have conducive to promote China's industrial structure optimization upgrade sustainable and rapid development and economic health.

## 2 Model

### 2.1 Causality test model

The correlation coefficient is one of the most common and effective method to test the correlation coefficient between variables, however there are two shortcomings: First, the correlation coefficient does not reflect a causal relationship between variables that is can not distinguish between the cause variable and the outcome variables; the second is the correlation coefficient is likely to cause a spurious correlation, that is, the original in reality the two variables, the formation of the two variables are highly relevant to the illusion of the existence of certain relationships on the trends. The Granger causality test proposed by the British econometricians Granger is one of the key methods to solve these two problems, the basic idea of the Granger causality test is: If X changes caused Y to change, so X changes before Y change. During the Granger causality test before the first data unit root testing, to determine the stationarity of time series, if the variable is non-stationary, we must further verify the existence of a cointegration relationship, otherwise the credibility of the Granger causality test results will be greatly reduced.

#### (1) Stationarity test

The common method of stationary test is the ADF (Augmented Dickey-Fuller) test, its model form is as follows:

$$\Delta X_t = \alpha + \beta t + \delta X_{t-1} + \sum_{i=1}^m \beta_i \Delta X_{t-i} + \varepsilon_t \quad (1)$$

$\varepsilon_t$  is white noise,  $\Delta$  is difference operator,  $t$  is time variable (trend factors).The null hypothesis  $H_0: \delta = 0$ , namely, the existence of a unit root time series is non-stationary; alternative assumptions:  $H_1: \delta \neq 0$ ; That there is no a unit root, time series is stationary.

#### (2) Cointegration test

If the variable is stable, you can proceed with the Granger causality test; if the variable is not stable, you need to further the cointegration test. The premise of the cointegration test is variable contains a unit root (i.e. first-order difference stationary), you can further test whether there is a long-term equilibrium relationship - cointegration relationship between variables.  $Y = C + \alpha X + \varepsilon$ .

The basic idea of Cointegration is: If two or more time series variables are non-stationary, but some of their linear combination, show smooth, and long-run equilibrium relationship between these variables. Cointegration test commonly used method included Engle-Granger two-step method and Johansen, the maximum likelihood method, frequency domain non-parametric spectral regression method, Bayesian method. EG two-step method (Engle, Granger two-step) cointegration test, first build the OLS regression equation:  $Y = C + \alpha X + \varepsilon$ .

Y is the dependent variable and X as independent variables, C is a constant,  $\alpha$  is the regression equation variable coefficient,  $\varepsilon$  is the residuals. Test the residuals  $\varepsilon$  for a smooth sequence, we can determine the variables Y and X Cointegration, or does not exist cointegration relationship.

#### (3) Granger causality test

With Stationary test or cointegration test variables, you can conduct the Granger causality test, otherwise it is impossible to test. Granger test requires the estimated regression equation:

$$Y_t = \sum_{i=1}^m \alpha_i X_{t-i} + \sum_{i=1}^m \beta_i Y_{t-i} + \varepsilon_{1t} \quad (2)$$

$$X_t = \sum_{i=1}^m \lambda_i X_{t-i} + \sum_{i=1}^m \delta_i Y_{t-i} + \varepsilon_{2t} \quad (3)$$

The original assumptions of the model (1)  $H_{10}$ : all  $\alpha_i$  are equal to zero; the original assumptions of the model (2)  $H_{20}$ : all  $\delta_i$  are equal and zero. Because there are four cases: accept  $H_{10}$ , accept both  $H_{20}$ , the two are not causally related; accepted  $H_{10}$ , rejected  $H_{20}$ ; accepted  $H_{20}$ , rejected  $H_{10}$ , so X is Y Granger reasons; rejected  $H_{10}$ , rejected  $H_{20}$  at the same time, they are with Granger cause each other.

The joint inspection of the partial regression coefficient of zero can be achieved by F test:

$$F = \frac{(RSS_R - RSS_U) / m}{RSS_U / (n - k)} \tag{4}$$

$RSS_R$  is bound to return to the original assumptions of the residual sum of squares,  $RSS_U$  indicates that the original assumptions, constrained regression residual sum of squares,  $m$  is the lag order,  $n$  is the number of samples,  $k$  is the regression factor in the constrained regression number. If the F value is greater than the critical value, reject the hypothesis that the causal relationships, on the contrary accept the null hypothesis.

**2.2 Regression model**

According to the commonly used statistical classification of the national economy, the industry is divided into three categories, namely, the three industries classification, due to the existence of influence of industrial structure on economic growth, namely, the industrial output is the input elements of the national economy, so you can build production influence function  $Y = f(A, X_1, X_2, X_3)$ , In which  $Y$  represents the gross domestic product (GDP),  $X_i$  Said the  $i$ -th industry value-added,  $A$  Said that the economic system and the technical level effects On function  $Y = f(A, X_1, X_2, X_3)$  perfectionist differential:

$$dY = \frac{\partial Y}{\partial X_1} dX_1 + \frac{\partial Y}{\partial X_2} dX_2 + \frac{\partial Y}{\partial X_3} dX_3 + \frac{\partial Y}{\partial A} dA \tag{5}$$

Equality divides both sides by  $Y$ -finishing available:

$$\frac{dY}{Y} = \frac{\partial Y}{\partial X_1} \frac{X_1}{Y} \frac{dX_1}{X_1} + \frac{\partial Y}{\partial X_2} \frac{X_2}{Y} \frac{dX_2}{X_2} + \frac{\partial Y}{\partial X_3} \frac{X_3}{Y} \frac{dX_3}{X_3} + \frac{\partial Y}{\partial A} \frac{A}{Y} \frac{dA}{A} \tag{6}$$

By the elasticity formula:  $\alpha = \frac{\partial Y}{\partial X} \frac{X}{Y}$

The above equation simplified to:

$$\frac{dY}{Y} = \alpha_1 \frac{dX_1}{X_1} + \alpha_2 \frac{dX_2}{X_2} + \alpha_3 \frac{dX_3}{X_3} + \frac{\partial Y}{\partial A} \frac{A}{Y} \frac{dA}{A} \tag{7}$$

Among them,  $\alpha_1, \alpha_2, \alpha_3$  representing the first, second, third flexibility of and  $\alpha = \frac{\partial Y}{\partial A} \frac{A}{Y} \frac{dA}{A}$ , adding

random error, can get the regression equation between economic growth and industrial structure model:

$$\ln Y = \alpha + \alpha_1 \ln X_1 + \alpha_2 \ln X_2 + \alpha_3 \ln X_3 + \varepsilon \tag{8}$$

**3 Empirical Analysis**

**3.1 Data**

This paper selects 1978-2010, China's gross domestic product (GDP) and the First, Second, and tertiary industry added value as a research object, the first, second and tertiary industries added value with the  $X_1, X_2, X_3$ ; basis of social retail price index on 1978, based on historical data reduction, to remove the impact of price changes. GDP, industry and social retail goods price index are from the 2011 Statistical Yearbook. Removing the effects of inflation are mainly two o'clock advantages: the one hand, take into account inflation, taking into account the time value of the data, remove inflation, GDP and industrial added value more comparable; the other hand, the removal of inflation can eliminate inflation non-stationary interference caused by the data, but also conducive to do smooth data analysis and regression testing.

An exponential relationship between the GDP and industry based on the regression model, in order to facilitate research, first of all variables in logarithmic processing, respectively, get  $\ln GDP, \ln X_1, \ln X_2$  and  $\ln X_3$  further examine the relationship between variables.

**3.2 Stationarity test**

Use Eviews software, with GDP from 1978 to 2010 a total of 33 years, the industry ( $X_1$ ), the secondary industry ( $X_2$ ), the tertiary industry ( $X_3$ ), respectively, taking the logarithm to get  $\ln GDP, \ln X_1, \ln X_2, \ln X_3$ , unit root test, and finishing results in Table 1.

**Table 1 Variables Stationarity Test**

Sequence	ADF test value	1% threshold	5% threshold	10% threshold	Conclusion
<i>LnGDP</i>	2.729735	-3.689194	-2.971853	-2.625121	Exist unit root
<i>LnX<sub>1</sub></i>	-0.151324	-3.653730	-2.957110	-2.617434	Exist unit root
<i>LnX<sub>2</sub></i>	1.833018	-3.670170	-2.963972	-2.621007	Exist unit root
<i>LnX<sub>3</sub></i>	0.901135	-3.699871	-2.976263	-2.627420	Exist unit root

Test results can be seen, the ADF of the four variables is greater than the 10% threshold, and therefore accept the null hypothesis that all variables are unit root non-stationary series. PP plot can also be visually observed, the variable upward trend in non-stationary series. Must be further observed first-order differential, to determine the possibility of a single whole, there is no need to carry out the cointegration analysis. Analyze each variable first-order differential stability analysis in Table 2.

**Table 2 The First-order Differential Variable Stationarity test**

Sequence	ADF test value	1% threshold	5% threshold	10% threshold	Conclusion
<i>LnGDP</i>	-2.819618	-3.661661	-2.960411	-2.619160	Don't Exist unit root
<i>LnX<sub>1</sub></i>	-6.749094	-3.661661	-2.960411	-2.619160	Don't Exist unit root
<i>LnX<sub>2</sub></i>	-3.669782	-3.670170	-2.963972	-2.621007	Don't Exist unit root
<i>LnX<sub>3</sub></i>	-5.249410	-3.689194	-2.971853	-2.625121	Don't Exist unit root

The first difference stationarity test explained the sequence of the first difference are stationary series, *LnGDP* first-order difference with 90 percent of the possibility is a smooth sequence, *LnX<sub>1</sub>* first difference with the 99 percent of the possibility is a smooth sequence, *LnX<sub>2</sub>* first order differential with 95 percent of the possibility is a smooth sequence, *LnX<sub>3</sub>* first order differential with 99 percent of the possibility is a smooth sequence, that is, each variable is a single integer, so you can cointegration test. EG two-step method to be tested, first constructed three regression equations:

$$LnGDP = C_i + \alpha_i LnX_i + \varepsilon_i, i=1,2,3; \tag{9}$$

Test residuals  $\varepsilon_i$  is a stationary sequence, they can determine the variables cointegration relationship between *LnGDP*, *LnX<sub>1</sub>*, *LnX<sub>2</sub>* and *LnX<sub>3</sub>*. The residuals of stationarity test results are shown in Table 3.

**Table 3 The Regression Residuals Stationary Test**

Sequence	ADF test value	1% threshold	5% threshold	10% threshold	Conclusion
$\varepsilon_1$	-3.765941	-3.670170	-2.963972	-2.621007	Don't Exist unit root
$\varepsilon_2$	-4.402012	-3.661661	-2.960411	-2.619160	Don't Exist unit root
$\varepsilon_3$	-3.660529	-3.661661	-2.960411	-2.619160	Don't Exist unit root

Residuals do not exist the unit root that is a stationary sequence on the table can be drawn, so can analyses further Granger causality test.

**3.3 Causality test**

Use Eviews to take on the 1978-2010 data, after logarithmic then Granger causality test, the lag period is selected as 1, the results are in table 4.

**Table 4 1978-2010 Variable Granger Causality Test**

H <sub>0</sub>	F-Value	P-value	Conclusion
<i>LnX<sub>1</sub></i> is not the <i>LnGDP</i> 's Granger cause	0.39981	0.5321	Do not reject
<i>LnGDP</i> is not the <i>LnX<sub>1</sub></i> 's Granger cause	12.9970	0.0012	Reject
<i>LnX<sub>2</sub></i> is not the <i>LnGDP</i> 's Granger cause	1.58637	0.2179	Do not reject
<i>LnGDP</i> is not the <i>LnX<sub>2</sub></i> 's Granger cause	4.03565	0.0539	Do not reject
<i>LnX<sub>3</sub></i> is not the <i>LnGDP</i> 's Granger cause	0.04738	0.8292	Do not reject
<i>LnGDP</i> is not the <i>LnX<sub>3</sub></i> 's Granger cause	0.97421	0.3318	Do not reject

Note: 5% significance level

Granger test results from Table 4, show that in the 5% significance level: the changes of China's gross domestic product (GDP) is the Granger cause of the primary industry growth, namely, raising the level of China's overall economic development can improve the first industry output value. However the increasing output value of primary industry is not the Granger cause to GDP growth, the growth of the primary industry has little effect on the level of national economic development; the secondary and tertiary increasing output value has no Granger causality between industrial output growth and GDP growth, significant interaction between the second and tertiary industries and economic growth does not exist. If the level is significantly increased to 10%, then GDP growth will be the second industrial growth Granger cause, the national economic growth can significantly promote the development of secondary industries.

The first two points in the above three conclusions are in line with the current economic structure and level of development. the actual situation in China is still in a period of industrialization, the proportion of primary industry decreased its industrial output value increased by more than rely on the economic development of the application of new technologies such as fertilizers, pesticides, seeds, mechanization, factory and product deep processing; and lower added value of primary industry, growth does not give the economy a larger role in promoting growth with the primary industry of national economic growth to be significantly lower than the national economy's impact on the growth of the primary industry. However, in current industrialization stage, growth of secondary industry should be the reasons for national economic growth. In the causality test, the secondary industry is Granger cause of GDP, should not be showing the opposite characteristics. We believe this is caused due to a longer time-series data, China has experienced 30 years of economic development, in terms of industry structure, market structure, development pattern, the current market compared to 1978 occurred a great change, resulting in data reflect distortion, it is necessary to segment analysis of the data, where the deepening of reform and opening up in 1992 as a dividing point, the time series data into the 1987-1991 and 1992-2010 years ago, following two were Grand Jay causality test analysis, tables 5 and 6.

(1)1978-1991 variable causality test

**Table 5 1978-1991 Variable Granger Causality Test**

$H_0$	F-Value	P-value	Conclusion
$LnX_1$ is not the $LnGDP$ 's Granger cause	4.30409	0.0648	Do not reject
$LnGDP$ is not the $LnX_1$ 's Granger cause	0.19114	0.6713	Do not reject
$LnX_2$ is not the $LnGDP$ 's Granger cause	20.8403	0.0010	Reject
$LnGDP$ is not the $LnX_2$ 's Granger cause	24.1142	0.0006	Reject
$LnX_3$ is not the $LnGDP$ 's Granger cause	0.80817	0.3898	Do not reject
$LnGDP$ is not the $LnX_3$ 's Granger cause	8.35038	0.0161	Reject

Note: 5% significance level

Be seen from Table 5, from 1978 to 1991, China's industrial structure and economic growth show a high correlation. Under the 5% significance level: there is no a significant Granger causality relationship between primary industry and GDP; the secondary industry and GDP are mutually reinforcing significantly, and the development of secondary industries can promote economic development, and national economic development but also in turn conducive to the development of secondary industry, this is mainly due to the stage in the reform and opening up Initially, the material needs of the national contradictions relative prominence of the industrial development of the economy into a powerful vitality, economic development of the national income increase is also beneficial to improve the purchasing power to buy industrial products, show both a high degree of mutual causality; GDP is the Granger cause to the development of tertiary industry, which is due to the reform and opening up before our individuals engaged in commercial activities, restrictions caused by the service sector development has lagged behind economic growth brought about by the reform and opening to expand the service needs towards the people, to promote the services sector development. Under 10% significance level, the primary industry is the GDP's Granger cause, which is the improvement of the gross national product due to the reform and opening up of China's agriculture accounted for up to one third, the improvement of agricultural output has a high role in promoting .the development.

(2)1992-2010 year variable causality test

**Table 6 1992-2010 Variable Granger Causality Test**

$H_0$	F-Value	P-value	Conclusion
$LnX_1$ is not the $LnGDP$ 's Granger cause	2.99420	0.1041	Do not reject
$LnGDP$ is not the $LnX_1$ 's Granger cause	8.20857	0.0118	Reject
$LnX_2$ is not the $LnGDP$ 's Granger cause	3.59742	0.0773	Do not reject
$LnGDP$ is not the $LnX_2$ 's Granger cause	6.86257	0.0193	Reject
$LnX_3$ is not the $LnGDP$ 's Granger cause	2.60032	0.1277	Do not reject
$LnGDP$ is not the $LnX_3$ 's Granger cause	0.01756	0.8963	Do not reject

Note: 5% significance level

It can be seen from Table 6, under the 5% significance level: the primary industry is not the GDP's Granger cause, but GDP is Granger cause of the first industry, that the national economic development to promote the development of the primary industry, is due to agriculture accounts for only about 10% of the national economy, this proportion is one-third of the reform and opening up, agriculture is no longer the highlight of the national economy, on the contrary the first industry relies more on national economic development to promote agricultural modernization and improve agricultural productivity; the secondary industry is not the GDP's Granger cause, but GDP is Granger cause of the secondary industry, the national economic development promote the development of secondary industry; the tertiary industry and GDP do not exist significant causal relationship. Significantly raise the level to 10%, secondary industry will be the GDP's Granger cause.

There are many reasons for these results, mainly due to China's regional economic differences and inequitable development. many developed eastern coastal cities such as Beijing, Shanghai of China, service industry has been as high as 70% or more, the service has entered the post-industrial era economic restructuring, the secondary industry is not the reason of GDP growth, GDP growth, in turn, will promote high-end industrial development. but central and western regions are still in the middle stage of industrialization, the second industry is still the main reason for GDP growth, which resulted in our whole secondary industry accounted for the dominant position of the national economy, but the end keeps the proportion of fluctuations in more than 45% rather than rapid growth, will show the growth of secondary industry is causes of GDP growth which is not obvious overall GDP growth.

Comparison with Table 6 and Table 5, the corresponding P-value of the causal relationship can be drawn: first, in the " $LnX_1$  is not the Granger cause of  $LnGDP$ ", the P values increased, in the " $LnGDP$  is not the Granger cause of  $LnX_1$ ", P was significantly lower, indicating that the first industrial development gradually don't promote economic development, but contrary the national economy development provide power to the first industrial development. second, in the " $LnX_2$  is not the Granger cause of  $LnGDP$ " and  $LnGDP$  is not Granger cause of  $LnX_2$ , the P values were increased, indicating that the secondary industry and the national economy is no longer close; in the " $LnX_3$  is not the Granger cause of  $LnGDP$ ", P value fell, P value of " $LnGDP$  is not Granger cause of  $LnX_1$ " significantly increased, explained the development of the national economy gradually is no longer the reason of the development of tertiary industry and the development of tertiary industry is gradually emerging role of national economic development. This is in line with the famous "Petty-Clark theorem" about the industrial structure of the thesis, namely: economic development, per capita income increased levels of national income and labor relative proportion of primary industry is gradually declining; the second industry of national income and the relative proportion of the labor force increased by further economic development, national income and labor relative proportion of tertiary industry also began to rise.

#### 4 Conclusion

This paper demonstrates that there are a kind of long-term stable equilibrium cointegration relationship between industrial structure and economic growth, the changes of industrial structure changes have a significant effect on economic growth, and this effect showed different characteristics in different stages of development, the current primary industry has entered the stage of development of economic feeding, the economic dominance of the secondary industry is changing, tertiary industry will gradually become the new engine of economic growth. But the secondary industry is still important reason for China's national economic growth, China has a vast territory, unbalanced regional development, should be actively promoted the coordinated development of regional economy, accelerate the industrialization process of the central and western regions, and promote the developed eastern

region to service-oriented economic restructuring, promote the development of modern manufacturing high-tech industries, in order to enhance the national economy quality.

# Research on the Cost and Benefit Management of Introducing High-Level Talents in University\*

Sun Xinqing, Cai Jianan, Sun Xiaoxi

School of Business and Economics, Zhongyuan University of Technology, Zhengzhou, P.R.China,  
450007

(E-mail: sxq@zzti.edu.cn, caijianan922@163.com, sunxinqing@126.com)

**Abstract:** With the coming of knowledge economy area and the change of colleges and universities development requests, talents have become the major force of competition among the universities. Many colleges neglects introducing high-level talents the input and output, do not consider their specific situation, the introduction of blind, high cost and do not bring the expected benefits. By analyzing the main contents of introducing high-level talents costs and the factors of influencing talent benefits, thereby to go deep in to the problems of influencing high-level talents costs and benefits, then put forward some measures to reduce cost and increase revenue.

**Key Words:** High-level talents; Introduce cost; Benefit; Countermeasure; Cost analysis

## 1 Introduction

The 21st century is the information and knowledge economics era. Since our country has joined WTO, the politics, economy, culture and other aspects should have more and more contracts with the other countries, so the competition of talents has becoming more intense. The competitions among countries have become into talents competitions gradually, so who owns talents has the dominant position in the competition, moreover the colleges and universities are the main place to cultivate high quality and high level talents. Therefore the training of qualified personnel has become very important to the universities. In addition the launch of science-education development strategy and the rapid development of science and technology not only to create opportunity, but also to bring challenges for the development of educational enterprise of university. In order to seize the opportunity and meet the challenge, colleges and universities have to strengthen training teaching staff and train more talents inevitably. But it is risky to introduce talents; the unquestioning introduction can't reach the purpose of introduction, but also waste the university resources, thus hinder the development of the colleges and universities. How to reduce the introduce cost and increase the benefits of introducing talents are the problems which must be solved in the process of introducing talents.

Developed countries to compete for overseas talents, formulate and revise the migration and study policy, for the overseas high-level talents resource into their open up the green channel, attract and accept many countries of human resources<sup>[1]</sup>. Talent introduce work or pay attention to in quantity and ignore the quality problem, high cost and low benefit to the policy of introducing talents and not promoting college's fast development. Based on the consideration not only pay attention to introduce talents when introducing this link, the most important is because of the cost of money will be the benefit of the introduction in combination, make a complete measures, give full pay to the resource advantages of high-level personnel.

## 2 The Cost Analysis of Introducing High-level Talents in University

### 2.1 The introduce cost of high-level talents in university

The high-level talents are point to have doctor's degree and associate professor title, and the experts or academic leaders who has influence in some areas<sup>[2]</sup>. The cost input of introducing high-level talents in university roughly includes recruitment costs, training education expenses and wage subsidies, concretely includes recruitment advertisement costs, entertainment expenses, travel expenses, transportation, the wages of introduce talents, allowance, scientific research allowance, relocation allowance, the costs of solving spouses' work and their children's schooling, the increase of training cost and so on<sup>[3]</sup>. The introduced high-level talents will most likely have professional knowledge and work experience, so they have cost less in the training education expenses. In order to make the introduced talents focus on their work and serve for the university for a long time, the university pay a lot of family

---

\*This paper is supported by the Soft Science Research Project of Henan Province (Research on the Introduce University High-level Talents and Management)(122400430023)

allowance, and also help solve the family problems, this part of cost occupy the larger proportion of the introduce cost, this is the important part of university to reduce the introduce cost.

**2.2 The Cost Analysis of introducing high-level talents**

**Table 1 the talent introduction cost specific amount of Zhongyuan University of technology**

Unit: Yuan

Cost Level Elem net	talent	academicians of the Chinese Academy of Sciences and Chinese Academy of Engineering	Provincial distinguished professor	school discipline distinguished professor	Doctor and graduate student(include postdoctoral)
residence, setting-in allowance		0	1040000	1040000	150000
job subsidies		0	120000	100000	0
Scientific research allowance		0	500000	100000	50000
Total		0	1660000	1240000	200000

Note: Because there are no academicians for the moment of Zhongyuan University of Technology, this cost is 0. We offer 130square meters housing for the provincial and university distinguished professor, according to current average price of 8000 per square meters in Zhengzhou of Henan Province. Because the recruitment and training cost and wages are all the same, they are not included in the list. In order to introduce the high-level talents, the university grants them to solve their spouses and children’s problems, while this hidden cost cannot be expressed as data, so it is not listed in this table.

It can be seen that the problems of input costs when the university introducing high-level talents:

(1) The input cost is more than the general types of talents. For introducing high-level talents some universities at all costs and regardless of the input costs. By offering the residence, setting-in allowance, job subsidies, scientific research allowance, resolving their spouses’ work and children’s school problems, these favorable conditions attract the high-level talents. The higher level, the more favorable policies, the highest of the university’s cost.

(2) The input cost mainly concentrates on the residence, setting-in allowance, job subsidies, scientific research allowance, resolving their spouses’ work and children’s school problems. And the highest is the setting-in allowance, the higher-level talents’ costs are higher. The cost of solving their spouse’s work and children’s school problem are not just money, but also low academic spouse, the university only solves these problems on themselves, and it reduces the overall quality of the university workers, this cost cannot measure it with figures.

**3 The Benefit Analysis of introducing high-level Talents in University**

**3.1 The Embodiment of Benefit of introducing high-level Talents**

Efficiency is a concept in economics, that is in order to pursuing a maximum profit the economic entity in the market, they take many times to increase production, there will be a difference between the benefits of every investment and the last benefits of investment, this difference is the efficiency. From the content the benefits of introducing high-level talents in university can be divided into social benefits (that is to increase the social status of university and improve the level of university) and economic benefits (that is to get the national project fund and attract more teachers and students); from the time length the benefits can be divided in to long-term benefit and short-term benefit.

**3.2 The Problems of Introducing High-level Talents Benefits**

On the one hand the benefits of introducing talents cannot be measured accurately. According to the scientific research and teaching to evaluate the benefits of introducing high-level talents in university. The university offers the relevant cost of scientific research when they introduce the high-level talents, and hope that they will give more results, and then improve the scientific research level and ability of the university. Through the teaching work the high-level talents will train high quality students, thereby improve the teaching quality and teaching level. But the university is different from enterprise, teachers’ labor have the ambiguity of labor time, the complexity of evaluation, the indirection and longevity of

value realization<sup>[4]</sup>. The cycle of value realization is long of introducing talents in university, it's hard to assess the stand or fall of introducing high-level talents' cost with the scientific research level and teaching level in a short time. On the other hand is the risk of introducing talents. The university uses the educational background as the criterion when they introduce the high-level talents, and this measure is lack of necessary skills tests. If they introduce some well-educated but the lower ability talents, it will make the university pay a heavy price, however, the university do not improve the scientific research level and teaching level, thus reduce the benefits of introducing talents.

#### 4 Results and Suggestions

In order to introduce high-level talents, the universities put the huge cost but ignore the benefits, and there is balance between the costs and benefits. Not only cause the wastes of resources but also not realized the purpose of introducing the high-level talents and it also hinders the development of the universities. So put forward some measures which reduce cost and increase profits:

1) It needs to introducing plan when to introduce high-level talents. The university costs big price when they introduce high-level talents, so they should not introduce without a purpose. Firstly, the university should break the experienced only, and should introduce the real talented core team leader. They can not only pay attention to the education, professional title and the number of published papers when they introducing talents, but to examine the comprehensive abilities, thereby introduce the talented and capable individuals, avoid influencing the quality of introduced talents and the quality of teaching, thus mislead and cause harm to the young men, finally it will affect the meritocratic quality of university and hamper the development of university. Secondly, its need to do the forecast analysis well and make the construction planning of teachers' team. According to the university's construction planning and the actual need, the university should center on their discipline construction, the university need to refine the number, quality, consist and levels of introducing talents, and then make the introduce planning which is predicted and also can reduce the cost.

2) When they introduce the talents, meanwhile, they should cultivate the internal talents, university should not pay attention to the "external" blindly, the internal talents are also the important force of their development. They need make full use of the knowledge of external talents, using external talents drive the internal and using the higher drive the lower, using the core drive the whole team, thus train the high-level talents of themselves. It should not only to expand the number of teachers' team and improve the malignant competition of introducing talents in university, but also to increase the overall level of teachers' team in university. Considering the long-term development of university, the enhancing of university's comprehensive strength can reduce the introduced talents in the future and the introducing cost of high-level talent.

3) The universities need to change the traditional introduce model and construct the diversified introduce model. On one hand it can change all talent the management mode, it has been found that: the highest cost is cultivating talents but not using them, then is cultivating and using them, the lowest cost is using the talents, but not cultivating them<sup>[5]</sup>. For the purpose of introducing talents the university should build the free flow of talent mode and also build cooperation relationship. The "ownership" has turned into "right to use" which can solve the difficult of introducing talents and realize the sharing of talents resources, and then reduce the cost of introducing talents. On the other hand, the universities may establish university alliance and promote the communication and cooperation of teachers among the adjacent universities, making the union university shared the cost of introducing talents and reducing the cost of introducing talents greatly.

4) Open a green channel and the appropriate policy tilt, communicating with the local government, adopting appropriate policy tilt aim at high-tech talents. The university should negotiate with the government and offer the corresponding preferential policies when the government introduce high-level talents, for example give certain subsidies and acquire the pro-gaze of high-level talents, thus part of introducing high-level talents' costs paid by the government, and then reduce the introduce costs of university.

#### 5 Conclusion

Through the specific analysis of introduce cost content, find the important factors of influencing the introduce costs and benefits. According to the problems the university should put forward measures to reduce the costs and increase the benefits; the university should also make the more reasonable human resource plan and policy. Making the high-level talents which introduced by universities play a

better role, promote the strength, managerial level and the rapid development of university. But the article for the benefit of the talents without an accurate quantitative evaluation method, the future will have to solve how to measure benefit and improved fundamentally introduction of high-level personnel benefits.

(Email: whicudaifang@126.com, mr.samnang@yahoo.com, yuanguohua93@yahoo.com.cn, wutxhb@163.com)

**Abstract:** Sales promotion as one of the key factors in promotional mix has been in constant growth since the 1960's for marketing luxury products in emerging economy. To provide a better understanding about how sales promotion helps Hennessy increase sales in Cambodia, a qualitative approach of case study was used to interview with consumers of Hennessy in Cambodia as a primary data collection tool. The findings indicate that the company has successfully used sales promotion such as Contest, Sweepstakes, premium, sampling, trade allowances, free merchandise, and so on for Hennessy in the Cambodian market. The focus, however, is not always on using sales tools to generate sales, but to improve relationships.

**Key words:** Sales Promotion; Luxury Products; Emerging Economy

### 1 Introduction

Promotion as one of the key factors in the marketing mix and has a key role in market success, which can be used to ensure the awareness of a luxury product in an emerging economy. The promotional mix is the combination of the different tools that can be used to convey appealing message to the customers. The tools can be advertising, direct marketing, public relations, personal selling, and sales promotion<sup>[1]</sup>. Among which, sales promotion consists of short-term incentives to encourage purchase or sales of a product or service, whereas advertising offers reasons to buy a product or service but sales promotion offers reasons to buy now<sup>[2]</sup>. Over the past two decades the popularity of sales promotion has been increasing. Two reasons for this increased popularity are undoubtedly related with the increased pressure on performance based on short-term results and the emergence of new purchase tracking technology.

The luxury goods industry is unique because it heavily relies on aggressive marketing and promotion to sell products to a specified group of people. Businesses that involved in marketing of luxury products use careful planning and implementation of sales promotional tools to generate business lead, stimulate purchase, reward customers and motivate sales people. Although the luxury market has been increasing greatly over the last decade and the marketing literature has recently seen substantial interest in the study of luxury brands, little is known about how best to market and monitor luxury brands<sup>[3]</sup>.

Figure 1 Market Share of Hennessy X.O in Cambodia in 2008

Cambodia is a developing country, so the income of Cambodian’s people increases from day to day. Hennessy is one of luxury products which people have known that its quality is very good and popularity, but the price is relatively higher than the other local wine products. Consumption of Hennessy has increased in Cambodia in recent years. As luxury goods, Hennessy products are also goods for which demand increases relatively more than income increases. Luxury goods therefore have high income elasticity of demand.[<sup>4</sup>]

By using the marketing of Hennessy product as a yardstick, this study aims to gain a better understanding about how sales promotions impact on the sales of luxury products for the consumer market in an emerging economy like Cambodia. In Cambodia, consumers of Hennessy are mostly high income and high class people, who are mainly targeted by Attwood Import Export Co., Ltd in Cambodia market.

**2 Research Methodologies**

**2.1 Source of data**

For the purpose of this study primary and secondary data are important. Primary and secondary data are collected by using various tools and techniques. Primary data are collected through questionnaire, interview with Hennessy consumers in Phnom Penh city, interview and discussion with the marketing manager and marketing staff of Attwood Import Export Co.; Ltd, observation and survey on Hennessy market situation in Cambodia. Secondary data are collected from Attwood Import Export Co.; Ltd, internet and some documents from the libraries at the Universities, and statistical data released by government of Cambodia.

**2.2 Sample selection**

The target population for this research is consumers who bought and drank Hennessy. Among 120 consumers are selected for in-depth interview and questionnaire survey, from which interview 100 completed and valid questionnaires are collected for data analysis in this research.

**3 Data Analysis**

**3.1 Consumption habits**

From the collected data we find out that among 100 respondents 26% are between 26 and 33 years old, and 25 are between 18 and 25. The most frequent drinkers are quite young but for a brand for elder generation, the reason could be understood as their fans for adventure and/or richness from their parents. The frequency for drinking can be grouped from the data as 46% under 1 time per month, 38% between 2-5 times per month, and 16% over 6 times per month.

As to their occupation 40% work in private company, more than 27% in government, 17% as exploiter, 13% as student and 3% at NGO . The consumers normally drink at club (bar), karaoke, and special occasion. Some consumers buy Hennessy as gift for some special person during the special day. Most of Hennessy’s consumers are living in town and city.

According to Table 1 it can be found that 63% respondents prefer to drink Hennessy for some special party rather than a habitual drinking.

**Table 1 Drinking Occasion**

Kind of Party	Number of Consumer	Percentage %
Wedding	14	14%
New House	01	01%
Birthday	05	05%
Meet with Friends	17	17%
Special Party	63	63%
Total	100	100%

**3.2 Preference for advertisement medium**

**Table 2 Advertisement System Consumers Like**

Advertisement System	Number of Consumer	Percentage %
Newspaper	11	11%
Magazine	07	07%
Radio	05	05%
TV	33	33%
Internet	08	08%
Banner	34	34%
Leaflet	02	02%
Total	100	100%

According to Table 2 we find that 34% respondents are attracted by advertisement of sales promotion on banner and 33% by advertisement on TV, 11% by advertisement on newspaper 11%, 8% by advertisement on internet, 7% by advertisement on magazine, 5% by advertisement on radio, and 2% by advertisement on leaflet.

**Table 3 Ranking of Sales Promotion Tools**

Sales Promotion Tools	Number of Consumer	Percentage %
Coupons	29	29%
Sweepstakes	17	17%
Rebates	14	14%
Contests	04	04%
Deals	11	11%
Premiums	22	22%
Sampling	03	03%
Total	100	100%

From Table 3 we also find that 29% respondents prefer to receive coupons, 22% respondents to receive premium. From Table 4 we find out that 28% respondents expect immediate discount from the dealer or Hennessy, 25% expect free samples, 22% welcome repetition of advertisement.

**Table 4 Consumers' Suggestion for Attwood Company about Hennessy**

Consumer Proposal	Number of Consumer	Percentage %
Discount	28	28%
Sweepstakes	06	06%
Increase Advertising	22	22%
Coupon	19	19%
Free Goods	25	25%
Total	100	100%

## 4 Conclusions

Sales promotion is very important for Hennessy to increase sales in Cambodia. Sales promotion tools can be used either as a push strategy towards dealers or as pull strategy towards end consumers. Though Hennessy is a popular brand with international fame, it's still difficult to sell more in Cambodian market if without proper sales promotion. Such a high price is the weakness for Hennessy to compete against their competitors in the market. This is why the marketing managers have decided to frequently use promotion tools to attract more consumers to buy Hennessy. The company has successfully to use sales promotion for Hennessy in the Cambodian market. These sales promotion tools such as Contest, Sweepstakes, premium, sampling, trade allowances, free merchandise, and so on.

This research has shown that sales promotion is not only important for creating short term sales increase, it is also an important tool for creating and maintaining market relationships. Therefore it is

very important for the manager not only to use sale promotion as a buying incitement for the customer, he should also use it for relationship creating and maintaining.

## Discusses on Performance Budget Evaluation System\*

Zeng Zhihong, Zhang Youtang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 82242948@qq.com)

**Abstract:** Performance budget evaluation is an important management innovation in the field of finance, but there are many difficult problems in practice. It is necessary to study how to design performance budget index system, methodology and so on. This paper analyses the connotation of performance budget evaluation system, puts up principles of performance budget evaluation system. On the base of it, this paper designs university performance evaluation system and evaluation index system. Finally this paper makes some suggestions how to carry it into practice.

**Key words:** university, performance budget evaluation, index system

### 1 Introduction

High school is an education agency to cultivate training talent, provide scientific research and social service. As a scarce social resource, it is important to make research in all countries how governments configure resource effectively. Performance budget evaluation is an important innovation in financial field. It can solve the problems who spend more effectively and whether money is spent worthlessly. Through performance budget evaluation, government can configure resource more effectively and optimize the allocation of resources. It is also be helpful for universities to set reasonable strategic target and develop better. So the budget performance evaluation is the direction of research in many countries. Since the 1980s, foreign countries began to study university performance budget evaluation. Our country put forward to establishing performance budget evaluation system at the Third Plenum of the 16th Central Committee of the CPC.

But there are many problems in implementation process of budget performance evaluation. It is very difficult to design performance index. Ma Guoxian, a professor in Shanghai University of Finance and Economics, said it is worldwide "performance indicators difficult problem". It is also difficulty to establish performance evaluation method and to carry out in practice. All these problems are needed to be studied and solved.

### 2 Connotation of Performance Budget Evaluation System

Performance budget evaluation is that government and financial department use performance index to make objective and fair evaluation and appraisal on performance of public spending.

The university performance budget evaluation system is a dynamic cycle system. On the base of strategic planning, universities set up budget performance target, decompose target, draw up budget and return to performance targets and strategic planning through performance evaluation.

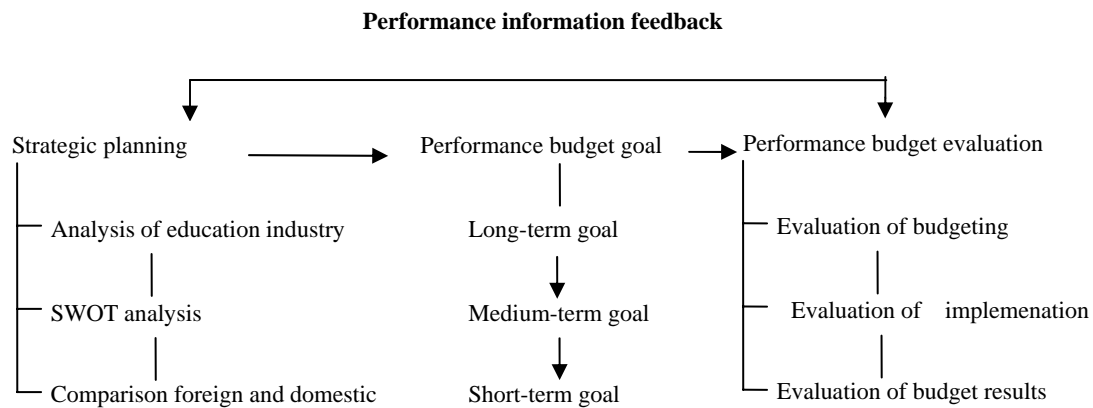

The system of performance budget evaluation contains three contents. One is goal evaluation, which is to evaluate strategic planning, rationality and feasibility of performance target and so on. The second is budget evaluation, which is to evaluate budgeting, budget execution, budget implementation evaluation. The third contents is results and impact evaluation, which is to evaluate result and continuous influence.

The main steps contain: 1) to set up strategic planning; 2) to set up budget performance strategic goal of universities, which includes long-term performance goal(five-ten years) and annual performance goal and establishes the relationship between budget requirements and performance goal. 3)to evaluate budgeting, budget implementation, budget implementation results at the end of financial year.4)to adjust strategic planning and performance goals according to the feedback.

The performance budget evaluation system of university is shown in figure 1.

---

\* This paper is supported by project 'Innovation of university performance budget evaluation model' (Project approval number: 10YAZH128) funded by Social Science Foundation of Ministry of Education Research China

**Figure 1 The Performance Budget Evaluation System**

### 3 Design Principles of Performance Budget Evaluation System

#### 3.1 Economic benefit and Social public benefit

Higher education investment has not only economic benefit but also public benefit. These should be considered in performance evaluation of higher education, such as graduate employment rate, scientific research achievements conversion rate, ecological environment and so on.

#### 3.2 Individual and Integrity

With the increasing popularity of higher education, universities display diverse trend. There are deployment universities and local universities, private universities and public universities, "State 211 Project" and "State 985 Project", etc. We couldn't evaluate different universities using the same performance budget evaluation system. It should include general index and special index in university performance budget evaluation system.

#### 3.3 Comprehensive and Importance

An integrity performance budget evaluation system should include the whole process of budgeting, budget implementation and budget implementation results. But designed index couldn't include every aspect and should be emphasis on some aspects.

#### 3.4 Scientific and Feasible

The performance evaluation system should objectively reflect university current situation. The indexes should not only be independence but also be linked. In designing index, we should consider not only the purpose and needs of research but also the possibility of objective conditions. The date in index could be obtained from existing financial information and be simplified as far as possible.

#### 3.5 Timeliness and Sustainability

According to university performance evaluation, we can evaluate university current situation and find problems in time so we can correct timely to reduce loss. Timeliness is very important to university. In addition to timeliness, the evaluation system should be sustainability. Longer the evaluation time is, more obvious the performance tread is. It could help university to set long-term goal and avoid opportunism.

#### 3.6 Conclusive and Orientation

The performance evaluation is not simple evaluations of the result of budgetary revenues and expenditures. The more importance is to evaluate effect of resource allocation, which could help universities comprehensively understand its condition, analyze subjective and objective factors and optimize allocation of resources to promote the development.

### 4 Designing University Performance Evaluation System

#### 4.1 University strategic planning

Universities should make clear mission according to its function. On the base of it, each department establishes its strategic planning through the long-term strategic planning. According to SWOT, universities identify their own competitive advantage, opportunities and threats to combine strategic planning with internal and external environment.

The analysis of university strategic planning is shown in figure 2:

<p>Strength--S Hardware facilities is improved; Teachers' quality is high; Adapting to social development; Public relation is good; .....</p>	<p>Weakness—W Lack of core competitiveness; Mechanism is not flexible; The contradiction of talent supply and demand is prominent; .....</p>
<p>Opportunity—O The demand of high level talented person is increasing; Higher education needs of people is increasing; National policy encouragement; school-aged population is huge; ...</p>	<p>Threat—T Overseas training and all kinds of nonacademic education is rising; High quality education resources is shortage; Market and technological environment bring a lot of challenges ;</p>

**Figure 2 SWOT Analyse of University Strategic Planning**

**4.2 University performance budget goal**

On the base of strategic planning, universities set up long-term performance budget goal and annual budget.

**4.3 Designing performance budget evaluation system index**

This paper selects some representative index and design performance budget evaluation system through Analytic Hierarchy Process, (“ AHP” for short). The index system is divided into three levels. The fist level contains teaching performance evaluation index, scientific research performance evaluation index, and financial management performance evaluation index. Each level contains some index and shown in table 1.

**Table 1 University Performance Budget Evaluation Index**

Level 1 index	Level 2 index	Level 3 index	Calculation method
Teaching performance evaluation index	Teaching expenditure index	Teacher-student ratio	equivalent students/teachers
		Students' average teaching expenditure	Education expenditure/equivalent full-time students
		Students' average book cost(including electronic books)	Book cost/ equivalent full-time students
		Students' average practice expenditure	practice expenditure/equivalent full-time students
		Students' average teaching space index	teaching space / equivalent full-time students
		Students' average teaching and scientific research instrument equipment cost index	teaching and scientific research instrument equipment cost / equivalent full-time students
	Teaching quality index	National excellent Doctoral dissertation ratio	Number of National Excellent Doctoral Dissertation / PhD Candidate
		National level excellent course ratio	Number of national level excellent course / undergraduate students per thousand
		National outstanding textbook ratio	Number of national outstanding textbook ratio / undergraduate students per thousand
		National outstanding achievement award ratio	Number of national outstanding achievement award ratio / undergraduate students per thousand
Scientific research performance evaluation index	Research ability index	Teachers' average research project ratio	Number of research projects/ teaching and research staff
		Number of national project	Number of 973/986/national project/project supported by NSFC.....
		National project amount	Amount of 973/986/national project/project supported by NSFC.....
		National project ratio	Number of national projects/number of scientific research project
		National project amount ratio	National project amount/scientific research project amount

		National research platform	National laboratory/national key laboratory/national engineering center/defense laboratory/national humanities and social science lab
	Scientific research achievements index	High level paper ratio	EI papers/teaching and research staff
		Cited papers ratio	SCI cited papers/ teaching and research staff
		Invention patent ratio	Number of invention patents / teaching and research staff
		scientific research monograph numbers ratio	scientific research monograph numbers / teaching and research staff
		teachers' average papers published in foreign academic journals	papers published in foreign academic journals / teaching and research staff
Financial management performance evaluation index	Financing index	Self-raised funds ratio	self-raised funds /gross income
	Budgeting index	Budget completion rate	Actual expenditure/budget expenditure
		Special funds Budget completion rate	Actual expenditure of special funds /budget expenditure of special funds
		Zero-balance accounts completion rate	Actual expenditure of zero-balance accounts /budget expenditure of zero-balance accounts
		Supplementary budget for expenditure ratio	special funds supplementary budget expenditure / special funds budget expenditure
	Financial regulations index	Financial management system	
		Performance of financial management system	
		Internal control system	
	Financial situation index	Assets liabilities ratio	Gross liabilities /gross assets
		Year-end balance	Total revenues-total expenses
		Education for appropriate ratio	Education for appropriate / total revenues
		Scientific research for appropriate ratio	Scientific research for appropriate / total revenues
		Education income ratio	Education income / total revenues
		Research income ratio	Research income / total revenues
		Basic expenditure ratio	Basic expenditure / total expenses
		project expenditure ratio	project expenditure / total expenses
		Wages and welfare expenses ratio	Wages and welfare expenses / total expenses
		Spending on goods and services ratio	Spending on goods and services / total expenses
		personal and family allowances ratio	personal and family allowances/ total expenses
		Other capital expenditure ratio	Other capital expenditure/ total expenses
rate of return on investment		Investment income/investment	
Foreign investment index	Alumni donation amount		
Social benefits performance evaluation index	Reputation index	Alumni donation ratio	Donation number / Effective number of alumni
		Employment rate	The employment of students / Graduate students
	Employment index		

#### **4.4 Method of university performance budget evaluation**

This paper briefly designs the performance evaluation index system of university. Furthermore, we need to use scientific evaluation method to evaluate results. There are some common methods such as the comprehensive evaluation method, layer analytical method, and fuzzy comprehensive evaluation method, Program Assessment Rating Tool (“PART” for short) and so on. It is needed to be further studied.

### **5 Conclusion**

University budget performance evaluation is not an independent system, it needs corresponding environment and institutional support. The performance budget evaluation of university still face many difficulties in implementation, we still need to take the following measures to ensure the smooth implementation of university budget performance evaluation.

#### **5.1 To strengthen the relevant system construction**

Budget performance evaluation demands that university being evaluated provides related foundation information and relevant materials. In order to avoid providing false report, government must make the budget systematized and legislated, and formulate relevant systems and laws. All of evaluation content, index, time and methods should be informed to various universities. Governments appeal to universities to take an active part in it, making sure the budget and performance evaluation is carried out in practice.

At the same time we must build a corresponding system of awards and penalizations. The reward must be clear and distinct to ensure university budget performance evaluation work into effect.

#### **5.2 Reform University accounting system**

Current financial accounting of university still executes on cash basis. It can't really reflect the true financial condition. Infrastructure financial is accounted for separately, which bring about accounting subject of universities with two sets of accounting system. It will affect some index effect. So universities should reform accounting system as soon as possible, execute on accrual basis and establish the restraint system, incentive system and reporting system of performance budget management.

#### **5.3 Full participation**

The performance budget evaluation of university is not only related with school. It includes faculty performance evaluation, individual performance evaluation. So universities should mobilize all people enthusiasm.

#### **5.4 To strengthen the information construction**

University budget performance evaluation needs a number of based data to establish and perfect information system. Information construction is a basic work of budget performance evaluation, which can not only improve the work efficiency but also transparency. It can also create a fair information symmetry and justice environment.

#### **5.5 To strengthen the team building**

Performance evaluation is a very professional job. Participants must have certain knowledge and professional quality. It is important to strengthen the team building. First, it needs a group of researchers to design the budget performance evaluation system and find out countermeasures in the actual work. Second, it needs a group of talent with both theory knowledge and organization ability. Intermediary organizations can participate in this process. Finally, it needs universal education about university performance budget evaluation concept and knowledge to let all people take part in.

## Internationalization of RMB: Benefits, Constraints and Proposals

Argelia Munoz Pahuamba, Abdoulaye Oury Bah, Ye Jianmu  
School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: argmuz@gmail.com, bahgio2008@hotmail.com, jianmuye@yahoo.com.cn)

**Abstract:** With the acceleration of global economic integration process and the rapid development of China in the world economy, the issue of RMB internationalization has gradually become the hot topic in the academic research field. The aim seems only too logical; that the second biggest economy in the world wants to promote its currency is perfectly understandable. Whether China wants to play a bigger role in the International Political Economy (IPE), it needs greater autonomy in international monetary affairs, and what better way to achieve this than to use its own currency in international transactions. The principal aims of this article is to provide a brief of how far has China gone on the internationalization of its currency, the RMB, to identify the main benefits, point the main constraints and finally the proposals that this process entails. At present the RMB is not used internationally yet, the RMB internationalization will signify a New Era of rapid growth in China's trade and investment links with the world.

**Key words:** RMB Internationalization; Benefits; Constraints; Proposals

### 1 Introduction

China is the world's second largest economy after the United States. It is the world's fastest-growing major economy, with average growth rates of 10% for the past 30 years. China is also the largest exporter and second largest importer of goods in the world. For 2010, inbound foreign direct investment into China surpassed \$100bn for the first time, and investment overseas by Chinese companies in non-financial sectors totaled \$59 billion. The country's per capita GDP (PPP) is \$7,518 (IMF, 93rd in the world) in 2010.

In the aftermath of the global financial crisis (2007-2008), the Chinese Government has started a policy of promoting the internationalization of its currency, the RMB, also known popularly as the Yuan. The crisis showed policymakers in Beijing how overly dependent China export industry is on the use of the dollar as the currency of settlement in international transactions. To avoid this, policymakers in Beijing have decided to promote the use of the RMB in international trade. Since the global financial crisis China has developed a multi-phase and multi-track strategy to make the RMB a reserve currency a la par to the dollar and the euro. In 2000 the RMB circulation in neighboring countries and regions, the expansion of China's WTO accession process and promote China-ASEAN Free Trade Area the internationalization of the RMB rise to national decision-making and domestic attention from theorists.

The aim seems only too logical; that the second biggest economy in the world wants to promote its currency is perfectly understandable. Whether China wants to play a bigger role in the International Political Economy (IPE), it needs greater autonomy in international monetary affairs, and what better way to achieve this than to use its own currency in international transactions. As Charles Kindleberger argued, "a country's exchange rate is more than a number. It is an emblem of its importance to the world, a sort of international status symbol". Similarly, Robert Mundell declared that "great powers have great currencies" (Kirshner 2003:15, both quotes). Hence, if China aspires to become a great power in the foreseeable future, it needs to raise the profile of its currency. Nevertheless, this is easier said than done, making ones currency global is certainly not an easy task.

China has some of the surrounding residents as a medium of exchange and RMB means extensive use of the BIS, which is based on China's economy strong and steady growth, and brought by the economic strength and strong stability of the RMB. The RMB in neighboring countries and regions, a large number of circulations, it is the result of market needs and choices, vote for China's development is a 'vote of confidence. "Although the circulation of RMB outside does not mean that the RMB has been internationalized, the RMB in circulation outside the combined with the relevant policies of supporting the expansion would lead to the internationalization of the RMB.

By speaking about the origin and basic concept of the internationalization of the RMB, Tse Yung-hoi, deputy chief executive of BOC International and president of the Chinese Securities Association of Hong Kong, first give it a definition, means taking the RMB outside of China and allowing nonresidents to hold the RMB extensively overseas and use it as a currency for routine payments, settlements, investments, and reserves. The process of internationalization of RMB benefits,

constraints and proposals is a problem of this article.

## 2 Benefits of RMB Internationalization

The potential benefits of internationalization of the RMB are obvious. First, it would reduce the exchange rate risk facing Chinese firms: (i) internationalization of the RMB means that more foreign trade and financial transactions would be invoiced and settled in the RMB, hence the exchange rate risk for Chinese firms would be reduced accordingly, although demand risk would remain; (ii) the increase in the weight of RMB-denominated assets in financial institutions would reduce the impact of foreign exchange risk in the computation of the BIS capital adequacy requirements; (iii) the risks associated with foreign currency denominated funds would also be reduced; and (iv) an internationalized RMB would make it possible to tackle the problem of “original sin” which many emerging economies have to live with.

Second, the internationalization of the RMB would improve the funding efficiency of Chinese financial institutions, thereby greatly increasing their international competitiveness, because they would enjoy the advantage of having easier access to the vast pool of RMB assets. That competitiveness would, in turn, promote the expansion of China’s financial service sector. Although internationalization of the RMB is not a necessary condition for establishing a financial centre in China, it would greatly help the Endeavour.

Third, internationalization of the RMB could boost cross-border transactions: (i) the cross-border flows of the RMB brought about by real economic activities such as cross-border trade and travel could provide an effective settlement method in bilateral transactions; and (ii) it could also enlarge bilateral trade and economic cooperation and promote the economic development of frontier regions inhabited by minority nationalities.

Fourth, internationalization of the RMB means that the RMB would be held by non-residents, which would allow the Chinese monetary authority to collect seigniorage from the rest of world. Seigniorage is the margin between the denomination of the notes and the cost of issuing the notes obtained by the note issuer. Issuing a world currency is equivalent to levying seigniorage on other countries. Although China does not have the goal of collecting seigniorage at some point in the future, the internationalization of the RMB could at least offset, to some degree, the seigniorage that China has to pay to the United States.

Lastly, internationalization of the RMB could help China to preserve the value of its foreign exchange reserves. China is the biggest holder of foreign exchange reserves in the world. However, all its foreign exchange reserves are denominated in foreign reserve currencies, of which more than 70% in the US dollar. If China’s claims on the United States were denominated in the RMB, China would not need to worry about the possibility of suffering huge capital losses on its foreign exchange reserves as a result of the US government’s debasing of the US dollar. Currently, because the United States owes China more than USD 1 trillion in US dollar-denominated debt, it can easily inflate away its debt burden. China is at the mercy of the United States.

### 2.1 Comprehensive analysis of the benefits of the RMB Internationalization

#### 1) Help enterprises avoid exchange rate risks and promote development of foreign trade

In international trade and investment activities will be reduced by the use of RMB exchange rate risk, and promote China's international trade and investment. The rapid development of foreign trade, foreign trade enterprises hold large amounts of foreign currency claims and liabilities. Higher risk due to currency exposure, exchange rate fluctuations will have business impact. Internationalization of the RMB, the foreign trade and investment can be denominated in national currency and settlement risks faced by the enterprises will follow reduce the exchange rate, which could further promote China's foreign trade and investment.

#### 2) Reduce the demand for foreign exchange reserves to maintain financial security

As the RMB non-convertible currency, import and export enterprises in China and other activities basically have to use the dollar, euro and Japanese yen and other key currencies, in order to maintain the RMB exchange rate stability, foreign payments to meet the needs of China must hold a certain amount of foreign exchange reserves to intervene in financial markets, to ensure the payment of foreign trade and investment activities. If the RMB as an international currency, the Yuan can be used for external payments, the RMB issue is China's monetary authorities can control, and then to a certain extent can reduce the amount of foreign exchange reserves holdings.

#### 3) Reducing the pressure of RMB appreciation eases the situation of excess liquidity in China

Since 2002, China's international balance of payments surplus for years, the appreciation of the RMB has been facing pressure because basically China's balance of payments surplus held in the form of foreign exchange in case of appreciation of the RMB, within the body tend to hold foreign exchange choose foreign exchange, foreign exchange to some extent exacerbated the situation of excess liquidity. If the RMB an international currency, domestic enterprises can payment RMB, while the RMB can be used as foreign investment, foreign currency loans and other countries reserve currency, the RMB by other countries to absorb liquidity, not only can reduce the pressure of RMB appreciation, but also help ease the situation of excess liquidity.

4) To obtain international seigniorage income

Seigniorage refers to the issuer by virtue of the privilege of issuing currency notes received and issued notes denominated in the difference between the cost issues. In its issue of notes, taken from the country should be used on their own, and issuing international currency is equivalent to levy seigniorage from other countries, such income is basically no cost.

5) The RMB has become an important international currency will change the pattern of the International Monetary System.

Internationalization of the RMB will not only help change the current international monetary system, increase the reserve currency of competition and restraint mechanisms, will help stabilize the global financial system. China as a developing country, its legal currency - the RMB as an international currency, will change the pattern of the international monetary system, making the developed countries dominate the world economic and financial situation change. The RMB as an international currency, international monetary system will gain a place in developing countries, is conducive to safeguarding the interests of developing countries.

6) To improve China's global influence of macroeconomic policy and international affairs, the right to speak.

The RMB as an international currency, will make China's exchange rate policy more international, and may result in some developing countries to peg the RMB's exchange rate policy. These are both the exchange rate of China's monetary authorities to control the level of ability and test of the international community on China's political and economic power of recognition. Internationalization of the RMB, China's macro-economic policy-making will also cause some other countries, the external economic development impact; with other countries on macroeconomic policy coordination is a must. Meanwhile, the internationalization of the RMB, China will assume certain tasks of international financial stability, when the international financial markets under attack, the Chinese have a large image of the country there, if necessary, should serve as a regional lender of last resort role, which will help improve China's international influence.

7) To promote China's financial institutions and international financial markets

As the Chinese financial institutions to conduct RMB business advantages, if the RMB internationalization, the outside of RMB loans, settlement demands, which will help Chinese financial institutions to "go out" to promote Chinese-funded financial institutions an international scale. In addition, foreign investment of RMB funds it needs a place, thus allowing the RMB back to foreign markets is China's financial system design and the practical needs of the integration point, the return of non-resident holders of RMB investment will promote China's financial market liberalization and internationalization.

### **3 Constraints of RMB Internationalization**

Currently the RMB in the international monetary system's status with China in the international community's political and economic status did not match, the RMB is not convertible for capital projects, not the international community generally accepted currency, many domestic scholars have called on the government should take active measures process of internationalization of the RMB but the internationalization of the RMB is not a consultation and on, but a gradual and dynamic process, the RMB's rising national credit process, because other countries and the increasing demand for the RMB to be satisfied in the process. From the current domestic situation, the internationalization of RMB in its infancy, there was a not only favorable condition; the future must face many challenges and risks.

From the actual conditions of the RMB and external environment analysis, the RMB as an international currency will be the trend of historical development, however, the RMB as an international currency obstacles remain, from the current situation analysis, the internationalization of RMB is still on the road there are many negative factors:

### **3.1 RMB capital project is not yet fully convertible**

The RMB to achieve the international, the fundamental requirement is the RMB fully convertible under the capital account, which allows freedom of Chinese citizens and businesses will be converted to other currencies, the RMB, non-residents can freely convert foreign currency into RMB. Because, holding a can not freely convertible currency at higher risk, thus holding costs are high, competition is bound in the money at a disadvantage, it is difficult to become an international community generally accepted international currency.

#### 1) RMB non-residents to obtain a narrow channel

According to "cross-border trade in RMB clearing pilot management" and its Implementing Rules and Regulations, the RMB settlement of cross-border trade under, foreign agents can set up foreign exchange correspondent accounts in foreign ways BEDDING funds, or by other means from the financial account RMB domestic bank financing.

#### 2) The inertia of transaction payment habits

Over the years, developed an international selection of international trade between the exporting country's currency is denominated settlement of trade between developing and developed countries generally use the advanced settlement of international currencies, payment of such transactions has become a habit, if the change this payment habits takes time, so there is bound to the RMB settlement of the growing acceptance of the process.

#### 3) Non-residents the lack of use of the RMB channels

RMB non-residents to obtain or hold cash, or used in the pilot cities to buy Chinese goods, the lack of use of other channels, and converted into other freely convertible currency higher costs, which to some extent, affected by non-residents willingness to hold the RMB

### **3.2 The spread between the RMB and foreign currency and RMB strong currency situation negatively affected the non-residents**

For a long period of time, the RMB appreciation trend of reducing the non-resident demand for RMB liabilities, non-residents by increasing the outflow of liabilities means there are certain difficulties for RMB. From a financial point of view of cost, people are always willing to reduce hard currency debt, increase hard currency assets, while the state of the RMB in a strong currency, China's foreign loans or foreign institutions to issue RMB bonds and other ways to increase the output of non-resident liabilities of RMB difficult, because, liabilities to non-resident holders of RMB revaluation losses suffered.

In the process of internationalization of the RMB, but also facing this problem, namely RMB assets attractive to non-residents, but has rarely been interested RMB liabilities, because the borrower may face due to the appreciation of the RMB exchange rate risk. To obtain more foreign enterprises is RMB funds obtained from the first Chinese exports of RMB funds, then people with money to pay for Chinese imports, the income and expenditure for the period, there is a need to invest RMB assets in the market.

#### 1) The lack of response for non-residents of RMB exchange rate risk of financial instruments

People's Bank of China and the Administration of Foreign Exchange issued to allow domestic institutions to handle the exchange rate swaps and other hedging long-term financial transactions are for the residents, rather than a lack of positions held by residents of the RMB exchange rate hedging instruments, the RMB in the case of a strong currency non-resident holders of debt and lack of RMB revenue in the future to return the RMB to purchase foreign exchange liabilities, exchange rate risk clearly exists, therefore, outside the NDF products have to survive.

#### 2) RMB Internationalization may lead to the exclusion of even the developed countries jointly resist

China has been achieved with the Western powers international currency, there was not only ideological differences, but also there is conflict of economic interests, the United States will not easily give up the dollar hegemony, with Japan, the United Kingdom formed the political and economic alliance and the euro area countries will maintain the vested interests and established the pattern, is likely to take measures to stop the process of internationalization of the RMB. In addition, the International Monetary Fund (IMF) initiative by the United States control, the United States can not easily give up the dollar in international currency status, the adoption of the proposed super-sovereign reserve currency. Russia, India and other emerging market economies have their own interests, but also urged the free convertibility of their currencies and international currency, the RMB internationalization must exist between certain conflicts of interest and cooperation.

#### 3) Opening up China lacks a certain breadth and depth of financial markets

The internationalization of RMB regionalization of RMB output area is a surplus countries of China, China's exports to these countries receive the RMB, while the value of the RMB relative stability

of the RMB assets are attractive, the key is China can provide a suitable offshore RMB back channels and invest. China's financial market is currently open only by QFH form, QFH total degree is only \$ 30 billion, and QFII not mind the return of funds outside the channels of the RMB. In addition, China's financial markets and limited government bonds and financial bonds, the balance of the term structure of the unreasonable high short-term debt security bond amount is limited, the lack of a certain breadth and depth of financial markets is not conducive to investment in domestic outflow of RMB bond market way back.

### **3.3 Implication for monetary policy as the risk of RMB Internationalization**

The policy implications of internationalization of the RMB are difficult to address for three reasons. First, it is always difficult to distinguish the impact of currency internationalization on monetary policy from that of other factors, such as the development of financial markets, the liberalization of financial sectors and increasing trade and financial integration. Second, although it is assumed that currency internationalization impacts on monetary policy mainly via its impact on the monetary policy transmission mechanism, a sound and well established analytical framework is still absent. Third, the RMB is far from being an international currency, and its use internationally and regionally is still very limited. Hence, the absence of data makes it difficult to discuss the relationship between the not-yet internationalized RMB and China's monetary policy. As it is difficult to carry out an empirical study and draw reasonable implications from statistical findings, the discussion on this subject is mainly conceptual.

First, internationalization of the RMB would stimulate the development of direct finance by increasing its private usage in bond and other debt securities and equity markets, which would bring about a quicker adjustment of market interest rates to the changes in official interest rates. This is because a more liquid and sophisticated financial market would be created following the enlarged usage of RMB financial instruments.

Second, internationalization of the RMB would stimulate arbitrage activities in response to monetary policy changes. In the case of monetary tightening, an interest rate hike would cause currency appreciation, given the free flow of capital across the border. If the interest rate or spot exchange rate deviate from the anticipated interest rate and exchange rate, or the real exchange rate deviates from the nominal exchange rate - which, in the case of monetary tightening, is presumed to be favorable for the holding of RMB assets - international investors would carry out interest arbitrage by buying more RMB assets. Again, the intensity of the effects of interest arbitrage depends on the degree of flexibility of the interest rate and exchange rate, and on the extent of capital account liberalization.

Third, internationalization of the RMB could also have an impact on the effectiveness of monetary policy via wealth effects. A decline in the official interest rate aimed at stimulating investment spending would induce a hike in asset prices by increasing the earnings from the holding of RMB assets. Correspondingly, the market value of firms would go up, which would give firms greater incentives for investment spending. International use of the RMB would thereby allow extra funds to flow into the RMB equity market, and hence enlarge the wealth effects of loose monetary policy.

Fourth, internationalization of the RMB would result in currency substitution and an increase in RMB deposits in third countries. There are no clear-cut theoretical explanations to confirm whether currency substitution and an increase in RMB deposits in third countries would have an impact on money demand. There might be different outcomes, depending on whether the increase in holdings is made by non-residents or by residents in third countries. For non-resident holdings, there might be a weak link to money demand, but for resident holdings outside China, the impact of changes in RMB holdings on the stability of money demand could be significant.

Lastly, another factor that needs to be considered is the likelihood of the growth of the euro-RMB market. It's difficult to quantify the risks, and hence the net effect, of currency internationalization. Furthermore, external factors are equivalently important when considering the rationales for internationalization of the RMB. In other words, for internationalization of the RMB, whether other countries are willing to accept the RMB in international transactions for both private and public purposes is as important as whether China wishes to internationalize its currency.

## **4 Proposals of RMB Internationalization**

### **4.1 The goal of internationalization of the RMB**

Goal is through the internationalization of the RMB, China can get rid of the international monetary system in the weak position, obtained with considerable political and economic strength of the

currency of great power status, China from both the international seigniorage, foreign economic organizations as well as lower domestic activities of the exchange rate risk, thereby contributing to the continuing healthy development of China's economy. Around the objective of promoting the internationalization of the RMB's overall strategy is: adhere to the "two legs" to walk; first use of Chinese and Southeast Asian countries trade advantage, advance RMB regionalization process; second is to use a variety of ways to promote the RMB in the international financial circulation on the market. To this end, the geographic expansion on "three steps" to promote the process of internationalization of the RMB, which upholds the periphery of the RMB to RMB regionalization and to develop international; at the same time, insist on the functional currency RMB, RMB investment and borrowing and simultaneous development of the official reserves of RMB strategy. In this process, and steadily promote the process of capital account convertibility of RMB, actively and steadily carry out RMB offshore financial services, timely and appropriate to promote the gradual and orderly process of internationalization of the RMB.

Specifically, the path of internationalization of the RMB arrangements are: first, to promote the development of regionalization of RMB, the RMB in the Asian region to promote international trade, foreign direct investment, international borrowing in use, and by non-residents to issue RMB bonds and stocks, etc. and to allow non-resident holdings of RMB products to expand the territory of China's financial market opening, the RMB to become one of the key currency in Asia, and gradually from the regional to international development. In addition, the dollar and the euro in response to competition, strengthen regional monetary cooperation, efforts to promote the RMB as a regional common currency of the main part of the organization.

As an international key currency is the main means of exchange, unit of account and store of value of currency. International monetary system is not a perfectly competitive market, many countries do not have the conditions of competition, therefore, these countries often adopt the currency peg or directly with the key way. Three conditions of the currency can be called a key currency:

- 1) Balance of payments in one currency most used;
- 2) The largest share of foreign exchange reserves of a currency;
- 3) Generally accepted international currency.

Second, the RMB internationalization and capital account convertibility, pressed forward and promote each other, without waiting for the realization of capital convertibility of the RMB and then promote the internationalization of the RMB; third is denominated in the RMB as settlement currency in international trade, international investment and international borrowing currency, the RMB a non-resident holdings of financial products on the Chinese market or in China to issue RMB-denominated bonds and stocks can advance in time, no need to distinguish the order; fourth, through various channels to promote the outflow of RMB and the establishment of offshore capital back institutional arrangements.

Although the RMB an international currency is the result of market choice, but choice and China's political and economic power is closely related to policy design.

#### **4.2 China's increasing importance in the world economy**

After 30 years of reform and opening-up, China has become one of the most dynamic economies in the world. Furthermore, according to an analysis based on a GTAP simulation: by 2025, China's share in global GDP will increase from 5% to 11.6% (assuming 20% growth in total factor productivity (TFP)), overtaking Japan's share and enabling China to become the third largest economy in the world. The other two scenarios show that even a lower growth rate of TFP does not significantly change the results. For instance, under the assumption of zero TFP growth, China's GDP share would be slightly below that of Japan by 2025, which would allow China to remain the fourth largest economy in the world. The growing size of the Chinese economy will be strongly supportive of the RMB playing an ever bigger global role.

## **5 Conclusion**

This article concluded that:

- 1) As a political and economic power, the RMB internationalization is necessary and urgent;
- 2) The internationalization of the RMB has to have certain conditions, the current time is right;
- 3) The Chinese government in the process of internationalization of the RMB to view the important role of government policy measures need to be taken to push dynamic process of internationalization of the RMB, RMB settlement of cross-border trade, foreign investment and international borrowing can be

synchronized carried out;

4) In a variety of sources, while the RMB, to be orderly opening up the domestic financial market, the establishment of offshore RMB back channels, in order to continue to promote the internationalization of the RMB;

5) The internationalization of the RMB in capital cases is not fully open to promote capital account convertibility and RMB internationalization process and promote each other, but the advanced stage of internationalization of the RMB of capital to be required account convertibility;

6) Both the internationalization of the RMB gains are at risk, need to take measures to minimize risk.

Finally, the internationalization of the RMB, China must first proceed independently at its own speed and promote RMB internationalization step by step. Second, China shouldn't allow rapid RMB appreciation tomorrow just because Western countries demand this today. China should act according to the development of its own economy. So, as a third point, China must establish a good currency backflow mechanism. The fourth point is how to develop Hong Kong into a well-rounded offshore center for RMB receipts, payments, settlements, investments, and reserves when China's capital markets are still not open. As an offshore center of the RMB, Hong Kong acts as a firewall for RMB inside China and also as a trial entity in its promotion of the internationalization of the RMB.

In conclusion, the RMB internationalization is a real long and complicated process, but in the process is full of risks and challenges, only to have every aspect to consider carefully the risks and take measures to prevent and resolve, to the internationalization of the RMB stable advancing.

# Study on SaaS Management Decision-making for Industrial Cluster Based on AHP\*

Chen Donglin, Fu Min, Nie Guihua

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: fuminkaixin99@126.com)

**Abstract:** Aiming at the problems existing in the study on SaaS management decision-making for industrial cluster, especially on the incompletely index system and the lack of quantitative research in qualitative indicators, this paper constructs a complete SaaS management decision-making index system for industrial cluster, and introduced AHP to calculate the index weight, and then take advantage of Shahe glass industry as an instance to collect data. Finally come up with three indicators that decision makers should first take into consideration: IT operation costs, security, hardware and software costs.

**Keywords:** SaaS; Decision-making; Industrial cluster; AHP

## 1 Introduction

As a use of software business model through internet, SaaS(Software-as-a-Service) is most widely used in enterprise applications, and it's the best carrier of information in industry clusters, which are associated with strong economies of scale and a high regional concentration. Since now a number of SaaS application platforms have been on the line, such as Suzhou Industrial Park, "Storm Riders Online", Wuxi city of China SaaS platform and so on.

SaaS Management decision-making now mainly focused on technical implementation and optimization. Based on the resources of the Web services architecture, Goscinski and Brock (2009) studied the dynamic SaaS service discovery and selection model by measuring the current state of the SaaS dynamic attributes of resource characteristics to select the right SaaS service<sup>[1]</sup>. Godse and Mulik studied the users' choice to buy under homogeneous SaaS market environment, and designed five first level indicators including features, architecture, ease of use, reputation and cost, as well as 16 secondary indicators to establish decision model of the users when they buy SaaS products.

The existing research nowadays is usually for a single enterprise, neither analyzing from the perspective of industrial cluster, nor considering the government's policy. Therefore, this article uses the Analytic Hierarchy Process(AHP) to analyze the elements that affect SaaS management decision-making, and designed three first-level indicators and thirteen second-level indicators to take Shahe glass industrial cluster as an example of quantitative model as the basis of SaaS management decision-making.

## 2 The Process Steps of AHP

### 2.1 Definition and principles of AHP

The AHP was first proposed by a famous American professor Satty and his associates in 1970s. It's a decision-making method which combines qualitative and quantities analysis together<sup>[2]</sup>. Its principle is to decompose a complex problem into several orderly levels, and then experts make judgment by comparing the importance of each element and offer an order from the best to the worst to help making decisions.

### 2.2 Establish a hierarchical model

According to different objectives or different functions, the system is firstly divided into a multi-level hierarchical structure. The highest level is generally the target layer; while the intermediate level general criteria layer; and the lowest level is usually a variety of measures or decisions to solve problems.

### 2.3 Establish a judgment matrix

Compare the importance of elements on the same level to the previous level and establish a judgment matrix. Assume that there is a domination relation from element y to elements  $x_1, x_2 \dots x_n$  in

---

\* This paper is supported by: National Natural Science Foundation of China under Grant No.71072077&71172043); National Key Technology Research Development Program under Grant No.2011BAH16B02); theFundamentalResearch Funds for the Central Universities under Grant No.2012-IB-063& 125215005; teaching and research project "professional practice research based on experimental teaching in computing and e-commerce

the next layer to establish a judgment matrix A (aij) n × n. aij represents the degree of influence of elements xi and xj on the target y. The value of Aij is always between the Satty gradations, shown in Table 1:

**Table 1 Satty Gradation**

<i>xi/xj</i>	Least important	Less important	important	More important	Absolutely important
<i>aij</i>	1	3	5	7	9

Note: the number 2, 4, 6, 8 living between two adjacent judgments.

**2.4 Calculate the sort weight vector**

The sort weight vector combines by the relative importance (i.e. weight) vectors a level factor relative to the previous level factors. The most common and practical method to compute weight vector is the square root method. The process is as follows:

(1) Calculate the product of the matrix elements in each row

$$Mi = \prod_{j=1}^n a_{ij}, i=1,2,\dots,n \tag{1}$$

Calculate the n-th root of Mi,

$$Wi = \sqrt[n]{Mi} \tag{2}$$

Normalize W' = [W1, W2, ... Wn]<sup>T</sup>,

$$Wit = \frac{Wi}{\sum_{j=1}^n Wj} \tag{3}$$

Then W = [W1t, W2t, ... Wnt]<sup>T</sup> is the target matrix.

(2) Calculate the largest eigenvalue of the judgment matrix,

$$\lambda_{max} = \sum_{i=1}^n \frac{(AW)_i}{nW_i} \tag{4}$$

(AW)<sub>i</sub> is the ith element of Vector (AW).

**2.5 Inspection consistency**

If the experts' judgment cannot be coordinated, it may lead to conflicting results. It's necessary to introduce two indicators: the general consistency index

$$CI = \frac{\lambda_{max} - n}{n - 1} \tag{5}$$

and the average consistency index RI. RI is a constant. Referring to 1 to 9 order of the judgment matrix, the corresponding values of RI are shown in Table 2. If CR = CI / RI < 0.10, it means the judgment matrix is with acceptable consistency. Otherwise, it needs to be adjusted until with a satisfied consistency.

**Table 2 The RI values of random index**

order	1	2	3	4	5	6	7	8	9
RI	0.00	0.00	0.52	0.89	1.12	1.26	1.36	1.41	1.46

**2.6 Sort decision-making**

When calculated the relative weights of the factor to the previous level, we need to have a combination of these weight from the top to the bottom. The combination operation is actually a multiplication with the weight of each factor. Then we can come out with the total level sort from the relative merits of sort value. Finally we can make decisions or choose options from the value of each weight.

**3 An Instance Application of Shahe Glass Industrial Cluster**

Shahe city is known as the "Glass City" reputation, and has formed its own industry cluster with a 15-billion-yuan scale of economy. So rapid the development of its industry cluster, its e-commerce is still in infancy, neglecting the constructing of an e-commerce website from a point of their own information needs and the trend of glass industry chain. So it plans to establish a public service platform to support the development of its industrial cluster.

**3.1 The SaaS management decision-making model of Shahe glass industrial cluster**

TCO (total cost): the cost advantage of SaaS is an important aspect to attract companies. It mainly includes the following four parts:

- 1) IT operation costs: the costs of users rent online cloud service;
- 2) Business operation costs: the hidden costs when SaaS is implemented;
- 3) Hardware and software costs: including all hardware, software, network storage, database and system upgrade, training and management costs;
- 4) Other intangible costs: including opportunity costs and other costs.

QoS (quality of service): 1) Ease of Use: the service can be successfully visited by the user at the appointed hour and under an appointed condition;

- 1) Reliability: the ability of suppliers that providing users with stable and unmistakable service;
- 2) Responsiveness: the ability and speed of suppliers when then solve problems;
- 3) Efficiency: the ease and speed of users when they visit the website;
- 4) Integration: the good integration capabilities of service and applications;
- 5) Security: the safety of information transmission and storage, including technical security and credit security.

Government-oriented Fiscal Policy (GFP): a) Financial policy; b) Tax policy; c) Laws and regulations.

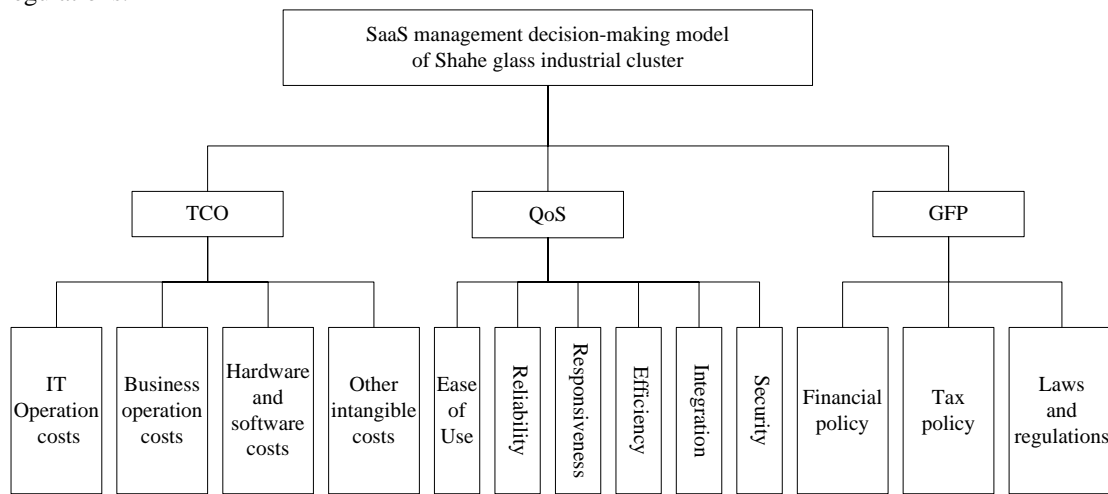

Figure 1 SaaS Management Decision-making Model of Shahe Glass Industrial Cluster

**3.2 Form a judgment matrix and calculate the sort weight vector**

According to the views of experts, the judgment matrix is formed as follows. Then calculate the weight of each indicator and test the consistency, showed in Table 4.

Table 3 The judgment matrix A-B

Target A	B <sub>1</sub> : TCO	B <sub>2</sub> : QoS	B <sub>3</sub> : GFP	W
B <sub>1</sub> : TCO	1	2	4	0.5584
B <sub>2</sub> : QoS	1/2	1	3	0.3196
B <sub>3</sub> : GFP	1/4	1/3	1	0.1220

CR=0.04517 < 0.1

Table 4 Weights of each attributes

	Criteria weights	Sub-goals	Sub-weight	Total weight
TCO	0.5584	C <sub>1</sub> : IT operation costs	0.2197	0.1227
		C <sub>2</sub> : Business operation costs	0.0857	0.0479
		C <sub>3</sub> : Hardware and software costs	0.1936	0.1081
		C <sub>4</sub> : Other intangible costs	0.0309	0.0173
QoS	0.3196	C <sub>5</sub> : Ease of Use	0.0787	0.0252
		C <sub>6</sub> : Reliability	0.0863	0.0276
		C <sub>7</sub> : Responsiveness	0.0534	0.0171
		C <sub>8</sub> : Efficiency	0.1539	0.0492
		C <sub>9</sub> : Integration	0.0985	0.0315

		C <sub>10</sub> : Security	0.3387	0.1082

		C <sub>12</sub> : Tax policy	0.0756	0.0092
		C <sub>13</sub> : Laws and regulations	0.3479	0.0424

$$CR_3=0.0520 < CR_2=0.0697 < CR_1=0.0843 < 0.1$$

### 3.3 Sort decision-making

The order of the weight of each influencing factor is: C<sub>1</sub> > C<sub>10</sub> > C<sub>3</sub> > C<sub>8</sub> > C<sub>2</sub> > C<sub>13</sub> > C<sub>9</sub> > C<sub>6</sub> > C<sub>5</sub> > C<sub>4</sub> > C<sub>7</sub> > C<sub>12</sub> > C<sub>11</sub>

### 3.4 Result analysis

We can see from the order that C<sub>1</sub>, C<sub>10</sub> and C<sub>3</sub> are the three most important factors. So when making SaaS management decisions, decision-makers should think these three factors first in order to try to cut down the IT operation costs, Hardware and software costs and to ensure security of SaaS. According to all the indicators considered above, C<sub>11</sub> and C<sub>12</sub> are the least important. In order to improve the quality of management and use resources effectively, the decision-makers should consider less about tax and financial policy.

## 4 Conclusion

Based on the comprehensive analysis through current study about SaaS management decision-making for the industrial cluster, this paper: 1) establishes an evaluation system facing Shahe glass industrial cluster, which includes 3 first-level indicators and 13 second-level indicators; 2) introduced AHP to calculate the index weight and to determine the relative importance of each indicator to the decision-making target; 3) establishes a quantitative model of the qualitative indicators, and collected relative data to help make a right choice. The decision-making is based not on the subjective judgment but the reference data, in a more scientific and rational way.

## A Motivation Mechanism on Disposing Non-Performing Bank Assets

Li Zhe

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: 616734324@qq.com)

**Abstract:** The non-performing assets' liquidating proportion and transfer price are bank's two important problems of disposing the non-performing assets, which are discussed by a model in this article. For the bank's liquidating proportion of non-performing assets, the government's different stimulus policy will produce a moral hazard and cause a welfare loss. The non-linearity transfer price of the non-performing asset is the bank's most affordable way of capital structure reconstructing without distorting the bank's incentive mechanism.

**Key words:** Commercial banks; Non-performing asset; Incentive mechanism; Non-linear transfer price model

### 1 Introduction

The transformation of banking system is the core content of the economic transformation, and is the key factor related to the succession of economic transformation. But in the banking system, a large number of non-performing asset has threaten financial economic security seriously. how to encourage state owned bank's managers to open their non-performing asset's proportion and in what price to liquidate the non-performing asset becomes the key of bank system's transformation. This article constructs a simple model to discuss, then analyses how managers will react and how many welfare lost ,when the government use different policies of restructuring capital structure, further, analyses that the non-linear transfer price may be the bank's cheapest way to reconstruct capital without distorting the incentive mechanism.

### 2 Model Introduction

Assuming that the bank's total assets is 1, which includes one asset in proportion of  $b$  that will produce return rate of  $R_f$  in the first period, and the other asset accounted for  $(1-b)$  does not produce any profits. For existing period of asset accounted for  $(1-b)$  that does not produce any earnings, include one asset in proportion of  $k$  which will produce return rate of  $R_p$  in the second period, and the other asset accounted for  $(1-k)$  does not produce any gains. When only liquidate assets which accounted for  $(1-b)$ , but is not extend period, the produced liquidation return rate defined  $L$ . At the same time, we also must assume that:

$$R_f > R_p > 1, \quad (1)$$

$$0 < L < 1, \quad (2)$$

$$\text{and } kR_p + (1-k)L < 1, \quad (3)$$

That is to say, the expected return rate of non-performing is less than 1, and expected earning is negative. Therefore, the bank's optimum choice is to extend period for assets of the proportion is  $k$ . For assets the liquidation proportion is  $(1-k)$ , the biggest return it can obtain is  $kR_p + (1-k)L$ .

Assuming that  $b$  can take two possible values  $b_1$  and  $b_2$ , each has probability rate of  $P_1$  and  $P_2$ , and  $b_1 > b_2 \geq 0$ . Considering the initial assets value 1, the bank's net value condition depending on the value  $b$  defined by following formula

$$U_i = b_i R_f + (1-b_i)[kR_p + (1-k)L] - 1 \quad (4)$$

From  $b_1, b_2$ , it can be seen that  $U_1 > U_2$ , and assuming that  $U_1 > 0, U_2 < 0$ . If the bank does not cheat, liquidation asset ratio will be  $d_i = (1-k)(1-b_i)$  in this two condition.

### 3 Moral Hazard of Disposing Non-Performing Assets

Assuming that the government can't see high quality assets of the proportion of  $b$  in the bank's balance sheet, but can see the number of liquidation asset, so making capital structure's recombination depends on the liquidation policy. The bank can be able to change the  $d_i = (1-k')(1-b_i)$  ( $k'$  is the bank's selective variables and can distort the liquidation decisions). After the bank disposal non-performing asset according to its own selective variable  $k$ , it's asset's continuity value is as following:

$$V = \min \{k, k'\} R_p + (1-k')L \quad (5)$$

1) when the  $k' > k$ , the bank manager narrows the proportion of non-performing asset, that is, assets

excessively continue, the return rate of disposing the non-performing is  $kR_p + (1-k')L$ . Because the assets of part  $(k'-k)$  do not get the liquidation value, the disposal loss of the excessive extended period assets were  $(k'-k)L$ .

2)when the  $k' < k$ , the bank manager exaggerates the proportion of non-performing asset, that is, assets excessively liquidated, the return rate of disposing the non-performing asset are  $k'R_p + (1-k')L$ . Because the asset of part  $(k-k')$  are liquidated ,but didn't extended, the disposing loss of excessive liquidation asset is  $(k-k')(R_p-L)$ .

Now to analyze the moral risk and welfare loss, caused by after the government carrying out different incentive policies of disposing non-performing assets, and the bank manager adopt corresponding countermeasures.

3)If the government implement strict capital reconstruction policies, that is , if the bank manager announced  $U_1 < 0$ , he will be fired. Assuming that the government can't see high quality assets of the proportion of  $b$  in the bank 's balance sheet , only see the number of liquidation asset. In this case, the moral risk will arise, bank managers will intentionally declare the  $U_1$  which actually  $U_2$  happens, and liquidate less project than actually need more . Because the banks announces  $U_1$  , the government can supervise the ratio of clearing non-performing assets is  $(1-k)(1-b_1)$ , but in state 2, the bank's actual liquidated the assets ratio were  $d_1 = (1-k')(1-b_2) = (1-k)(1-b_1)$ . From  $b_1$  and  $b_2$ ,  $k' > k$ , excessive extended period will appear.

4)If the government implement soft capital reorganization policies, that is, when the bank manager announces  $U_1 < 0$ , he won't be fired, and may even earn profit from excessive reconstructing. In this case, the moral risk also will exists, bank manager will intentionally announce  $U_2$  which actually  $U_1$  happens, resulting in excessive liquidation. Because the bank announce  $U_2$ , so the government can supervise the ratio of clearing bad assets is  $(1-k)(1-b_2)$ , but in state 1, the bank' actual ratio of capital liquidation is  $d_2 = (1-k)(1-b_1) \equiv (1-k)(1-b_2)$ . Because  $b_1 > b_2$ , get  $k' < k$ , excessive liquidation will appear and welfare loss is  $\lambda/[P_1(U_1-U_2)]$ .

From the view point of welfare, the expected losses caused by tough policy will be  $P_2(1-k)[(b_1, b_2)/(1-b_2)]L$ , and the expected loss caused by soft policy of capital structure reorganization will be  $P_1\{(1-k)[(b_1, b_2)/(1-b_2)](R_p-L) + \lambda(U_1-U_2)\}$ . When the value  $P_1$  is higher , that is, when people think that economic conditions are good, then the strict policy is better; But when people think the economy is in crisis, and the value  $P_2$  is also higher, the soft policy is better.

#### 4 The Transfer Price of Non-Performing Assets

In disposing the non-performing asset, the government introduces cleaning bank as a policy tool. In the above , on the basis of analyzing the proportion of the liquidation ratio of the non-performing asset, now discuss the problem of transfer price of non-performing asset. Under in which conditions that dose banks have incentive mechanism to get rid of the non-performing asset? In other words, what price must to be paid to the bank to make it transfer the assets to the cleaning bank?

Making the price level is  $t$ . Obviously, we must have  $t_1 < R_f$ , so that the bank does not sell off good assets and when  $t = 1$ , the bank will sell bad debt in the initial book value, and can earn profits from good assets. A cheaper price is not only making bank 'net value is positive1 in state 1, but also making it break even in state 2. In general , banks have positive net. Here,  $t$  is the solution of the formula of  $b_2 R_f + (1-b_2)kR_p + (1-b_2)(1-k)t = 1$ .

Now hypothesizing, for bank asset combination  $W$ , set transfer price of assets of share  $m$  is  $t_L$ , the part exceed  $m$  are set  $t_H$ , and the price mechanism has the following characteristics.:

1) In order to avoid the bank to exaggerate the scale of non-performing, there must be:

$$T_H \leq R_p \tag{6}$$

2) In the state 1, the utility of selling bad asset to the government shall not be higher than the utility of liquidating accounts, but can't dare to sell assets to the government,

$$(d_1 - m)t_H + mt_L \leq d_1L \tag{7}$$

3) The transfer price mechanism must allowed the bank to reconstruct capital under state 2:

$$b_2R_f + (1-b_2)kR_p + (d_2 - m)t_H + mt_L \geq 1 \tag{8}$$

Constraint conditions formula(7) and (8) are not linearly related , so if a solution exists, it is not the only one. Using two constraint conditions formula, we can get:

$$(d_2-d_1)t_H \geq 1 - d_1L - b_2R_f - (1-b_2)kR_p \tag{9}$$

Obviously, minimum transfer price that keep the incentive compatible (in making the bank can only transfer its asset which should liquidated) is a non-linear transferred price .This way is actually

restructuring bank assets structure. The intuitive explanation is, through setting low price for part of the portfolio, it may inhibit the bank selling assets in the state 1, then the higher price of remaining part of asset portfolio can be calculated, making the bank Profit and loss balance in state 2, but the premise is the price is not higher than the bank are willing to sell "good part" of non-performing assets.

If the constraint conditions formula (5) and (9) are compatible with each other, there exist solutions. A related selection  $t_H = R_p$  and  $t_L = 0$ ; So, from (7), and we get  $m = d_1 (R_p - L) / R_p$ .  $M$  is the assets boundaries of setting non-linear transfer price. It can be seen, under the above assumptions, the Bank can get the positive net whether in state 1, or in the state 2 through setting the nonlinear transfer price mechanism.

## 5 Conclusions

From the above, we can obtain the conclusion that: if without setting non-linear transfer price incentives, no matter the government carries what incentive measures for the bank restructuring its asset structure, it will still happen moral hazard. In the interest driven, but after setting up non-linear transfer price, the bank can get positive value assets even if it clean up assets. So, the bank is willing to set nonlinear transfer price for reconstructing its assets, and not go against the government's policies of reconstructing assets structure. Visibly, non-linear transfer mechanism may be a feasible way cheap of reconstructing bank's capital structure under the condition of not distorting the bank's incentive mechanism.

# Factors Influencing Current Coffee Consumption Preference and Behavior in China

Eskinder Asfaw Bantiwalu

School of Management Science, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: eskinderasfawb@gmail.com)

**Abstract:** The hot drinks market of China consists of the retail sales of coffee, tea and other hot drinks. This research focuses on the different factors that are influencing the Chinese current coffee consumption behavior and the reason behind for the preference of coffee from other hot drinks. Survey conducted in Chinese four main cities to identify the different factors which can alter the two main variables. Therefore, the survey proved that the Chinese coffee consumption behavior is positively affected by the availability of quality coffee, use of coffee for socialization, attitude towards coffee and negatively associated by the price of coffee and age. Coffee preference from other hot drinks is influenced by attitude towards coffee, age, education & quality coffee availability and it is negatively affected by price.

**Key words:** Coffee Consumption; Preference Factors; Hot Drink Market

## 1 Introduction

Coffee is an agricultural product growing mostly in developing countries. It is the second most traded commodity in the world after oil. Coffee is produced in more than 50 developing countries providing income for approximately 25 million smallholder producers (DFID 2004; Oxfam 2002b), and employing an estimated 100 million people (NRI 2006). It is consumed almost in all over the world, yet the culture and level of consumption might differ from countries to countries. It's true that the coffee culture is influencing many nondrinking coffee societies, four decades ago Japan had been known as a tea consuming society, the per capita of coffee consumption was less than 300gm currently Japan is listed as a major coffee consumer and their per capita is more than 4 kg.

Coffee and China officially introduced in 1980's. Chinese are much known as a tea drinking and passionate society towards tea not for coffee. However, recently the coffee culture in China is emerging. As mentioned above like Japanese in the 60's and 70's the coffee "revolution" threatening tea in China. For the last ten years the demand for coffee has grown by 70 pc in China. While the demand is growing less than 2 pc per year in the world but in China it is growing by 30 pc. The fast growing westernized middle class Chinese, high number of returnees and ever growing number of expatriates are contributing for the boost of Chinese coffee consumption. In the future, China has the potential to become a major coffee-consuming country. There are approximately 200 million potential coffee consumers in China, which would potentially put China one of the major coffee consumers next to United States (SPR Coffee, 2010).

## 2 Chinese Coffee Consumption Analysis

People worldwide drink a total of 7.4 billion cups of coffee every year, and 20 million cups of coffee are consumed every day. Every coffee drinker drinks an average of 120 cups annually. Coffee beans with a retail value of US\$80 billion are sold each year, which puts coffee second only to petroleum on a list of the top-selling commodities. Average coffee consumption in China is less than one cup per person per year, and consumption is still less than five cups per person per year in urban areas. Annual coffee sales are only approximately ¥4 billion. Despite all these, China's coffee market offers boundless potential. The coffee market is growing by 30% annually. As a consequence, the coffee industry and coffee shop operation represent highly promising blue sea business areas (SPR Coffee, 2010).

The China coffee market has boundless Potential. China's coffee consumer market offers tremendous Promise. China will play a pivotal role in the world coffee industry's in a near future if the growth maintain the same pace.

### 2.1 Overall analysis of the china market

According to statistics, the five million residents of Finland consume a million bags of coffee every year. In contrast, the 1.3 billion residents of China consume only 200-400,000 bags of coffee annually (1 bag = 60 kg). However, in the future China's coffee market offers truly immense promise. The fastest

growing of Chinese Economy (an average rate of 10% per year since 1990), results in an ever growing purchasing power of the People and the big tendency of westernization are the major indicators of the future potential.

**Table 1 Average Cup of Coffee per Capita per Year**

Country	Average Cups of Coffee per Capita per Year
Finland	1,459
Sweden	1,117
Netherlands	1,071
Norway	1,051
Denmark	982
Austria	850
France	735
Germany	731
USA	400
Japan	360
Korea	140
China	5

Source: (SPR Coffee)

According to SPR coffee (2010) there are approximately 200 million potential coffee consumers in China, which would potentially put China as the major coffee consumer just next to United States. In addition, Coffee consumption in China is currently growing at a rate of 30% annually. In contrast, coffee consumption worldwide is growing at an annual rate of only 2%. The Chinese coffee market has grown by 70% in total volume sales between 2003 and 2008 reached 30,000 tones. Euro monitor findings show that, within Asian countries, affluent consumers with a high degree of Western influence are more likely to accept a coffee culture (Hope Lee, 2004). Therefore, all this can show in the future China has the potential to become a major coffee-consuming country.

**Per Capita Consumption Analysis:** The countries of Europe and North America have average per capita coffee consumption in excess of 400 cups annually. Japan's per capita coffee consumption is roughly 360 cups annually. In contrast, Chinese per capita coffee consumption is less than five cups per year. Average annual per capita consumption is only around 20 cups even in such large metropolitan cities like Beijing, Shanghai, and Guangzhou. We may therefore conclude that China's coffee consumer market has enormous room for future growth.

In the other Consumption analysis the retail sales volume of coffee in China was slightly more than 30,000 tons in 2009. This translates to just over 0.02 kg per capita per year. However, it is China's growing urban population of 600 million people that accounts for an estimated 90% of coffee consumption in the country. This would put annual per capita consumption by the target consumer market around 0.05 kg.

Rising consumer income and increasing standards of living, as well as awareness of better-off lifestyles, especially among the growing number of middle-class consumers, have boosted the demand for high-quality products. According to Euro monitor International, fresh coffee, though much more expensive than instant coffee, grew by double digits in both volume and value in 2009, faster than growth for instant coffee. Although there has been a consistent increase in consumption of roasted and ground coffee in recent years, instant coffee still accounts for well over 90% of consumptions, with some estimates as high as 99%. Fresh coffee remains a niche category of the coffee market. This is partly because of relatively high prices and the low penetration of coffee machines in China. But fresh coffee manufacturers are exploring ways to develop the Chinese market. For example, to promote sales of fresh coffee beans, some manufacturers and distributors provide coffee machines free of charge to offices and households.

As such, fresh coffee is primarily consumed by Chinese drinkers outside of the home (in cafés and restaurants) because many coffee drinkers do not know how to brew coffee or do not want to invest in the cost of a coffee machine. There were around 560 cafés belonging to coffee chains in China in 2009, according to Euro-monitor International. Starbucks currently has more than 300 outlets in mainland China. The company has around 400 outlets in Hong Kong SAR, Macao SAR, and Chinese Taipei. Starbucks expects China eventually to surpass Japan to become the company's second largest market in the world.

**Table 2 Per Capita Coffee Consumption in Selected Countries in 2009**

## 2.2 Trends in coffee consumption 2004-2009

Instant coffee (including 3-in-1, i.e. coffee, sugar and creamer) has always been the predominant form of coffee consumed in China. Base sales of fresh coffee remain relatively low compared to instant coffee, but the trend is toward increased consumption of coffee in this form. Sales of fresh coffee, which includes fresh ground coffee as well as fresh coffee beans, rose by an average of 12% per year from 2004 to 2009. The rate of increase declined by 1%-2% each year during that period, however, the low base sales of fresh coffee make it difficult to forecast whether this trend will continue in the next five years.

## 3 Econometric Analysis of Coffee Preference (CP) and Current Coffee Consumption (CCC) Behavior

An econometric model in general may be written as:

$$y = x\beta + u \quad (1)$$

Where  $y$  denotes dependent variable,  $x$  the vector of relevant explanatory variables including road accessibility determining  $y$ ,  $\beta$  the parameters, and  $u$  the error term to account for unobserved random factors affecting  $y$ . We, however, assume that  $u_i$  is independent of  $x_i$  and  $u_i \sim N(0, 1)$ . Based on the theoretical and empirical framework and nature of data, I specified the estimable econometric models used in the study as follows.

### Model 1: Coffee Preference (CP)

$$y = x\beta + u \quad (2)$$

where  $y$  denotes the dependent variable taking values 0, 1 and 2 if the attitude of a particular respondent toward coffee preference is neutral, disagree (negative) and agree (positive) respectively,  $x$  the vector of explanatory variables including attitude toward coffee, reasonable price of coffee available in the market, and availability of quality coffee in the market determining  $y$ , and  $u$  the error term with  $u_i \sim N(0, 1)$ . Since the dependent variable was ordered, I used the ordered probit model based on random utility in order to investigate the factors influencing the Coffee Preference (CP). An ordered probit model is an extension of a binary probit model. Since it has more than two discrete ordered choices, it is built on a latent regression in the same manner as the binomial probit model. In this case, the ordered probit model can be summarized as follows:

$$\begin{aligned}
 y^* &= x\beta + u \\
 &0 \text{ if } y^* < \alpha_1 \\
 y &= 1 \text{ if } \alpha_1 \leq y^* < \alpha_2 \\
 &2 \text{ if } \alpha_2 \leq y^*
 \end{aligned}
 \tag{3}$$

Where  $y^*$  stands for Coffee Preference (CP) as a latent variable,  $y$  the data we observe,  $u$  the error term with  $u_i \sim N(0, 1)$ , and  $\alpha_1$  and  $\alpha_2$  the cut-off points.

**Model 2: Current Coffee Consumption (CCC)**

$$y = x\beta + u \tag{4}$$

where  $y$  denotes Current Coffee Consumption taking the values 1, 2, 3, 4 and 5 if a particular respondent doesn't drink coffee, drink coffee once in a long time, drink coffee once in a month, drink coffee once in a week, drink coffee every day,  $x$  the vector of explanatory variables including coffee preference (CP), price of coffee (P), quality coffee availability (QCA), attitude towards coffee (AC) and coffee for socialization (CS) determining  $y$ , and  $u$  the error term with  $u_i \sim N(0, 1)$ .

Since the dependent variable was ordered, I used the **ordered probit** model based on random utility in order to investigate the factors influencing the current coffee consumption (CCC). An ordered probit model is an extension of a binary probit model. Since it has more than two discrete ordered choices, it is built on a latent regression in the same manner as the binomial probit model. In this case, the ordered probit model can be summarized as follows:

$$Y = \begin{cases} 1 \text{ if } \infty \leq Y^* \leq \mu_1 \\ 2 \text{ if } \mu_1 < Y^* \leq \mu_2 \\ 3 \text{ if } \mu_2 < Y^* \leq \mu_3 \\ 4 \text{ if } \mu_3 < Y^* \leq \mu_4 \\ 5 \text{ if } \mu_4 < Y^* \leq \mu_5 \end{cases}
 \tag{5}$$

where  $y^*$  stands for Coffee Preference (CP) as a latent variable,  $y$  the data we observe,  $u$  the error term with  $u_i \sim N(0, 1)$ , and  $\mu_1, \mu_2, \mu_3, \mu_4$  and  $\mu_5$  the cut-off points.

**3.1 Factors Influencing Coffee Preference in China (CP)**

To identify the factors that influence Chinese Coffee Preference (CP), it is estimated an ordered probit model with Coffee Preference (CP) as dependent variable and with Attitude toward Coffee (AC), Price (P), and Availability of Quality Coffee (AQC) in the market along with other relevant factors as explanatory variables.

Table 3 the results of the ordered probit model. Attitude toward coffee (AC) and availability of quality coffee in the market (AQC) influence Chinese coffee consumption Preference (CP) positively and price of coffee in the market (P) stress Chinese coffee consumption Preference (CP) negatively.

Attitude towards Coffee (AC) and availability of quality coffee in the market (AQC) influence Chinese coffee consumption Preference (CP) positively but insignificant effect on coffee consumption Preference, and price of coffee in the market (P) stress Chinese coffee consumption Preference had negative but insignificant influence on coffee consumption Preference.

In line with my hypothesis, Coffee Preference significantly influenced by the level of education of the consumers, the research analysis has proved the same. The main reason for this could be, when the Chinese people get more educated there is a tendency to be influenced by the western cultures, fashions and styles. Since coffee consumption is considered as a western culture in China, education will bring openness for westernization.

**Table 3 Results of ordered probit model of Coffee Preference (CP)**

cp	Coef.	Std. Err.	z	P> z	[95% Conf. Interval]

### 3.2 Factors Influencing Current Coffee Consumption (CCC) in China

To identify the factors that influence Current Coffee Consumption (CCC) behavior, it is estimated an ordered probit model with CCC behavior as dependent variable and with Coffee Preference (CP), Price (P), Quality Coffee Availability (QCA), Attitude towards Coffee and (AC) Coffee for Socialization (CS) along with other relevant factors as explanatory variables.

Table 4 illustrates the results of the ordered probit model. Coffee Preference, Attitude towards Coffee and Coffee for Socialization influence CCC behavior positively where as Price of coffee in the market and Quality Coffee Available in the market affect Current Coffee Consumption (CCC) negatively.

**Table 4 Results of Ordered probit Regression of Current Coffee Consumption (CCC)**

ccc	Coef.	Std. Err.	z	P> z	[95% Conf. Interval]	
age	-.0754099	.1181839	-0.64	0.523	-.3070462	.1562264
educ	.0766465	.2042585	0.38	0.707	-.3236929	.4769859
cp	.2441215	.12383	1.97	0.049	.0014192	.4868238
ac	.0637677	.1479269	0.43	0.666	-.2261637	.353699
p	-.4553935	.2154985	-2.11	0.035	-.8777627	-.0330242
cs	.1536052	.1118026	1.37	0.169	-.0655238	.3727342
qca	-.2245117	.198293	-1.13	0.258	-.6131588	.1641354

Number of obs = 111 LR chi2(7) = 13.78

Prob > chi2 = 0.0552 Log likelihood = -149.48046

Pseudo R = 0.0441

Relatively, Current Coffee Consumption significantly affected by Coffee Preference (CP) and reasonable Price (P) existing in the market whereas the other independent variables such as Attitude towards Coffee, Coffee for Socialization and Quality Coffee Available in the market influence Current Coffee Consumption (CCC) insignificantly. Quality Coffee Availability in the market negatively associated with Current Coffee Consumption (CCC) in the analysis.

### 4 Finding

It is clearly recognized that the Chinese coffee market is growing rapidly and the fast growing westernized middle class Chinese, high number of returnees and ever growing number of expatriates are contributing for the boost of Chinese coffee consumption. There are several factors that can affect positively or negatively the current coffee consumption behavior of Chinese. Basically coffee preferences, price of coffee, quality coffee availability in Chinese market, attitude towards coffee are the main independent variables which can affect the current coffee consumption pattern in China. Why coffee preference among other hot drinks in China also studied in this article. There are independent variables which, has taken in to account such as price of coffee, quality coffee availability in Chinese market, attitude towards coffee, coffee for socialization, educational background and age. These independent variables have a positive and negative association with coffee preference

### 5 Conclusion

This research has proved Coffee demand in China is highly concentrated in large cities such as Beijing, Shanghai and Guangzhou. The target markets in these cities are categorized in three major groups Westernized young Chinese professionals, Ex-pats and Returnees. On the survey conducted on the above cities, one third of the sample population has showed a preference for coffee. The same survey has confirmed that three fourth of the population consume coffee irrespective of the price consideration and their age. From these we can conclude that the Chinese coffee consumption behavior cannot by the price of coffee but influenced by the availability premium quality coffee.

## Analysis on Management Innovation of China Insurance Brokerage on MIT Mode

Liu Meng

China Youth Foundation Investment Management (Beijing) Co., Ltd., Beijing, China, 100028

(E-mail: liumengbj@126.com)

**Abstract:** This paper analyzes the insurance brokerage management innovation of China in MIT model based on the rational transformation background and puts forward that the most important mission for China insurance brokerage industry is to satisfy the market growing multi-angle insurance brokerage demand with the advanced technology innovation development mode, to integrate industry chain by the technical service innovation and to forge core development power with China insurance brokerage group advantage. This paper elaborates the construction and practical experience of MIT model, we can get the conclusion that the core development power is different in different stage, and that we should integrate financial service supply chain by using new technology of insurance brokerage, take innovation management comprehensive service platform development as a orientation, promote service level by M&a and diversification and use innovation model to promote the insurance brokerage enterprise management revolution in China.

**Key words:** MIT mode; Collectivization integration; Management innovation; Core development power

### 1 Introduction

With the birth of China's first insurance broker company in June 2000, China insurance broker industry has developed from the scratch for over a decade, and we can see that the annual growth rate is over 30%. So China insurance broker industry has been called the most promising industry in the most promising business. Meanwhile, China insurance brokerage has inevitably experienced various problems and bottlenecks which have impede the industry into a more scientific and global growth in the past development process. As the theory of diversity in China insurance broker which should be combined with the reality is absent, so we must take measures to improve the study about China insurance broker.

In October 2007, Guangdong FanHua insurance brokerage came into market in NASDAQ. Its rapid development announced the end of the first developing generation in insurance brokerage with the core of relationship, information, technology and service. Subsequently, the second developing generation with the core of capital, mode, product and service comes onto the stage. Therefore, such issues for China insurance brokerage as what is the promising developing mode, what is a feasible and excellent developing mode, and how to build China insurance brokerage industry have been put in front.

The more and more obvious trend proves that the world of the future will be a world in which mobile application is the main contact platform. The insurance broker profession as the insurance intermediary part of the insurance broker development, the important way is relying on mobile business applications for employees and custom mobile Internet platform. In this platform, the staff can be effective in carrying out business, contact at any time and place to want to contact, and get strong backup network support.

In June 2012, CIRC (China Insurance Regulatory Commission) put forward an notice about the further insurance intermediary market access regulation. In his notice, all professional insurance intermediary organizations except the insurance intermediary services companies, auto production, sales and service enterprises, bank postal enterprises, insurance companies, insurance agents, brokerage companies and their branches, national insurance agents and brokerage company branches, which invest more than 50 million registered capital are forbid application for the establishment temporarily. The development history of insurance brokerage industry is so short and its foundation is so weak that China insurance brokerage institution specialized level is low and their risk control ability is weak. Many little, messy and low level institution must be transformed to be specialized, conforming to the insurance intermediary market development trend to effectively improve the professional level and the service ability of China insurance brokerage enterprises .

The 20 years practical experience of China's insurance market has proved that the mission of

insurance brokerage is to continuously satisfy the growing and multi-angle market demand of customers, adapt to the social economic development to the needs of the insurance broker and obtain international competition and multinational operation ability. Insurance brokerage enterprise must forge the core development power revolving around the needs of the customers to form the market competition and their own influence sustainable development force and establish the significant insurance market brokerage enterprise. Only with the internal sustainable development of the enterprise can get the market influence. Only with the market influence, can the enterprise obtain the core development power in the fierce market competition and get the sustainable development.

To better bridge the development cracks in role localization, CIRC put forward the Insurance Intermediary Services Company Supervision regulation in October 2011. This regulation makes the standard of insurance intermediary services group company market access, operating rules, supervision and management. The Insurance Intermediary Supervision Points Regulation in 2012 explicitly points out that we should encourage the insurance intermediary groups, improve the level of management and professional organization ability, and effectively improve the professional level agent market and comprehensive service ability. It is the best time for the improvement of China insurance brokerage in the near future.

## 2 Definition

Mobile Integrated Terminal is called MIT for short and it is an improving mode of mobile internet. The employees of insurance brokerage companies can do business by professional equipments such as laptops or Epos through the final customer service on internet. At the same time, they can learn about insurance brokerage solutions and products, docking electronic agent insurance policies, premium payment, insurance brokerage commission online payment and automatic transfer and other insurance brokerage services on the net. This mode effectively solve the problems of traditional insurance brokerage services sales mode, and it not only introduce the low carbon environmental protection, but also supply an efficient chain integration to promote the insurance brokerage enterprise management innovation.

Supply chain conformity is one of effective core elements of China insurance brokerage enterprise competitiveness. In modern time, it changes business scale so deeply, influence scope so broad and permeate links so deeply that it must be one of the subjects we need to study seriously. After the global financial storm in 2008, electronic supply chain promotes the acceleration of enterprises. Constructing an electronic business core services platform integrated of Production, supply and sales with insurance brokerage enterprise as the core will make different enterprises and different departments in one company coalesced deeply and reduce the chain transaction cost.

Collectivization can not only greatly strengthen the comprehensive competitiveness of the intermediary enterprise, improve management ability and market competition ability, but also improve the sustainability of the whole insurance intermediary industry. After more than ten years of development, the management idea, system mechanism and the personnel quality of China insurance intermediary industry has been improved greatly. Before the meeting hold by CIRC in March to support the construction of Min Taian insurance public evaluation Co., ltd., guangzhou MeiChen investment management consulting Co., Ltd., YingDa Changan insurance brokers Co., LTD and Beijing joint insurance brokers Co., LTD, there has been a number of insurance intermediary enterprises with considerable capital strength. It's no wonder that the collectivization of China insurance brokerage will be widely spread in the near future.

Core development power is the sustainable growth power based on the advantageous competitiveness. It is the collective wisdom integrated and accumulated by the whole business team and it will develop with the development of the whole business. It will Support the market competitive advantage of the enterprise in past, at present and in the future and it is the incorporation of the competitiveness and the development power.

The mission for China insurance broker is to realize the increasing multiple demands from the clients, and to acquire the capability to compete globally and operate multi-nationally. Only revolving the client's demand to develop the core power can the insurance broker company obtain the influence and sustainable development in this industry.

### **3 Composition**

#### **3.1 Distinctive corporate culture**

A distinctive corporate culture which is the source of business vitality is the precondition to develop the core power for an insurance broker company. Core development power comes from the management of the corporation, and the management is based on the corporate culture. The corporate culture in insurance broker industry consists of five elements: business environment, corporate value, heroic image, etiquette formality, and cultural network, amongst which the corporate value as the basic idea is the core. A successful insurance broker company puts forward clear corporate value as the common aim and regular norm for the staff. Meanwhile, such value is intensified by the heroic image, the legendary story as well as the etiquette formality.

The success of the corporate depends on whether the employees can identify accept and act as the values in this company or not. If the employees of the company can do as that, the corporate culture will be unique, and the corporate must be successful. The characteristics of the corporate culture in insurance brokerage filter into every business section. An excellent corporate culture not only encourages the employees' initiative and creativity but also makes up the shortage in business structure. Meanwhile, different corporate culture gives different service to its client, which determines the sustainability of the mutual business relationship.

#### **3.2 Distinctive service network**

Customers can complete all insurance purchase process through the 3G technology. At the same time, the new technology can offer product introduction, offer application, insurance contract instant completion, insurance premium transfer settlement, business management, all transactions in the validation and query. What's more, it can offer protection in the deal process, phone voice payment, WAP gateway payment and In APP products, which formed a complete mobile payment products matrix to fully meet the needs of businesses mobile payment. In the near future, there will be more remote and site pay and value-added application based on mobile interactive, mobile perception, mobile computing and mobile network, which play full use of the mobile business booster.

The enterprise should set up the fast and convenient insurance brokerage services system by the new technology like we elaborate above, and create unique brokerage market service system closely around the market demand and depending on the market. So the theme of the market competition is to win not the TOP but the ONLY. As we all know, the corporate can't be successful with basic competitive advantage. What is more, the TOP will be easily lost for the fast development and transmission of knowledge communication and employee turnover. The ONLY contributes to the exclusive service network which consists of expertise, human resource, public network and subsequent value-added service. The corporate should combine the TOP with the ONLY to make it unique, attractive and competitive. Only by this way can make the corporate get sustainable development, especially for the new insurance brokerage.

#### **3.3 Insurance brokerage environment innovation**

MIT model is opening a new insurance brokerage era, which offers a solution to solve the insurance buyers and sellers information block and bring great convenience during the process of insurance industry customers seeking, customization and personal services. Insurance brokers shorten the distance between the insurance company and clients, mobile intelligent terminal make insurance service and insurance consumption bundle together on Internet through MIT model. Especially, the development trend of the insurance company groups at present make the insurance company acquire a large number of customer data through the life insurance, insurance, health care, pensions, financial management, investment, Banks, credit card, rescue and so on. By using intelligent analysis system, whether they can offer new insurance products or not will be the key to the future individual insurance market competition. In mobile Internet age, production can't decide consumption, but consumption determines productions. In the past 200 years, the industrial revolution which we are familiar with may end. Humans will enter into the era of small-scale production. In this "small-scale production age", insurance customers no longer have no choices. In the key advantage products field, we must look for enterprise competitiveness. The figure 1 shows that China premium income of the constitution from the 2011, life insurance is the insurance brokerage business accounts for smaller field, and enterprise property insurance is the focus of insurance brokerage.

On the other hand, MIT model is a perfect choice as a kind of technical mean for the competition

obtaining. MIT model not only promoted insurance customer experience, but can also create a new insurance operation mode which can greatly reduce the operating costs and provide more favorable insurance service development space for the insurance brokerage in China. Research data shows that the Internet sales insurance costs are only 1/15 of the cost of insurance agent sales, cost of sales of the phone is 1/2. The service costs are only 1/42 of the agent service costs and it is 1/17 of the cost of services phone sales. Obviously, it is a win-win development in the path of the insurance business through the MIT model to promote insurance business development. This model reduces the cost and brings more profit to the enterprise. At the same time, it provides a more convenient channel, the more active insurance product selection and the more personal insurance service. First of all, we should strive to achieve insurance e-commerce "one-stop service target and extend the online insurance business sales from deal completion to the insurance checking, compensation checking and other

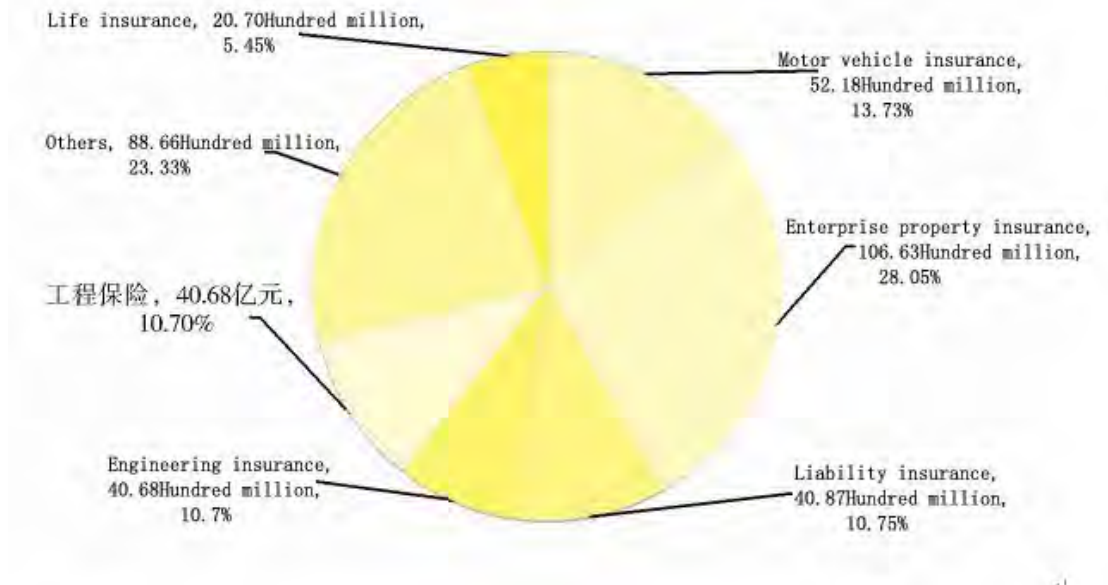

Figure 1 China Premium Income Constitution from the 2011

after-sales service process. Secondly, the electronic commerce environment of the insurance improve must be developed greatly. On the one hand, we must promote the construction and completion of the related electronic contract, both parties identity authentication, electronic payment, security and the construction and perfection of laws and regulations. On the other hand, we should support electronic commerce development of preferential policies, such as a related rate policy, to show the electronic commerce cost and price advantage and attract more customers. Then we must strengthen the construction of the electronic commerce insurance safety. Data encryption in E-commerce transactions which is to prevent hackers broke into and steal information or destruction of trading system, will be the focus of network security trading. Therefore, it's necessary to improve the network trade safety technical level and popularize the network security trade knowledge to promote the development of insurance for the network and provide a secure transaction platform to assure the safe and effective of the insurance e-commerce

Customers can enjoy the insurance portfolio which is designed by the insurance company based on the personal favor, which will do goods to the customer maintenance and promoting new business and expanding the market competitiveness.

At present, there are hundreds of millions of mobile e-business users in the world. The rapidly rising mobile equipment applications not only change the work mode, but also bring us a new way of life. According to ShangPu consulting data showed in January to march of 2012, global smart phone sales number is 146 million, an increase of 45%. Among them, the number in China accounts for about 22% of the world sales, which is more than 19% of the United States and become the world's largest smart phone market. Intelligent mobile phones, laptops, tablet computers and the growing popularity mobile devices, as well as the wireless network of broad coverage make the enterprises and customers in

real-time interaction between states anywhere. They can contract to cash flow from the integrity of the process, record telephone, response hotline, access to important information as long as instant access to their employees the handheld devices.

## **4 Methods**

### **4.1 Enhance the entrepreneur's consciousness for core development**

As the core and the leader of a business, the entrepreneur is supposed to obtain the core development consciousness which is essential in insurance brokerage industry. On the one hand, the entrepreneur with such consciousness is able to search the accurate market niche as well as to build the competitive operational mechanism. On the other hand, it is such entrepreneur that is able to make the decision and strategy before a full consideration on the core development.

### **4.2 Concentrate resources on the key sectors**

Such factors as advantages in the market and the product, and the scientific strategy help obtain short-term superiority. Only the combination of the core development and the long-term benefit can the insurance broker companies be established permanently. Therefore, the resources of insurance broker companies should be focused on building the distinctive corporate culture, create a unique service network, and develop human resource as well as on the sectors of risk management, virtual network and the VIP clients.

### **4.3 Create the comparative advantage in insurance broker market**

The comparative advantage, inspired by the competitor and the market, is to build the core development which is in turn supports this advantage. The advantage compared with the competitor is created after discovering its shortage. And the advantage from the market is created from market vacancy.

### **4.4 Build core development at varied stages**

At the beginning of a insurance broker company, it focuses on making a flexible and distinctive strategy to survive in the market. Further at the growing stage, the company has double points in core development which are firstly to acquire the core technology and secondly to improve the inner structure and management for a cohesive corporate culture.

## **5 Conclusion**

### **5.1 Open the insurance brokerage market**

Only with further insurance brokerage opening to the outside world and making full use of foreign capital advantage, learning from foreign advanced experience can we rapidly improve the overall operation of industry level and make the insurance brokerage market standardization, professional and international quickly. We should deeply open the insurance brokerage market and actively look for new development power and quickly seek for the best business model to improve the insurance sales function ability. We must pay more attention to the danger of exploration and research according to its own characteristics in the traditional and carry out actively service patterns of innovation, which will alter the existing income structure.

### **5.2 Merge and restructure the industry**

The mergence and restructuring of the potential insurance brokers realizes to establish the large scale broker company with combined industrial advantages as well as nationwide service network. Those small or medium sized companies of uneven and low qualification will be withdrawn from the market.

### **5.3 Go to public for capital**

Going to public in an allowed market environment breaks the capital bottleneck, improve comprehensive competitive power of these companies and make them more specialization and intensive developed. The corporate should make efforts to enhance their own degree of specialization and service level in order to adapt to the needs of the development of the insurance market.

In 2007, with the precedent combination of Fan Hua and Nas Dark in USA, the insurance brokers have confidence and desire to go public for adequate capital which is a fresh commercial model to integrate the resources in insurance industry. In modern time, many companies Take new business model to integrate the insurance industry resources, which will make insurance products of each big insurance company in the industry optimized combined. These products will meet the needs of users depending on the advanced technology and network platform with the most convenient and personalized services. It can be said that this will be the best solution to provide insurance service for the user in the future.

#### **5.4 Encourage industrial innovation**

The measures of establishing affiliates, virtual sale, and call sale help upgrade the insurance industry for a sustainable development. China insurance industry is promising and will develop quickly in the future. However, we are also faced with many troubles, and we should make more study about China insurance industry.

# The Construction of Enterprise Culture in Hubei Province of China Based on Experiences of Haier

Wang Hong

Hubei University of Economics, Wuhan, P. R. China, 430205

(E-mail: wangh@hbue.edu.cn)

**Abstract:** As the spiritual pillar of business survival and sustainable development, Enterprise culture is an important source of cohesion and creativity and the determining factor of the core competency of enterprises; therefore it is the common demands of enterprises and employees to build enterprise spiritual highlands and to strengthen the building of enterprise culture. Realistically in Hubei province, drawing on the experiences of successful cases (such as that of Haier) in building enterprise culture is of great significance for promoting the construction of enterprise culture in this province, building enterprise spiritual highlands, and enhancing the competitiveness of enterprise. Through the analysis of core effects of cultural factors on the success of Haier and the status quo and problems with the construction of enterprise culture in Hubei province, this paper put forward several proposals to strengthen the construction of enterprise culture in Hubei province of China, namely, to foster the unified core values among employees, to develop the people-oriented enterprise system, to build eclectic culture with its own characteristics, and to build a workforce with creativity and learning ability.

**Key Words:** Haier; Enterprise culture; Cultural innovation; Enterprises in Hubei province;

## 1 Introduction

Enterprise Culture is a new discipline stemming from the field of management sciences in the 1980s. Through 30- year rapid development, this discipline is gradually arousing the wide attention of academic circles and business world both domestically and abroad. It has become the spiritual power of enterprises to improve business performance, promote enterprise development and enhance the core competency. In the 21st century, with economic globalization and fierce competition in the market, the competition among enterprises will mainly focus on the core competency and learning ability which are based on enterprise cultures. The Sixth Plenary Session of the 17th CPC Central Committee clearly state that culture is the essence and soul of civilization, and that it is the inexhaustible spiritual support of and the source of power for national survival, development and prosperity. As an integral part of the socialism cultural system, enterprise culture will play a more prominent role in the development of people and society. Moreover, a large number of leading enterprises with prominent main business, strong core competency and obvious market competitive advantages will be needed to strongly support the leaping development of science in Hubei province, and to quicken the transition of Hubei province from 'Big' to 'Strong' in terms of industry and culture.

Excellent enterprise culture can unite the overall strength of enterprises, motivate employees to struggle for the common developmental goals and will ultimately enable enterprises to achieve sustainable success. The development of enterprise culture directly contributed to the successful rise of many world-class benchmark enterprises in China, such as Haier and Lenovo. Founded in 1984, a collective enterprise with only 800 staff at the beginning and an ever loss of RMB 1.47 million, Haier has developed into a leading enterprise globally in Home Appliance and has become a model of successful modern enterprises after 28 year development, during which the group witnessed such four developmental stage as brand creation, diversification, internationalization and globalization. Among others, the characteristic culture of Haier plays a leading role in its success. "Enterprise culture is the core competency of Haier", said Zhang Ruimin, CEO of Haier. Haier culture has been integrated into the operational management of the Group, guiding its development, standardizing its operation and enabling it to develop rapidly and vigorously in the competitive environment of economic globalization. Therefore, it is of great significance to draw on the successful experience of Haier to promote the building of enterprise culture and core competency.

## 2 Features of Haier's Enterprise Culture

As the sum of business philosophy, values, way of thinking and behavior recognized by the majority of employees and gradually developed in the long-term production, operation and management practice, enterprise culture is the main source of cohesion and core competency of enterprises. It is not

noticed in China both theoretically and in the business world until the 1980s, when enterprises in China began to develop from monopoly to completion. In 1984, with a loss of RMB 1.47 million, Haier first proposed the cultural concept of 'Culture First and Philosophy First', and this concept gradually develops into the current enterprise culture of Haier.

### **2.1 Innovation - the core of enterprise culture**

The core of Haier culture is innovation. Haier's enterprise culture is a staff-recognized staff value of innovation from business leaders. The survival and development of an enterprise depend on its own value, which is also its strategic point and the cornerstone against various temptations. In the course of 20 years development, Haier gradually formed a distinctive cultural system which takes conceptual innovation as guide, strategically innovation as direction, organizational innovation as guarantee, technological innovation as means and market innovation as goal. Haier culture itself is experiencing innovation with the development of the Group, and the essence of Haier's culture of innovation is to create the mechanism and platform producing first-class talents, based on which values are created for customers continuously and win-win culture is consequently developed, inputting powerful spiritual power for the enduring of the Group.

### **2.2 Core value - the soul of enterprise culture**

In the long-term business practice, Haier has established its core value: customer-oriented, development-focused, and interest-driven.

Customer-oriented - Think what consumers think. This means that customers are always right, while Haier itself is always wrong, and this is the momentum for itself to create users. Haier thinks that customers are always right and therefore tries all means to meet their needs and even create needs for them. On the other hand, Haier believes that it is always wrong, and this attitude can help to continuously challenge itself and make breakthrough - deal with change with change, and seek for success in the process of change. Both attitudes form the intrinsic genetic characteristic of the sustainable development of Haier - not changing with the change of the world, and developing with the development of times. This gene, with the two creative spirit of Haier people (entrepreneurship and innovation), forms its core features maintaining its competitive advantage in the ever-changing market.

Development-focused-Entrepreneurial spirit and creativity. Haier requires that each employee should possess both entrepreneurship to transfer him/herself from "managed and motivated" to "self-managed and self-motivated" and spirit of innovation to create new values, which result from the creation of new customer resources. These two creative spirits are the unchanging genes of Haier culture, which not only guide the personal development of employees, but also restrict the employees' values.

Interest-driven - win-win Culture. Haier is about all stakeholders - our employees, customers and shareholders. Only the win-win culture can guarantee the sustainable growth of Haier. In order to realize this goal, Haier will continue to innovate its business modes to build a Haier-specific win-win culture-the enterprising and innovative employees will be committed to value creation for customers in different independent operations, while at the same time realize values for themselves, the company and shareholders. In independent operations, each employee enters into a contract with the customer, shifting from "managed and motivated" to "self-managed and self-motivated". This is what we call "human-oriented management". The win-win culture at Haier provides resource and system support for every employee to be enterprising and innovative, which ensures spontaneous innovation in the ever-changing world.

### **2.3 Full participation - the characteristics of enterprise culture**

The most significant feature of Haier culture is employees' identification and their active participation. Haier has encouraged its employees to show their things around them in the form of cartoon by themselves since 1998. The employees' full participation and their identification form an unique "employees' pictures and words" culture of Haier, which fully arouses the enthusiasm of all staff, deepen their understanding of corporate culture, but also promotes their active participation.

Corporate culture must be the culture of maximizing the value of all staff. Haier's current goal is to create a brand-name in the world, and win the glory for the nation, which perfectly combine the development of Haier and the value pursuit of its employees. Every staff will fully realize his or her value and pursuit during the process of becoming the brand-name in the world. Turn the social man into the masters of the enterprise, turn the intellectuals into the experts of enterprise management, and turn the migrant workers into the industrial workers, realize the maximization of enterprise value and the value of all employees.

### **2.4 Mechanism - the guarantee of enterprise culture**

The formation of Haier culture is system engineering, also an important reflection of Haier's Core competency. This ideological form, explicit in style and features of the factory and implicit in the heart of the employees, is implemented into the various branches and each department's operation and management, and reflected through Haier's business strategy and all the standards and systems of Haier characteristics.

Haier's law is also called slope ball theory. It thinks that the enterprise is a ball located on the slopes. If the ball is slightly relaxed, it will slide down. Therefore, companies need a stop power, which is the management. The management of the enterprise is a long-term work, which needs to be persisted, rather than some unexpected activities. In order to reinforce the basic management, Haier created Haier model, namely, the OEC management, which is composed by the target system, the control system and an effective incentive mechanism. The Target system refines the target to every person per day, and clear their responsibilities and objectives. The control system, strictly requires the daily workload to be completed, and demands that every day's performance should be improved. An effective incentive mechanism includes "three co-exist, the dynamic conversion", "points wages", "total points wages" etc. The target system is to set goals, the control system is to manage various basic work to achieve the goals, and an incentive mechanism is to ensure that the full efforts toward this direction. OEC management has attracted wide attention, because it can well control their work to be completed according to targets, which thus solve the problem of current enterprise's hard management after its development.

### **3 The current situation and problems of the construction of Enterprise Culture in Hubei**

The enterprise culture is always associated with a certain stage of the development of enterprises, especially the more mature phases in the development of enterprises. The development of enterprise culture of Hubei is closely related to the development of the enterprises themselves in Hubei. Along with the continuously development and growing of the enterprises in Hubei, the overall construction of the enterprise culture in Hubei is also showing a process of development from spontaneous to conscious.

#### **3.1 The understanding of the construction of enterprise culture is gradually deepened.**

The construction of enterprise culture in Hubei started in the 1980s. With the continuous deepening of the reform of the economic system and the strong promotion of the Marketization process, the understanding of the construction of enterprise culture is gradually deepened.

First, change the understanding tendency, which thinks the construction of enterprise culture, is superfluous and insignificant. In the development process, enterprises in Hubei gradually realize the importance of cultural construction and no longer pursue the superficial, slogan, and moving of cultural activities, but combine enterprise culture construction with the modern enterprise management closely, and so implement enterprise culture practically.

Second, change the understanding tendency in the past that the construction of enterprise culture is the matter of the leader, and it has nothing to do with the general staff. Enterprise culture can make employees combine the embodiment of their own values with business goals. The construction of Enterprise culture requires not only the correct leadership of the highest leader, also depends on the participation of the entire staff.

Third, change the understanding tendency in the past that the construction of enterprise culture is the cultural accumulation, rather than the active construction. An excellent enterprise culture does not happen overnight or by accident, usually requires a longer period of accumulation and then gradually reveals. However, the culture of the spontaneous formation by employees, often vary from the enterprise's development strategy, long-term planning and the design of the system. If we ignore it, it is bound to affect the ultimate realization of the corporate goals.

#### **3.2 The characteristics of the construction of enterprise culture are gradually vivid.**

In general, the fundamental values of the enterprise culture must reflect some of the ethical spirit. The enterprises in Hubei change the past practices, which only focus on the dominant role of "people-oriented", "integrity" and "innovation" etc, as the basic values, thus ignore the combination of common practice and their own personality traits. They especially attach importance to give the construction of enterprise culture a new connotation and content, combine the individual characteristics with the business practice, and carry out the construction of enterprise culture creatively, finally form an enterprise culture full of special feature.

There are 24 enterprises which are short-listed the outstanding units of the national enterprise culture construction in 2011. WISCO, Dongfeng Motor, Daye Nonferrous, Yangtze Optical Fiber, Group

of Bai buting, Blue Special Group and other enterprises, form the enterprise culture with distinctive characteristics, such as "Asia Plus" of Dongfeng Motor Corporation, "Four Day" culture of WISCO, "Cultural Localization" in Hubei Yihua, "Fiberhome Cultural" of Wuhan Institute of Posts and Telecommunications, "Human Oriented Culture in Project" of China Railway 11th Bureau, "Daohuaxiang Culture" of Hubei Daohuaxiang group by long-term exploration and construction, which embody the people's minds, and promote the development of enterprises.

### **3.3 The measures of the construction of enterprise culture is gradually improved**

The construction of enterprise culture requires long-term accumulation, practice, advocacy, nurture and shape. After years of exploration and practice, Hubei enterprises continuously build and perfect the system of corporate culture. In this process, Hubei enterprises stick to this concept-"educating staff, managing enterprise, promoting the enterprise by culture", continuously improve the quality of enterprise culture construction, actively explore new paths of cultural construction and management for enterprise development, and make efforts to achieve the transformation of enterprise management from management to culture, from promoting by single enterprise to advancing by enterprise , party and government, society as a whole, and form the matching of form and content, form a good pattern of the construction of enterprise culture, which is the resonance of leader advocating and staff involving, the combination of enterprise culture-"soft" and institutionalized management-"stiffness" ,internal and external coordination, spirit and substance into account.

### **3.4 The role of the construction of enterprise culture is increasingly prominent.**

In the era of global economic integration, the power of culture has been an important driving force for the development of enterprise. Enterprise culture is the "engine" which promotes the rapid development of enterprise. The construction of enterprise culture unite the wisdom and strength of the staff to the fullest extent, make the formation of values-oriented and institutional constraints, harmonize the labor relations, and give full play to workers' initiative. It also promotes the enterprise and workers to build a community of interests, provide an inexhaustible source of the power to the scientific development of enterprise, and enhance the Core competency of the enterprise. Dongfeng, WISCO, Yihua, Wuhan Tobacco, Daye Nonferrous, Third Ring Road, Huaxin, The Flames of Communications, entered China's top 500 manufacturing enterprises in 2010, and Dongfeng, WISCO entered the World's top 500 in 2010. At present, there are 51 Chinese famous products, 63 Chinese well-known trademarks, 655 famous brand products in Hubei province. The manufacturing competitiveness index of Hubei is 82.43, ranking the first in the central.

Although the construction of enterprise culture in Hubei has achieved some success, there are still some problems, such as the unbalance development of enterprise culture construction, less understanding of it, insufficient attention to it, and the weakness of the material foundation, etc. We should further strengthen the guidance, change concepts, research strategies, and implement the plan.

## **4. The implication of Haier culture on the construction of enterprise culture in Hubei**

Haier's success shows that enterprise culture plays an important role in the existence and sustainable development enterprises. Compared with Haier, enterprises in Hubei far lag behind in this respect, and therefore the successful experience of Haier provides a useful inspiration for further promoting the construction of enterprise culture in Hubei.

### **4.1 Refining the unified core value of employees**

Unified value requires that employees should possess the same value orientation in their ideology, which should also be displayed in their words and deeds. Such quality as dedication and the pursuit of excellence (Haier Spirit), customer-oriented attitude, the concept of quality that the defective is the waste and so on are all the impetus for customer creation in Haier. Haier culture is very unique, and its content involves many aspects of enterprises. It is an ideology which infiltrates enterprise, and especially some of the central part of Haier culture are explored and created by the enterprise and is widely recognized and learned. Therefore, the construction of enterprise culture in Hubei should pay particular attention to refining, explaining and guiding the core values of enterprise culture, making employees intuitively understand and accept it both in mind and in deeds.

### **4.2 Establishing people-oriented enterprise system**

Integrating institutional culture into enterprise culture is conducive to the formation of staff awareness and behavior. Haier's OEC management model (O - Overall, E - Everyone, Everything, Everyday and C - Control, Clear), the conception that everyone is talented and skillful, and the full

market chain concept that everyone is a market and that everyone has a market and so on all deeply expound the people-oriented ideas and systems from different angles. Therefore, the cultural construction of enterprises in Hubei should adhere to the combination of popular culture of staff and enterprise culture, the combination of personal development and enterprise vision, and the combination of institution building and cultural construction. Enterprises should follow the principle of self-management and self-improvement among employees, foster the shared values of employees and enterprises, coordinate the relationship between diversified personal values and unified enterprise value, and enhance the level of institutionalization and standardization in the construction of enterprise culture.

#### **4.3 Building the eclectic characteristic culture**

An excellent enterprise culture must integrate the essence of national culture and the historical humanistic spirit, and should absorb the nutrition of traditional culture and world culture to enrich and develop itself. Zhang Chaoyang, the CEO of Haier Group, integrates ideas of traditional culture from "The Analects of Confucius", "The Art of War" and "Moral" into the construction of enterprise culture. On the basis of inheriting Chinese traditional patriotic spirit, he actively absorbs the spirit of innovation and teamwork from American and Japanese enterprises, and proposes the enterprise culture with rich traditional cultural atmosphere. The enterprise culture of Haier is gradually enriched and developed in its developmental process to adapt to the needs of the enterprise development. Therefore, the construction of enterprise culture, should not only be based on traditional culture, but also actively absorb the world's outstanding culture. By integrating the essence of both of them, enterprises can develop its unique eclectic culture.

#### **4.4 Cultivating the workforce with innovation and learning ability**

Continuous innovation is the fundamental way for enterprises to develop themselves, and is also the most effective way to improve the competitiveness of enterprises and to maintain a competitive advantage. Haier's innovations, such as the creation of the win-win culture are the learning results of Haier people, and they fully show that the spirit of entrepreneurship and innovation is the unchanging gene of the Haier culture. Therefore, Hubei enterprises should continuously improve the quality of staff, create a strong atmosphere of learning and innovation, and foster new work-based learning and learning-based working concept, creating a learning-oriented enterprise to improve innovative capacity.

### **5 Conclusion**

The building of enterprise culture is a long-term process and a system engineering project. Excellent enterprise culture is an important guarantee to keep the enterprise energetic. Therefore, it is the important issue of theoretical and practical research to actively explore the law of the enterprise culture construction and establish the cultural system with distinct time characteristics that meets the needs of the times, meet the modern enterprise needs, meet the specific needs of enterprises. The successful experience of the excellent enterprises will undoubtedly provide a positive inspiration to promote the building of enterprise culture in Hubei province.

(E-mail: lornayy@gmail.com)

**Abstract:** Using the method of principal component analysis to analyze the 74 listing Corporations' financial situation in Hubei province. We select 7 financial indicators, using SPSS software to extract 4 main components with principal component analysis method, and we get composite scores of the listing Corporations. The comprehensive analysis of listing Corporations' financial strength in Hubei Province of China provides some evidence for the listing Corporation to improve management, investment decision and Hubei college students' employment.

**Key words:** Financial strength; the principal component analysis; Comprehensive Evaluation Index System; Hubei province

## 1 Introduction

With capital market development, economic entity, which has become the leading force of Chinese market-oriented economy, is represented by the listed companies. From national economy's point of view, the success of its development highly depends on the overall strength of listed companies. From investor's point of view, financial status of listed companies are different, it is difficult for creditors and investors to choose the lending or investing target. Therefore, how to analyze the financial status of listed companies and the comprehensive evaluation has become the focus of the national security administrative organization. The formal financial status evaluation method is traditional ratio analysis. This method's determination of weighing and application of quantization grading is heavily relying on the author's subjective judgment. Besides, numerous interconnected indicators cannot be differentiated. Therefore, the evaluation result cannot objectively reflect financial status of listed companies.

At present, the principal component analysis method and factor analysis method are widely used, and they have achieved remarkable results in economics, sociology, biology, medicine and other fields. By using principal component analysis (PCA), this article eliminates interaction of evaluating indicators when deals with multi-dimensions and interrelated variable space, as well as determines weight according to the degree of variation of each index value. It also avoids priorities due to personal deviation. By evaluating status of stock circulation of 74 listed companies in Hubei province, the article provides scientific and practical evaluation method to those related decision makers.

## 2 Construct Comprehensive Evaluation Index System

### 2.1 Principle of constructed index system

1) Objectivity principle: When constructs index system, it must in accordance with reality, and on the basis of disclosure information which has audited and verified by certificated public accountant or the related regulator.

2) Overall principle: When constructs index system, the content must thorough reflect every element which influenced financial status of listed companies. Each indicator must be coordinated. Dynamic indicator must act in concert with static indicator; comprehensive indicator must act in concert with individual indicator.

3) Practical principle: When constructs index system, it must be practical that possibility, reliability and economical efficiency of obtaining all indicators' data must be considered.

### 2.2 Design comprehensive evaluation index system

Based on above principles, this article chooses 7 indicators which are rate of Main Business Profit Margins (A1), Inventory Turnover Ratio (A2), Asset Liability Ratio (A3), Equity Ratio (A4), Receivable Turnover Ratio (A5), Cash Ratio (A6), and Quick Ratio (A7).

Construct comprehensive evaluation index system of financial statuses of listed companies. 1) Factor of fund allocation: it mainly indicates stocks' quantity that the listed companies owned, as well as working capital ratio, etc. Generally speaking, earning capacity of a company is

proportional to its capital holding and circulating fund. 2) Earning capacity index, which reflects the listed companies' profit and capacity. Greater earning capacity means better financial status. The index includes Main Business Profit Margins and Inventory Turnover Ratio. 3) Fixed Asset Index, which shows listed companies' market value and equipment valuation etc. 4) Operating capacity index, which tells managers' management usage efficiency and expansion capacity about assets. It embodies assets operating capacity. Higher management capacity means better financial status. It includes Receivable Turnover Ratio, etc.

### 3 Construct the Principal Component Analysis

On the basis of competitive strength evaluation index system of software companies, the article applies the principal component analysis, and constructs comprehensive evaluation model of competitive strength of software companies. Here is the following steps:

Suppose there are m listed companies and has n evaluation index of competitive strength, which form the following matrix:

$$X_{n \times m} = \begin{pmatrix} x_{11} & x_{12} & \cdots & x_{1m} \\ x_{21} & x_{22} & \cdots & x_{2m} \\ \cdots & \cdots & \cdots & \cdots \\ x_{n1} & x_{n2} & \cdots & x_{nm} \end{pmatrix} \tag{1}$$

#### Step 1: Pretreatment of Primary Data

Each indicator determined by the evaluation has different dimension and order of magnitude, which means neither can compare together, nor use multivariate statistical analysis. Therefore, standardizing index value is essential so as to eliminate the differences of dimension and order of magnitude, which makes it comparable. Two steps are taken for data transform processing: centralizing the data and standardizing standard deviation.

##### 1) Centralization

Changed the primary data as:

$$z_{ji} = x_{ji} - \bar{x}_j \quad (j = 1, 2, \dots, n; i = 1, 2, \dots, m) \tag{2}$$

Among all,  $\bar{x}_j = \frac{1}{m} \sum_{i=1}^m x_{ji}$ , is mean value of index in each row. As the result of transform, it comes

to the new matrix:  $Z_{m \times n} = [z_{ji}]_{nm}$ .

##### 2) Standardization

Changed the data in Matrix  $Z_{m \times n} = [z_{ji}]_{nm}$  as:

$$z_{ji}^* = z_{ji} / s_j \tag{3}$$

Among all,  $s_j = \sqrt{\frac{1}{m} \sum_{i=1}^m (x_{ji} - \bar{x}_j)^2 / m - 1}$ , is unbiased variance of indicator in each row. After

centralization and standardization, it comes to the new matrix:  $Z^*_{m \times n} = [z^*_{ji}]_{nm}$ .

#### Step 2: Find Out Correlation Matrix among Indicators

According to the new matrix,  $Z^*_{m \times n} = [z^*_{ji}]_{nm}$ , compute sample correlation coefficient matrix  $R = [r_{kl}]_{nm}$ . Among all,  $r_{kl}$  is the correlation coefficient of indicator k and indicator l.

$$r_{kl} = \frac{1}{n} \sum_{j=1}^n z^*_{jk} z^*_{jl} \quad k, l = 1, 2, \dots, m \tag{4}$$

#### Step 3: The Principal Component Analysis

1) According to sample correlation coefficient matrix R, find out its Eigen value  $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_n \geq 0$ , and corresponding unit Eigen value characteristic vector is  $(e_1 \ e_2 \ \dots \ e_n)^T$ ;

2) The P<sup>th</sup> principle component of the j<sup>th</sup> column is  $y_{pj} = e_p \cdot z_j^*$  (p=1,2,...,m),  $e_p$  is the p<sup>th</sup> Eigen value's corresponding Eigen value characteristic vector, and  $z_j^*$  is the column vector of n indicator in column j;

3) The p<sup>th</sup> principle component's contribution rate is  $a_p = \frac{\lambda_p}{\sum_{i=1}^n \lambda_i}$ , the cumulative contribution rate

of the first k principle components is  $\sum_{i=1}^k a_i$ .

**Step 4: Comprehensive Order of the Principle Components**

The cumulative contribution rate of the adopted first k principle components is normally more than 80%. This can not only cover the major information of n variables, but also reduce to k, which can achieve simplification of multi-indicators' comprehensive evaluation.  $a_p$  is weight, find out weight.

Sum of  $y_{pj}$ , it can get integrated value  $y_j$  of the j<sup>th</sup> column:

$$y_j = \sum_{p=1}^k a_p y_{pj} \tag{5}$$

Among all:  $a_p$  is the contribution rate of the p<sup>th</sup> principle component,  $y_{pj}$  is the p<sup>th</sup> principle component of column j.

**4 Application of the Principle Component Analysis**

**4.1 Source and pretreatment of sample data**

In this paper, it studies 72 listed companies' financial data in Hubei province, which are selected from Tong Huashun software in 2011. Geographically, Hubei lies in the center of China, which runs north and south, with large population. Analyzing financial status of listed companies and competitive industries in Hubei is highly related to China's development.

**4.2 Apply spss to the principle component analysis**

1) Standardized transformation of data.

In order to eliminate incomparability of dimension, use formula(2)、(3) to standardize pretreatment data.

**Table 1 Relationship between Eigen value of related matrix and cumulative contribution rate**

Component	Explained Total Variance								
	Initial Eigen values			Extract Square and load			Spin Square and load		
	Total	Variance %	Cumulation %	Total	Variance %	Cumulation %	Total	Variance %	Cumulation %
A1	2.823	40.328	40.328	2.823	40.328	40.328	2.029	28.983	28.983
A2	1.412	20.169	60.497	1.412	20.169	60.497	2.014	28.778	57.761
A3	1.246	17.795	78.292	1.246	17.795	78.292	1.399	19.983	77.744
A4	.988	14.115	92.407	.988	14.115	92.407	1.026	14.663	92.407
A5	.526	7.514	99.921						
A6	.006	.079	100.000			.000			
A7	-2.065E-17	-2.951E-16	100.000						

2) Correlation matrix derived from standardized matrix.

Since 7 indicators derived from standardized matrix has strong correlation, which makes information that reflected by each table overlapping. This means that using the principle component analysis has advantage in objectively dealing with multidimensional correlated indicators.

3) Table 1 shows relationship between Eigen value of related matrix and cumulative contribution rate.

From table one, the first four components' cumulative contribution rate is 92.407%>85%. Therefore, using overall evaluation to analyze the first four components out of 74 listed companies can not only simplified analyzing structure, but also can assure accuracy. By using SAS6-12, it can output the first four eigenvector's normalized Eigen value characteristic value, which is shown on table 2.

4) Economic Implication of the principal component

Eigenvector in table 2 shows that Asset Liability Ratio, Equity Ratio, Cash Ratio and Quick Ratio of the first principle component are not only positive, but also large. Though Inventory Turnover Ratio is positive, it is almost zero. Therefore, the first principle component illustrates capital allocation of listed companies, which here, it is called asset allocation factor. Main Business Profit Margins, Inventory Turnover Ratio of the second principle ratio is not only positive, but also large. Hence, the second principle component mainly shows the earning capacity of listed companies, it is called efficiency factor. Inventory Turnover Ratio of the third principle component is high, so it is called fixed asset factor. Only Receivable Turnover Ratio of the fourth principle component is positive and large, so, it tells operation capacity of listed companies. It is called operating factor.

**Table 2 Component Matrix**

Component Matrix				
	Component			
	1	2	3	4
Zscore(A1)	.383	.701	.284	-.012
Zscore(A2)	.076	.747	.297	-.383
Zscore(A3)	-.827	-.154	.529	-.088
Zscore(A4)	.827	.154	-.529	.088
Zscore(A5)	-.056	.266	.271	.907
Zscore(A6)	.804	-.346	.477	-.036
Zscore(A7)	.807	-.355	.465	-.039

Method :The Principle Component Analysis  
a. picked up 4 components

5) Overall Score derived from formula (5), listed from high to low in Hubei Province in Table (3).

Among 74 listed companies in Huberi Province, Wuhan Guide Infrared Co., Ltd, Yuan Hua Real Estate Co., Ltd, and Hubei Chu Tian Expressway Co. are the top 3 companies in comprehensive evaluation of financial status, which means they are powerful in all. Wuhan National Pharmaceutical Technology Co. Ltd , Chang Jiang Shipping Group Phoenix Co., Ltd, and Guodian Changyuan Electric Power Co., Ltd are last, the next to last and antepenultimate, which means week in earning capacity, debut paying capacity and operating capacity. Though listed in ST portfolio, Hubei Wuchangyu Co., Ltd has better debt paying ability, so it ranks in the middle of evaluation. Because of lacking data, it fails to find out the overall score of Wuhan Double Co., Ltd and Changjiang Securities Company Limited. What is more, Hubei J.S Corrugating Machinery, Hubei Yihua Chemical Industry Co., Ltd and Wuhan East Lake High Technology Group Co., Ltd were listed on the market in 2009, which were raised a large amount of circulated fund, which influenced the result to some extent. Therefore, considering the influence of anomaly, these three companies should be ranked behind.

**Table 3 Overall Score of Listed Companies' Financial Strength**

Name	Overall Score	Name	Overall Score	Name	Overall Score
Wuhan Guide Infrared Co., Ltd	2.2839	Wuhan Kaidi Electric Powe Co. LTD	-0.0381	SDIC Power Holdings Co., Ltd.	-0.2661
Yuan Hua Real Estate Co., Ltd	1.8702	Routon Electronic Co., Ltd	-0.0437	Hubei Bothwin Investment Co., Ltd.	-0.2699
Hubei Chu Tian Expressway Co., Ltd	1.5765	Angel Yeast Co., Ltd	-0.0448	Wuhan East Lake High Technology Group Co., Ltd	-0.2739
Wuhan Zhongyuan Huadian Science and Technology Co., Ltd	1.4918	Wuhan Yangtze Communications Industry Group Co., Ltd	-0.0496	Hubei Guochuang Hi-tech Material Co., Ltd	-0.2808

Hubei Fuxing Science and Technology Co. Ltd	-0.0359	Hubei Yihua Chemical Industry Co., Ltd	-0.264		

## 5 Conclusion

In general, we use the principle component analysis to extract 4 main components from the whole 7 financial indicators, and we get composite scores of the 74 listing Corporations. The comprehensive analysis of listing Corporations' financial strength comparatively and objectively reflects the financial status and overall strength of these 74 listed companies in Hubei Province.

On the one hand, this article provides some directive significance to investors and creditors' decision making; On the other hand, each listed company can find out their strength and weakness by this objective evaluation, which can achieve better development; Moreover, there are numbers of listed companies and colleges and universities in Hubei Province, graduates have doubts when they are hunting for a job. Job hunter can choose a suitable listed company by using this overall ranking and financial index of these listed companies.

In future research, we can combine the method with cluster analysis or other methods to achieve better effect and it can also be extension used in the research of real estate, new energy, automotive and other industries.

# An Empirical Research on the FDI in Services and the Economic Growth in China

Li Cheng, Xu Hongyi

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: cerise\_hy@163.com, xuhongyi@whut.edu.cn)

**Abstract:** Today it's globalizing world, and China has already become one of the countries who absorb the most FDI, especially the FDI in service industry(SFDI) has become one of the most important factor affecting China's economic development. This paper employs an econometric model to explore the relationship between SFDI and GDP per capita, and reports the differences of the FDI of main service industries on economic growth. At last, it gives comments and suggestions for the development of various FDI on the basis of results.

**Key Words:** FDI; High-end service; Economic growth; Regression equation

## 1 Introduction

With the development of economic globalization and the adjustment of world economics structure, the service industry as an important part of the industrial structure has gradually become a main engine of national economic development. After China has been entered into WTO, the improving status of Foreign Direct Investment has brought a lot of employment opportunities and economic profit for our country, to promote the growing of China's economic strength. Especially, foreign direct investment in service industry (SFDI) played an important role. According to statistics, foreign direct investment accounted for 1.78% of the gross domestic product (GDP) in 2010, compared to a decline in 2009; SFDI accounted for 47.25% in total foreign investment, compared to an increase in 2009; besides, the SFDI proportion of GDP was higher than in 2009. From here we can see that, SFDI has been in a growth trend, as a whole, and its contribution to China's economic is gradually enhanced. This paper builds some models to state the differences of the FDI of several major High-end Service in China high-end service industry on the impact of China's economic growth.

## 2 Relevant literature review

The theory research of SFDI abroad focuses on two aspects, one is to lead the research of manufacturing FDI theory into SFDI, the other is to explain SFDI by international trade theory<sup>[1]</sup>.

Although the related research in our country is not much, some also confirmed the important role of the production of services to China's economic growth, and it can promote China's economic development through technological progress and innovation, deepening the division of labor, increasing production efficiency, industrial clusters, improving the region's investment environment as well as the interaction with industry and other services. For example, the research of some people or organizations such as Borensztein, Arrken, Langnan Chen, and Wei Zuolei showed that the FDI of production services has a significant role in the host country's economic growth. Huang Weiping also analyzed from a quantitative point of view, confirmed that, whether in the short or long term, the FDI of production services and GDP have strong correlation and it has a remarkable enhancing effect on GDP growth<sup>[6]</sup>.

Early empirical researches mostly focused on the study of the correlation between FDI and economic growth, then researchers started to pay attention to their causal relations. Some empirical researches based on the new growth theory do deep analysis on the mechanism of FDI on economic growth. There are two basic conclusions of the study, first is that there's a positive correlation between FDI and economic growth, but the existence of causal relations and direction are not consistent; the second is that there are various impacts of FDI on economic growth, and its effects is relevant to the absorptive capacity of the host country.

Zhang Yun<sup>[1]</sup>, who chose Shanghai as the object of study, found than the effects of the level of industrialization and urbanization and the service labor market on the FDI of Shanghai's modern service is not significant, while the opening and market structure play a greater role in the process of attracting the FDI of Shanghai's modern service. Yang Jing<sup>[7]</sup> did a regression analysis about the FDI of our service industry and the GDP of some related services, found that the FDI of our service industry have greatest driving effect on the economic growth of China's real estate, and smallest on the transport storage and post and telecommunications industry. Wu Tao's study found that the driving effect of service industry to the GDP is

obvious, and the effects of technological research and technical service are the greatest<sup>[8]</sup>. Concerning the mechanism of action that SFDI do to China's economic growth, Zhuang Lijuan believed the technical effect, trade effects and employment effects play the most significant role in promoting our economic growth, and The role of size in order is employment effects, technical effects and trade effects<sup>[9]</sup>.

In summary, we found that most studies have shown that the FDI or SFDI play an active and positive role in promoting economic growth in the past at home and abroad, and it has spillover effects to the host country to bring the knowledge, technology and other intangible assets. However, most studies at home and abroad were about the services in whole or production services, and little about high-end services that have many effects on our economic development. Therefore, this article aims to examine the specific impact of each industry on economic growth from the perspective of the FDI of some major high-end services.

### 3 Empirical Analysis

#### 3.1 Data sources

At present, most scholars generally agree that high-end services have "high five" characteristics, high intellectual, high-income (benefits), high-fashion and high efficient, accounting for 70% of the service industry, and they are the engine of China's economic development. This article learns from abroad related to the classification of high-end services, and takes into account the contribution of some services to China's economic growth and the possible impact on the political, social and cultural, therefore, we divide high-end services into the following seven kinds: "Transport, storage and postal industry"; "Financial industry"; "Education"; "Information transmission, computer services and software industry"; "Scientific research, technical services and geological prospecting industry"; "Business services"; "Real estate industry". In the data selected aspects, concerning its accessibility, long-term and stability, we choose five from seven to do analysis, they are "Transport, storage and postal industry"(abbreviated to JT and called "Transport" later), "Financial industry"(abbreviated to JR), "Education"(abbreviated to JY), "Scientific research, technical services and geological prospecting industry"(abbreviated to KX and called "Science" later), "Real estate industry"(abbreviated to FC). All data used for analysis are from the China Statistical Yearbook, and the sample interval is from 1999 to 2010. In order to remove the effect of changes in the price level, these indicators are adjusted to 1978 price levels. We use EVIEWS to do regression analysis on the FDI of high-end services and economic growth, taking per capita GDP (abbreviated to MGDP) as explained variable and the FDI in various sectors as explanatory variables, and then explore the differences exist. In addition, in order to eliminate possible heteroscedasticity, this paper changes variables into natural logarithm when in use.

#### 3.2 Effect analysis of SFDI and China's economic growth

Regression analysis can help us understand the dependencies between a variable with another variable, knowing the closely relationship between economic growth and services, we first build up a regression equation between the whole FDI of high-end services (abbreviated to AFDI) and MDP, and analyze the dependence relationship between the two, the regression result is as follows:

$$\begin{aligned} \ln(MGDP) = & -2.887672073 + 0.434657164 * \ln(AFDI) + 0.2412365637 * \ln(AFDI(-1)) \\ & (-1.958042) \quad (2.60186) \quad (1.04414) \\ & + 0.02875478373 * \ln(AFDI(-2)) \quad (1) \\ & (0.17455) \\ R^2 = & 0.874672 \quad F = 13.95808 \quad D.W. = 0.726731 \end{aligned}$$

Because in the result  $t = 2.60186$  is larger than  $t_{(0.025)}(8) = 2.306$  under the significant level of 5%, we can see that the overall FDI of high-end services was significantly associated with GDP per capita in 1999 to 2010, but in the latter, their association is not very obvious and AFDI has little impact on economic growth. The value  $R^2 = 0.874672$  shows that 87.47% of the changes in per capita GDP can be explained by the changes of high-end services above. Through the coefficient ahead of AFDI, we can see that, Every increase AFDI \$10000, per capita GDP will increase by \$0.435 when AFDI for each additional \$10,000. DW value look-up table shows there is no self-related phenomenon.

#### 3.3 Effect analysis of the FDI of some related services and China's economic growth

In general, economic indicators will be influenced by environment, technology, politics, and so on. Therefore, we should consider all aspects of the economic indicators to assess the overall effectiveness, but also explore the future development direction when finding differences. In this paper, we established

distributed lag models to analyze the FDI of several major high-end services and economic growth, respectively, so that we get a thorough understanding of the relationship between the current and late FDI and economic growth. The regression equations are as follows:

Transport:

$$\begin{aligned} \ln(MGDP) = & -3.658087651 + 0.3552265296 * \ln(JT) + 0.4915799118 * \ln(JT(-1)) + \\ & (-0.885896) \quad (0.87419) \quad (1.07423) \\ & 0.07958355359 * \ln(JT(-2)) \quad (2) \\ & (0.25850) \end{aligned}$$

$$R^2 = 0.498554 \quad F = 1.988464 \quad D.W. = 0.768240$$

Financial industry:

$$\begin{aligned} \ln(MGDP) = & 2.413952948 + 0.1573145661 * \ln(JR) + 0.06194668046 * \ln(JR(-1)) + \\ & (3.372681) \quad (1.93746) \quad (0.60978) \\ & 0.1613888289 * \ln(JR(-2)) \quad (3) \\ & (1.75803) \end{aligned}$$

$$R^2 = 0.745236 \quad F = 5.850409 \quad D.W. = 0.780947$$

Education:

$$\begin{aligned} \ln(MGDP) = & 7.474112955 - 0.1390907203 * \ln(JY) - 0.01406573119 * \ln(JY(-1)) - \\ & (25.41439) \quad (-2.55006) \quad (-0.18143) \\ & 0.2002885626 * \ln(JY(-2)) \quad (4) \\ & (-3.00168) \end{aligned}$$

$$R^2 = 0.911580 \quad F = 20.61944 \quad DW = 2.213948$$

Science:

$$\begin{aligned} \ln(MGDP) = & 2.429307467 + 0.3453150082 * \ln(KX) - 0.1142841048 * \ln(KX(-1)) + \\ & (18.79589) \quad (6.97695) \quad (-2.50633) \\ & 0.1126763004 * \ln(KX(-2)) \quad (5) \\ & (4.36397) \end{aligned}$$

$$R^2 = 0.990290 \quad F = 203.9652 \quad D.W. = 2.126339$$

Real estate industry:

$$\begin{aligned} \ln(MGDP) = & -1.962315149 + 0.3921450215 * \ln(FC) + 0.1778530235 * \ln(FC(-1)) + \\ & (-1.096864) \quad (2.25323) \quad (0.74088) \\ & 0.06901184793 * \ln(FC(-2)) \quad (6) \\ & (0.37212) \end{aligned}$$

$$R^2 = 0.785360 \quad F = 7.317910 \quad D.W. = 0.615241$$

Because of the  $t_{(0.025)}(8) = 2.306$  under the significant level of 5%, we can see from the results that there are only "Education" and "Science" which are significantly associated with MGDP; because of the  $t_{(0.05)}(8) = 1.860$  under the significant level of 10%, four service industries above except "Transport" are significantly associated with MGDP, and their relevance ranking of the current period is above:

Science > Education > Real estate industry > Financial industry

Something should be noted that among these industries which have significant correlation with MGDP, "Science" has one and two lag effect, it has a strong stimulating effect on China's future economic development.

Contrasting the value  $R^2$  in each equation, we find that 99.03% of the changes in per capita GDP can be explained by the changes of "Science", and the value  $R^2$  of "Education" is also more than 90%, it shows science education has an important influence on China's economic growth.

It is remarkable that, the coefficients of the FDI of education industry are negative, and it indicates there is significant negative correlation with economic growth in China. The likely reason is that when we are developing education vigorously, more investment and income are still focused on domestic, but

less use of foreign investment. What's more, the advantages of other country's education are not fully applied in China's education system. Contrast the coefficients of "Science", "Real estate industry" and "Financial industry", sector FDI impact factor, despite the impact of the FDI of "Scientific" on economic changes is bigger, the actual contribution of the FDI of "Real estate industry" is highest, and per capita GDP increased by \$ 0.392 when average increase of \$ 10,000.

#### 4 Conclusion

In this paper, through the regression analysis of the FDI of high-end services and in China's economic growth between 1999 and 2010 FDI, we find that the former have an important impact on the latter, the following conclusions are:

First, the current FDI of high-end services has a significant positive correlation to China's economy, and it can promote economic development, but lacks of late effects. So, China should increase foreign direct investment inflows to high-end services, take adequate and reasonable use of the technology spillover effects of foreign direct investment, thereby enhancing the competitiveness and the overall level of China's high-end services, and increase high-end services industry's role in promoting China's economic growth.

Second, although the transportation, storage and postal services industry takes a large proportion in the foreign direct investment, it has no significant effect of economic growth. On the contrary, the FDI of emerging science and education have a greater impact. It shows that China should correctly understand the correlation between various industries and economic growth, effectively implementing the strategy of rejuvenating the country through science and education to strengthen the use of foreign direct investment. In education, we should change current related negative into a positive correlation; In science, we should pay close attention to its late effect on economic growth, and give full play to its impact on other industries in China's economic structure.

Third, through the analysis of the regression equation, we should see their actual contribution while understand the degrees of influence of the FDI of various industries on the economic changes. In this sphere, the actual contribution of "Real estate industry" is highest, and "Science" is second, "Financial industry" is followed. Therefore, China should increase the FDI in the rectification process of the real estate industry.

## Analysis on Status and Characteristics of China's Wheat Flour Processing Industrial Structure\*

Niu Yanshao

School of Management, Henan University of Technology, Zhengzhou, P.R.China, 450001

(E-mail:hnjcx@haut.edu.cn)

**Abstract:** At present, the industrial structure of China's wheat flour processing has changed greatly. These structural changes make China's wheat flour processing industry present some new characteristics. Identifying these characteristics will help to optimize the industrial structure of China's wheat flour processing, which will accelerate the sustained and healthy development of wheat flour processing industry. This paper analyzes the status of China's wheat flour processing industrial structure using ratio analysis method based on statistical data. The characteristics of China's wheat flour processing industrial structure are also studied by means of comparative method based on statistical data. The results reveal that the industrial structure of China's wheat flour processing was optimized and presented new characteristics in 2010.

**Key words:** Wheat flour processing industrial structure; Status; Characteristics; Ratio analysis method; Comparative method

### 1 Introduction

Grain industry covers grain production, acquisition, storage, processing, sales and other links, which constitute an industrial chain involving agriculture, industry and trade. Grain processing is divided into 8 categories, which are rice processing industry, wheat flour processing industry, edible vegetable oil processing industry, corn processing industry, grain food processing industry, coarse cereals and potatoes processing industry, feed processing industry and grain machine equipment manufacturing industry. Grain processing industrial structure is in constant change with the development of China's economy. Adjusting and optimizing grain processing industrial structure will lead to a good and rapid development of the grain processing industry. Therefore, studying the status and new characteristics of China's grain processing industrial structure will have an important practical significance to the optimization of wheat flour processing industrial structure.

Existing Chinese literatures only considered the annual production capacity (referred to as capacity for short) and output of wheat flour processing in the status research of China's grain processing industrial structure and only explained the annual production capacity and output of wheat flour processing with the then rough statistical data.<sup>[1]</sup> Some Chinese experts only explored some characteristics of China's grain processing industry; and research about the characteristics of the wheat flour processing industrial structure is rare.

### 2 Status of China's Wheat Flour Processing Industrial Structure

#### 2.1 Regional distribution of China's wheat

Wheat is the most important crop in the world. The population living on wheat as their staple food is more than 35 % around the world.<sup>[2]</sup> Wheat is the staple food of the majority of Chinese people. Wheat grains contain rich starch, lots of protein, a small amount of fat, and a variety of mineral elements and vitamins B.<sup>[3]</sup>

In China, there are 10 eco-wheat growing regions: northern winter wheat region, Huang-Huai winter wheat region, winter wheat region along the middle and lower reaches of Yangtze River, winter wheat region along the upper reaches of Yangtze River, southern winter wheat region, Qinghai-Tibet spring and winter wheat region, northeast spring wheat region, northern spring wheat region, northwestern spring wheat region and Xinjiang winter and spring wheat region.<sup>[2]</sup> The output of hard winter white wheat in Henan Province, Shandong Province and Hebei province accounts for about 60 % of the national output. There are three high-quality dedicated wheat industrial belts in China, which are Huang-Huai-Hai Plain, Middle and Lower Yangtze Plain and Great Khingan foot.<sup>[1]</sup>

#### 2.2 Characteristic of wheat flour processing regions in China

---

\* This paper is supported by the natural scientific research program of The Education Department of Henan Province(2010A630069)

The annual production capacity of China's wheat flour processing industry ranks the first in the world. In recent years, the major wheat cultivation regions have carried out industrialized operation with a close chain by taking advantages of their abundant wheat resources, enhanced their brand awareness, improved their product competitiveness and market share, and continued to study and adopt new technologies and new process, thus further improving their product output and quality; and also they have conducted management innovation and system innovation within the enterprises, constantly improved the modern enterprise system, promoted integration and combination, optimized the industrial structure, and emphasized the development of wheat flour processing industry, thus it has a number of wheat flour processing industrial belts took shape nationwide, among which are the high quality dedicated wheat processing industrial belts in Hebei and Henan Province.

The annual production capacity and output of China's wheat flour processing industry is centralized in the major wheat producing regions in Huang-Huai-Hai Plain, and the output of Henan, Shandong and Anhui provinces accounts for 59.4% of the total output.\*

Henan Province is a strong player in China's wheat flour processing industry. All its main indicators of wheat flour processing industry rank the first in the country. According to statistics, in 2010, there were 720 wheat flour processing enterprises in Henan Province, accounting for 23.8% of the total number of wheat flour processing enterprises in China; the annual production capacity of its wheat flour processing was 46.99 million tons, accounting for 29.4% of the total annual production capacity of wheat flour processing in China; while the wheat flour output was 22.98 million tons, accounting for 30.5 % of the total wheat flour output in China; in addition, Henan Province acquired 62 patents in the wheat flour processing industry, accounting for 24.2% of the total patent number in wheat flour processing industry in China. These data suggest that, Henan Province is at present China's largest wheat flour processing industrial belt, which plays a significant role in China's grain security.

### 2.3 Number structure of China's wheat flour processing enterprises

China's wheat flour processing enterprises can be simply divided into five types according to their daily wheat flour processing capacity (tons/day): enterprises with capacity of less than 30 tons, enterprises with capacity of 30-100 tons (including 30), enterprises with capacity of 100-400 tons (including 100), enterprises with capacity of 400-1000 tons (including 400), and enterprises with capacity of more than 1000 tons (including 1000). The number structure of wheat flour processing enterprises by daily wheat flour processing capacity reflects the number distribution situation of enterprises of all kinds of daily wheat flour processing capacity, which reveals the concentration ratio of wheat flour processing industry. Statistical data shows that, at the end of 2010, there were 3025 wheat flour processing enterprises in China, in which, enterprises with capacity of less than 30 tons account for 8.6% of the total number, enterprises with capacity of 30-100 tons account for 28.0% of the total number, enterprises with capacity of 100 - 400 tons account for 49.3% of the total number, enterprises with capacity of 400-1000 tons account for 11.4% of the total number, enterprises with capacity of more than 1000 tons account for 2.7% of the total number, and enterprises with capacity of more than 400 tons account for 14.1% of the total number(see Figure 1).<sup>1</sup>

Figure 1 Number Structure of China's Wheat Flour Processing Enterprises

Figure 1 shows that, at present, wheat flour processing enterprises with capacity of less than 30 tons were few, enterprises with capacity of more than 1000 tons are the least in number, and about 1/2 enterprises fall into the scope of enterprises with capacity of 100-400 tons, which suggests that most wheat flour processing enterprises are medium-sized, better than the entire grain processing industry

\* Wu Zidan. Statistical Data of Grain and Oil Processing Industry in 2011. 2011:13-81(In Chinese)

dominated by SMEs, that the concentration rate of wheat flour processing industry is relatively high, however, still a big gap from that of the United States, France and other Western developed countries.

#### 2.4 Annual production capacity structure of China's wheat flour processing industry by daily wheat processing capacity

China's wheat flour processing industry can be simply divided into five types based on the daily wheat processing capacity (tons/day): daily capacity of less than 30 tons, daily capacity of 30-100 tons(including 30),daily capacity of 100-400 tons (including 100), daily capacity of 400-1000 tons (including 400), and daily capacity of more than 1000 tons (including 1000). Annual production capacity of wheat flour processing industry refers to that calculated on the basis of the designed daily wheat processing capacity and 24hours a day with three shifts. Enterprises' production capacity refers to the maximum quantity of products of certain types and certain quality that can be produced, or the maximum quantity of processing certain raw materials that can be processed during a certain period of time with all fixed assets for production of the enterprise under a certain organizational technical condition. Annual production capacity of wheat flour processing enterprise reflects the scale of the enterprise. Annual production capacity structure of wheat flour processing industry by daily wheat processing capacity reflects the annual production capacity distribution situation of enterprises of various types of daily wheat processing capacity and reveals the scale degree of the wheat flour processing enterprises. The statistical data shows: in 2010, the annual production capacity of China's wheat flour processing industry was 159.54 million tons, in which, annual production capacity below 30 tons accounted for 0.7% of the national total capacity; annual production capacity of 30-100 tons accounted for 7.3% of the national total capacity; annual production capacity of 100-400 tons accounted for 44.9% of the national total capacity; annual production capacity of 400-1000 tons accounted for 29.1% of the national total capacity and annual production capacity above 1000 tons accounted for 18.1% of the national total capacity(see Figure 2).<sup>1</sup>

Figure 2 Annual Production Capacity Structure of China's Wheat Flour Processing Industry by Daily Wheat Processing Capacity

Figure 2 can be seen that, at present, annual production capacity of China's wheat flour processing industry below 30 tons takes an extremely minor percentage; annual production capacity of over 1000 tons takes a relatively greater percentage; annual production capacity of 100-400 tons takes a significant percentage; while annual production capacity of 100-1000 tons accounts for 74 %; annual production capacity of China's wheat flour processing industry by daily wheat processing capacity is dominated by 100-1000 tons, and the scale degree of wheat flour processing industry is relatively high.

#### 2.5 Annual production capacity structure of China's wheat flour processing industry by enterprise economic types

China's wheat flour processing industry can be simply divided into state-owned and state controlled enterprises, foreign, Hong Kong, Macao and Taiwan invested enterprises and private enterprises by enterprise economic types. Annual production capacity structure of China's wheat flour processing industry by enterprise economic types reflects the wheat flour production capacity distribution of enterprises of different economic types and reveals the possible roles of wheat flour processing enterprises of various economic types. The statistical data shows that, in 2010, China's wheat flour capacity was 159.54 million tons, in which, wheat flour capacity of state-owned and state controlled enterprises was 14.39 million tons, accounting for 9% of the total capacity; wheat flour capacity of foreign, Hong Kong and Macao and Taiwan invested enterprises was 6.99 million tons, accounting for 4.4% of the total capacity; and wheat flour capacity of private enterprises was 138.14 million tons, accounting for 86.6% of the total capacity.<sup>1</sup> It can be seen that private enterprises play a leading role in the production capacity of China's wheat flour processing industry.

## 2.6 Output structure of China's wheat flour processing industry by varieties

Wheat flour processing industry varieties are divided into seven types: patent flour, clear flour, straight flour, whole meal, tailored flour, strengthened nutritious flour and others.<sup>[4]</sup> Output structure of wheat flour processing industry by varieties reflects the output distribution situation of various grades of wheat flour and can reveal the propensity to consume and its distribution in the case of a balance between supply and marketing. The statistical data shows that, in 2010, China's wheat flour output was 75.29 million tons, in which, 33.52 million tons were patent flour, accounting for 44.5% of the total output; 20.35 million tons were clear flour, accounting for 27.0% of the total output; 12.25 million tons were straight flour, accounting for 16.3% of the total output; 750,000 tons were whole meal, accounting for 1.0% of the total output; 5.81 million tons were tailored flour, accounting for 7.7% of the total output; 320,000 tons were strengthened nutritious flour, accounting for 0.5% of the total output; and 2.29 million tons were others, accounting for 3.0% of the total output (see Figure 3).<sup>1</sup>

Figure 3 Output Structure of China's Wheat Flour Processing Industry by Varieties

Figure 3 can be seen that, presently, the main products of China's wheat flour are patent flour and clear flour, the total output of which accounts for 71.5 % of the total output, and this also reflects the improvement of living standards of the people of China.

## 2.7 Output structure of China's wheat flour processing by enterprise economic types

As mentioned earlier, China's wheat flour processing industry can be divided into state-owned and state controlled enterprises, foreign, Hong Kong, Macao and Taiwan invested enterprises and private enterprises by enterprise economic types. Output structure of wheat flour processing industry by enterprise economic types reflects the wheat flour output distribution situation of enterprises of different types and reveals the role and position of wheat flour processing enterprises of different economic types. The statistical data shows that, in 2010, China's wheat flour output was 75.29 million tons, among which, the wheat flour output of state-owned and state controlled enterprises was 5.65 million tons, accounting for 7.5% of the total output; wheat flour output of foreign, Hong Kong, Macao and Taiwan invested enterprises was 3.78 million tons, accounting for 5.0% of the total output; and wheat flour output of private enterprises was 65.86 million tons, accounting for 87.5% of the total output.<sup>1</sup> It can be seen that, private enterprises are at present the main body of absorbing and arranging labor force and employment which decides the trend of wheat flour processing industry and holds a dominant position in China's wheat flour processing industry.

## 3 New Characteristics Analysis of China's Wheat Flour Industrial Structure

Analyzed in accordance with relevant statistical data and survey data, the new characteristics of China's wheat flour industrial structure in 2010 are as follows.

### 3.1 Further improvement of the overall strength of wheat flour processing industry

The policies of maintaining price and stabilizing supply, directed marketing and auction taken by China have ensured the sufficient grain resources of wheat flour processing enterprises and controlled the price growth of wheat flour. Statistical data shows that, in 2010, there were 3025 wheat flour processing enterprises in China, increased by 239 with a growth of 9% compared with the previous year; the annual production capacity of wheat flour processing industry was 159.54 million tons, increased by 37.86 million tons with a growth of 31% compared with the previous year; wheat flour output was 75.29 million tons, increased by about 20 million tons with a growth of 36% compared with the previous year; the total industrial output value of wheat flour processing enterprises was 225.1 billion Yuan with a growth of 42.5 % compared with the previous year; the industrial added value was 24.2 billion Yuan

with a growth of 54.2 % compared with the previous year; the total profit was 4.1 billion Yuan with a growth of 57.4% compared with the previous year; while the profit margin of sales revenue was 1.9% with a growth of 0.2 percentage points compared with the previous year.<sup>1</sup>The capability to withstand market risks of China's wheat flour processing enterprises was improved and the economic benefit was also increased slightly.

### 3.2 Further optimization of product variety structure of wheat flour processing industry

Among the wheat flour varieties, patent flour, clear flour, straight flour and tailored flour are in the dominant position. As mentioned earlier, in 2010, patent flour output accounted for 44.5% of the total wheat flour output in China, clear flour output accounted for 27% of the total output, straight flour output accounted for 16.3% of the total output, and tailored flour output accounted for 7.7% of the total output, while the output of these four products together accounted for 95.5 % of the total output, thus these four products were in a dominant position. In terms of the wheat flour output structure by varieties, clear flour, straight flour and whole meal were increased in their output compared with the previous year, patent flour and nutritionally strengthened flour remained basically the same with the previous year; while tailored flour and others were decreased in output compared with the previous year. The output of all wheat flour varieties had increased compared with the previous year, and as shown by the statistical data, in 2010, the output of whole meal increased by 46.6% compared with the previous year, ranking the first; straight flour increased by 46.4 % compared with the previous year, ranking the second; nutritionally strengthened flour increased by 46.3% compared with the previous year, ranking the third; while tailored flour increased by 5.3% compared with the previous year, ranking the last(see Table 1). The product variety structure of wheat flour processing industry was further optimized, showing a good trend.

**Table 1 Output Structure of China's Wheat Flour Processing Industry by Varieties**

Item	2009		2010				
	Output (10000 T)	Structure( %)	Output (10000 T)	Structure( %)	Output increase (10000 T)	Growth rate (%)	Structure change (%)
Patent flour	2465	44.6	3351.7	44.5	886.7	36.0	0.0
Clear flour	1422.4	25.7	2035.4	27.0	613	43.1	1.3
Straight flour	837	15.1	1225.5	16.3	388.5	46.4	1.1
Whole meal	50.9	0.9	74.6	1.0	23.7	46.6	0.1
Tailored flour	551.5	10.0	580.8	7.7	29.3	5.3	-2.3
Strengthened nutritious flour	21.6	0.4	31.6	0.4	10	46.3	0.0
Others	184.3	3.3	228.9	3.0	44.6	24.2	-0.3
Total	5532.7	100	7528.5	100	1995.8	36.1	

### 3.3 Consolidation of private enterprises' dominant position

In terms of capacity, output, total industrial output value, product sales revenue, profits, etc. of wheat flour processing industry, China's private enterprises enjoy an advantage over other grain processing industry (except the edible vegetable oil industry). As mentioned earlier, in 2010, the wheat flour capacity of China's private enterprises was 138.14 million tons, accounting for 86.6% of the total capacity with a growth of 31% in capacity and 0.1 percentage point in capacity structure compared with the previous year; while the wheat flour output of private enterprises was 65.86 million tons, accounting for 87.5 % of the total output with a growth of 38 % in output and 0.9 percentage point in output structure compared with the previous year. It can be seen that the dominant position of private enterprises in wheat flour processing industry has been consolidated continuously and private enterprises have become the main force of China's wheat flour processing industry.

As mentioned earlier, in 2010, the wheat flour capacity of foreign, Hong Kong, Macao and Taiwan invested enterprises in China was 6.99 million tons, accounting for 4.4% of the total capacity with a growth of 32.4 % compared with the previous year, which was 1 percentage point higher than the average capacity growth of wheat flour processing industry, thus presenting a relatively rapid capacity growth; while the wheat flour output of state-owned and state controlled enterprises in China was 5.65 million tons, accounting for 7.5% of the total output with a growth of 43 % compared with the previous

year, which is 6.8 percentage points higher than the average output growth of wheat flour processing industry, presenting a rapid output growth.

### **3.4 New heights of scale operation of wheat flour processing industry**

China has integrated some small and medium-sized enterprises in the wheat flour processing industry; after the integration, enterprises of backward capacity are eliminated, while the number of large and medium-sized enterprises increases and the scale operation gets further development. As mentioned earlier, in 2010, the number of enterprises with daily wheat processing capacity of 100-400 tons was 1490, increased by 256 with a growth of 20.7% compared with the previous year; the number of enterprises with daily wheat processing capacity of more than 400 tons was 427, increased by 165 with a growth of 63% compared with the previous year; while the product output of enterprises with daily wheat processing capacity of more than 400 tons was 42.445 million tons, accounting for 56.4% of the total output with a growth of 4.2 percentage points compared with the previous year. It can be seen that the scale operation of China's wheat flour industry has obtained new results and has laid the foundation for the enhancement of scale economies.

### **3.5 Gradual increase of capacity utilization rate of wheat flour processing industry**

The capacity utilization rate of wheat flour processing industry is the ratio between the annual raw materials processing quantity and the annual raw materials processing capacity,<sup>[5]</sup> which reflects the capacity utilization degree of wheat flour processing industry. It is internationally recognized that it shall be taken as overcapacity if the capacity utilization rate is below 75%.<sup>[1]</sup> At present, the capacity of China's wheat flour industry is still in a state of overcapacity as a whole. Statistical data shows that, the capacity utilization of China's wheat flour processing industry is 70.3% in 2010, with a growth of 3.1 percentage points compared with the previous year.<sup>1</sup> This shows that the capacity utilization rate of wheat flour processing industry is gradually increasing and the phenomenon of equipment being in idle and equipment waste is reducing.

## **4 Conclusions**

According to above the status and characteristic studies of China's wheat flour processing industrial structure using ratio analysis method and comparative method, the paper made the following conclusions:

We found that the industrial structure of China's wheat flour processing had been further optimized in 2010, such as number structure of China's wheat flour processing enterprises, annual production capacity structure by daily wheat processing capacity, output structure by varieties, etc.

The industrial structure of China's wheat flour processing presented new characteristics in 2010, such as the further optimization of product variety structure, the consolidation of the leading role of private enterprises, new breakthrough of large-scale operation, the gradual increase of capacity utilization rate, and so on.

The industrial structure of China's wheat flour processing is in constant change and need to be timely adjusted and optimized to promote a sustained and healthy development of wheat flour processing industry.

# The Influence of Investment in Fixed Assets on GDP in Liaoning Province of China

Sun Lili, Li Yunhong

Liaoning University of Science and Technology, Anshan, P.R.China, 114000

(E-mail: sunli3282@163.com, 519947778@qq.com)

**Abstract:** With economic development, Liaoning Province of China investment in fixed assets is increasing, which is a growing role in boosting the GDP. Investment in fixed assets can be divided into a lot of kinds by economic types, we collected data from 1995 to 2010 in Liaoning Province, and used econometric method to study the influence of three major investment in fixed assets on GDP, the three major investment in fixed assets are state-owned fixed assets investment, the collective economy fixed assets investment and individual economy fixed assets investment, which account for a larger proportion in the amount of investment in fixed assets. We want to illustrate the importance of investment in fixed assets in Liaoning Province to the province's economic development.

**Key words:** GDP; State-owned fixed assets investment; Collective economy fixed assets investment; Individual economy fixed assets investment; Econometric method

## 1 Introduction

In 2008, the international financial crisis struck, China's economy suffered a huge impact. China decided to invest 400 billion yuan to expand domestic demand, and fixed assets investment accounted for a large proportion in the 400 billion yuan investment. Today, China introduced measures to expand domestic demand have effectively prevented the economic downturn, ensured the growth rate, but also provided the impetus to world economic recovery. In this context, to study the fixed assets investment in boosting the economy is very significant.

Academia has researched the impact of investment in fixed assets on economy for a long time, De Long and Summers in 1992 proved that there was significant positive correlation between fixed assets investment and economic growth in some countries such as America, the higher the rate of investment in fixed assets, the faster the rate of economic growth<sup>[1]</sup>. However, there are some results show that between investment growth and economic growth independent of each other, there is no causal relationship (Lutz, 1999; Harris and Vally, 2000). Domestic scholars on the study of investment in fixed assets, Liu Jinquan et al. (2002) find that exist simple two-way causal relationship in the level between investment in fixed assets and actual GDP (non-Granger causality), but there is no correlation between the rate of change. Mao Jingyi (2006) thinks that the influence of the fixed assets investment fluctuations on economic fluctuations is significant, which plays a positive role in fixed asset investment growth boosts output growth, and influence model is dynamic, fixed assets investment fluctuations before economic fluctuation two months<sup>[2]</sup>.

In previous studies, there are more literatures about the influence of national investment in fixed assets on GDP, while the sub-region, detailed classification of fixed asset investment, quantitative analysis of the impact of a particular investment in fixed assets in the region on its GDP in few papers. Especially in recent years, the researches about the impact of Liaoning Province of China investment in fixed assets on its GDP are less. But I think the investment in fixed assets is the main driving force for national economic development, but also an important indicator to measure a national and regional production capacity. The allocation proportion of investment in fixed assets in the different forms impacts on the future ownership structure, investment diversification is the first mentioned conditions to adjust and improve the ownership structure. Since the 1990s, the growth of investment in fixed assets in Liaoning Province is rapid and stable. From 1995 to 2010, total fixed asset investment increased to 1.604303 trillion yuan from 86.55 billion yuan, which is the main driving force to promote the Liaoning sustained and rapid economic growth.

Therefore, based on the background of the economic growth mode transformation, through statistical analysis to study Liaoning Province investment in fixed assets since the 1990s, is of great practical significant for the province to promote economic development.

## 2 The Selection of Variables

In this article, I mainly analyzed the impact of investment in fixed assets in Liaoning Province of

China on the province's economic situation. I used the GDP indicators to reflect the economic performance of Liaoning Province. I mainly collected state-owned economy, collective economy and individual economy the three accounted for a larger proportion of the investment project data for the empirical analysis.

GDP, namely gross domestic product, refers to in a period of time (a quarter or a year), the value of all final goods and services produced in a country or region's economy, is often recognized as the best indicator to measure a country's economic situation. So in this paper, I selected Liaoning province's GDP to measure the economic conditions of Liaoning province.

Investment in fixed assets can be divided into the investment in fixed assets of state-owned economy, collective economy, individual economy, joint ownership, share holding economic, foreign funded, Hong Kong, Macao and Taiwan investment economy by economic types. Among them, state-owned economy, collective economy and individual economy of these three types of investment and GDP remained the same rising trend since the 1990s, and account for a large proportion of the total investment in fixed assets, it can be said that the three types investments largely affect economic growth, so in this article, I selected the state-owned economy, collective economy and individual economy, the three types of investment as the explanatory variables that impact on GDP.

### 3 Fixed Assets Investment and GDP Relationship Modeling and Solving

#### 3.1 Data collection

My data is collected from the Internet, mainly from the National Bureau of Statistics of China and the China Statistical Information Network. The data covers the total GDP, the state-owned investment in fixed assets, the collective economic investment in fixed assets and the individual economy in fixed assets investment of Liaoning Province from 1995 to 2010(Unit: 100 million yuan). As follows:

**Table 1 Liaoning Province Data**

Year	GDP	State-owned fixed assets investment	The collective economy fixed assets investment	Individual economic fixed assets investment
1995	2793.40	584.87	79.56	45.31
1996	3157.70	544.66	102.83	69.30
1997	3582.50	573.76	97.36	87.16
1998	3881.70	651.21	119.26	100.33
1999	4171.70	662.95	140.00	121.42
2000	4669.10	649.42	154.13	149.10
2001	5033.10	690.71	158.7	179.08
2002	5458.20	648.90	173.54	240.19
2003	6002.50	712.22	229.49	335.16
2004	6672.00	930.59	326.43	523.53
2005	8047.30	1245.53	499.02	813.40
2006	9304.50	1700.33	185.30	1486.56
2007	11164.30	2051.43	278.71	2091.58
2008	13668.60	2496.84	442.12	3140.67
2009	15212.49	2845.47	480.72	4108.29
2010	18457.27	3875.48	504.36	5437.45

#### 3.2 The establishment of the model

According to the Keynesian model:  $Y=C+I+(X-M)$ , we can know that the investment is an important part of the gross domestic product (GDP), they are a positive correlation. So I created a multiple linear regression model.

Set: GDP is the explanatory variable  $Y$

State-owned fixed assets investment is variable  $X_1$

Collective investment in fixed assets is variable  $X_2$

Individual investment in fixed assets is variable  $X_3$

The initial model:  $Y=\alpha+\beta_1X_1+\beta_2X_2+\beta_3X_3+U_t$  (1)

**3.3 Economic significance test**

**3.3.1 Preliminary regression**

Preliminary regression to the original model, get the following results:

Dependent Variable: Y				
Method: Least Squares				
Date: 06/05/12 Time: 20:25				
Sample: 1995 2010				
Included observations: 16				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1091.664	906.2440	1.204603	0.2516
X1	3.843294	1.508762	2.547317	0.0256
X2	5.723170	1.830148	3.127162	0.0087
X3	0.047129	0.897984	0.052483	0.9590
R-squared	0.985050	Mean dependent var	7579.773	
Adjusted R-squared	0.981313	S.D. dependent var	4734.256	
S.E. of regression	647.1757	Akaike info criterion	15.99543	
Sum squared resid	5026036.	Schwarz criterion	16.18858	
Log likelihood	-123.9634	Hannan-Quinn criter.	16.00532	
F-statistic	263.5649	Durbin-Watson stat	0.901043	
Prob(F-statistic)	0.000000			

**Figure 1 OLS Regression Results**

Model estimation results:

$$Y=1091.664+3.8433X_1+5.7231X_2+0.0471X_3 \tag{2}$$

(1.2046)(2.5473)(3.1272)(0.0525)

$$R^2=0.9851 \quad F=263.5649 \quad D.W.=0.9010$$

It can be seen that the model parameters are positive, the state-owned economy, collective economy and individual economy of these three fixed-asset investment and GDP showing a positive correlation, in line with economic theory. R<sup>2</sup> (coefficient of determination) =0.9851, modified coefficient of determination is 0.9813, which indicates the model's goodness of fit is very good, the fixed assets investment has a strong explanatory power to GDP.

F-test, under significance level 0.05, check the degree of freedom in the F distribution table for k = 3, n-k-1 = 12 the critical value F<sub>0.05</sub>(3,12) =3.49, obviously F = 263.5649 greater than 3.49, shows that these three type of investment in fixed assets together have a significant impact on GDP.

T-test, under significance level 0.05, check the degree of freedom 12 in the T distribution table , the critical value T<sub>0.025</sub>(12)=2.18, seen from the results, X<sub>3</sub> T-test is not significant, the influence of the state-owned fixed assets investment and individual economic fixed assets investment on GDP is significant, but the collective economic investment in fixed assets in this model do not show a significant impact on GDP, which may be the existence of multicollinearity.

**3.3.2 Multicollinearity inspection and correction**

	X1	X2	X3
X1	1.000000	0.804124	0.993738
X2	0.804124	1.000000	0.795947
X3	0.993738	0.795947	1.000000

**Figure 2 Correlation Coefficient Matrix**

As can be seen from the correlation coefficient, there is a correlation coefficient greater than R<sup>2</sup>, so the model has multicollinearity.

The following, use the stepwise regression to correct the explanatory variables. X<sub>1</sub>, X<sub>2</sub>, X<sub>3</sub> were regressed to y respectively by using ordinary least-squares, have:

$$Y=1554.119+4.6208X_1 \tag{3}$$

(4.6212)(22.4002)

$$R^2=0.9729 \quad F=501.7695 \quad D.W.=0.5067$$

$$Y=1016.593+26.4409X_2 \tag{4}$$

(0.8330) (6.2714)

$$R^2=0.7375 \quad F=39.3308 \quad D.W.=1.3289$$

$$Y=4288.503+2.7821X_3 \tag{5}$$

(14.1128) (18.3237)

$$R^2=0.9600 \quad F=335.7579 \quad D.W.=0.2378$$

Explanatory variables in order of importance,  $X_1, X_3, X_2$

With the first equation  $Y = 1554.119 + 4.6208 X_1$  as the foundation, followed by the introduction of  $X_3, X_2$ .

First introduce the  $X_3$  to the model, have

$$Y=1472.275+4.7613X_1-0.0857X_3 \tag{6}$$

(1.2666)(2.4856) (-0.0738)

$$R^2=0.9729 \quad F=233.0648 \quad D.W.=0.5252$$

When  $X_3$  is added, its coefficient is negative, because the fixed asset investment and GDP is a positive correlation, so this is inconsistent with economic theory, and did not improve the  $R^2$ , T - value does not pass inspection, so remove the  $X_3$ .

Then  $X_2$  introduced into the model, have

$$Y=1047.059+3.9211X_1+5.7186X_2 \tag{7}$$

(3.4642)(14.6705) (3.2556)

$$R^2=0.9850 \quad F=428.1932 \quad D.W.=0.9110$$

After introducing  $X_2$ ,  $R^2$  slightly increased, its coefficient is through the T-test, so keep  $X_2$ . State-owned economy investment in fixed assets and collective economy investment in fixed assets both have a significant impact on GDP.

In summary, for this model, the  $X_3$  is redundant, should be removed. New fitting results are as follows:

Dependent Variable: Y				
Method: Least Squares				
Date: 06/05/12 Time: 20:34				
Sample: 1995 2010				
Included observations: 16				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1047.059	302.2528	3.464184	0.0042
X1	3.921121	0.267279	14.67054	0.0000
X2	5.718627	1.756583	3.255541	0.0063
R-squared	0.985047	Mean dependent var	7579.773	
Adjusted R-squared	0.982746	S.D. dependent var	4734.256	
S.E. of regression	621.8576	Akaike info criterion	15.87066	
Sum squared resid	5027190.	Schwarz criterion	16.01552	
Log likelihood	-123.9653	Hannan-Quinn criter.	15.87808	
F-statistic	428.1932	Durbin-Watson stat	0.911008	
Prob(F-statistic)	0.000000			

**Figure 3 OLS Regression Results**

$$Y=1047.059+3.9211X_1+5.7186X_2 \tag{8}$$

(3.4642)(14.6705)(3.2556)

$$R^2=0.9850 \quad F=428.1932 \quad D.W.=0.9110$$

At this point, the model's goodness of fit is high, the T-test and F-test are passed. The influence of state-owned economy investment in fixed assets and collective economy investment in fixed assets on GDP is significant. They are positively correlated.

### 3.3.3 Autocorrelation inspection and correction

Test with LM method:

Breusch-Godfrey Serial Correlation LM Test:			
F-statistic	4.254944	Prob. F(1,12)	0.0615
Obs*R-squared	4.188209	Prob. Chi-Square(1)	0.0407

**Figure 4 Autocorrelation Inspection Result**

Because  $TR^2=4.1882 > \chi^2_{0.05}(1)=3.841$ , so there is autocorrelation. This may be due to the inertia of reasons, most economic time series has autocorrelation, its current value is often affected by lag phase, GDP and fixed asset investment will slowly change over time, thereby build models lead to the error term autocorrelation.

I use the Generalized Difference Method to correct autocorrelation.

Dependent Variable: GDY Method: Least Squares Date: 06/05/12 Time: 21:11 Sample (adjusted): 1996 2010 Included observations: 15 after adjustments				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	899.1643	171.9562	5.229031	0.0002
GDX1	3.939377	0.194927	20.20949	0.0000
GDX2	2.769213	1.092663	2.534371	0.0262
R-squared	0.981790	Mean dependent var		4163.104
Adjusted R-squared	0.978755	S.D. dependent var		2619.616
S.E. of regression	381.8229	Akaike info criterion		14.90465
Sum squared resid	1749464.	Schwarz criterion		15.04626
Log likelihood	-108.7849	Hannan-Quinn criter.		14.90314
F-statistic	323.4956	Durbin-Watson stat		1.119524
Prob(F-statistic)	0.000000			

**Figure 5 OLS Result After Correcting Autocorrelation**

Use  $GDY, GDX_1, GDX_2$  as sample, regressed again, have:

$$GDY=899.1643+3.9394GDX_1+2.7692X_2 \tag{9}$$

(5.2290) (20.2095) (2.5343)

$R^2=0.9818 \quad F=323.4956 \quad D.W.=1.1195$

The generalized least squares estimate of the model is:

$$Y=1976.1853+3.9394X_1+2.7692X_2 \tag{10}$$

(5.2290)(20.2095)(2.5343)

$R^2=0.9818 \quad F=323.4956 \quad D.W.=1.1195$

After correction, each index all through the test in the model, there is no autocorrelation.

3.3.4 Heteroscedasticity inspection

Use White Test to inspect heteroscedasticity:

Heteroskedasticity Test: White			
F-statistic	1.489312	Prob. F(5,9)	0.2840
Obs*R-squared	6.791597	Prob. Chi-Square(5)	0.2366
Scaled explained SS	1.283002	Prob. Chi-Square(5)	0.9367

**Figure 6 Heteroscedasticity Inspection Result**

Because of  $TR^2=6.7916 < \chi^2_{0.05}(5)=11.071$ , so the error terms of the model does not exist heteroscedasticity.

After a series of tests, I get the final model:

$$Y=1976.1853+3.9394X_1+2.7692X_2 \quad (11)$$

$$(5.2290)(20.2095)(2.5343)$$

$$R^2=0.9818 \quad F=323.4956 \quad D.W.=1.1195$$

#### 4 Conclusions

This paper collects the national economy annual statistical data of Liaoning Province of China from 1995 to 2010, uses econometric method, through multicollinearity inspection, autocorrelation inspection, heteroscedasticity inspection, conducts an empirical analysis to study the influence between GDP and fixed asset investment, mainly state-owned fixed assets investment and collective economy investment in fixed assets in the province from 1995 to 2010. The resulting model is  $Y=1976.1853+3.9394X_1+2.7692X_2$ . From the test result, we can see China's fixed asset investment and GDP exists between long-term stable relationship and the dynamic equilibrium mechanism. The correlation coefficient of the state-owned fixed assets investment and GDP is higher than the correlation coefficient of the collective economy fixed assets investment and GDP, which shows the state-owned fixed assets investment than collective economy fixed assets investment has a greater impact on the province's economic growth.

Through previous study, we can know that fixed asset investment and GDP is a linear positive relationship, which is consistent with the model I have got. According to a study of the relationship between Liaoning Province 1980 to 2010 fixed assets investment and its economic growth shows: there is a strong correlation between social fixed assets investment and economic growth, every 1% increase in investment in fixed assets can bring Liaoning Province national economy increase of 2.90 %. Based on this result, the author thinks presently investment in fixed assets in Liaoning Province efficiency is relatively low<sup>[3]</sup>. This conclusion and the model are also consistent.

China's fixed asset investment and GDP exists between long-term stable relationship and the dynamic equilibrium mechanism. Known from the previous model, the influence of state-owned fixed assets investment and collective economy investment in fixed assets on GDP is significant and the impact of state-owned fixed asset investment even more strongly.

From the test data we can see in the next few years, the main power of Liaoning economic growth will still come from rapid investment growth, investment rates will continue to keep higher level. Our province should not only keep the rapid growth of investment, but also to prevent overheating investment; both must play investment to economic growth impetus function, and to prevent the blind construction and low level repeated construction. This requires us to do: 1) insist on deepening the reform of the investment system<sup>[4]</sup>; 2) maintain investment in long-term stable growth; 3) determine reasonable investment scale, maintain a modest investment<sup>[5]</sup>; 4) grasp a reasonable investment structure, formulate rational investment direction.

**Abstract:** Using a partner selection process in the start of strategic alliances is not yet general practice. This is regarded as one of the reasons why many strategic alliances fail to be successful. The use of a structured partner selection process could be a way to build one's alliance capability and create a better fit and higher alliance performance.

In this paper, drawing from quantitative and qualitative research, we argue that alliances are more likely to increase alliance success when the partners pay particular attention to aspects with legal dimension within their partner selection process. Our key argument is that, as inter partner conflicts are the main reasons for alliance failure, by taking a legal perspective and providing adequate governance structure as instruments early on during the partner selection process, may diminish those conflicts and increase alliance success.

Our findings from a quantitative study among alliance professionals suggest that the use of negotiation and standard governance is highly effective in helping firms to increase their alliance success. As our study indicates that including clear steps regarding legal aspects of alliance selection, we further explored the role 'the law' (contracts and lawyers) plays and may play in (to optimizing) a successful selection process. We not only show the added value of taking a legal perspective, we also suggest which and when legal elements may be organized in such a way that they support a successful partner selection process.

**Key words:** Alliance management; Partner selection process; Legal involvement

### 1 Introduction

Governance conflicts and opportunism are often found to be the root of alliance conflicts and they often result in a lower level of alliance performance (Bell et al., 2006; Dacin et al., 2007; Dekker, 2008; Reuer & Ariño, 2007; Vlaar et al., 2007). Many conflicts and opportunistic behavior are either prevented or triggered by certain legal arrangements between the partners (Mayer & Argyres, 2004; Sampson, 2004). Contracts for example, can lead to agreement in a legally valid manner on strategy, demand competencies, and specific details of the roles, the responsibilities, and the collaboration process. If done properly, they facilitate collaboration and increase trust, whereas uncertainty and misunderstandings, on the other hand, increase the chance of conflict (Vlaar et al., 2007). Accordingly, legal aspects are necessary to give guidance and to control unforeseen events, and by incorporating them in the partner-selection process they may help to define partner expectations and to plan activities (Ryall & Sampson, 2003; Ariño & Reuer, 2004). There is therefore a clear role for legal aspects in the partner selection process when starting the alliance formation process because they often help to bridge the governance structures of the two partners and improve the selection process. The design of a legal framework may help partners to stay on course during the lifetime of the alliance.

Given its importance, it is surprising that only a few articles have been written about legal governance related to partner selection processes. There are some articles concerning the role of governance for alliances in general, but none considers which legal aspects need to be organized during the partner selection process. So far, alliance researchers tend to ignore the impact of legal aspects in partner selection processes. To fill this gap, this paper will empirically explore how alliance managers perceive the need to incorporate legal involvement in the selection process and procedure.

For this purpose two research questions will be investigated.

*Which legal aspects play a role and when do they need to be addressed over the life cycle of the partner selection process?*

This chapter starts with a review of the economic and legal literature on contractual arrangements and the partner selection process, including the role of negotiation and lawyers. The subsequent section describes how we gathered empirical material to measure the success of the use of legal mechanisms. We first describe which legal aspects may be organized in the partner selection process to enhance alliance success as valued by the expert panel and we design a framework to show when legal involvement is

necessary within the steps of the partner selection process. Finally we will analyze the added-value of lawyers and other legal involvement within the partner selection process. In the discussion section we will discuss the main results and provide several implications of our findings.

## 2 Theoretical Background

### *Economic and legal theory on contractual legal arrangements and the partner-selection process*

Two different perspectives—structural and relational—have contributed to the theory of alliance governance (Madhok, 1995; Powell, 1998). Based on transaction cost theory, the structural perspective assumes opportunistic behavior among partners (e.g., Williamson, 1985). It indicates that partnering expectations, the business plan, and the initial structural design combined with legal mechanisms such as contracts may prevent opportunism (Ariño & Reuer, 2005; Hennart, 2006). The other perspective is relational and based on social exchange theory (Blau, 1964); it assumes trust among partners. In contrast to the structural perspective, the relational approach indicates that trust and communication between partners lead to success because governance issues are handled with trustworthy behavior and good communication instead of legalities (Das & Teng, 2002; Salk, 2005).

Because of the specific focus of each perspective, other studies suggest combining the two (Bell et al., 2006; Doz, 1996; Reuer & Ariño, 2007; Vlaar et al., 2007). Using alliance evolution theory (Doz, 1996), these researchers assume that relational and structural/legal processes influence each other. They state that the design and application of structural elements (i.e., contracts) is related to relational processes such as the evolution of trust over the life cycle of the alliance (Faems et al., 2007). They point to the negotiation of the contract as a vital process in alliances because it leads to mutual interdependence and competence trust (Argyres & Mayer, 2007; Faems et al., 2007).

What is the added value of a structural-contracts perspective and taking lawyers' roles into account in partner selection? Contractual arrangements are considered to be catalysts, increasing or decreasing the chance of success of (pre)contractual relationships with legal experts as professionals influencing their contents and interpretation. This makes it worth examining their role during partner selection when the parties explore potential partners and make their initial promises. Even before a legal contract is signed the negotiations may have legal effect.

There are various reasons why contracts or legal documents describing bilateral agreements between parties are important in structuring relationships such as alliances. According to contract theory, collaboration processes do not always go smoothly without contracts (Shavell, 2003). For economists, this justifies the existence of contracts and the possibility of their enforcement by outside intervention (Craswell, 2000; Cooter & Ulen, 2007).

Economists stress several reasons for using contracts. First, contracts provide parties with a platform for interaction (Shavell, 2003; Polinsky & Shavell, 2007; Cooter & Ulen, 2007). Contracts enable people to coordinate their actions, and to specify what they agreed on, and to find jointly beneficial goals. Through contracts, parties specify the actions that they will take in the future, and contracts also allow them to share risk in mutually beneficial ways (Shavell, 2003).

Secondly, contracts help to delimit the range of acceptable behavior. Because contracts are enforceable by law, they help to secure optimal commitment and reliance. Economic theories on the importance of this enforcement base it either on the utility created by the eventual performance of the promise (welfare is usually increased by carrying out a promise) or on the utility created by the ex-ante incentives of the promise supported by a general rule of enforceability (Craswell, 2000; Goetz & Scott, 1981; Shavell, 1991; Katz, 1998). The incentives creating an efficiency gain are, for instance, the incentive for the promisee to rely on the promise made by the promisor by agreeing on a rule requiring compensation, or measures for a better allocation of the risks if the parties differ in their attitude towards risk. Such incentives may encourage telling the truth about the conditions that will affect performance (Craswell, 2000; Goetz & Scott, 1981; Shavell, 1991; Katz, 1998).

Thirdly, there are costs involved in negotiating and enforcing promises (transaction costs)

(Klaes, 2002; Williamson, 1985; Williamson, 2002). The assumption is that if such costs did not exist, rational actors would come to mutually beneficial terms (Ulen, 1999). Contracts are expected to reduce transaction costs because the parties agree on how they will work together over a period of time (Masten, 2000). Therefore, entering into a contract reduces the prospect of costly, repetitive bargaining. The parties minimize the transaction costs of negotiation by supplying efficient default terms and regulations for their relationship.

Finally, contracts may provide means for dispute resolution. Most contain a paragraph on the applicable law and legal authority. Detailed conflict-resolution techniques may be included in contracts or a reference to the applicable conflict-resolution rules. In summary, a contract is a mechanism that supports the parties' collaboration process, and contract law acts as a backup in case parties fail to regulate an issue or obligation explicitly (Cooter & Ulen, 2004).

In the partner-selection process these tasks are relevant because enforcement possibilities help partners to trust each other and make the collaboration more smooth during the selection stage. Contractual arrangements allow them to coordinate their interaction, to secure commitment and reliance, and can lower the costs of negotiation by providing clear agreement or rules. Finally, identifying conflict and deciding how conflict will be resolved at the earliest stages of a contractual relationship can prevent subsequent problems.

*Role of negotiation and lawyers in the partner-selection process*

The steps of negotiation are as follows ((Menkel-Meadow, 2000; Wilson, 1995): the parties start to negotiate, develop a relationship, identify potential differences of opinion, and plan how to deal with them. Negotiation processes are fundamental to successful selection and collaboration. They develop relationships between people and entities. They also allow for interactions in order to foresee conflict and plan conflict management. Because the alliance partners interact over time, the relationship matters. Through negotiations with the other party a bond is developed and a relationship created. The process of alliance management also involves this. The parties' relationship is a key variable for successful collaboration. One may perceive the parties' relationship as their vehicle for cooperation. A good relationship facilitates interaction and communication, makes transactions more efficient and therefore less costly, and creates a bond between the parties (Kritzer, 1991; Menkel-Meadow et al., 2005). It facilitates the growth of trust between the cooperating partners and their representatives. Moreover, a good relationship creates a mutual dependence that may further strengthen the bond.

The process of developing a relationship that allows the parties to achieve their goals mainly takes place through negotiations (Boddy et al., 2000). First, the client develops a relationship with a number of potential partners. After the selection of a partner, the relationships with the other candidates end and the relationship with the selected candidate intensifies. The companies enter into a contract and may create a legal partnership to facilitate their cooperative actions. The relationship continues to develop during the collaboration process (Dacin et al., 2007; Dekker, 2007; White & Lui, 2005).

Lawyers are often regarded as a necessary evil and unhelpful in ensuring a successful start of this collaboration process (Barondes, 2001). However, lawyers may fulfill a variety of roles in the design of legal arrangements and their negotiation and interpretation. They are expert designers and negotiators of contracts. Lawyers and other legal professionals help to provide explanations and guidance in legal matters. In some situations their involvement is helpful, either as representatives in court proceedings, as drafters of complex contracts, or as specialists in legal systems that are often daunting in their complexity.

For these reasons, lawyers play important roles in legal negotiations (Menkel-Meadow, 2000). Legal negotiations have been defined as "negotiations (between parties) with lawyers in the middle and legal institutions in the background." Lawyers' role and approach will depend on the goal of the negotiations. The goal may be deal making and conflict resolution before and during litigation. During partner selection lawyers may be of value because the partners are about to enter into a contract. Lawyers may assist in identifying potential conflict issues or try to solve conflicts early on and provide for elaborate dispute-resolution mechanisms. Lawyers may also help to manage the commitment process during the negotiations (Mnookin et al., 2000).

In negotiations, the presence of lawyers enhances the "shadow of the law" because of their thorough knowledge of the law and legal cases. They use this knowledge to bolster their arguments. Thus, investing in a sound legal framework and involving lawyers at the early stages of an alliance relationship may increase the chances of success.

Earlier we referred to their role as a necessary evil. This is because lawyers are trained to take a distributive negotiation approach (dividing goods or money with a zero-sum approach) (Kritzer, 1991; Menkel-Meadow et al., 2005). Research indicates that this is the usual approach in legal

proceedings and contract negotiations, and it fits with the organization of the legal system. The literature observes that involving lawyers in negotiations has disadvantages (Salacuse, 1998; Mnookin & Susskind, 1999). Legal professionals are trained in the distributive negotiation method that is characteristic of the legal system (Menkel-Meadow, 2000; Kritzer, 1991).

In a traditional legal approach, distributive bargaining competition and the defense of one’s position are paramount. If one lawyer initiates competition, the other will most likely follow suit (matching behavior; e.g., Murnighan & Roth, 1983; Ury, 1991). Thus, lawyers may increase competition and the chance of conflict. This may threaten the collaboration process between the alliance partners, if not during the partner-selection procedure, then in the subsequent stages.

Although prior studies have addressed the issue of alliance success and legal relationships, the literature is affected by two sets of limitations. First, research has been done from either a business perspective or a legal perspective, and there is no integration of these viewpoints. Moreover, studies (Dacin et al., 2007; Dekker, 2007; White & Lui, 2005) may argue the influence of legal issues on alliance formation but fail to investigate the influence in depth by doing research into why and how legal aspects affect the early stages of alliances or which legal measures improve the partner-selection process. Legal studies state the importance of alliance contracts and the use of lawyers, but they do not indicate how to integrate them into the partner selection process (Hennart & Reddy, 1997; Mayer, 2003; Reuer & Ariño, 2002, 2003; Vlaar et al., 2007).

This research follows the structural perspective based on transaction cost theory and it will give insights into the importance of legal involvement including how and when legal involvement may be incorporated in the partner selection process.

### 3 Data Collection and Methodology

A survey was carried out to gather data on firms’ partner-selection processes and criteria. This quantitative analysis is in line with numerous other studies in the field of alliance research (Anand and Khanna, 2000). The survey questionnaire was sent to 500 alliance managers worldwide. The membership database of Alliance Best Practice (ABP) was used to direct the questionnaires. ABP is an internationally oriented company that helps companies to accelerate their partnering efforts with reduced risk by benchmarking them against a proven best-practice database of collaborative experience (see [www.alliancebestpractice.com](http://www.alliancebestpractice.com) for more information).

The goal of the survey fits well with the aims of ABP. First, ABP has members worldwide from a wide variety of industries, as can be seen in Table 1. Secondly, by using the ABP database, we could contact top alliance managers who could give key information on partner-selection processes and criteria. According to Tippins and Sohi (2003: 757) and Kale et al. (2002), the use of key informants is currently the standard methodology in corporate-level strategic research.

**Table 1 Clients of ABP**

IBM (USA)	Rolls Royce	Eli Lilly	Reckitt Benckiser	Vodafone
IBM (UK)	KLM	StorageTek	uLogistics	Starbucks

Siemens	TNT	Cap Gemini	Nortel	Alcatel
BT	Micro Focus	Bax Global	Microsoft	Air France
Computacenter	HP (UK)	Exel	Oracle	Delta Airlines
				Cognos

Source: ABP (2008)

The survey technique was designed to receive as many responses as possible (Rea & Parker, 2002). Three techniques were used to optimize the response rate: a digital questionnaire with a clear design, reminder messages, and incentives. To obtain information about which steps, criteria, and tools are critical for the partner-selection process, the questions referred to a firm’s entire alliance portfolio. We do not analyze individual alliances because we expect that microlevel mechanisms have a similar impact on all of a firm’s alliances. Most of the survey questions were closed and respondents were asked to give answers on a 1- or 5-point Lickert-type scale. The survey instrument was created and pretested with the help of several experts to erase any aspects that could cause bias.

Academic researchers checked the relevance and operationalization of the survey, and eight alliance managers tested the terminology and clarity. In addition to pretesting the questionnaire, the alliance managers were also interviewed after the survey had been conducted, to verify the empirical findings and to validate arguments for expected and unexpected results. These people were selected

based on their knowledge and ability to contribute to the research.

Respondents were assured that their responses would be treated confidentially and that the results would be put on the ABP website and an executive summary would be sent to them. Via the ABP constant-contact system, a personalized email containing the survey was sent to the ABP membership database. A reminder email was subsequently sent to optimize the response rate. The original message was repeated because some people had discarded it.

The following incentives were offered to maximize the response rate (Larson & Chow, 2003):

1) Respondents could gain insight into the latest developments in alliance management; the results were made available via [www.alliancebestpractice.com](http://www.alliancebestpractice.com) and a report discussed them was emailed. Respondents could therefore benchmark their performance with that of their peers.

2) ABP offers 110 tools on their website. Temporary membership was offered to those who filled in the questionnaire so they could choose four tools or research pages to use for their own purposes.

The survey was sent to 500 alliance managers; they form the total population of this study. We received 150 responses, and after excluding incomplete and/or incorrect surveys, the final response rate was 20% because 100 responses could be used effectively. This is a good response; most international mail surveys in strategic management have a response rate between 6% and 16% (Harzing, 2002; Kale et al., 2002; Snow and Thomas, 1994). The main reason for these low response rates is the large number of surveys that alliance managers receive (Zollo et al., 2002).

As mentioned earlier, the sample consisted of 100 alliance managers from a variety of industries (see table 2): consultancy (25%), IT (23%), health (4%), software (18%), financial services (3%), air transport (4%), education and public sector (2%), process industry e.g., Philips (13%), and pharmaceuticals/biotechnology (8%). The alliance managers responded to the survey with regard to their most important alliances and in total the dataset reports on 992 important alliances.

**Table 2 Primary Industry of Each Company**

		Frequency	Percentage	Valid Percentage	Cumulative Percentage
Valid	Consultancy	25	25.0	25.0	25.0
	IT	23	23.0	23.0	48.0
	Health	4	4.0	4.0	52.0
	Software	18	18.0	18.0	70.0
	Financial services	3	3.0	3.0	73.0
	Air transport	4	4.0	4.0	77.0
	Education	2	2.0	2.0	79.0
	Process industry	13	13.0	13.0	92.0
	Pharmaceuticals and biotechnology	8	8.0	8.0	100.0
	Total	100	100.0	100.0	

The next tables show the distribution of the size of the firms, measured on the basis of the number of employees and the total worldwide sales volume last year in Euros. We see that 39% of the firms have between 1 and 500 employees and 55% have over 1000 employees. This indicates that a balanced set of firms is represented in the sample data. With respect to the total worldwide sales volume, the largest group of respondents (31%) is found between 1 and 50 billion Euros and again a balanced set of firms is represented.

**Table 3 Number of Employees**

		Frequency	Percentage	Valid Percentage	Cumulative Percentage
Valid	0	1	1.0	1.0	1.0
	1–500	39	39.0	39.0	40.0
	500–1000	5	5.0	5.0	45.0
	>1000	55	55.0	55.0	100.0
	Total	100	100.0	100.0	

**Table 4 Total Worldwide Sales Volume Last Year in Euros**

		Frequency	Percentage	Valid Percentage	Cumulative Percentage
Valid	0	1	1.0	1.0	1.0
	<1 million	18	18.0	18.0	19.0
	1 million to 100 million	27	27.0	27.0	46.0
	100 million to 1 billion	10	10.0	10.0	56.0
	1 billion to 50 billion	31	31.0	31.0	87.0
	>50 billion	13	13.0	13.0	100.0
	Total	100	100.0	100.0	

To ensure that the data were not biased by non-response, they were screened to determine if our sample was representative of the population (see Table 5). Three variables were analyzed: the number of employees, total worldwide sales, and the company’s overall success rate. Chi-square tests for each of these variables were performed. The results were compared to see if there were differences between early and late respondents on the assumption that late respondents can be compared to non-respondents (Armstrong and Overton, 1977).

All the variables have a p-value >5% indicating that there is no significant correlation between item scores and survey response time. So there was no significant non-response bias in the dataset. Moreover, the average success rate in the last five years was 57%. This means that 57% of the alliances realized their initial goals, which is comparable to the results of other studies on alliance performance (Park and Ungson, 2001). In conclusion, the results indicate that the dataset was valid and not influenced by non-response bias.

**Table 5 Number of Employees \* Response time  
Chi-Square Tests**

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	14.411(a)	12	.275

Number of Valid Cases	100		

We adopted a design approach to validate our results (Van Aken et al, 2007). This design approach is relevant to management research because of its evidence-based research and the information by practice (Vermeulen, 2005; Chatman and Flynn, 2006). We followed the following steps of the design process ( van Aken, et al. 2007) over the course of this study:

1) *Identifying the research problem:* There is little literature on the partner selection process including legal involvement. Hence, details on the problem will be obtained in the studies in this chapter.

2) *Seek inputs for the design:* Design research employs both quantitative and qualitative methods (Laurel, 2003). In this chapter, the goal is to gather inputs from the literature and from experts that can be used to develop a design solution for the research problem. We made use of expert interviews to validate the role of these issues and how to design a successful framework. The reason these unscripted interviews were held was to determine the necessity of legal involvement for a successful partner-selection process. These experts were selected on the basis of their knowledge and ability to contribute to the research. We talked to 12 alliance managers with an experience ranging from 5 to 20 years managing alliances and working in close collaborations with their business partners overtime. They were presented with legal involvement aspects within the partner selection process and were asked how often discussions arise about these points. They were also asked to rate them in order of relevance when including these elements as part of the governance structure and/or the legal framework. We also interviewed 10 legal experts from both academia and practice, including 2 working in legal academic faculties from the Netherlands, 2 lawyers practicing at law firms and 6 legal in house experts from companies involved in alliances. We focused on the role they believe legal involvement e.g. contracts and lawyers do and may play in facilitating cooperation.

3) *Developing the design- from inputs to design:* We assimilated all the details from the quantitative and qualitative research and we gathered ideas and principles involved. Finally, we came up with the following design idea: the steps in a structured partner-selection process partly correspond with the relationship development stages identified in the alliance literature. We used the stages of relationship development as identified by Wilson (1995) and others as categories for the factors that influence collaboration. We designed a legal framework dealing with all the issues that may be organized in the partner selection process.

4) *Design justification and validation:* The design concept of this paper has been validated by subjecting the legal framework to assessment by alliance managers. We used some of the experts out of step 2 of this design study, but we first contacted respondents of the overall questionnaire to ask for their feedback. The interviews were held as an extra measure to falsify the findings from the empirical studies (those mentioned in paragraph 2) on the factors in legal frameworks that influence cooperation. To be able to obtain results that would help to generalize for alliance situations, the focus was on the experts' experience in several partner selection processes over the last 10 to 15 years. This way we were able to get insights on the experiences of managers in a number of alliances in which various approaches in partner selection were used. In the interviews we primarily discussed the experts' perceptions of the accuracy of the legal involvement aspects we found: Whether we found the right aspects or not, and whether aspects were missing.

This form of validation is more appropriate since what is needed is the assessment of its feasibility. The design is validated when the alliance managers who assess the designed framework, find it useful and wish to adopt it. Feedback from the experts enabled us to assess the feasibility of the designed framework.

#### **4 Analysis and Results**

We asked our respondents how contracts and lawyers are used and how they influence success. This may shed light on different partner-selection tactics and their effectiveness in creating value from alliances. Only 11.5% of the respondents are positive about the effect of lawyers on partner selection; 26% state that more than half of their alliance breakdowns were caused by interpartner conflicts. More than half of the respondents use a legal/contractual document in their partner-selection process. Accordingly, it may be that managers are using contractual documents and lawyers, perhaps because of their former experience with interpartner conflicts. However, they may not use them effectively because former analyses did not indicate the importance of documents and lawyers.

Finally, experts were asked to value which legal issues need to be organized in the partner selection process to enhance alliance success. First, negotiation was perceived as the only aspect that needs to be organized. In the negotiation process all elements of the alliance need to be discussed, and the intense interaction between the partners will give them a feeling for the feasibility of the alliance from a cultural and personal-chemistry viewpoint. Secondly, experts agree that the way legal structure, legal culture and organizational structure of the partner organization is organized, is less frequently used when selecting a

partner. Experts believe that if not paid attention to, legal differences may particularly surface when conflicts arise. Parties may have the feeling of a loss of control. Different structures may apply than they are used to, they may be unfamiliar with the other's culture for dealing with conflicts (e.g., adversarial approaches as opposed to collaborative approaches), and the legal structure may differ leading to differences of opinion about dealing with legal matters. These issues may drive partners apart. Accordingly, experts state that comparing decision-making procedures to govern the alliance may be organized in the beginning of the partner selection process: the chance of conflict is increased when there are fundamental differences in decision-making procedures. Addressing the issues that lead to conflicts may decrease the chance of them arising. This discussion should be a part of the selection process. This can be addressed at meetings early in or before the contractual relationship. A failure to make decisions adequately is also found to lead to the failure of relationships. The resulting bureaucracy causes delay and frustrates both parties. By addressing decision-making procedures during the selection process parties may identify potential problems and be able to agree on mandates. Finally experts state that the use of pre-contractual issues like standard governance and a joint business-planning workshop including the relevance of contracts and lawyers are most effective in helping firms to improve their success so they may be organized in the beginning of the partner selection process.

In the following sections we will present a legal framework and explain how and why the issues identified by the second expert panel may be used in the partner-selection process.

#### *Role of a legal framework in the partner-selection process*

In the literature on organizational relationships, the process of creating and maintaining a relationship is subdivided into a number of phases (Boddy et al., 2000).

Researchers distinguish the following stages in the development of long-term legal relationships (Wilson, 1995):

- 1) First contact
- 2) Discussing the purpose of the relationship
- 3) Agreeing on how the contract will be structured
- 4) Finalizing and writing the agreement
- 5) Creating value through joint efforts
- 6) Renegotiating the agreement
- 7) Concluding the alliance relationship

A legal structure for successful alliances should facilitate the steps of the alliance-selection process and help to prevent or overcome the factors that lead to alliance failure (mistrust, disappointment). During the partner-selection process as defined in Table 4.1, the alliance partners cover the first four stages of relationship development as mentioned above. They use negotiations to get from one stage to the next. Combining the process with 'management and organization' issues creates a framework that supports the development of a relationship. We now list a design as what a partner-selection process ideally provides following a legal structure. Figure 1 and 2 are elements from the pre-contractual phase, which influence the juridical aspects of the contractual phases from figure 3 and further. This pre-contractual phase considers preparation, negotiation and joint business planning before the execution of the alliance contract. This is essentially an internal process which plays a central role in the alliance process. The ultimate objective is to achieve a thorough understanding of the target process, so that the partners can make informed decisions about whether it should ally, and about price, risk and intentions. This will also allow the team members to get to know each other, become acquainted with the different skills and share information.

Negotiations often end with the drafting of business principles or heads of agreement. The latter is a document that lays down all important principles and agreements on which the parties have decided after negotiations. This agreement is the starting point for the contractual phase in which all the aspects and decisions made in the pre-contractual phase will be used in the final alliance contract. Accordingly, the legal framework from the contractual phase is dependent from content and relation as developed during the pre-contractual phase. Figure 1 and 2 influence the final juridical contract of an alliance as written in the contractual phase from figure 3. Legal involvement cannot be separated from the management and organization aspects like joint business planning. They influence each other, without negotiation and joint business planning, a contract cannot be made.

#### **The first contact (step 7):**

1) *First contact*. People start building a relationship from the first time they meet. At this stage the individuals are getting to know each other (the social bonding process), and reputations for performance

and trustworthiness are tested and built. This is the phase of contact and partner selection and includes the general exploration of the goals of the relationship through negotiations. (For a relationship-marketing perspective see Achrol (1997)). The relationship is still poorly defined, and the requirements are still unclear; however, the parties look to develop interpersonal relationships, and trust may start to develop (Ford, 1982, 1998; Thompson & Sanders, 1998). Figure 1 shows the legal framework for step 7 of the partner-selection process during the first contact.

1. The initiator sets the tone for the relationship with cooperative strategies that will inspire the less powerful party to react in the same way.
2. To build trust the initiator is transparent about the selection procedure; for example, the initiator will provide clear selection criteria, provide a clear tendering procedure, encourage open information exchange, and be willing to explain and inform.
3. The initiator describes the guidelines and principles that are central in the relationship.
4. The parties agree on the norms for the negotiations that take place during the selection process and make them part of the agreement (Ellickson, 1991).

**Figure 1 Framework for Step 7 of the Partner-Selection Process: The First Contact**

*A. The purpose of the relationship (steps 9–13):*

2) *Discussing the purpose of the relationship.* Subsequently, the persons involved start defining the exact purpose of the relationship and its terms. At this stage the parties try to find a balance between shared goals and individual goals; they clarify mutual goals and set the boundaries of the relationship. Regulations for the exchange between the parties start to develop (Ford, 1982; Boddy et al., 2000; Wilson, 1995). Social bonding becomes more established, mutual goals are formulated, and trust increases, which strengthens the bond between the parties. Figure 2 shows the legal framework for steps 9–13 of the partner-selection process during the discussion of the purpose of the relationship:

1. Share information on the subject of the relationship.
2. Be clear about intentions and willingness to enter into a contractual relationship and agree on penalties or other mechanisms to apply if negotiations are broken off without sufficient reason.
3. Determine what both parties expect from the relationship and how they define a relationship that works.
4. Determine whether there is enough of an overlap in desires between parties and a chance for profitable future encounters.
5. Determine if and how the parties' long-term self-interest is served before making a commitment to the relationship.

**Figure 2 Framework for Steps 9–13 of Partner-Selection Process: Discussion of the Purpose Of the Relationship**

**How the contract will be structured (steps 13 and 15)**

3) *Agreeing on how the contract will be structured.* More detailed structuring and ordering of the relationship occurs at this stage. The parties negotiate in more detail the goals of their relationship, the conditions for reaching those goals, and the terms of their agreement. This happens through a bargaining process, resulting either in an agreement to work together to achieve their goals or the end of the negotiation. There are many reasons that this is important and omitting this step will increase the chance of conflict and alliance failure. By writing contracts together the parties can choose to take a more collaborative (or integrative) approach.

This is the stage at which goals become concrete and misunderstandings may surface. Provided the parties discuss goals in a broad sense this is unlikely. When the goals are translated into duties, rights, and responsibilities they become more concrete and opposing interests typically surface at this point. If this step is not done thoroughly, the parties may fail to discover the misunderstandings that could be addressed at this early stage. This may lead to subsequent friction about the contract. Moreover, the

writing of the contract itself may threaten the alliance. There can be an essential mismatch between the idea and the structure of the alliance form (sharing) and the way in which legal contracts and legal thinking in general are structured (dividing). As a result, the concept may lose its collaborative spirit when it is translated into a legal document. Thus, contracts may constitute a threat to an alliance. A collaborative contract-drafting effort is necessary to counter this effect. Figure 3 shows the legal framework for steps 13 and 15 of the partner-selection process during the discussion of how the contract will be structured.

1. The partners agree to invest in the relationship and specify how these investments will be made.
2. The partners use the bandwidth that the legal system provides because it enables them to establish a framework that optimally contributes to a cooperative relationship.
3. They are aware that a strong imbalance in power may frustrate a balanced relationship and be a disincentive for cooperative behavior.
4. The contract contributes to a cooperative relationship by stating the rights and obligations of the parties; providing a detailed set of rules and procedures for resolving disputes; and providing a legal framework in which future negotiations over the terms of trade will take place.
5. The contract is a “blueprint for exchange” and a means to plan the collaboration, to set partner expectations, and, consequently, to reduce misunderstandings and costly missteps.
6. The contract includes elements of collaboration that help to clarify the parties’ intentions even if they are not legally enforceable.
7. The contract defines the precise meaning that the parties attach to abstract concepts such as rules of respect, fairness, and reciprocity.
8. The contract facilitates mechanisms in a relationship that allows both parties to reward cooperative behavior and punish defective behavior.
9. The partners should be aware that the framework for a relationship, particularly the contract, may reflect and amplify unwanted power differences.
10. The partners should consider integrating social norms into the different phases of the relationship-building process, because they may complement the contract and prevent problems particularly for the parts of the agreement that are hard to enforce legally.
11. They should deal with conflict.
12. The partners should choose among the options in conflict management, such as the level on which to deal with conflict, and discuss this early in the collaboration process.
13. The partners should estimate the likelihood of conflict, discuss how to react to conflict-inducing behavior, and share information about such behavior.

**Figure 3 Framework for Steps 13 and 15 of Partner-Selection Process: Discussion of How the Contract Will Be Structured**

**Finalizing and writing of the agreement (step 15):**

4) *Finalizing and writing the agreement.* When the parties reach agreement on the goals of the relationship they start formalizing (writing down in a contract) what they have agreed. At this stage the conditions of the relationship and its boundaries are formalized (Wilson, 1995). The parties create a document in which the promises are summarized: the contract. The first step in cooperation is getting to know a partner, to discover compatible aims and a willingness to share ideas and to develop them further together. This is an important stage because the rules formulated govern the relationship. A lack of clarity about the terms of the agreement can lead to subsequent disagreement about what was decided.

Decision making procedures is not a standard element of contracts (Polinsky & Shavell, 2007; Cooter & Ulen, 2007). As a result, the parties tend to fail to discuss this. The literature on dispute system design (Albers, 2005; Argyres, N. & Mayer, K.J. 2007; Vlaar et al. 2007). suggests that agreeing on clear decision-making steps (in particular for conflict-resolution processes) at the selection stage will contribute to the early resolution of conflicts when they arise. Decision making between parties that are already in a conflict is difficult. A failure to be concrete about the process of working together can lead to conflict. Setting the tone early on (discussing how the parties deal with each other and what their beliefs are) prevents clashes later. Memoranda tend to be broad and nonspecific. This makes them easier to agree on but can lead to differences in interpretations. Figure 4 shows the legal framework for step 15 of the partner-selection process during the finalizing and writing of the agreement.

*What a framework following a legal structure for a partner-selection process ideally provides during the finalizing and writing of the agreement:*

1. Negotiate optimal outcomes based on relevant information while taking into account all possible options and drawing on accurate inferences.
2. Follow rational decision-making steps (define the problem, find criteria, give the criteria values, identify alternatives, test each alternative against the criteria, calculate the optimal decision, reach a decision, and act on it).
3. Work toward negotiation outcomes that satisfy both parties' preferences in the light of the ongoing negotiation process.
4. Use the freedom that the legal system provides for the content of the contract to tailor it to the relationship in the manner that best enables a successful collaboration process.
5. Discuss and consciously choose the legal regime that applies to the contract, because this choice impacts the way in which courts interpret the document.
6. Be specific on contract terms; define ambiguous terms; do not leave anything out; use terms consistently; and fully account for any sensitive issues (unless the parties want default rules to apply).
7. Agree on criteria for the contract interpretation rules; refer to them in the contract; and avoid ambiguity by being specific.

**Figure 4 Framework for Step 15 of the Partner-Selection Process: Finalizing And Writing of the Agreement**

### **5 Lawyers and the Added-Value of Legal Involvement within the Partner Selection Process**

The parties may want the lawyer to perform integrative negotiation to optimize the negotiation outcomes through a process of creating and distributing value. However, empirical findings show that an integrative negotiation approach is not commonly used by lawyers and is not well supported by the legal system.

Lawyers may be tempted to choose the distributive negotiation approach even if another approach will create a more mutually beneficial outcome (Gilson & Mnookin, 1995; Mnookin et al. 2000). However, the approach actually chosen by lawyers in a specific situation will depend on the goal of the negotiations and what they are asked to do by their clients. If a dispute has already emerged, the lawyer will most likely be a litigator trained in arguing a case in a court and will tend to have an adversarial style. A lawyer engaged to help with the commitment process, a so-called transaction lawyer, is more likely to have a cooperative style. Thus, the involvement of lawyers increases the danger of conflict escalation. Their involvement may encourage competitive behavior (Mnookin & Susskind, 1999). Therefore, the parties should weigh the benefits and risks of involving lawyers in their disagreements.

Lawyers may use their knowledge to facilitate collaborative negotiation and conflict resolution, but their use of the legal approach may also result in highly distributive contracts and the aggravation of conflicts (Gilson & Mnookin, 1995; Folberg & Golann, 2006). There are not many incentives that encourage lawyers to use the integrative negotiation method. It is not a method that the legal system facilitates or a strategy in which lawyers receive much training (Menkel-Meadow, 2000). Empirical research indicates that lawyers often undervalue creativity when dealing with conflicts and therefore may not look for creative win-win solutions (Kritzer, 1991; Mnookin & Susskind, 1999). Therefore, to prevent further escalation it is wise to choose a lawyer who is familiar with the negotiation method that a particular situation requires (Gilson & Mnookin, 1995).

Ideally, validated by experts, in the partner-selection process the partners will:

- 1) Anticipate the competitive effects of contracts and the involvement of traditionally trained lawyers.
- 2) Anticipate the escalation process that may result from the interaction between lawyers.
- 3) Involve lawyers in analysis of the problem at an early stage. Keep the threshold low, and try to prevent a conflict from becoming a legal problem.
- 4) Choose together the preferred level (self, together, with help of lawyers, or neutral) at which to deal with conflict.
- 5) Discuss and agree on a general approach and on approaches to particular conflict situations.
- 6) Choose problem-solving as the general approach to conflict resolution.
- 7) Agree on particular conflict-resolution styles for different conflict situations based on the type of conflict.
- 8) Make a trade-off between what is optimal for the collaboration process and the importance of the issue.
- 9) Avoid relational and task conflict, except in situations of pure difference of opinion where compromising or even forcing may be beneficial.
- 10) Agree on third-party conflict management processes.

## 6 Conclusion and Discussion

The results of this study reveal some interesting findings about the necessity of legal involvement in the partner selection process for alliance success. Our first research question asked which legal aspects play a role within the partner selection process?

We found that more than half of the managers use contractual documents and lawyers, perhaps because of their former experience with interpartner conflicts, but they are negative about the use of a lawyer. According to experts, the specific role of lawyers is closely related to the success of alliances. When these agents, experts at negotiating and structuring legal agreements, play a leading role and fail to steer the parties in the right direction they may do much damage. When instructed carefully they provide excellent support in drafting a contract. Accordingly, as stated in paragraph 4, this research does not conclude in line with the widespread idea of not involving lawyers in the early stage of the partner selection process (Barondes, 2001). If anticipating the competitive effects of contracts and the involvement of traditionally trained lawyers, and if anticipating the escalation process that may result from the interaction between lawyers, lawyers should be involved in analysis of the problem at an early stage. Keep the threshold low, and try to prevent opportunism and a conflict from becoming a legal problem.

Additionally, negotiation is perceived to be crucial in the partner selection process. In the negotiation process all elements of the alliance are discussed, and the intense interaction between the partners will give them a feeling for the feasibility of the alliance from a cultural and personal-chemistry viewpoint. Trust will evolve and opportunism will be prevented. Secondly, legal structure, legal culture and organizational structure need to be used more often as selection criteria. Experts believe that if not paid attention to, legal differences may particularly surface when conflicts arise. These issues may drive partners apart. Accordingly, experts state that comparing decision-making procedures to govern the alliance should be organized in the beginning of the partner selection process: the chance of conflict is increased when there are fundamental differences in decision-making procedures. Addressing the issues that lead to conflicts may decrease the chance of them arising. This discussion should be a part of the selection process. This can be addressed at meetings early in the contractual relationship. A failure to or bureaucracy delays to make decisions is also found to lead to the failure of successful

relationships. By addressing decision-making procedures during the selection process parties may identify potential problems and be able to agree on mandates. Finally, experts state that the use of standard governance and a joint business-planning workshop are most effective in helping firms to improve their alliance success so they may be organized in the beginning of the partner selection process.

Our second question asked how to address legal aspects within the partner selection process. Based on qualitative research, a legal framework has been developed that increases alliance success. For each of the stages of relationship development in a structured partner-selection process, we list important factors. As can be seen in figure 1 and 2, there are less legal aspects in these two pre-contractual phases. Although lawyers may facilitate these pre-contractual aspects, the real legal involvement starts afterwards in the contractual phases from figure 3 and further. Nevertheless, the pre-contractual phase is crucial because it influences the content and relation of the contractual phase, as stated in section 4.

Summarizing, legalities may be integrated in the partner-selection process to define partner expectations and to help plan activities. Despite its importance for the control of alliances, the partner-selection process and the integration of legal issues in this process have received scant attention in the literature and empirical studies. Our study aimed to enhance our understanding of the partner-selection process, its importance for alliance success, and the influence of legalities. It also indicated how not only taking into account the legal aspects but also using legal structures may increase success.

These results have implications for research. Our study adopted several methodological aspects common to a design approach in order to validate our legal framework. We see this as a start for further continuation of design research within partner selection specifically. Future management research may incorporate this start of design research to investigate further the practical usefulness more into detail.

Our research also has implications for the emerging literature on the added-value of legal involvement in the partner-selection process. To date this literature has hardly looked at the combination of legal aspects at different stages of alliance management e.g., the partner-selection process. It has not yet considered the use of legal issues in different alliance capabilities. This study shows that it is worthwhile to study in more depth individual processes and/or stages in combination with a legal framework. The next step in alliance-capability research may be to investigate how a legal framework is used at other stages and capabilities of alliance management, e.g., during the operation of the alliance or during its finalization.

Our results also have implications for management. Alliances are not only about alliance experience, trust, and informal governance. A structured, well-thought-out, legal framework for selecting partners performs better than a less-structured process. Investing in a rational and legal partner-selection process will therefore deliver value. Because the majority of alliance managers use legal documents, it appears that many companies have already combined the legal aspects with partner selection. However, there is still a negativity about lawyers and a lack of understanding of the importance of legal involvement in the partner-selection process. Companies are advised to revisit these aspects of the process.

# Adoption of Project Portfolio Management as Organizational Innovation: Towards a Conceptual Framework

Henk-Jan Haasnoot<sup>1</sup>, Sergey Filippov<sup>1</sup>, Herman Mooi<sup>1</sup>, Mark de Reuver<sup>1</sup>, Robert Boer<sup>2</sup>

<sup>1</sup>Faculty of Technology, Policy and Management, Delft University of Technology, Delft, The Netherlands

<sup>2</sup>KPMG Management Consulting, Amstelveen, The Netherlands

(E-mail: H.Haasnoot@student.tudelft.nl; S.Filippov@tudelft.nl; H.G.Mooi@tudelft.nl;

G.A.deReuver@tudelft.nl; Boer.Robert@kpmg.nl)

**Abstract:** Project Portfolio Management (PPM) has the potential to bring considerable benefits to organizations. Although PPM should improve project success, not all project management (PM) based working organizations have fully adopted PPM as part of their way of working. This calls for thorough research. The topic of PPM Adoption has not received much academic attention so far. The positive link between PPM Adoption and portfolio success has been found by a few authors, but the circumstances under which PPM should be adopted represent an under-researched topic. We draw upon the concept of organizational innovation and portray the PPM Adoption as the implementation of a new organizational method in the firm's business practices. The paper develops a conceptual framework of PPM Adoption, considering PPM Adoption as movement along a spectrum, influenced by nine factors.

**Key words:** Project portfolio management; Organizational innovation; Portfolio performance

## 1 Introduction

As more and more companies start working in project-based environments, the interest towards project management starts growing too. One of the current topical subjects in project management is Project Portfolio Management (PPM). In a comprehensive literature review of project management research, Kwak and Anbari (2009) identify Strategy & PPM as “*the most important project management research subject (...) in the top management and business journals*”.

PPM has the potential to bring considerable benefits to organizations. For example, discussing the power of PPM, Pennypacker and Retna (2009) argue “*The potential benefits for the business can be immense*”. More specifically, Cooper et al. (2000) mention various benefits of PPM, some of which are financial reasons (return maximisation), maintaining competitive position and “to forge the link between project selection and business strategy”. De Reyck et al. (2005) conclude that a high level of PPM positively impacts project return and negatively impacts the number of project-related problems reported. Also, some authors approach this from the opposite perspective, describing situations that PPM helps to avoid. For example, Filippov et al (2010) indicate that PPM helps to effectively eliminate the wrong projects wrongly executed from a project portfolio. However, organizations struggle with successfully adopting PPM (Filippov et al, 2010; Blichfeldt et al, 2008), leading to lower PPM success (De Reyck et al, 2005) and eventually to financial consequences. To sum up, most publication on PPM generally view established PPM as a necessary determinant of project success (Teller et al, 2012; De Reyck et al, 2005).

As for the current practice, while the benefits of PPM are evident, seemingly not all project-based organisations have adopted PPM as the main way of business. Looking from a theoretical perspective, although a sizeable body of knowledge has formed within the field of PPM, this topic still offer ample opportunities for academic and practice-oriented research, and PPM Adoption is one of them. The concept of PPM Adoption has not received much academic attention so far, with some exceptions as Ajjan et al (2008). Filippov et al's (2010) PPM Saturation Model, relating the need for PPM to Organizational Project Complexity, is portrayed as a “*first attempt to determine the optimal period for introduction of PPM*”. The authors also argue that “*The question of when, under which circumstances and how PPM should be introduced is largely under-researched in the extant body of literature. PPM is usually treated as given or presented from a normative perspective – as ‘how PPM should look like’*” (Filippov et al, 2010).

The study of PPM Adoption is the main intention of the paper. The objective of this paper is to determine conditions and driving forces responsible for PPM Adoption in contemporary project-based organizations. To achieve this objective we develop a conceptual framework by conducting a thorough literature review, supported by expert interviews with project management practitioners.

## 2 Theoretical Background

### 2.1 Terms and definitions

We start the literature review with definition of key terms and concepts, such as project and portfolio management. 'Project' and 'Programme' are commonly recognised definitions by the Project Management Institute (PMI). The classic definition of a project is "*a temporary endeavour undertaken to create a unique product, service or result*" (PMI, 2006). In its turn, a programme is "*a group of related projects managed in a coordinated way to obtain benefits and control not available from managing them individually*" (PMI, 2006).

As for the definition of 'project portfolio', we combine a classic definition of PMI (2006) with other definitions proposed in the literature, such as Martinsuo and Lehtonen (2007). Our proposed definition is as follows. *A project portfolio is a group of projects, programmes and other work that share and compete for the same resources and are carried out under the sponsorship of an organizational body with the purposed of achieving strategic business priorities.*

Project Portfolio Management is in its essence the process of managing project portfolios. Drawing upon a number of definitions, we can define it as *The process of selecting and prioritising projects in the project portfolio in order to align the portfolio with strategy, to balance resources and to optimise benefits, by means of centralisation and standardisation, as well as screening and monitoring of the projects in the portfolio.* The selection of projects is aimed at strategy alignment, resource balancing and benefit optimisation. In order to be able to make these selection and prioritisation decisions, good information is required, which is achieved through centralisation, standardisation, screening and monitoring.

As we have stated previously, the extant literature is modest in defining and describing the process of PPM Adoption. Most works on PPM (e.g. Teller et al, 2012) consider a workable PPM as given and do not address the aspects of a complex transition towards PPM. In our search for a definition of PPM Adoption, our first assumption is that PPM Adoption is not binary, e.g. either a company has sufficient PPM in place, or it has not. PPM is multifaceted and one aspect can be advanced while other aspects may be underdeveloped. As proposed by De Reyck et al (2005), PPM Adoption can be measured by multiple variables, each of them may be at a different level of maturity in a particular organisation. This can also be explained intuitively. Under the condition of finite resources, organisations always require and apply some mechanism for selecting what to do and what to drop. Levels of advancement of this selection mechanism may however differ. In the extreme forms, it could be the intuition of the CEO that determines the selection decision or there is a highly formalised system of methods and procedures for the selection of projects. Between these two extremes, many forms may exist. This intuition is corroborated by the organizational innovation literature. For example, Damanpour and Schneider (2006) argue that adoption of organizational innovation is not dichotomous. Hence, we opt to consider PPM Adoption as following a spectrum of advancement rather than a binary step. We define PPM Adoption as *a set of managerial decisions and actions to advance the current level of PPM in a specific organisation.*

## **2.2 Project portfolio management**

The section starts with a historical perspective on PPM, discussing the roots in Modern Portfolio Theory, and the contribution of Cooper's research on New Product Development, as well as the rapidly increasing attention for PPM over the last decades from academics as well as from professional associations like PMI and OGC. Next, the fundamental PPM element of project selection and its ideally repetitive nature is discussed, followed by a discussion on the location, range and scope of PPM in the organisation and a discussion on the differences and similarities of PPM Adoption with PPM Maturity Models. The section is concluded with an overview of research on the link between PPM Adoption and PPM success, as well as managerial challenges surrounding PPM.

As Kwak and Anbari (2009) write, the popularity of and interest in Project Management research has considerably increased over the last decades. Filippov et al (2010) state that organisations are moving from functional management towards Project Management as a way to organise work. They also state that this 'projectification' brings about 'project overload', leading to lower project efficiency as the human resources have too much to concentrate on, leading to lower task focus, lower adherence to time schedules and other similar issues. PPM is viewed as a mechanism to tackle this project overload.

PPM has its roots in Modern Portfolio Theory (MPT), which was initially developed for financial investments allowing to balance returns and risks (De Reyck et al, 2005). Later, MPT found another application area in Project Management. From the 1980's onward, academics started paying attention in PPM. The article by Roetheli and Pesenti (1986) describing the application of MPT in a Swiss pharmaceutical firm shows that in the 1980's MPT was already being applied to multi-project environments for balancing the various aspects of an organisation's set of projects, including risk,

duration and turnover. Meanwhile in the 1980's and 1990's, Robert G. Cooper and his colleagues applied portfolio theory to new product development projects, introducing the stage-gate system (Cooper, 1990). Cooper's work is considered as foundational in PPM research (Petit, 2012).

Over the last decade, the professional associations for project management have shown considerable activity regarding PPM, as can be observed from their publications of PPM standards and methods. The Project Management Institute (PMI), known for its Project Management Body of Knowledge (PMBOK) published the first edition of 'The Standard for Portfolio Management' in 2006, meanwhile succeeded by a second and a third edition (PMI, 2006). Also the British Office of Government Commerce (OGC), known best for the PRINCE2 best practice, has published the guide 'Management of Portfolios' in 2011 (OGC, 2011).

#### 2.2.1 PPM as a dynamic project selection process

One of the key objectives of PPM is the selection of projects (in line with the business strategy). A variety of models can be applied for this selection process. Meredith and Mantel (2010) categorise all selection models to numeric or nonnumeric. The nonnumeric models are those in which there appears to be no choice, as the project 'just needs to be done'. Among these models are the boss's 'sacred cow', operating necessity and competitive necessity. Also, more belief- or intuition-based models are distinguished, in which not much of a rational decision is made. "*Decision makers can act on their beliefs about what will be the likely impact on the total system performance*" (Meredith and Mantel, 2010). The authors mention the somewhat more structured 'comparative benefit model', in which senior management or a selection committee chooses project by intuitively ordering all potential projects.

As opposed to nonnumeric models, there are numeric models for project selection, relying on measurable indicators, comprising profitability models like payback period, net present value (NPV) and Real Options, as well as numeric non-weighted and weighted scoring models in which potential projects are evaluated by a pre-established list of criteria. Meredith and Mantel (2010) argue strongly in favour of weighted scoring models because they allow reflection of the multiple organizational objectives, their flexibility regarding changes in managerial philosophy or environment and their relatively low bias toward the short run, as compared to profitability models. Important criteria that ideally should be included in the selection process comprise strategy alignment (Pennypacker and Retna, 2009), resource availability (Pennypacker and Retna, 2009), cost savings or profitability (Meredith and Mantel, 2010, Pennypacker and Retna, 2009), boundary conditions set by the organisation or externally imposed, like legal boundary conditions (Meredith and Mantel, 2010) and risk balance (Reyck et al, 2005).

The selection of projects is not necessarily a one-shot exercise performed at some starting point. On the contrary, various authors plea for considering PPM as a continuous activity, also considering projects that are already on the way. The world is continually changing, meaning that business cases change relative to their environment. As Ter Mors et al (2010) put it, "*The assumptions that were made when the project was started may lose their validity over time, whether expected or not, which may require reprioritizing of projects in the portfolio. Thus, projects need to be periodically assessed in terms of their status and performance. Companies that do not reassess their portfolio of projects on a regular basis disregard possibilities that they may have to reprioritize. That is, they forgo possibilities to abandon unpromising projects and to expand investments in successful projects*".

Archer and Ghasemzadeh (1999) also highlight this idea: "*Project portfolio selection is the periodic activity involved in selecting a portfolio*", as well as Blichfeldt and Eskerod (2008) who include the words "*the concurrent reprioritisation of projects in the portfolio*" in their definition of PPM. Martinsuo and Lethonen (2007) define PPM as "*a dynamic decision process, where a list of active projects is constantly updated and revised*". A method that enables reduction of this one-shot issue is the widely applied stage gate principle in which a project is divided in multiple smaller stages (e.g. initiation, execution, closure) at the end of which it has a 'gate' at which the progress of the project is reviewed. Re-evaluating the position of the project in the portfolio at each stage-gate would reduce the one-shot issue.

#### 2.2.2 Range and scope of PPM

The position PPM process in organizational terms is not the same in every organisation. Besides the individual project managers and a project steering committee per single project, typical functions and/or bodies that exist around PPM are one or multiple Project Management Offices (PMO's), responsible for providing project information, and a committee that makes the project selection and prioritisation decisions (Pennypacker and Retna, 2009). On the basis of empirical findings, Filippov et al (2010) describe variations in the share of PPM in all business operations. PPM may cover only a part of business operations, e.g. with routine operations considered as line activities. It can also occur that

PPM may cover a specific business sector/area within a company, like IT. Finally, a complete overlap is also possible, in which all business activities are done in projects and the functional work may virtually not exist.

Blichfeldt and Eskerod (2008) have found that in practice PPM does not necessarily cover all projects within an organisation or organizational body. Smaller so called 'under-the-radar' projects are frequently not part of the organisation's PPM system. '*PPM often only covers a subset of on-going projects, while projects that are not subject to PPM tie up resources that initially were dedicated to PPM projects*' (Blichfeldt and Eskerod, 2008). This poses a dilemma of on the one hand not wanting to lose track of the smaller projects which are initially not covered by PPM for the sake of good resource management, and on the other hand over-bureaucratisation leading to overhead work and dissatisfaction of employees for losing a part of their freedom of self-controlling their activities. The authors advise to decide first whether or not to include all projects in PPM, and in the not-case to have top-management decide the boundaries for which projects should be in and out of PPM and decide on the amount of resources that are dedicated to the out-of-PPM projects.

### 2.2.3 PPM maturity models

Various frameworks exist for assessing the maturity of Project Management and PPM in organisations, with maturity being roughly described as the state in which the organisation is in a good condition to achieve its business objectives and realise its strategy. Pennypacker and Retna (2009) explain the goal of a maturity model as "*to help an organization assess its level in absolute terms and then develop a roadmap to rise to higher levels*". Common project management maturity models include P3M3 (Portfolio, Programme and Project Management Maturity Model) by UK's OGC, OPM3 (Organizational Project Management Maturity Model) by PMI, CMM/CMMI (Capability Maturity Model /-Integration) by Carnegie Mellon University's Software Engineering Institute, etc.

Using these models, the maturity of Project Management and/or PPM in an organisation is assessed for a number of variables on typically a 5 point scale, ranging between the first awareness of the process and the optimised level. In this scale, the maturity PPM is measured from various perspectives. For example, P3M3 uses seven perspectives, being Management Control, Benefits Management, Financial Management, Stakeholder Engagement, Risk Management, Organizational Governance and Resource Management (OGC, 2010).

Although close, the maturity of PPM is different from PPM Adoption. First of all, PPM maturity considers the current state of affairs, whereas in PPM Adoption the decision of implementation is central, hence the reasons for desiring a particular level of PPM.

### 2.2.4 PPM Success

The link between PPM Success and PPM Adoption has been researched by De Reyck et al (2005), with the return of projects and (inversely) the number of project-related projects as indicators of PPM success. Their conclusion is that "*an increased PPM adoption level has a significant positive impact on the return on the projects in the portfolio and a significant negative impact on the number of project-related problems reported*" (De Reyck et al, 2005). The authors have found that adopting only a few PPM elements can already deliver benefits and that some elements, e.g. PPM software, are more effective when the organisation in its totality is already considerably advanced in PPM.

In a similar fashion, Teller et al (2012) study the effect of both single project formalisation and PPM formalisation on success, mediated by PPM quality. They find that both single project and portfolio formalisation are positively related to PPM quality, which gets even stronger when these two forms of formalisation increase both as well as when project complexity is higher. The authors conclude that "*PPM quality is significantly related to project portfolio success*" (Teller et al, 2012). Altogether this means that increasing formalisation implies higher PPM success. Formalisation is comparable to PPM Adoption (De Reyck et al, 2005).

## 2.3 Innovation and adoption

In this section a deeper look is taken into research on adoption of innovations, the roots of which lay in diffusion research. A selection of the work of these authors is discussed. Although the authors do not explicitly study the innovation of PPM, they do focus on process / organizational innovations. In a number of these works, critical factors are mentioned that are instrumental to our conceptual framework.

### 2.3.1 Innovation

The academic father of diffusion research is Everett M. Rogers. His book 'Diffusion of Innovations' (Rogers, 2003) was first published in 1962, has been cited extensively and reprinted in several editions. In line with Rogers' work, various scholars in the field of diffusion research have independently found that the diffusion of innovation follows an S-shaped curve over time. Well-known

contributions of Rogers comprise the adopter categories (innovators, early adopters, early majority, late majority and laggards) and the innovation-decision process (from knowledge through persuasion, decision and implementation to confirmation). The decision step in the innovation-decision process forms the link to adoption, since the decision can either be rejection or adoption (Rogers, 2003). Rogers' work takes primarily a macro perspective, the perspective of, as Rogers calls it, 'the change agent'. This change agent is the person or organisation that 'brings' rather than 'receives' the innovation and hence Rogers mainly studies aggregate diffusion effects of the innovation.

Traditionally, the term 'innovation' has implied bringing new (physical) objects on the market, embracing new technologies. The contemporary understanding of innovation is much broader. Innovation is understood as the creation of better or more effective products, processes, services, technologies, or ideas that are readily available to markets, governments, and society. This idea is consistent with the way Rogers (2003) defines innovation, as "*an idea, practice, or object that is perceived as new by an individual or other unit of adoption*". Rogers (2003) identified an organizational innovation as a discipline of study. It is anything that is done for the first time in an organisation, and it is part of the organizational change process.

In its Oslo Manual, OECD (2005) defines an organizational innovation as "*the implementation of a new organizational method in the firm's business practices, workplace organisation or external relations*". In other words, innovations in workplace organisation involve the implementation of new methods for distributing responsibilities and decision making among employees for the division of work within and between firm activities (and organizational units), as well as new concepts for the structuring of activities, such as the integration of different business activities. Organizational innovation is driven by three main factors, as behaviour of individuals, internal characteristics (culture) of the organisation, and factors external to the organisation.

As the service (tertiary and quaternary) sector starts to play a critical dominant role in most Western economies, innovation in services, and/or organizational innovation have come to the fore. In this way, we consider PPM as an organizational innovation at the level of particular organisations. This innovative practice is expected to improve the organisation's performance as we have argued in the previous section.

### 2.3.2 Adoption

As opposed to Rogers' macro perspective, studying factors that influence PPM Adoption requires a micro perspective, being that of the individual adopter, in this case the adopter being an organizational body. Various authors have researched innovation adoption from the micro perspective (adopter perspective). Damanpour and Schneider (2006) have studied the influence of various factors on adoption of innovations by approximately 1200 public organisations in the United States, categorising the factors into environmental, organizational and top-manager's characteristics and concluding that each of these dimensions is to a higher or lower extent responsible for unique variances in the adoption of innovation. For example, Damanpour and Schneider (2006) find that the organizational characteristics and top managers' attitudes toward innovation are more powerful than environmental and top managers' demographic characteristics. The influential factors that Damanpour and Schneider (2006) mention comprise 'complexity and size' of the organisation and 'top management's attitude to innovation, which they also refer to as 'change-oriented behaviour'. Wong and Aspinwall (2005) have investigated the critical success factors for adopting one particular innovation, being Knowledge Management (KM). They found 'Management and leadership support' and 'Culture' as the most important factors for KM adoption success.

Teller et al (2012) have studied the influence of formalisation (e.g. adoption) on PPM success, finding that complexity is an important moderating factor. Čudanov and Jaško (2012) have studied the influence of dominant management orientation on ICT adoption and found that organisations in which dominant management orientation was result-oriented had much better and effective ICT adoption.

## 3 Conceptual Framework

This section brings insights from research on PPM, organizational innovation and adoption together to develop a conceptual framework of PPM Adoption. The framework consists of two parts. Firstly, it is the state of PPM Adoption, based on the variables identified in De Reyck et al (2005). Secondly, it specifies the factors – conditions and drivers – that influence PPM Adoption. These factors have been derived from the extant body of academic literature. Additionally, their relevance and validity were supported in a series of explorative interview with management consultants specialised in PPM,

conducted in the course of March-May 2012.

### 3.1 The stages of PPM Adoption

De Reyck et al (2005) have studied the link between PPM Adoption and PPM success. For this, nine variables were developed to measure the degree of PPM advancement. These variables are presented in Table 1. De Reyck et al (2005) suggest using a 4-item Likert scale to measure each of the variables and to express the simple average of the response levels for each of this variables as the 'overall adoption level'.

**Table 1 Variables to measure the degree of PPM Adoption**

Variable	Description
Centralised view	To have an inventory of current and proposed significant projects
Financial analysis	Determining the value of projects using various financial techniques for project selection, like Return on Investment (ROI) and Net Present Value (NPV)
Risk analysis	Management of overall risk analysis of the project portfolio, regarding various types of risks (e.g. technology, cash flow, market)
Interdependencies	Management of interdependencies between projects. Interdependencies comprise overlap in project outcomes, implementation bottlenecks and resource competition.
Constraints at portfolio level	Consideration on portfolio level of constraints in budget, human resource, infrastructure and staff capability
Overall analysis	Management of overall measures of the project portfolio including diversification and risk vs. reward analysis
Categorisation, selection, accountability and governance	Strategy alignment, top management involvement, accountability and governance
Optimisation	Central benefit tracking, target-outcome comparisons, regular revisions of the overall project portfolio
Specialised software	The use of specialised software to manage the portfolio of projects

Source: based on De Reyck et al (2005)

### 3.2 Factors influencing PPM Adoption

Factors influencing PPM Adoption form an under-researched topic in the extant body of literature. In this paper, we formulate these factors on the basis of our literature review, supported by explorative expert interviews. In identifying and describing the factors that are of influence on PPM Adoption, difference has been made between conditions (descriptive factors, factors describing characteristics of the organisation) and drivers (normative factors, factors that describing the actions the organisations seeks to undertake or its needs).

#### 3.2.1 Conditions

- Relative resource scarcity

Relative resource scarcity is the relative lack of resources (human, financial, infrastructural and other) that an organisation has in comparison to the total amount of resources required for performing all the (potential) projects. This factor is at the core of any selection model in PPM. Organisations facing high relative resource scarcity, implement selection models to make rational decisions as to which project proposal to accept and which to decline. If organisations have abundant resources for all project proposals, the need for selection models would not be acute. It is therefore expected that increasing relative resource scarcity will have a positive effect on PPM Adoption.

- Portfolio complexity

Portfolio complexity brings the challenge for maintaining oversight over the portfolio. Complexity consists of multiple components. First of all, it is the sheer number of projects. It is easier to keep track of a few projects, while a higher aggregate budget of many projects increases the need to manage the portfolio centrally. Secondly, project interdependencies increase the need for oversight and complicate the oversight over the portfolio. For example, intermediate outputs of one project may form critical inputs to another on-going project. Thirdly, it is single project uncertainty describing the average extent to which the course and results of a single project are predictable. For example, innovative projects, such as new product development, generally face a relatively high uncertainty in comparison to a

repeated rollout of a small software application. Altogether, Portfolio Complexity is expected to have a positive effect on PPM Adoption, i.e. the more complex the current project portfolio, the higher is the need for PPM Adoption. This factor is mentioned by various authors such as Damanpour and Schneider (2006), Teller et al (2012). On the basis of empirical analysis of several case studies, Filippov et al (2010) have concluded that the main problem leading to introduction of PPM practices was the growing amount and complexity of projects.

As one of the respondents in our research stated, *“If you have to complete 30 projects and you have no structure to achieve it, then you’re just trying to blindly work through whichever one comes up first... for my client they had realised very quickly that that wasn’t going to help them accomplish any real strategic goals”*.

- Organizational culture

The culture of an organisation, involving management culture, is a critical condition of any organizational innovation (Hurley and Hult, 1998). Management culture describes to what extent top management desires to be in control, to what extent top management prefers bureaucratic management over a looser management style. Čudanov and Jaško (2012) use the terms ‘result oriented vs. people oriented’ for this. Wong and Aspinwall (2005) mention leadership as a critical element of managerial culture. A more control/result oriented management culture is expected to positively influence PPM Adoption. Empirics corroborates the theory; as one of the respondents argued, *“It takes more of a strategically focused personality in a manager to push for the adoption of PPM”*.

The ‘change readiness & innovation attitude’ describes the extent to which the organisation is open to the introduction of PPM itself. Introducing an innovation like PPM comes with shifts in power balance and the perception of change in working style, which potentially evokes resistance within the organisation. Commitment and involvement of top managers in PPM (and other stakeholders) are always emphasised in all PM and PPM professional guidelines. In line with it, Jeffery and Leliveld (2004) argue that managers may resist implementation of PPM and it can be viewed as a critical hurdle to PPM, undermining its success. This resistance lays in the potential decrease of managers’ power, which embraces their control over the project budget and resources. PPM Adoption is not only about introducing support project management mechanisms and structures; PPM Adoption may require a culture shift in the organisation. As one of the respondents put it, *“PPM Adoption has a lot to do with the culture of an organisation. (...) Adoption is not just the implementation of the structure to support PPM”*. Overall, change readiness and innovation attitude are expected to show a positive relation to PPM Adoption.

- PPM Gap size

This factor describes the relative effort it would take to adopt and consecutively implement PPM. First of all this lies in the access to knowledge about PPM. This idea is derived from Damanpour and Schneider (2006) who discuss the availability of information for innovation. Organisations that have high exposure to PPM, for example due to their contacts with similar organisations with PPM in place, or knowledge of top managers who used to work with PPM in other organisations, may consider adopting PPM sooner and more pro-actively than those organisations that are not exposed to it much. The factor of top management exposure to innovative practices is discussed by Young et al (2001). Also, the relative ease with which knowledge about PPM is accessible is important too. If an organisation has relatively affordable access to a consultancy company, or it can hire experts with PPM knowledge and experience or has other means for getting access to PPM knowledge, this can contribute to the ease to adopt PPM, and hence bridge this gap.

The other part of this variable is the current state of the organisation. If the organisation has already much in place for what is required for PPM (for example, a formalised Project Management methodology), it would be easier to further adopt PPM. It would make the decision to take up PPM less critical because of its relatively lower impact.

Altogether, the PPM Gap size is expected to have an inverse (i.e. negative) relation to PPM Adoption, i.e. the larger the PPM gap, the less rapid the PPM Adoption will be.

### 3.2.2 Drivers

The section enlists drivers that influence PPM Adoption. By drivers we understand not only factors positively influencing PPM Adoption, but also factors hampering it (negative influence).

- Desire for better information transparency

Top managers may desire to have better information about the project portfolio, in order to be better able to steer it. This factor is derived from the list of potential benefits that PPM brings to

organisations. Levine (2005), Pennypacker and Retna (2009) and others have emphasised that PPM is expected to bring better oversight and better transparent information about the projects in the portfolio. In a study of several cases, Filippov et al (2010) mention that lack of overview leads to frustration on various levels, and hence better transparency is desired.

This factor is expected to have a positive relation to PPM Adoption.

- Need for better predictability of company results

Organisations may experience the need for better predictability of or for more certainty about future results. For example, a stock listed company has the need to predict future profits. Better information about portfolio costs and benefits contributes to this predictability. Thiry and Deguire (2007) mention that predictability is one of the key drivers for implementing a PMO, which can be considered a substantial element in PPM Adoption.

Hence the need for better predictability of company results is expected to have a positive relation to PPM Adoption.

- Desire for project success rate improvement

A widely known fact is that globally most of the projects do not stay within their earmarked budget and planned schedule, leading to higher project costs than intended. Organisations may experience a strong need or desire for improving their project success rates. De Reyck et al (2005) argue that the advancement in PPM Adoption is inversely related to the number of project related problems. In other words, the desire to reduce these problems, alternatively formulated the desire to improve project success rates, is expected to positively influence PPM Adoption.

- Desire for portfolio rationalisation

The desire for portfolio rationalisation is the desire for having fixed criteria for starting and killing projects and to consistently and continuously executing a project selection mechanism. Pennypacker and Retna (2009) mention state that the benefit of PPM is that it should enable to base portfolio decisions on logic, reasoning, and objectivity. This desire is expected to have a positive relation to PPM Adoption.

- Alternative organizational priorities

Alternative organizational priorities mean that top managers perceive other things to be more important to the organisation's performance than PPM Adoption. The adoption of PPM, for example, requires a dedicated budget that may be unavailable in the meantime. The alternative organizational priorities are expected to have a negative relation to PPM Adoption.

### 3.3 The conceptual framework

The previous sections have presented separate elements of the conceptual framework. It is summarised in Figure 1. The framework includes the PPM Adoption spectrum based on the nine variables identified by De Reyck et al (2005) (Section 2.1) and the nine factors potentially influencing PPM Adoption (Section 2.2).

Figure 1 The Conceptual Framework

## 4 Conclusions

Project Portfolio Management has emerged as a distinctive stream of research in the project management discipline. A considerable body of literature (both academic and practitioner-oriented) has been formed, focusing on various aspects of PPM, such as strategic alignment, commitments and human interactions, resource management, etc. Most publications discuss adoption from either a normative or positive perspective. This is either how an ideal PPM should look like, or how PPM works in practice in various organisations. Consequently, research has sought to explain differences between these two perspectives.

A subject in PPM which is largely under-researched is how and under what conditions organisations start and advance their transition towards PPM. The objective of this paper was to contribute to bridging this research gap.

We position PPM Adoption as an organizational innovation that brings about changes to the current practices of organisations. This change can be very profound in project-based organisations. It involves shifting balance of powers and reengineered business practices. Hence the change embraces many organizational aspects, and cannot be limited only to installation of a specialised software as some consultancy companies tend to portray it. It should be noted that there are organizational barriers to innovation and hence PPM Adoption, such as fixed, hierarchical structure, mismatch of people and tasks, unclear goals and objectives, lack of training and no organisation for the management of ideas.

On the basis of literature review and explorative expert interviews we have designed a conceptual framework which can be applied to study the process of PPM Adoption in various organisations. The framework contains nine variables to measure the current state of PPM Adoption as well as nine factors that drive this adoption.

Further research should address the application of this framework in a number of case-studies. As well as using a quantitative approach in a longitudinal study. We can conclude that PPM Adoption is a promising avenue of further academic research.

**Abstract:** Complexity of projects is hotly debated and a factor which affects innovativeness of team performance. Much attention in the past is paid to technical complexity and many issues are related to natural and physical sciences. A growing awareness of the importance of socio-organisational issues is announced by researchers and consultants which is much less investigated. The failure of projects may be due partly to overlooking these issues. In this study within a single organization an exploratory framework was developed to research relations between group dynamics (team mindfulness, safety, learning and defensive behaviour, complexity of projects and the outcomes of team performance. Combining data from face-to-face interviews, a survey and a team observation lead to the recommendation that greater attention for group dynamics is beneficial for the output of project teams who are managing and executing complex innovative projects.

**Key words:** Managing innovation; Managing teams; Project management; Soft skills; Project complexity

### 1 Introduction

While a growing number of articles are published on project complexity, many studies have been carried out on the 'hard' technical side, but much less has been investigated on the 'soft' socio-organisational side (Antoniadis, Edum-Fotwe & Thorpe, 2011). 'Hard' project complexity gets most of the attention in studies of large scale construction projects or the application of highly sophisticated new knowledge and technology. 'Soft' project complexity studies put a stronger focus on the human side, for example on issues concerning stakeholders, team dynamics, and leadership. Research conducted by Azim, Gale, Lawlor-Wright, Kirkham, Khan and Alam (2010) indicates that in the perception of project managers the impact on project complexity is largest from people, compared to process and product. According to the authors this implies people not only largely contribute to project complexity, but, consequently, 'soft' skills may also be of more importance than 'hard' skills: hard skills in the context of project management generally refer to processes, procedures, tools and techniques, whereas the soft skills refer to dealing with human issues, i.e. the 'people' part of the project, e.g., communication, teamwork, leadership and conflicts (Azim et al, 2010). What typifies many projects these days are numerous project failures in practice (Thomas & Mengel, 2008). According to several researchers our society as a whole has become an open web of many interacting elements which is changing constantly, and with a fast growing number of interrelationships, while many of us hold on to the dominant project management approach of orderly planning and control which, in spite of that, is no longer suitable to complex projects and project management (Azim, et al, 2010, Baccarini, 1996; Williams, 1999; Pich, Loch & De Meyer, 2002; Jaafari, 2003; Cicmil & Marshall, 2005; Vidal & Marle, 2008; Whitty & Maylor, 2009; Geraldi, Maylor & Williams, 2010; Antoniadis et al, 2011; Gul & Khan, 2011).

This article is concerned with the complexity of innovation projects and asks attention for the 'soft', socio-organisational aspects of project management. Our ambition is to bring together several social-scientific constructs in one study design for the first time and to perform an exploratory analysis on their relationships. The results are meant to better understand some elements of the complexity of project management and to find keys how teams can deal with complex projects (Thomas & Mengel, 2008).

This contribution starts with a description of the organisation studied, which is a large research and technology organization (RTO) in the Netherlands. Subsequently we outline a framework, derived from a literature review. Thereupon the research method – interviews with project managers, a survey among project team members, and a team observation – and results are presented. We end with our conclusion and points of discussion.

## 2 The Case Study Organization and Its Management Challenge

The RTO under study is organized as a project matrix organisation, where the project manager has authority over personnel, finance and other resources (Hobday, 2000) and partly over the content of the project. The project matrix organization crosses functional groupings – here ‘expertise groups’ from natural, technical and social sciences – by projects that align with topics and as such are linked to client segments – here called ‘thematic lines’. Projects may combine expertise from different ‘expertise groups’ and can combine several topics to serve specific client preferences.

The RTO has as purpose to develop innovative and applicable knowledge for the benefit of the economy in general (a quarter of its turnover), while at the same time acquiring commercial orders commissioned by private or public bodies. At the level of projects the RTO promotes larger projects combining several disciplines that could create as much societal impact as possible. In practice, however, most projects are organized within specific disciplines (‘thematic lines’) and within pooled expertise groups, hence reflecting a certain kind of specialized division of labour which may limit the desired impact. The organization unintentionally conveys a paradoxical ‘mixed message’ to its personnel between on the one hand a concern for impact and innovation, and on the other hand for turnover and feasible organizing its projects.

Our study focuses on exploring the management of innovation projects carried out at the level of project teams. These teams consist of scholars from different disciplines selected from either natural science, technical science or social science expertise groups. For these teams and the overall management layer (‘programme management’) steering the projects of these teams is affected by the environment, i.e. the organisational opposing targets, which cannot be completely controlled. However, besides already determining costs, time, scope (‘hard skills’), this overall project management can intervene in the group dynamics (‘soft skills’) of the project teams. The overall project management and the project team members have to deal with the mixed message of being innovative and efficient simultaneously. A risk being unconsciously conducive to avoid complex trajectories that can truly be innovative. The overall project management’s assumed collaboration between project team members being a key variable for both innovative and efficient outcomes. The management problem, therefore, can be formulated as a concern for the proper steering of the projects to reach both these outcomes.

The RTO basically carries out two types of projects, namely innovation projects and routine projects. Innovation projects are characterized by uncertainties such as partly open specifications and unpredictability of results, whereas routine projects are known for their definitive functional specifications and rather concrete wishes from clients. Routine projects are in many cases commercial assignments for which much available knowledge is to be made applicable for specific solutions. Conversely, innovation projects aim to develop new knowledge and new applications, without a distinct client profile or market purpose. The experience of several managers and employees of this RTO is that their innovation projects could be more successful. Although their experience is not representative, the results of these projects are too often not the desired breakthroughs hoped for. The management of one cluster of innovation projects (there are six of such clusters), regarded this situation as a management challenge, and commissioned a research to explore in what way the collaboration among team members of innovation projects could be improved in enhancing truly innovative project outcomes.

The exploratory research has three assumptions which will be expounded. The first assumption is innovation projects are perceived as more complex than routine projects, which differ in obtaining expected results. A second assumption is that the perceived complexity of a project functions as an impetus on humans to stay in control of the situation which subsequently activates defensive behavior. Consequently, defensiveness may function as a counterforce for innovative behavior. The third assumption following from the second is that some kind of unnatural behavior is needed to overcome this defensive behaviour and to make team members aware of their ineffective ways of acting. The research purpose is to explore these three assumptions and investigate if team mindfulness, team psychological safety and team learning behaviour can be helpful to project teams to manage complex innovation projects, thereby overcoming the possible presence of defensive behaviour in teams. A new framework combining several theoretical constructs and methods to measure them needed to be developed.

## 3 Perceived Project Complexity and Team Dynamics: Literature Review

We studied the literature on project complexity and team dynamics to develop a framework how outcomes of team processes are affected. The framework relates four constructs: 1] perceived

complexity of projects, 2] dynamics of groups to deal with complexity (i.e. team mindfulness, team psychological safety and team learning behaviour); 3] one type of dynamics of groups which may interfere with adequately dealing with complexity (i.e. defensive behaviour) and, 4] outputs of project teams (i.e. team innovativeness, team external and internal effectiveness). This framework will result in the research questions and hypotheses.

#### *Project complexity and project management*

In a recent paper Gul and Khan (2011) develop a comprehensive model of project complexity which nicely summarizes the discussion on the topic and consist of three elements: structural complexity, uncertainty and people uncertainty. Structural complexity is founded on the two concepts differentiation and interdependency (Baccarini, 1996). Differentiation refers to the number of varied elements and interdependency to the degree of interrelatedness amongst those elements. Uncertainty refers to the degree to which the two concepts of goals and methods are well-defined (Turner & Cochrane, 1993). Gul and Khan add to this the factor of environmental uncertainty. Williams (1999) combined structural complexity and uncertainty into one model and contended that the former refers to the structure of the project and product, while the latter adds to the complexity of the project. Gul and Khan (2011) extend this model of Williams one step further by adding people uncertainty, which consist of social interactions and rules of interaction. Social interactions refer to relations between people and rules refer to schemas and strategies that, respectively, 'describe or predict others behaviour' and 'suggest to an individual what to do as the game unfolds'.

The extended model combines complexity of structure and people, and describes it in an objectified manner. This study, however, concentrates on how project members perceive complexity. Eventually we want to know how team members deal with complexity as they experience it. While project complexity is related to how complicated it is to arrive at the desired results, and to what extent the process of events can be predicted and managed, Schlindwein and Ison (2005) make a helpful distinction between descriptive complexity and perceived complexity. The first refers to objective, intrinsic properties of a system, while the second considers complexity as subjectively understood through the perception of an observer. Observers in our study are the members of project teams. Project complexity is the way team members experience the complicatedness of their project, therefore, complexity is a property of the project, such as its structural characteristics, uncertainty, dynamics, pace and socio-political characteristics (Gerald et al., 2010). Observers such as team members in this case, may consciously or unconsciously distinguish between their own more distant description of the characteristics of a project and their own experiences of interactions with persons involved. Observers may combine a descriptive view of a project as something 'out there', while at the same time experience being 'in there' as part of the project. Their perceived complexity is a joint property of their distant view and their own experiences, which cannot be separated, because what is out there is what team members experience to a certain extent (Stacey, 2005).

#### *Project complexity and defensive behaviour*

Perceived project complexity implies that executing such projects is difficult and a fallible endeavour, which may invoke feelings of anxiety, skepticism, moral duty and commitment, which are mediated by power relations, and which can be both encouraging and inhibiting (Cicmil & Marshall, 2005). The reasons are mainly of a psychological nature. Humans have a preference for control which makes them feel comfortable. If humans perceive a situation as complicated and as difficult to master they may feel anxiety and are inclined to restore the situation to a state of control. Argyris refers to this kind of behavior as organisational defensive routines, which are any action, policy, or practice that prevents organisational participants from experiencing embarrassment or threat and, at the same time, prevents them from discovering the causes of the embarrassment or threat (Argyris, 2004b: 392). Examples of defensive behavior are shifting responsibility, blaming others, avoiding conflicts, reducing a big problem into a small issue, which prevents feelings of embarrassment, threat and anxiety. This is often the case in complicated situations, such as situations in project teams dealing with complex projects. Complexity is a source for one of the most frequently occurring defenses, namely sending mixed messages. Argyris illustrates how this works: "'Mary, you run the department, but check with Bill', or 'John, be innovative, but careful'. The logic is: (a) send a message that is inconsistent; (b) act as if it is not inconsistent; (c) make steps (a) and (b) undiscussable; and (d) make the undiscussability undiscussable" (Argyris, 2004b: 392). The theory of action helps to explain why humans perform defensive behavior (Argyris, 1990, 2004a, 2004b; Argyris & Schön, 1996). Human beings hold two types of theories of action. The one they espouse is usually expressed in the form of stated beliefs and values (the 'espoused theory'); the other one is their 'theory-in-use' which can only be inferred from

observing their actions, their actual behaviour. In practice this means that human beings craft their positions, evaluations, and attributions in ways that inhibit inquiries into and tests of them with the use of independent logic. Consequently, these strategies are likely to be defensiveness.

*Unnatural behaviour to deal with complexity*

Innovation projects perceived as complex create group dynamics that may trigger defensive routines. Innovation, however, urges for deviation of routine behaviour. Talking about creating new music, avant-garde musician Frank Zappa says: “Without deviation from the norm, progress is not possible” (Zappa, 1989: 185). From the field of risk and crisis management one can learn that unnatural behaviour is helpful to deal with unexpected situations (Weick & Sutcliffe, 2007; Barton & Sutcliffe, 2009; 2010). Natural behaviour refers to theory-in-use actions that help humans to unilaterally control their feelings and thoughts in complex and unexpected events that arouse anxiety and uneasiness. The reason why complexity leads to unexpected events, is that, in project teams and their environments, humans perform multiple responsive interactions at a ‘local’ level that lead to ‘emergent patterns’ that cannot be predicted (Stacey, 2005). ‘To manage the unexpected’ one needs to know how expectations work. Humans tend to except as evidence all that confirms their expectations, and actively seek out such evidence (confirmation bias, Weick & Sutcliffe, 2007: 23-27, 167). High-risk organizations, like nuclear power plants, surgery teams in emergency rooms, crisis management organizations, fire fighting departments, traffic control towers, or aircraft carrier flight decks, train their personnel to counteract confirmation seeking tendencies, by learning to fight their own expectations, and in doing so performing unnatural behaviour. The purpose is to prevent failures and disasters and to limit the escalation of those failures and disasters that occurred nonetheless. These organizations are organizing a ‘mindful infrastructure’ to combat the mechanism of expectations, that make people, for example, preoccupied with ‘weak signals’, resist oversimplification, and be resilient, i.e. being able to maintain or regain from errors, setbacks and disappointments, which allow to continue operational focus. Such mindful organizations become ‘high-reliability’ organizations (Weick & Sutcliffe, 2007: 2-17; 2006: 516; Weick, Sutcliffe & Obstfeld, 1999).

#### **4 Framework to Explore Dynamics in Project Teams and Hypotheses**

Team mindfulness, team psychological safety and team learning are explored to study whether they have a positive influence on the results of project teams. Team mindfulness is defined as a collectively shared mental orientation toward continuously being alert about unexpected events and what can go wrong in the project. Team mindfulness should help team members to come into action when a project goes off-track. But a team consisting of various individuals may not work as a well coordinated team should. At times when action is needed a team may fail to act, for example due to the fact that the team may not notice weak signals or team members get stuck in their theory-in-use. Instances like these may lead to ‘dysfunctional momentum’, when people continue to work toward an original goal without pausing to recalibrate or re-examine their processes, even in the face of ‘weak signals’ suggesting they should change course (Barton & Sutcliffe, 2009; 2010). Momentum means team members are engaged in a particular course of action, usually aimed at a specific goal, which can become dysfunctional for various reasons, among them seeking for confirmation of expectations. Barton and Sutcliffe point out that their ideas bear relevance to other than high-risk organizations such as business organisations and innovation teams (Barton & Sutcliffe, 2010).

Team mindfulness can lead to voicing concerns, which is a necessary condition for teams to reconsider their actions. Speaking out, however, is not self-evident. Argyris (1990) has pointed to the triggering of organisational defensive routines if voicing concern could imply embarrassment, rejection or punishments from team members, and Janis (1982) pointed out that group cohesiveness and groupthink may reduce the preparedness to stick out deviant views. Therefore, team psychological safety is an important condition to make ‘the undiscussable discussable’, which is defined as a shared belief the team is safe for interpersonal risk taking (Edmondson, 1999). Edmondson holds that team psychological safety is meant to suggest a sense of confidence that the team will not embarrass, reject, or punish someone for speaking up, implying mutual respect and trust among team members as a team climate (1999: 354).

For team mindfulness to become manifest, teams may also have to perform team learning besides team psychological safety. Learning by individuals is inhibited when people face the potential for threat or embarrassment (Argyris, 1990; Barton & Sutcliffe, 2009, 2010), therefore the absence of learning threatens team performance (Edmondson, 1999). Team learning at group level is an ongoing process of

reflection and action, characterized by asking questions, seeking feedback, experimenting, reflecting on results, and discussing errors or unexpected outcomes of actions (Edmondson, 1999). The project teams of the RTO not only consist of team members who come from various locations and positions within the organization, they also bring together different disciplines and backgrounds ('expertise groups' and 'thematic lines'). Team diversity is significant as teams differ in attributes like gender, ethnicity, professional status, educational degree and scientific discipline. Team diversity poses barriers to collaboration in teams, largely to impeding effective communication. "Superficial or ingenuous conversation may soothe in the short run but is likely to block progress in the longer run. This is especially true for teams engaged in innovation and involved in other work activities that call for behavioral and organisational change" (Edmondson & Roloff, 2009: 202).

Our framework reflects the following line of reasoning. Complex projects –perceiving projects as complex, e.g., due to higher degrees of innovativeness – associate negatively with perceived project results. The reason is that project complexity negatively relates to team mindfulness, team psychological safety and team learning. On its turn, team mindfulness, team psychological safety and team learning associate in a negative way with defensive behaviour: the more mindfulness etc., the less defensiveness. And, finally, on its turn, defensive behaviour has a negative relation with perceived project results: the more defensiveness, the lower perceived projects results. Therefore, group dynamics like team mindfulness, team psychological safety and team learning may suppress defensive behaviour, and when it does team members can better cope with complex projects, which leads to a more positive perception about the results they achieve. Figure 1 visualizes the framework.

**Figure 1 Framework of the Study**

The research questions, following from this framework, are: Can mindfulness, safety and learning in project teams enhance the results of project teams?; Does defensive behaviour affect project results?; Are the results of project teams affected by perceived project complexity? This study will explore whether team mindfulness, team psychological safety and team learning together contribute to the performance of project teams of the RTO, i.e., that team members perceive their (expected) project results in a positive way:

*Hypothesis 1 (H1):* Team mindfulness, team psychological safety and team learning are positively associated with perceived project results.

Following Argyris' insights the study investigates the impact of defensive behaviour on perceived project results, which is expected to be negative:

*Hypothesis 2 (H2):* Defensive behaviour is negatively associated with perceived project results.

Innovation projects compared to routine projects may be more confronted with difficulties in good cooperation, effective communication and a shared understanding of the goal of the project. It is plausible that teams whose members report a stronger perceived project complexity may see the project results in a less positive sense. Therefore:

*Hypothesis 3 (H3):* Perceived project complexity is negatively associated with perceived project

results.

It can be suspected that team members reporting high scores on team mindfulness, team psychological safety and team learning show less defensive behaviour. As a consequence defensive behaviour has a weaker effect on perceived project results, because there is a spurious relationship. In this case team mindfulness etc. is a confounding variable that causes defensive behavior being suppressed and perceived project results being positive.

*Hypothesis 4 (H4):* Defensive behaviour is negatively associated with team mindfulness, team psychological safety and team learning.

## 5 Methods

### *Procedure*

The framework presented is meant to eventually argue whether innovation projects and routine projects may differ in their extent of complexity of projects, their group dynamics and their outcomes. We were, however, not able to compare project teams of types of projects during this phase of exploring what constructs and theories may be helpful. We were interested in learning how project team members were perceiving their projects, team dynamics, and outcomes. Therefore we investigated in an exploratory way if the constructs applied make sense in understanding complexity of projects? Subsequently we wished to propose how to improve the collaboration in teams afterwards. For this purpose we studied project team members of various teams, not individual teams or separate types of projects.

To explore the framework via the formulated hypotheses, team members of the RTO are studied using a combination of three methods.

- First, six project managers on innovation projects were interviewed face-to-face with the purpose to make an inventory of their experience with team collaboration and establish if they report problems connected to collaboration in teams. These indicators were used as input for the questionnaire.
- Second, in the project team of one of those six managers a meeting was observed to study possible defensive behaviours. The behaviours were translated into items of the questionnaire.
- Third, a survey (the questionnaire) was held among a sample of team members to explore various relevant constructs. This survey has an exploratory character to investigate associations and directions of correlations which are not much researched until now.

The face-to-face interviews, together with the outlined literature review on teams and innovation, served as background for the design of the questionnaire. The observation of the project team has a special purpose. Argyris and Schön have stressed on several occasions that it is impossible to derive people's espoused theory from interviews: 'When someone is asked how he would behave under certain circumstances, the answer he usually gives is his espoused theory of action (...) However, the theory that actually governs his action, is his theory-in-use, which may or may not be compatible with his espoused theory' (Argyris & Schön, 1974: 6-7; also 1996: 13, 76-77). Especially when researching defensive mechanisms it is unwise to solely rest on surveys or questionnaires, as observations of actual behaviour are regarded as a much more valid method. The observation is meant to collect additional data on defensive behaviour.

### *Survey data*

After testing the questionnaire among a small group of individuals of the same RTO other than the sample, from randomly selected research groups – subgroups within the so-called expertise groups – 379 individuals were approached through the RTOs' intranet and were requested to complete the survey of which 150 responded, a response rate of 40%. Of these 150 surveys, 83 were filled out completely. 36% was working mainly on innovation projects; 58% mainly on routine projects; and 6% on neither of these, which were excluded from the analysis. The relatively low response rate is explained by the desire to test several constructs which made the (exploratory) questionnaire extensive.

As the main purpose of this study was to explore our framework through the hypotheses rather than to describe the properties of particular organisational departments or to compare between teams, the sample was not selected to ensure representativeness of the RTO's population. The level of analysis is the organization as a whole, which implies that all statements made refer to the organisational level, not to individuals or teams.

### *Measures*

Team mindfulness is constructed by adapting the 'organisational mindfulness' scale from Weick and Sutcliffe (2007: 87), which was designed as an audit instrument at the level of an organization to

assess the 'mindful infrastructure'. Moreover, the items were domain-specifically targeted at high-risk organizations which were reworked to be applicable to project team members.

Team psychological safety and team learning behaviour were reproduced from Edmondson (1999) and slightly adapted. Both team psychological safety and team learning behaviour consisted of 7 items each.

Defensive behaviour was measured by reworking 14 defensive strategies investigated by Ardon (2009: 245) based on the theory of Argyris (1990) how unilateral control leads to defensiveness. Ardon arrived at these defensive strategies from using an action research approach, emphasizing narratives and interactions within case studies to try to infer theories-in-use.

Perceived project complexity was inspired on the five aspects of project complexity distinguished by Vidal and Marle (2008: 1097-1098, 1105): size of a project system, variety of the project system, interactions and interdependencies within the system, context and environment dependency of the project system, and, uncertainties and change propagation as consequences of complexity.

Innovation project (1) and routine project (0) formed a dummy variable based on the survey question 'Are you working in an ETP project?' ETP stands for Enabling Technology Project, directed at developing new knowledge and solutions (innovation projects), contrasted by regular projects for customers that resemble routine research projects (routine projects).

The output measures are team innovativeness, external team effectiveness and internal team effectiveness, which are used as indicators for the performance of the project teams with respect to their results. Team innovativeness was measured with a scale constructed by De Dreu and West (2001) consisting of four items derived from Anderson and West (1998).

Perceived external and internal effectiveness respectively reflect the degree to which objectives are met that are associated with external factors, such as budget constraints, overall goals, and interest of clients and stakeholders on the one hand, and the management of team processes on the other hand. The scales are derived from Musallam (2011) who based them on the work of Espirito (2001). The original scales were domain-specifically developed to establish the functioning of nongovernmental organizations, which were made applicable to project team members.

Table 1 presents the Cronbach's alphas for the scales and examples of items, which shows that the internal consistency of all scales are satisfactory with scores of .66 or higher.

**Table 1 Constructs of Independent and Dependent Measures**

Constructs	Examples of items	Cronbach's $\alpha$
Team mindfulness (1=disagree very much to 5=agree very much)	We are very alert to unexpected events and turns in the project' Team members worry constantly about misunderstanding agreements and / or relevant events	.76
Team psychological safety (1=disagree very much to 5=agree very much)	If you make a mistake in this team, it is held against you Team members are able to bring up problems and bottlenecks	.67
Team learning behavior (1=disagree very much to 5=agree very much)	We regularly take time to improve our team's work processes We invite people from outside the team for presentations and / or have discussions with us	.67
Defense mechanisms (1=disagree very much to 4=strongly agree)	That I say 'yes' to a joint decision, in which my real 'commitment' is untrue (compliance strategy) That I participate in attributing causes 'outside the team' or 'to others' once things go against us (blame strategy) That I reduce the problem of seemingly unsolvable issues in order for us to control it (reduction strategy) That I shift responsibility to another person (shirk strategy).	.66
Perceived project complexity (1=disagree very much to 5=agree very much)	This is a very complex project concerning the number of involved team members, stakeholders, financial budget, throughput time, constituent activities and /or decision process This project is characterized by a high degree of uncertainty, for example due to shifting of goals, shifting of interests, changing composition of project team members and / or changing of funding	.74
Team innovativeness (1=disagree very much to 5=agree very much)	Team members apply new ideas to improve the quality of our product / service / knowledge This is a innovative team	.79
External effectiveness	Specific objectives are met within the budget	.83

(1=disagree very much to 5=agree very much)	Team members regard ‘impact’ of the services / products that we provide important

### *Face-to-face interviews*

From the face-to-face interviews with project managers and project leaders from innovation projects – hence not with representatives from routine projects – an inventory of bottlenecks and encountered difficulties was made, summarized in Table 2. Findings accentuate the events and issues that project managers experience which are complicating the performance of innovation projects. This bias towards negative experiences, underexposing what goes particularly well, was caused by the scope of the research. The project managers mention as (1) structural characteristics that initially project goals are often ill-defined, team composition is diverse and that this can be based on questionable criteria, which enhance the project complexity. With regard to (2) the group dynamics in teams the respondents mentioned that communication between team members is friendly and never confrontational, yet they are very well aware that everyone has their own agenda and possible competing interests. Project managers indicate that communication is sometimes difficult as team members work in several other projects simultaneously, are hard to bring together, and are working at different geographical locations. Project managers also point to a number of (3) external factors such as the management style of higher management and the organisational culture that is creating dilemma’s between business goals and innovation goals. That these bottlenecks contribute to the project complexity in terms of high cognitive demands to manage the project is easy to imagine. What may be less obvious is that the mentioned factors may contribute to role ambiguity, conflicts of interest and less effective cooperation among team members, as they may evoke groupthink and confirmation bias (Janis, 1982) and shadow organizing (Shaw, 1997) instead of enhancing commitment, innovation and creativity. The dilemma between business goals and innovation goals is an overt example of a mixed message, i.e., project complexity which can provoke defensive behaviour. Therefore it is important to mention that the respondents do never speak in these terms. In explaining why processes in their teams do not always go according to their wish, they tend to either attribute causes to external factors or tend to identify the mentioned structural and behavioural characteristics.

**Table 2 Highlights from face-To-Face Interviews with Project Leaders / Managers about Bottle-Necks and Risks in Carrying out Innovation Projects**

	Elements enhancing complexity (from the interviews)	Occasion for mixed messages (the researchers analysis of possible consequences)
(1) Structure characteristics	<ul style="list-style-type: none"> <li>- project definitions and project goals are abstract, general and partly undefined from the outset; regularly the composer of an initial project plan that is approved of for financing is not the same person as the eventual project manager;</li> <li>- a purpose to stimulate innovation is to compose teams consisting of members from diverse backgrounds of disciplines;</li> <li>-the composition of project teams is a matter of having expertise groups being represented, rather than selecting the best person available.</li> </ul>	<ul style="list-style-type: none"> <li>- expectations of the project manager, stakeholders and team members need to be clarified and need to be fine-tuned which is a process that is time consuming, and demanding great meticulousness and involves many individuals;</li> <li>- diversity in disciplines means incorporating differences in expertise, professional languages and a variety of standards and norms (paradigms) and demands clear role structures and tasks and fine-tuning the added value of all team members in each other’s directions; it also demands fine-tuning of interests from stakeholders behind the scene and with departments of the RTO who are delivering manpower and investments implying the use of influence and power;</li> <li>- the project manager sometimes has very limited influence to compose a team according to his/her needs and wishes and has to address preferences from all kind of stakeholders; a project manager is a ‘broker’ in interests, which may lead to a division of a larger project in smaller parcels (addressing more needs but losing focus).</li> </ul> <p>All these factors may contribute to role ambiguity, conflict and less effective cooperation.</p>

\* p< .05: \*\* p< .01 (2-tailed)

The framework of our argumentation, unfolded in the hypotheses, was investigated using hierarchical regression analysis, excluding missing values pairwise, on three dependent variables team innovativeness, team internal effectiveness and team external effectiveness. In the first step team mindfulness, team psychological safety and team learning behaviour were entered; in step two four behavioural defence items were entered; and in the third step innovation project and perceived project complexity were entered. The same analysis was performed with entering control variables at the first step (gender, education and average team size), but these had no significant relationship with team innovativeness,  $F(3,75)=1.08$ ,  $p < .36$ . Results of the regression analyses without these control variables are summarized in Table 4.

The main effects – team mindfulness, team internal effectiveness and team external effectiveness – explained a significant and large amount of variance in team innovativeness,  $R^2 = .44$ ,  $F(3, 75) = 19.45$ ,  $p < .01$ , and team internal effectiveness,  $R^2 = .47$ ,  $F(3, 75) = 22.09$ ,  $p < .01$ , and a moderate amount (between small and medium according to Cohen, 1992) of variance in team external effectiveness,  $R^2 = .14$ ,  $F(3, 75) = 3.97$ ,  $p < .05$ . Entering the defensive behaviour variables in step 2 nor the project features in step 3 had much influence on the explained variance. Only the model with team innovativeness gains a very small effect from the defence mechanisms ‘external attribution’ and ‘shift responsibility’, adjusted  $R^2 = .09$ ,  $F(4, 71) = 3.48$ ,  $p < .05$ .

These findings are consistent with the hypothesis (H1) that team innovativeness, team internal effectiveness and team external effectiveness contribute to project results in a positive way. The main effects remain robust and clear in explaining team innovativeness and team internal effectiveness, but not in explaining team external effectiveness. The hypothesis (H2) that defensive behaviour has a negative effect on project results is not fully confirmed. The third hypothesis (H3) stating that complexity in the form of perceiving the project as complex or working on an innovation project is negatively associated with project results has to be rejected. Although the model explaining team internal effectiveness reports a significant standardized beta of innovation project in the expected direction,  $\beta = -.20$ ,  $p < .05$ , supporting the proposed line of reasoning. The fourth hypothesis (H4), namely defensive behaviour is negatively associated with team mindfulness, team psychological safety and team learning, is supported by the significant correlations (Table 3).

### *Team observation*

Following the guidelines of Argyris & Schön (1974; 1996) defensive behaviour was additionally studied by observing a meeting of one of the project teams, consisting of six participants, which was videotaped (90 minutes were recorded). The meeting was one of the teams' regular meetings to discuss the progress of the project and exchange views, information and experiences. The atmosphere was constructive and friendly and participants told afterwards that they felt it was a good meeting and that substantial progress was made. It proved to be difficult to detect defensive behaviour during the meeting. This may stress how subtle defensive behaviour is performed and how unaware humans normally are when it is performed – skilled incompetence in Argyris' words. The friendly atmosphere probably contributed to this, as feelings of embarrassment or threat, which are conditional to observe defensive behaviours, may not have been stimulated strongly (Argyris & Schön, 1996: 77).

From the fourteen defensive strategies that were identified by Ardon (2009: 245) the following seven could be observed: (1) compliance strategy: if your superior persuades you to commit, say that you comply regardless of whether you really do; (2) plan strategy: agree to make a plan and act as if you comply with the plan; this way you contribute to change and stay in your comfort zone; (3) reduction strategy: if things become threatening or embarrassing, reduce the problem until it is controllable again; (4) distance strategy: if the discussion comes too close, change the subject to discuss 'other' parties or general observations, such as employees, middle management, or 'the organization'; (5) 'we' strategy: talk in terms of 'our responsibility' and 'what we should do'; as a consequence, nobody has to feel personally responsible; (6) joke strategy: if things become threatening or embarrassing, make a joke and change the subject; (7) shirk strategy: shift the responsibility to an 'outsider' and avoid sharing your own opinion about the process or colleagues. To illustrate these findings, Table 5 presents some slightly edited and shortened excerpts of the discussion that were taken from the meeting.

**Table 5 Excerpts from the meeting of the project team managing an innovation project**

---

**Compliance strategy**  
 Team members discuss a proposal of higher management to enhance the knowledge position in a coherent way that is to have 'impact' in a practical sense, which seems to be in conflict with their own interests to realize stronger scientific embeddedness within universities.  
 TM 1 "I feel this leads to a mismatch with our relation with universities"  
 TM 2 "You may be right, but it depends on how we explain things. If we do *more* than we have to, it could fit in well just as easily"  
 TM 1 "You mean, as long as it contribute to the value of the themes (for higher management) we are working on? Okay. That would work well for us"  
 TM 3 "Yes, let's just do both".

---

**Reduction strategy**  
 Team members are discussing the target to produce the number of scientific articles. The norm that they discuss is that for each €100.000,- that is invested into the project at least one scientific article should be published.  
 TM 1 "Dissemination is an important issue. How do we proceed?"  
 TM 2 Trying to laugh it off: "It is not necessary to have peer reviewed articles since our reading audience are mainly politicians"  
 TM 1 "I see what you mean. If we quantify the output it is easier to reach our targets"  
 TM 2 "Exactly"

---

**Plan strategy and we strategy**  
 The project manager mentions four points of attention that the team should decide upon by choosing the direction how to go forward.  
 PM "These points of attentions ask where will be our focus, what will we contribute and what is the role of cases that we study?"  
 TM 1 "I certainly agree we need to talk about this"  
 PM "We need to be more plain in what we will do..."  
 TM 2 "Well I feel that there are more topics than you mention" and mentions several other issues that demand a decision  
 TM 3 "My opinion is we need to know more about those first"  
 TM 1 "Good idea....do we know enough of the details"  
 TM 3 "We can't know it all, can we?"  
 TM 4 "no..no... not yet.."  
 TM 1 "Let's discuss this at the next meeting, ok"  
 PM reluctantly "Okay. I will put it again on the agenda. In the mean time we have to inform each other on all topics so we can quickly take decisions"

TM=team member; PM= project manager

## 7 Conclusion and Discussion

The results of the study clearly show that team mindfulness, team psychological safety and team learning behaviour contribute to positive outcomes of project teams (H1) and that these factors associate with decreased defensive behaviour (H4). The role of defensive behaviour provides an inconsistent picture. On the one hand it could be observed that the defence mechanisms external attribution and shift responsibility had only small negative effects on project results, but non-committance and reducing problems had no effect on the other hand (H2). With respect to innovation project and project complexity the expected negative effects on project results did not clearly emerge in the survey-data (H3). This does, however, not lead to the conclusion that defensive behaviour nor project complexity and the innovative character of projects are no points of concern for project results. The face-to-face interviews and the video-observation of the meeting gave clear indications that project complexity can lead to mixed messages and that defensive behaviour is quite subtle and difficult to detect. Such 'weak signals' are easily misinterpreted by the members of the teams and may negatively influence the realization of innovative results in project teams without realizing this. The interviews and video-observation put the survey-data in a broader perspective.

The examples of experienced bottlenecks and risks by the interviewed project managers and the video-excerpts illustrate complex interrelating of people on the one hand and non-confronting behaviour to not upset others on the other hand. 'Local interactions' form 'global patterns' of behaviour; patterns which are constituted by humans, and humans are at the same time constituted by this patterning. This 'complex responsive processes' of 'interaction between human bodies' is ongoing and unpredictable, and as such never completely controllable by any individual, even if individuals behave intentional and even if some individuals have power over others (Stacey, Griffin & Shaw, 2001: 188; Griffin, Shaw & Stacey, 1998, 1999; Shaw, 1997; Stacey, 2005, 2007). The complexity perspective becomes manifest in the fact that there is no mono-causality in the way people influence each other in their day-to-day practice of communicating. Individuals interact with several intentions, but when threats of embarrassment, anxiety of unsafety may inhibit being either vulnerable or confrontational, there very seldom is an open communication where everything is said that needs to be told and where thoughts are

spoken out frankly. Because people ease in and process thoughts individually, managing processes in project teams gets complicated; it is impossible to completely control what emerges and how team members think and experience what is going on. Moreover, human acts and experiences are partly based on unconscious processes, further complicating managing such processes. Defensive behaviour is lurking in such team dynamics.

There are a possible number of reasons why not all expected relations were not found in the survey-data.

First, the number of respondents is limited as only 83 from the 150 respondents completed all the questions of the questionnaire.

Second, concerning defensive behaviour, respondents may be inclined to give social desirable answers, hence the survey-data may be an underestimation of the real phenomenon. On the other hand, the answering pattern could be viewed as the ultimate affirmation of the presence of defensive behaviour. Defensive behaviour may be unsuitable to be researched through a survey because the underlying psychological process is hard to operationalize and measure with survey items (Argyris & Schön, 1974; 1996).

Third, the variable innovation project, although associated with project complexity in the expected direction, did not have strong and significant correlations with project outcomes and team mindfulness and team psychological safety. Respondents in innovation projects and routine projects experience their project both as rather complex and do not discriminate strongly (means were respectively 2.47 and 2.13 on a recoded 3-point scale; Chi square test was not significant). Relevant to mention is that the programme under which the innovation projects reside was under way for only 10 months at the time of measuring. Maybe it was too early to expect salient results.

Besides the limited number of respondents, which ask for replication among larger samples, two more limitations of the survey should be mentioned. Firstly, the research assumed causal directions but in a cross-sectional survey directions of causality may be in different directions as expected or as found. In the second place, several measures are based on the perception of respondents, like the project results, which can be biased. With a shortened questionnaire and a time frame in which results of innovation projects may be expected, a quantitative follow-up study solve these limitations.

The present results also ask for a follow-up study of a qualitative nature into the mechanisms of defensive behaviour and the characteristics of experiences with project complexity within project teams dealing with innovative goals as targets. One way of doing so is by a (already planned follow-up) research to study the explorative framework in different organizations with project teams working on innovation projects, and investigate how these deal with failures and success, thereby using conjoint analysis and compare cases.

The practical implications of the findings for project management and project teams are that team mindfulness, team psychological safety and team learning behaviour are of importance to improve project results. Some informants of the RTO under study were of the opinion the innovation projects could be more successful by improving the collaboration within teams. This assumption seems to be valid, and may even gain importance if we compare the mean of team innovativeness with other studies. The mean of the RTO was 3.41 versus 3.81, 3.71 and 4.29 (on a 5-point scale; please note Table 3 gives a recoded score of a 3-point scale) reported for the team innovativeness of a private company involved in recruitment, selection and assessment, based on the response by the team supervisors of teams (respectively De Dreu & West, 2001; De Dreu, 2002; 2006 ). Despite the disputability to compare between these figures, due to difference in type of organization and respondents, the RTO's score is relatively low, which may be worrisome for an organization whose most important task is to innovate.

Project teams with innovation as a target, need to be able to successfully explore deviant behaviour. For that purpose they should not be mindless, they should feel safe to undertake risks and they should be facilitated in learning. It is assumed that overcoming defensive behaviour should contribute to being mindful, feel safe and to learn. Project complexity is associated with the presence of mixed messages, paradoxes and dilemma's which make it difficult for project teams to operate effectively. Team mindfulness, team psychological safety, team learning behaviour, and possible also overcoming defensive behaviour, is helpful to better deal with project complexity. The field of innovation in organizations may benefit from the field of safety and crisis management to make its team members more alert and resilient in managing and organizing the unexpected. One recommendation is to develop an intervention to enhance the competences of teams in this manner and test the results. With regard to resilience a recent study supports the idea that innovator resilience potential may strengthen the innovative capabilities of project members after experiencing a setback such as project failure

(Moenkemeyer, Hoegl & Weiss, 2012).

**Abstract:** With the continuous development of Chinese capital market, how to identify and govern listed companies' financial reporting fraud effectively has gained much public concern in the community. Based on the information from the fraud actors, this study introduces the corporate governance perspective to explore the identification model of the listed companies' financial reporting fraud. The result of the empirical analysis presents that fraud companies have more abnormal changes in financial indicators and companies with weak internal governance are more likely to commit financial reporting fraud. Overall, our results provide empirical evidence suggesting that the model based on financial and nonfinancial information can be effectively used to assess the likelihood of fraud.

**Key words:** Financial reporting fraud; Financial indicators; Nonfinancial indicators; Multiple linear regression model

## 1 Introduction

Listed companies financial reporting fraud is not uncommon in the capital markets of countries around the world, and it has intensified along with the economic development. The financial reports of listed companies engaged in corrupt conduct a serious beat on the confidence of the majority of investors, restrict the development of national economies and destroy the effectiveness of capital market. Therefore, identifying, preventing, and governing listed companies' financial reporting fraud has always been a heated topic in the theoretical and pragmatic circles.

The existing literature on listed companies' financial reporting fraud can be summarized in three aspects. Firstly, concerning researches on the identification of financial reporting fraud, a significant and positive correlation between frauds and the quality of management exists in corrupt firms (Albrecht1986). Secondly, With regard to researches on the identification method of listed companies' financial reporting fraud, using the logistic method can find significant differences in the scale of independent directors, serving time of outside directors, shareholding proportion of board and other features (Beasley 1996).Thirdly, through studies on the identification of nonfinancial indicators, customer satisfaction and future business has a significant positive correlation (Ittner and Larcker 1998).

After a brief review of existing literature, we found the following questions: Chinese listed companies fraud motivation and economic consequences still need further summary and analysis to ensure that regulatory measures can be effectively implemented; additionally, as studies on the methods of fraud identification of listed companies is limited, thus we will do further study to improve these problems.

This paper is organized as follows. Section II develops our hypotheses and models. Section III analyse the data by Empirical tests and provides the results. Section IV conclude this paper .

## 2 Development of Hypotheses and Model

### 2.1 Hypotheses

#### 2.1.1 Financial indicators transactions and financial reporting fraud

Financial reporting frauds are mainly in two forms: inflated assets and inflated profits. Based on fraud financial reporting of listed companies in the China Securities Regulatory Commission, 2002-2006 penalty notice, there are significant differences in fraud and normal company's financial indicators, such as high debt ratio, low quick ratio, and high-receivables ratio (Beaseley 1996). Therefore, we put forward the first hypothesis:

Hypothesis1: In terms of the changes in financial indicators, corrupt companies are more significant than non-fraud companies.

#### 2.1.2 Corporate governance and financial reporting fraud

According to the theory of corporate governance, good corporate governance mechanism depends on the effective combination of the internal mechanisms and external mechanisms and so on. The fundamental causes of the listed companies' financial reporting fraud are the imbalance of shareholding

structure, the failure of Board mechanism, the management mechanism corruption and external governance defects and other internal governance factors.

Hypothesis2: The weaker corporate governance exists, the greater likelihood of financial reporting fraud.

## 2.2 Study design

### 2.2.1 Sample selection

#### 1) Fraud samples of listed companies

We identify fraud sample from Xenophon database and the sample is the company punished by China Securities Regulatory Commission for its violation in the period 2006 to 2009. we exclude firms from our sample for the three following reasons: firms with punishment for interim report fraud; firms that manipulate listed market; listed companies in finance and insurance industry; Listed companies with missing key data. Since companies continuously engaged in corrupt conduct, we choose the first fraud year as a fraud sample to prevent the likelihood of the overestimation of fraud. Finally we get 89 fraud samples:

#### 2) Paired samples of non- fraud listed companies

For each matched-pair, we refer to findings of previous scholars that select companies which have similar assets scale in the same industry to make little difference in financial position within a certain time. We identified non-fraud sample for the three following reasons: company that is in the same industry with the fraud sample(referring to guidelines "listed companies in the industry classification guidelines" published by SFC in April 2001); company with most similar asset scale to fraud listed companies prior to the initial fraud year; company that has never been punished. A total of 89 fraud companies selected on the basis of the above methods. Regarding fraud annual report as a sample, there are 89 samples, 89 paired samples, 178 overall samples.

### 2.2.2 Variable definition

**Table 1 Variables and Description of Financial Indicators**

Criterion	Indicator	Indicator description	
Profitability $X_1$	$X_{11}$	Return On Assets	Net Income / Average Total Assets
	$X_{12}$	Return On Sales	Net Income / Operating Income
	$X_{13}$	Return On Equity	Net profit / Stockholders' Equity
	$X_{14}$	Degree of Financial Leverage	(Total Profit + Financial Expenses)/ Total Profit
Solvency $X_2$	$X_{21}$	Current Ratio	Current Assets / Current Liabilities
	$X_{22}$	Quick Ratio	(Current Assets - Inventory) / Current Liabilities
	$X_{23}$	Debt Asset Ratio	Total Liabilities / Total Assets
	$X_{24}$	Equity Ratio	Total Liabilities / Total Owner Equity
Asset Quality $X_3$	$X_{31}$	Inventory Turnover	Operating Expenses / Average Inventory
	$X_{32}$	Asset Turnover	Net sales /Average Asset
	$X_{33}$	Current Asset Turnover	Net sales/Average Current Asset
	$X_{34}$	Accounts Receivable Turnover	Net sales/Average Accounts Receivable

#### 1) Explained variables

Regard whether corrupt conduct exist in financial statement as explanatory variables. The variable set equal to 1 if the firm commit the financial report fraud and 0 otherwise.

#### 2) Financial Indicators explanatory variables

Referring to the research results at home and abroad, we select the samples' change rate of the financial indicators that is in that year and previous year. From three aspects of profitability, solvency, asset quality, we select 12 financial indexes variables (Table1).

#### 3) Nonfinancial indicators explanatory variables

According to the provisions of the OECD corporate governance guidelines and dual structure of the corporate governance, we select nonfinancial indicators from the general meeting of shareholders mechanism, board governance mechanism, Supervisory Committee governance mechanism. According to the agency conflicts under the corporate governance theory, we select nonfinancial indicators defined as follows (Table 2(1), 2(2)):

**Table 2 Variables and description of non financial indicators**

Criterion	Indicators		Indicators description
general meeting of shareholders Y <sub>1</sub>	Y <sub>11</sub>	attendance at annual Shareholders' Meeting	attendance at the Shareholders' Meeting
	Y <sub>12</sub>	number of annual Shareholders' Meeting	total number of annual Shareholders' Meeting
board governance mechanism Y <sub>2</sub>	Y <sub>21</sub>	number of the board of Directors meetings during the year	number of Board of Directors meetings during the year
	Y <sub>22</sub>	chairman change	an indicator variable coded 1 if the firm changed Chairman and 0 otherwise.
	Y <sub>23</sub>	size of the board of directors	total number of directors
	Y <sub>24</sub>	Independent Directors on the board	the percentage of independent directors on the board
	Y <sub>25</sub>	CEO=COB	an indicator variable coded 1 if the firm's CEO was also Chairman of the Board and 0 otherwise.
	Y <sub>26</sub>	Audit Committee building	an indicator variable coded 1 if the firm sets audit committee and 0 otherwise.
Supervisory Committee governance mechanism Y <sub>3</sub>	Y <sub>31</sub>	number of the board of supervisors meetings within the year	number of the board of supervisors meetings within the year
	Y <sub>32</sub>	the scale of the board of supervisors	number of the Board of Supervisors
	Y <sub>33</sub>	change in chairman of the Supervisory Board	An indicator variable coded 1 if the firm changed Chairman of the Supervisory Board and 0 otherwise.
proportion of insider ownership Y <sub>4</sub>	Y <sub>41</sub>	Directors' Shareholding on stock	the percentage of Directors' Shareholding on stock
	Y <sub>42</sub>	Supervisors' Shareholding on stock	the percentage of Supervisors' Shareholding on stock
	Y <sub>43</sub>	Executives' Shareholding on stock	the percentage of Executives' Shareholding on stock
salary system Y <sub>5</sub>	Y <sub>51</sub>	The top three Directors' annual salary	In(sum of the annual salary of the top highest remuneration of the directors)
	Y <sub>52</sub>	The top three Executives' annual salary	In(sum of the annual salary of the top three remuneration of executives) Note: exclude directors, supervisors
ownership concentration Y <sub>6</sub>	Y <sub>61</sub>	largest shareholders on stock	The percentage of largest shareholding on stock
	Y <sub>62</sub>	Z index	percentage of the largest shareholders/ percentage of the second-largest shareholder
	Y <sub>63</sub>	Herfindahl_5 index	sum of squares of former five Directors' Shareholding proportion
	Y <sub>64</sub>	Herfindahl_10 index	sum of squares of former Directors' Shareholding proportion

2.2.3 Model design

Because the selected explanatory variables Fraud is a qualitative variable, it is only through logistic regression analysis. Use logistic regression to analyse and test the fraud mode, Model as follows:

$$fraud = \ln \frac{1 - p}{p} = \mu_1 X_{1i} + \mu_2 X_{2i} + \mu_3 X_{3i} + \mu_4 X_{4i} + \varepsilon_1 \tag{1}$$

$$fraud = \ln \frac{1 - p}{p} = \eta_1 Y_{1i} + \eta_2 Y_{2i} + \dots + \eta_6 Y_{6i} + \varepsilon_2 \tag{2}$$

$$fraud = \ln \frac{1 - p}{p} = \alpha_{mi} X_{mi} + \beta_{ni} Y_{ni} + \varepsilon_3 \tag{3}$$

Note, P: the probability of no fraud to listed company; X<sub>mi</sub>: financial indicator variables having a significant impact on listed companies' financial reporting fraud; Y<sub>ni</sub>: nonfinancial

indicator variables having a significant impact on listed companies' financial reporting fraud;  $\alpha_{mi}$ 、 $\beta_{mi}$ : Coefficient;  $\varepsilon_3$ : Random error.

### 3 Data Analysis

#### 3.1 Significance test

##### 3.1.1 Significant test on the financial indicators

**Table3 Significant Test on the Financial Indicators and Nonfinancial Indicators**

Indicator	Asymp.Sig. (2-tailed)	Indicator	Asymp.Sig. (2-tailed)
X <sub>11</sub>	0.043790921	Y <sub>11</sub>	0.6281136
		Y <sub>12</sub>	0.0704798
X <sub>12</sub>	0.206733321	Y <sub>21</sub>	0.5063805
		*Y <sub>22</sub>	0.0255545
X <sub>13</sub>	0.193457705	Y <sub>23</sub>	0.5403702
		*Y <sub>24</sub>	0.0024884
X <sub>14</sub>	0.196462215	Y <sub>25</sub>	0.1565567
		Y <sub>26</sub>	0.2821171
*X <sub>21</sub>	0.078393242	Y <sub>31</sub>	0.2465475
		Y <sub>32</sub>	0.3517504
*X <sub>22</sub>	0.010507744	Y <sub>33</sub>	0.0001016
		Y <sub>41</sub>	0.0221515
X <sub>23</sub>	0.014244962	Y <sub>42</sub>	0.317355
		*Y <sub>43</sub>	0.0310819
X <sub>24</sub>	0.059602956	Y <sub>51</sub>	0.2352371
		*Y <sub>52</sub>	0.087689
X <sub>31</sub>	0.298317089	Y <sub>61</sub>	0.4245346
*X <sub>32</sub>	0.039843409	Y <sub>62</sub>	0.3648203
X <sub>33</sub>	0.06858115	Y <sub>63</sub>	0.5874281
X <sub>34</sub>	0.363280253	Y <sub>64</sub>	0.5854262

According to the fraud samples' financial indicators that are in that year and previous year, we calculate the change rate of financial indicators and conduct significant test. Test results are shown in Table 3. In the 0.1 significance level are Return On Assets (X<sub>11</sub>), Current Ratio (X<sub>21</sub>), Quick Ratio (X<sub>22</sub>), Debt Asset Ratio(X<sub>23</sub>), Quito Ratio(X<sub>24</sub>), Asset Turnover (X<sub>32</sub>) and Current Asset Turnover (X<sub>33</sub>). These seven indicators have a significant impact on financial reporting fraud.

##### 3.1.2 Significant test on the nonfinancial indicators

Table 3 also lists the significant test results of nonfinancial indicators. In the 0.1 significance level are the number of annual Shareholders' Meeting (Y<sub>12</sub>), Chairman change(Y<sub>22</sub>), Independent directors on the board (Y<sub>24</sub>), CEO=COB (Y<sub>25</sub>), Change in Chairman of the Supervisory Board (Y<sub>33</sub>), Directors' Shareholding on stock (Y<sub>41</sub>), Executives' Shareholding on stock (Y<sub>43</sub>), executives' salary(Y<sub>52</sub>) and largest shareholders on stock(Y<sub>61</sub>). These nine indicators have a significant impact on financial reporting fraud.

### 3.2 Regression analysis

#### 3.2.1 Regression analysis based on fraud recognition model of financial indicators

Table 4 includes financial reporting fraud recognition model based on 12 financial indicators incremental. The goodness of fit of the model is 0.33, which has a certain explanatory power. There exists a positive correlation between the change rate of financial indicators and fraud probability of listed companies. The greater fluctuation of financial indicators incremental it is, the greater probability of fraud occurring. H1 assumption is confirmed by this conclusion. Through the regression results of the increment of the four financial indicators which reflect the quality of assets, we can see that the greater the changes in inventory turnover, current asset turnover, accounts receivable turnover, the greater

likelihood of fraud during that year and previous year. In order to reverse the adverse operating conditions of the previous year, fraud companies usually inflate accounts receivable, inventory, income, and other means to adjust the income statement, which result in inventory turnover, current asset turnover and accounts receivable turnover changes a lot over the previous year. In addition, due to mismanagement, fraud company's assets condition will not be very good, therefore there are less change in asset turnover.

**Table 4 Regression Analysis Results of Model One and Two**

Indicator	B	S.E	Wald	df	sig.	Exp(B)	Indicator	B	S.E	Wald	df	sig.	Exp(B)

3.2.2 Regression analysis based on fraud recognition model of nonfinancial indicators

From the regression results (Table 5), the H2 hypothesis supported by the following evidence: Firstly, from the view of shareholder governance, the number of the annual general meeting of shareholders is negatively related to the probability of the fraud listed companies; Secondly, from the point of internal governance, the salient features of fraud companies is that: the more frequent change of chairman of the board, the less proportion of independent directors, as well as the chairman and general manager being the same individual; Thirdly, from the view of equity structure and concentration, increasing the stake of the Board will reduce supervision motivation of the board, encourage earnings management behaviour in different forms, which will increase the probability of fraud. Increasing the stake of manager will reduce the agency conflicts between shareholders and managers, which will decrease the probability of fraud. The higher ownership concentration it is, the more opportunity for

major shareholders to occupy small shareholders and the more likely financial reporting corrupt occur.

**Table 5 Regression Analysis Results of Model Three**

Indicator	B	S.E.	Wald	df	Sig.	Exp(B)	Indicator	B	S.E.	Wald	df	Sig.	Exp(B)
X <sub>11</sub>	0.01	0.02	0.64	1	0.42	1.01	Y <sub>22</sub>	0.57	0.51	1.23	1	0.27	1.77
X <sub>21</sub>	1.49	0.73	4.13	1	0.04	4.44	Y <sub>24</sub>	-2.3	1.06	4.71	1	0.03	9.98

3.2.3 Recognition model of financial indicators and nonfinancial indicators

**Table 6 Classification Table for Observing the Amount**

Observed(model one)	Predicted(model one)				Predicted(model two)				Predicted(model three)			
	fraud		Percentage Correct		fraud		Percentage Correct		fraud		Percentage Correct	
	0	1			0	1			0	1		
fraud	0	71	18	79.78	65	24	73.03	72	17	80.9		
	1	40	49	55.06	25	64	71.91	24	65	73.0		
Overall Percentage				67.42			72.47			77.0		

Take the original samples into the model for forecast test, the classification of test results for the three models are shown in Table6. Under the identification method of single financial or nonfinancial indicators, the overall ability to identify listed companies' financial reporting fraud is 67.42% and 72.47%. As we identify the corrupt conduct of listed companies with the consolidated financial and nonfinancial indicators, it shows that 24 companies are considered as non-fraud companies by mistake, and 16 companies are considered as fraud companies among 89 companies by mistake, whose comprehensive correct rate is 77%. Our results provide empirical evidence that nonfinancial indicators have the power to aid fraud detection. Using financial indicators and nonfinancial indicators established by the logic model can predict the risk of fraud of listed companies more accurately, which has good value to identify listed companies' financial reporting fraud.

Take the original samples into the model for forecast test, test results for the three models are shown in Table6. Through empirical analysis, we can get conclusions as follows:

From the incremental view of the financial indicators, compared with non-fraud companies, fraud company's financial indicators fluctuated in the year and previous year. Therefore we can use financial indicators incremental combined with common means of listed companies' financial reporting fraud to identify the fraud of listed companies;

From the identification of nonfinancial indicators of corporate governance, the governance of the Board of Directors under the shareholders' meeting is more significant to identify listed companies fraud. Compared to its paired samples, Fraud samples have smaller independent directors' scale, more frequently changes in the board of directors and higher proportion holds in the board of directors. This shows that the board of directors can control fraud in listed companies. Increasing the proportion of

managerial ownership and their salaries can reduce the principal-agent problem to a certain extent. Therefore, an appropriate degree of ownership dispersion can decrease the probability of listed companies' corrupt conduct. This supported H2 assumption.

#### 4 Conclusions

We identify fraud sample punished by China Securities Regulatory Commission for its violation in the period 2006 to 2009 and does empirical analysis on the identification and governance of China's listed companies' financial reporting fraud. The changes in financial indicators of fraud listed companies are more significant; the internal governance of the fraud listed companies is weaker. Fraud identification model can help auditors, creditors, minority shareholders and other external stakeholders to identify listed companies' reporting fraud more easily, thus reduce loss of the information asymmetry. Compared with the single financial indicators and nonfinancial indicators model, using a combination of financial indicators and nonfinancial indicators of fraud recognition model has higher predictive accuracy.

**Abstract:** This study examines the effectiveness of micro-credit loans in terms of business innovation and income level. Using survey data of micro-credit clients from Bangladesh, the study finds that loan size has a positive effect on income level, although does not have positive and significant effect on business innovation but in the presence of innovation can generate more income. We find that general education is significant predictor of income level but has no relation with business innovation. The finding also suggests that competitive intensity has significant positive effect on income level but negative effect on business innovation. Therefore, this study has significant policy implications for micro-finance institutions, clients, practitioners and micro-credit regulatory authority.

**Key words:** Micro-credit, Innovation, Income, Loan effectiveness

### 1 Introduction

Innovations refer to either the novel combination of existing ideas and routines (Schumpeter, 1934), or more radical or incremental improvements in offering products or services that provide some distinct advantage over competitors. In developed economies, both positive incentives for income growth and negative incentives related to business survival drive companies to take risk through innovation (Baumol, 2002). In developing economies, the barriers to innovation are greater due to deficiencies in education, the institutional environment, technical infrastructure, social networks as well as financial resources (Aubert, 2010). For those able to overcome these obstacles and innovate, it is expected that there will be opportunities to generate higher income due to similar constraints on competitors (Bradley, Artz & Hulett, 2012). The idea of financial inclusion or providing micro-credit loans are now getting increased attention worldwide, based on the perception that a small amount of loan associated with some support services could overcome those barriers to innovation and transform the ideas of the poor people in to profitable income generation activities. Mohammad Yunus (pioneer of micro-credit model) and Grameen Bank popularized these efforts by providing loans to the poor through group lending practices rather than physical assets as collateral. This form of policy innovation of financial inclusion has been replicated worldwide with or without modification based on the different country contexts. With this success micro-finance has served 150 million borrowers with 39 billion USD in loans and holding, 22 billion in deposits from 67 million clients (Mix, 2010). The micro-finance movement in Bangladesh having been started since 1970s now is at the maturity level, and highly competitive; in some cases supplies of micro-credit products exceed demand. Trend shows that the number of branches of NGO-MFIs has increased over the last five years by 133%, whereas the number of clients and borrowers has increased only by 31.61% and 31.48% respectively during this period (MRA, 2009). Under such circumstances loan products without any productive use by the clients could have negative impact on the economy as well as society through over indebtedness and diminishing returns rather than enhancing income and poverty reduction. Therefore, study on the effect of micro-finance products on innovation and income generation could have practical implications for both microfinance institutions and clients as well as microfinance regulatory authorities for further modification of policy strategies. This study examined the direct and indirect effects of innovative activities as an important link in generating higher income for micro credit clients.

### 2 Literature Review and Hypothesis Development

The poor are thought to be precluded from entrepreneurship, not because they have failed to recognize profit potential, but because they lack the capital (human, social, and particularly financial) to exploit those opportunities (Aghion et al., 1999; Fishman and Simhon, 2002; Patrick, 1966). In such cases, lack of capital diminishes social welfare not only by denying the poor the capacity to increase their income and improve their standard of living, but also by preventing the development of a marketplace that views them as customers and seeks to serve their needs (Arndt, 1988; Karlan and

Morduch, 2009; Prahalad, 2009). Therefore, the underlying logic assumes that, if capital is expanded through efforts like education, skill training or access to networks or loan availability, then business development will necessarily follow. Based on this, following three hypotheses have been drawn.

*Hypothesis 1: General education increases analytical ability to assume opportunities and pursue innovative ideas. Therefore, general education has significant relation with (a) Innovation and (b) Income.*

*Hypothesis 2: Business training can be applied to recognize opportunities to innovate in the market. So business training has significant relation with (a) Innovation and (b) Income.*

*Hypothesis 3: Lack of capital prevents the poor from increasing their income through entrepreneurship. Consequently, loan size has significant relation with (a) Innovation and (b) Income.*

Financial resources allow time for new businesses to develop products/services, learn business processes and find a niche in the market. However, there is no guarantee that resources will be converted to value-added benefits to the resource holder. The process of income generation is also dependent on individual characteristics of the owner and their ability to locate and execute on opportunities in the environment in which the business operates (Bradley et al., 2012). Individuals higher in self efficacy (the belief in one's own ability to perform a given task) and locus of control (the belief in one's ability to influence the current environment) would be expected to pursue more novel ideas and generate greater income (Rotter, 1966; Bandura, 1997; Shane, 2003). Therefore, hypothesis four & five are-

*Hypothesis 4: Locus of control has significant relation with (a) Innovation and (b) Income.*

*Hypothesis 5: Self-efficacy has significant relation with (a) Innovation and (b) Income.*

As the density of competitors increase, more of the resources needed to build and sustain a business have been claimed by others leading to greater challenges in the ability for a business to survive, grow and generate income (Carroll and Hannan, 2000). Therefore, competition is expected to cause greater search for innovative business ideas while simultaneously making it more challenging to generate higher income (Bradley et al., 2012). So hypothesis six has been drawn as

*Hypothesis 6: Competitive intensity has positive relation with (a) Innovation and (b) Income.*

Those who have innovative ideas are more likely to convert loan capital into greater personal income. Prior work indicates that the creation of imitative businesses within microcredit groups offers diminished returns that make loan repayment more difficult (Bateman and Chang, 2008; Davis, 2006). As loan capital becomes more abundant through lending programs, well-known opportunities are more likely to be exploited. This suggests diminishing socio-economic returns on future funds invested by poor entrepreneurs unless the next wave of entrepreneurs discovers or creates opportunities that do not already exist in the market (Bradley et al. 2012). So it is assumed that micro-credit loan will be effective and sustainable only when business innovations are found to be present. Therefore, hypothesis seven is-

*Hypothesis 7: Innovation has significant relation with income.*

### 3 Methodologies

Although the impact of microfinance on income and innovation is not easy to measure, as successful entrepreneur not always active clients of micro-finance institutions and active clients are not always entrepreneur, moreover the loan capitals have not always been used for increasing income. However, we attempt to get the actual situation of microfinance clients' income and innovation effect. We took two villages of Tangail districts from Bangladesh and surveyed 200 clients through interview based on semi-structured questionnaire and found 88 micro entrepreneurs who have micro credit loans from micro-finance institutions. Among them 49 usable questionnaires have been used for this study.

The sample in this research is a judgement sample, a type of purposive sampling used in exploratory research in which the researcher selects a sample to meet specific criteria (Emory and Cooper, 1991). Dependent variable income level were measured using monthly family income within a given range, for example-'1'= 1-9000, '2'=10000-19000. Innovation was assessed by three items as a change in products, processes or markets. Competitive intensity was the number of firms competing in the same business. Loan size was current total loans outstanding and education was 1 to 5 numerical values like 1= primary education, 2=Secondary school education etc. Business training was assessed based on whether the client reported receiving training in business operations and its accompanied benefits which ranges from 1 to 5. For locus of control and self efficacy Likert scale (1-5) was used. Owner age, business age and number of dependents were included as control variables. Finally based on structural equation model, five linear regression models have been drawn to assess the direct and

indirect effect of innovations on income level.

#### 4 Model

Considering the literature review, Figure 1 can be adapted for the research objective. Figure 1 has been adapted from the work of (Bradley et al., 2012).

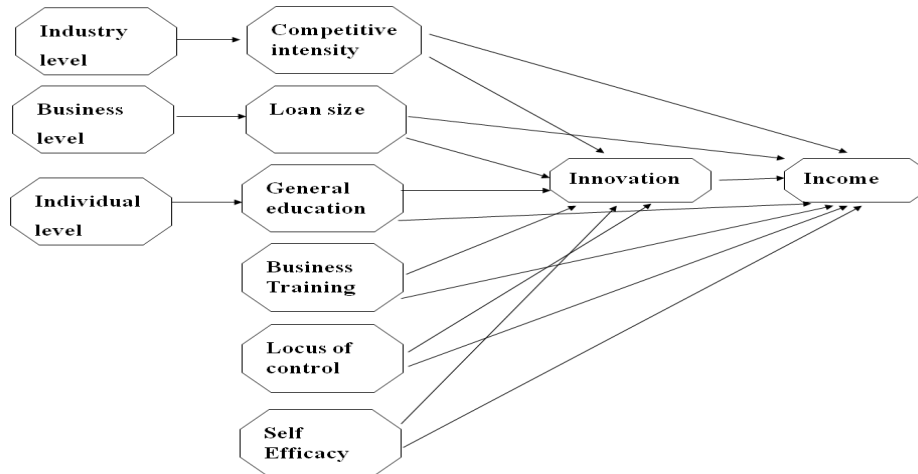

Figure 1 Factors Affecting Innovation and Income Level

#### 5 Result and Discussion

Table 1 provides descriptive statistics of the data. In table 2 we present the result of the structural equation model predicting innovation and income level. Model 4.1 is a baseline control model. Model 4.2 shows the direct effect of innovation on income level and no significant relationships were found. Model 4.3 and 4.4 test the significance of the environment, business and individual level indicators on innovation and income level. In model 4.3, owner age shows significant but negative association with innovation that means younger people are more likely to adopt innovative ideas. Competitive intensity was negative and significant predictor of innovation but was significant and positive predictor of income level. The result contradicts the findings of other previous analysis (Carroll & Hannan, 2000; Bradely et al., 2012 ). Although it is expected that more competitors in the same business will reduce the share of income/profit, but in our sample villages, they have competitive advantage in producing particular products which has demand over the whole country. Therefore, experience of competitors helps them enhance their skills in the same business and thereby, influence earnings positively. Loan size although was not a significant predictor of innovation (model 4.3) but was a positive and significant predictor of income level (model 4.4). When the fully specified model including innovation was tested in model 4.5, the result showed that loan capital becomes a significant predictor of income level in the presence of innovation. Thus loan size was (.268-.252=).016 times more likely to increase income level but only when innovations were taken into account. Similar with the findings of Bradely(2012) general education level did not predict innovation but did have a positive relationship with income level. Locus of control and self efficacy were positive and marginally significant ( $p=.053$  &  $.077$  respectively) predictor of innovation but did not significantly predict income level, more surprisingly was negatively related with income level. Miller (1986) and Mueller (2001) also found positive association between locus of control (high internal locus) and innovation strategies. Bradely (2012) found significant but negative association between locus of control and innovation but positive association with income. Analysis of variance shows that except the control model 4.1 & 4.2, rest of the model is highly significant. Full model 4.5 shows R square .600 that is 60% of the variance is accounted for the variables in the model.

#### 6 Conclusion

Based on the above findings we can accept hypothesis 1(b), 6 (a & b) and 7 that is competitive intensity is the significant predictor of innovation and income level and general education & innovation are the significant predictors of income level. Loan size although does not predict innovation but in the presence of innovation influence income level. Therefore, hypothesis 3(b) is accepted while 3(a) is

rejected. Early studies indicated loans improve participant income levels, increase the accumulation of assets and increase per capita household consumption (Hossain, 1988; Hashemi et al., 1996; Pitt and Khandker, 1998). Similarly, our study also found evidence for increased income. But evidence also shows that giving loans to poor household does not necessarily improve their livelihoods rather in some cases let them fall in chronic poverty. Loans made to clients for businesses with little or no potential for increasing income are detrimental to the person, the micro-credit agency and industry in the long run (Bradely et al., 2012). Therefore, micro-finance institutions need to focus on those issues that helps micro entrepreneurs to enhance their business earnings as well as general knowledge that could guide them to capture new opportunities from the environment and do business in a more innovative ways.

# Construction of Internal Risk Management System of Financial Holding Company

Guo Chunfeng

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: chunfengguo@yahoo.cn)

**Abstract:** There are three special risks of financial holding company: contagion of risks, confliction of interests and overlapping calculation of capital. The paper analyzes two models for internal risk management system of the financial holding company: integral risk management model and dual one, and concludes that the former is helpful to the management of special risks of financial holding company. Hence, the improvement of governance structure for financial holding company is needed. Canceling the listed position of subsidiary and realizing or maintaining the listed position of financial holding company is a good way to solve the problem. In addition, it is suggested that the independent governor system for financial holding company should be improved.

**Key words:** Financial holding company; Special risks; Internal risk management system; Governance structure; Comparative analysis

## 1 Introduction

For purposes of this paper, a financial holding company is defined as a company that controls at least two types of financial institutions of the bank, securities company and insurance company, or defined as a company whose subsidiaries include at least two types of financial institutions of the bank, securities company and insurance company. The two definitions are the same because according to related law and regulations in China, controlling or being controlled is the criterion for judging the relationship between parent company and subsidiary. Financial holding company and its subsidiary constitute a financial group. In the following part of this paper, some "financial holding companies" refer to the financial group under the control of the financial holding company.

In recent years, financial holding companies have developed rapidly in the United States, Britain, Japan and other countries. However, the system of separated operations and regulations is still be taken in China, which may make China's financial industry have more difficulties in adapting to the trend of mixed operation in the world. The financial holding company is a realistic choice for China's financial industry to transform from separated operation to mixed operation, because the financial holding company faces fewer restrictions, can benefit from the effects of scope economy and scale economy and is suitable to the current conditions of risk management of China's financial institutions.

However, the structure of financial holding company may bring about some special risks. Freixas and Loranth (2007) study the risk-taking incentives of a financial conglomerate and conclude that when capital requirements are set optimally, capital arbitrage within holding company conglomerates can raise welfare by increasing market discipline. Wang Zili (2008) investigates the risks of financial holding company and argues that China should establish unified supervisory institution. Xie Chuanbo and An Lijuan (2010) contend that in order to improve the supervisory framework of financial holding company in China, the supervisory responsibility and scope should be clearly defined, the precaution mechanism should be established and external audit should be enhanced. Knaup and Wagner (2012) find that estimated tail risk exposures for U.S. bank holding companies are negatively correlated with their share price beta, suggesting that banks which appear safer in normal periods are actually more crisis prone than their beta would suggest. Adams and Mehran (2012) analyze the relationship between independence and size of bank board and performance and conclude that governance regulation should take unique features of bank governance into account. In sum, the risks of financial holding company and the external supervisory model are discussed more frequently, however, the internal management system of financial holding company have not been discussed detailed. The paper aims at analyzing the construction of internal risk management system of financial holding company.

The layout of this paper is as follows. Section 2 analyzes special risks of financial holding companies, Section 3 discusses the selection of models for internal risk management system of the financial holding company in China, Section 4 discusses the improvement of governance structure for financial holding company, and Section 5 concludes.

## **2 Special Risks of Financial Holding Companies**

### **2.1 Contagion of risks**

Under the framework of financial holding company, the financial troubles in one member of the group, for example the lack of solvency or liquidity, may spread to other members in the group, endangering the financial institutions especially commercial banks, damaging the interests of depositors and the public, creating systemic risks and making the financial system instable. The contagion of risks is mainly via affiliate transactions. *Intra-Group Transactions and Exposures Principles* issued by Basel Committee on Banking Supervision, International Organization of Securities Commissions and International Association of Insurance Supervisors enumerates the main affiliate transactions in the group, which include: 1) cross shareholdings; 2) trading operations whereby one group company deals with, or on behalf of, another group company; 3) central management of short-term liquidity within the conglomerate; 4) guarantees, loans and commitments provided to, or received from, other companies in the group; 5) the provision of management and other service management, e.g. pension arrangements or back office services, etc. On one hand, affiliate transactions facilitate financial holding company to fulfill the effects of scope economy and synergies. On the other hand, they make it easier for risks in one entity to spread to other entities in the group. Thus, they must be well managed.

### **2.2 Confliction of interests**

Another risk of financial holding company is the confliction of interests. The group controlled by the financial holding company offers banking, securities and insurance services as a whole, and the multi-role can result in confliction of interests, which may include: 1) financial institution may offer misleading suggestions to customers and damage their interests when it can sell the products of another institution in the group; 2) commercial bank may loan to the third party non-prudentially in order to help the security company within the group underwrite or sell securities; 3) the financial holding company can get the information of the increase of customer's bankruptcy risks through subsidiaries' loan and insurance services, and transfer the risk to the public by persuading the customers to issue bonds or shares, etc.

### **2.3 Overlapping calculation of capital**

Overlapping calculation of capital occurs when two or more entities in the group controlled by the financial holding company cover risks with the common capital. When the parent company obtains equity fund from outside, the fund becomes the capital and assets of the parent company. If the parent company invests to subsidiary using a part of assets as the long-term investment, the investment fund becomes the capital and assets of the subsidiary. It looks as if the capital of the group as a whole equals the sum of subsidiaries' capital. But in fact, the investment fund of parent company to the subsidiary is calculated twice and results in overlapping calculation of capital. Thus, it must be eliminated. Otherwise the capital level of the group will be overestimated. Furthermore, if the subsidiary invests to its subsidiary with a part of assets as long-term investment, the investment fund will be calculated overlapped once again. In a word, the volume of the group's capital as a whole only consists of the capital from outside. Lack of approaches and mechanism to eliminate the overlapping calculation will result in overestimation of the group's capital level.

## **3 The Selection of Model for Internal Risk Management System in China**

### **3.1 The classification of models**

The model of internal risk management system of financial holding company is related to the juristic and regulatory system, as well as the structure of the financial holding company. Therefore, it has the feature of diversification. But it can be classified into two categories.

1) Integral risk management model. Under this model, the financial holding company participates subsidiary's risk management directly. Although the holding company and subsidiary build their risk management framework respectively, and risk management committee is set up under the board of governors and is responsible for guiding risk management department, it is the risk management department of the holding company that makes unified risk management strategies, polices and institution, directly manages and supervises the subsidiaries' risk management. The risk management staffs of subsidiaries are under the control of holding company, fulfilling their duty of risk management on behalf of the holding company. This model has the characteristics of integral risk management. And the holding company can view the overall risks of the whole group comprehensively and timely. Thus it is helpful to the management of special risks under the framework of financial holding company.

2) Dual risk management model. Under this model, the financial holding company just acts as

controlling shareholder and guides subsidiary's risk management indirectly by influencing the board of governors and risk management committee of subsidiary. Both the holding company and subsidiaries set up their risk management organizations respectively. The risk management department of the holding company makes the overall risk management policies, directs and supervises the risk management of subsidiaries. Nevertheless the subsidiaries' policies of risk management are carried out by the committee and department of risk management of subsidiary. And the risk management committee of subsidiary is led by the board of governors of the subsidiary. The features of this model are that subsidiaries have more rights and take more responsibilities in risk management, which is useful to tighten the linkage between business operation and risk management. However, the control imposed by holding company on subsidiary is weakened. Hence, the holding company has more difficulties in coordination and management of special risks of financial holding company.

### **3.2 The selection of models in China**

The selection of internal risk management system must comply with law and regulations of supervisory institutions. *The Listed Company Governance Principles* issued by China Securities Regulatory Commission have some regulations on behaviors of controlling shareholders and independence of listed companies, which include:

1) The controlling shareholder takes fiduciary duties to the listed company and other shareholders. The nomination for candidates of governors and supervisors of the listed company must comply with the qualifications and procedures set by laws, regulations and company constitutions. The candidates nominated by controlling shareholders should have related professional knowledge and supervisory ability. The controlling shareholder has no rights to approve the personnel resolution made by the general meeting of shareholders and board of governors, and must not appoint or remove top managements surpassing the general meeting of shareholders and board of governors of the listed companies. And the controlling shareholder must not interfere with the company's decisions and legal businesses directly or indirectly, impairing the interests of the company and other shareholders.

2) The controlling shareholder and listed company should separate their staffs, assets, finance, institutions and businesses, calculate their costs and profits and take responsibilities and risks respectively. The board of governors, committee of supervisors and other institutions of the listed company should run independently. There do not exist superior or subordinate relationship between controlling shareholder, its departments and listed company and its departments. The controlling shareholder and its departments must not make plans for or order listed company and its departments concerning the operation of listed company, nor affecting listed company's independence in operation and management. Controlling shareholder and its other affiliates must not run businesses that are the same to or similar with those of listed company. And effective measures should be taken by controlling shareholders to avoid horizontal competition.

Hence, if the subsidiary of financial holding company is a listed one, integral risk management model can not be adopted. If it is not listed, there doesn't exist such restriction. Furthermore, integral risk management model can be adopted if the subsidiary is wholly owned by the financial holding company. And dual risk management model should be adopted if the subsidiary is not wholly owned by the financial holding company for the purpose of protecting the interests of non-controlling shareholders.

## **4 The Improvement of Governance Structure for Financial Holding Company**

### **4.1 The governance between financial holding company and its subsidiary**

In order to make the best of synergies and take the integral risk management model, it is demanded that the parent company have very strong control over subsidiary. In general, parent company has stronger control on non-listed subsidiary than on listed subsidiary given the same portion of shares held by the parent company. And parent company has stronger control on wholly-owned subsidiary than on non-wholly-owned subsidiary. Nevertheless, both the parent company and the subsidiary are independent entities, it is an important issue how to build good governance structure between the parent company and subsidiary in order to make the best of synergies and protect the interests of non-controlling shareholders. Canceling the listed position of subsidiary (if it is listed) and realizing or maintaining the listed position of financial holding company (parent company) is a good way to solve the problem.

In addition, the advantages of financial holding company's (parent company's) being listed are as follows: financial holding company's being listed is useful to diversity of equity, which is helpful in

solving the problem of ambiguousness of ownership; In general, law and supervisory institutions in most countries have fewer restrictions on capital operation such as M&As conducted by financial holding company than those conducted by banks. Being listed of financial holding company instead of subsidiary benefits large scaled M&As, which is important to the expansion of the group.

In order to cancel the listed position of subsidiary and realize or maintain the listed position of the financial holding company (parent company), operation transfer and share exchange are two important ways in addition to the financial holding company is listed directly and set up or takeover subsidiaries.

1) Operation transfer. If the former financial institution is a listed company, the financial holding company (parent company) becomes the listed company, and the shareholders of former financial institution become the shareholders of the financial holding company (parent company). The company that receives the business, assets and liabilities of the former financial institution becomes the subsidiary of the financial holding company.

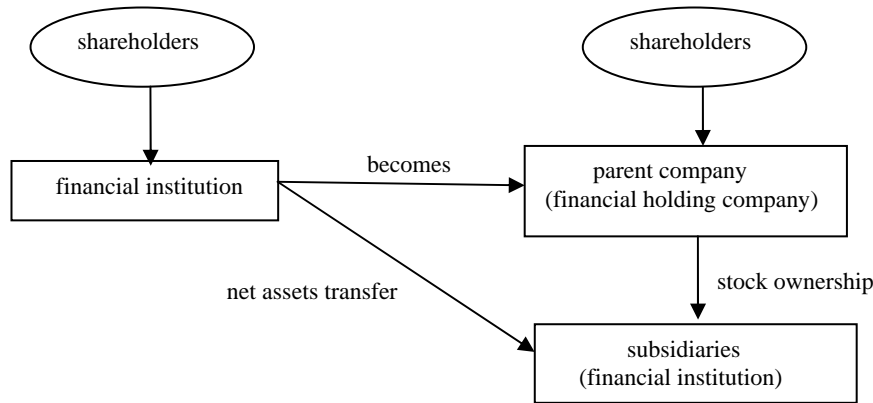

Figure 1 Operation Transfer

2) Share exchange. If a financial institution is a listed company and the financial holding company does not exist, the shareholders of the financial holding company transfer all the shares of the financial institution to the future financial holding company, then the financial institution becomes the wholly-owned subsidiary and the listed position is cancelled, the shareholders of former financial institution become the shareholders of the financial holding company, and the financial holding company becomes the listed company. If an existing financial holding company wants to takeover a listed financial institution and make it become the wholly-owned subsidiary, the procedure is similar. The shareholders of financial institution transfer all the shares of the financial institution to the existing financial holding company. And the financial institution becomes the wholly-owned subsidiary of the financial holding company and the listed position is cancelled. At the same time, the former shareholders of the financial institution get the newly-issued shares and become the shareholders of the financial holding company.

Figure 2 Share Exchange

**4.2 The independent governor system for financial holding company**

Independent governors refer to the governors that have no significant relations with the company. According to the regulations of the US Securities Exchange Commission, “Having no significant relations” includes the conditions as follows: The independent governors are not the former executive

directors of the company and have no professional relations, are not important consumers or suppliers, are not recommended or appointed on the basis of personal relationship, have no close personal relationship with any executive director, have no significant shares of the company, and do not represent any important shareholder of the company. The independent governors can play an important role in the governance of the financial holding company, supervising the operation and managements of the company, making balance between controlling shareholders and other shareholders, monitoring the affiliate transactions of the financial holding company, etc.

At present, the financial regulatory institutions of China have some requirements on the independent governor system of shareholding-system commercial banks, but have no regulations on financial holding company. *The Independent Governor and External Supervisor of Shareholding-system Commercial Bank Guidelines* issued by the People's Bank of China has guidelines as follows: The board of governors of shareholding-system commercial banks should include at least two independent governors, who express their objective, impartial and independent opinions about the issues discussed by the board of governors. The independent governors should pay more attentions to significant affiliate transactions, the plan of profit distribution, the appointment or remove of top managements, the items that may result in significant losses to commercial banks or damage the interests of depositors and small shareholders. The guidelines set also regulations to the qualifications of independent governors of shareholding-system commercial banks. The paper suggests that regulations with respect to independent supervisor system of financial holding company should be made, taking reference to *The Independent Governor and External Supervisor of Shareholding-system Commercial Bank Guidelines*.

## 5 Conclusion

Financial holding companies have three special risks: contagion of risks, confliction of interests and overlapping calculation of capital. There are two models for internal risk management system: integral risk management model and dual one. And the former is more helpful to the management of special risks of financial holding company. If the subsidiary of financial holding company is a listed one, integral risk management model can not be adopted. If it is not listed, there does not exist such restriction. Furthermore, integral risk management model can be adopted if the subsidiary is wholly owned by the financial holding company. And dual risk management model should be adopted if the subsidiary is not wholly owned by the financial holding company. Therefore, the improvement of governance structure for financial holding company is needed. Canceling the listed position of subsidiary (if it is listed) and realizing or maintaining the listed position of financial holding company (parent company) is a good way to solve the problem. In addition, it is suggested that the independent governor system for financial holding company should be improved.

**Abstract:** Given the rapid change in the high-technology industries, many firms in these industries undertake acquisitions to get access to new capabilities. These acquisitions, however, are often destined to fail. Post-acquisition capability transfer implications have been mentioned as the primary reason for such high failure rates. Nonetheless, we still do not know how to enhance post-acquisition transfer of target's capabilities. Prior post-acquisition research has broadly focused on two aspects, namely: post-acquisition capability transfer vs. developing a general acquisition capability. This present study argues for a synthesis of these two prior post acquisition literature streams. As a result, the importance of a grafting capability—that is, an acquisition capability specifically developed for transferring capabilities—is recognized. The findings of this study show that in contrast with the existing literature on capabilities that focuses more on deliberate learning mechanisms, the microfoundations of such a grafting capability are search activities—that is, ad hoc problem solving. In addition, it is shown that the effect of such search activities could be strengthening when firms involved have common knowledge.

**Key words:** Grafting capability; Microfoundations; Post-acquisition capability;

### 1 Introduction

In order to understand performance variations across firms, the concept of organisational capabilities has been the focus of many strategy scholars for the past decades. In essence, an organisational capability refers to a learned behavior of the firm that enables it to carry out certain activities successfully—or preferably, more successfully than competitors can (Nelson & Winter, 1982; Winter, 2003). Such behavior has been argued to emanate from two forms of learning: experiential learning and learning from others (e.g. Levitt & March, 1988). Experiential learning represents learning by actually experiencing the task at hand, that is, by doing (Argote & Greve, 2007; Dosi & Marengo, 2007; Huber, 1991; Levitt & March, 1988). Learning from others can take place, according to Huber (1991), through vicarious learning and grafting. Vicarious learning represents learning about the practices of other organizations, for example, by imitating them (Huber, 1991). Grafting, on the other hand, constitutes a form of learning whereby the focal firm acquires capabilities through access to new members, such as in the case of an acquisition (Huber, 1991; Madhok, 1997; Puranam, Singh, & Zollo, 2006). Hence, in the case of vicarious learning, the focal firm learns from others by tapping into their experience more or less indirectly, whereas in the case of grafting the focal firm makes those “others” part of its own organization and thus, has the opportunity to tap into the desired capability directly (e.g., Argote & Miron-Spektor, 2011).

Given the rapid change in high-velocity environments such as high-technology industries, firms frequently choose to acquire new capabilities instead of developing them internally (hereafter called ‘capability-based acquisitions’), which points to the importance of grafting as a vehicle for gaining competitive advantage (e.g. Ahuja & Katila, 2001; Madhok, 1997; Makri, Hitt, & Lane, 2010; Puranam et al., 2006; Ranft & Lord, 2002). Clearly, however, simply acquiring a target firm by no means guarantees that its capabilities will be successfully grafted onto the acquirer’s organization (e.g. Bresman, Birkinshaw, & Nobel, 2010; Ranft & Lord, 2002). Thus, capability-based acquisitions seem to be prone to failure (Barkema & Schijven, 2008a; Bresman et al., 2010; King, Dalton, Daily, & Covin, 2004). Post-acquisition integration problems have been mentioned as one of the main reasons for acquisition failure (Puranam, Singh, & Zollo, 2003; Vermeulen & Barkema, 2001). Therefore, understanding how to enhance post-acquisition learning among employees of the acquired and acquiring firm and thus, capability transfer of capability-based acquisitions, would be a crucial step forward to increasing acquisition performance.

Given that the roots of organisational learning can, by and large, be traced back to two foundational theories—that is, the behavioral theory of the firm (Cyert & March, 1963) and evolutionary economics (Nelson & Winter, 1982)—it is not surprising that these two theories play leading roles in the growing literature on learning in the context of acquisitions. Thus far, prior research has developed arguments

along two lines. One stream of literature, while taking into account various important aspects that could play a role during post-acquisition capability transfer—such as the importance of the size of the firms involved, of having common knowledge, and of retaining key employees—emphasizes the importance of social integration and thus, the development of a new joint social community post-acquisition (Birkinshaw, Bresman, & Håkanson, 2000; Bresman, Birkinshaw, & Nobel, 1999; Bresman et al., 2010; Ranft, 2006; Ranft & Lord, 2002; Schweizer, 2005; Verbeke, 2010). This approach highlights the role of ad hoc problem solving which ensures that employees collectively search for solutions while collaborating and building the needed social relationships in order to enhance learning, which is in line with the behavioral theory of the firm. On the other hand, strategy scholars, more in line with evolutionary economics, have argued for the importance of routinized activities in the form of deliberate learning mechanisms for experience accumulation, articulation, and codification—such as an M&A department, or an M&A repository or retrieval system—which could enhance learning from the acquisition process by developing an acquisition integration capability (hereafter called ‘acquisition capability’) (Amiryany, Huysman, De Man, & Cloudt, 2012; Barkema & Schijven, 2008b; Helfat et al., 2007; Zollo, Reuer, & Singh, 2002; Zollo & Singh, 2004; Zollo & Winter, 2002).

However, it is rather surprising that, with the exception of work addressing the importance of transferring capabilities (Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Ranft, 2006; Ranft & Lord, 2002; Schweizer, 2005; Verbeke, 2010) and a few studies emphasizing the importance of post-acquisition integration issues of such capability-based acquisitions (Puranam, Singh, & Chaudhuri, 2009; Puranam et al., 2003, 2006; Puranam & Srikanth, 2007), little research to date has pursued a deeper understanding of how firms can learn to graft and thus, develop a grafting capability. In other words, a synthesis of the above-mentioned two streams of research, namely: grafting itself and developing a capability to be able to graft successfully, is still lacking. Indeed, notwithstanding the contributions of prior research, we still neither know how the actual grafting process takes place, nor how firms can learn to graft (e.g. Amiryany et al., 2012; Felin & Foss, 2005, 2009; Foss, 2007; Foss, Husted, & Michailova, 2010; Helfat et al., 2007). This has some implications. On the one hand, research needs to reveal whether it is justifiable to recommend deliberate learning mechanisms for developing a grafting capability. On the other hand, if this is the case, one needs to question what such mechanisms should advise, for example, in the case of an M&A department trying to enhance capability transfer or contain such as in the case of an M&A repository or retrieval system. However, if this is not the case, what should firms, then, do to enhance grafting? Should firms, for example, rely more on ad hoc problem solving as proposed by the behavioral stream of research?

Acquirers that rely on capability-based acquisitions not only need to learn the focal target’s capability, but also need to learn how to engage in this grafting process more effectively for future acquisitions, that is, to develop a grafting capability as distinct from a general acquisition capability. This is because the latter could also be related to non-high-technology firms, focusing on integration issues regardless of the importance of getting access to new capabilities such as in the case of acquisitions meant to gain access to new clients, whereas the former—a grafting capability—is a capability required when involved in capability-based acquisitions, meant to ensure that target capabilities are transferred successfully post-acquisition. However, developing such grafting capability that is focused on integrating those acquisitions that are meant to get access to new capabilities, has not been the focus of research until now. Therefore, gaining more understanding regarding the microfoundations of a grafting capability and thus, how such capability can be built, is vital in order to extend existing theory. In addition, given the high failure rates of acquisitions (Barkema & Schijven, 2008a; Bresman et al., 2010; Hayward, 2002; King et al., 2004; Ranft, 2006)—in particular capability-based acquisitions—and the increasing importance of capability-based acquisitions in high-velocity environments, gaining deeper insight into the grafting process and how acquirers can develop a fruitful capability for this process, also has a practical value. This paper aims to shed more light on these issues, based on quantitative and qualitative data gathered in the context of high-technology acquisitions that serve to gain access to new capabilities. More specifically, this paper seeks to answer the question of how firms can learn to graft while taking into account what the specific activities are that enhance learning through grafting, in an effort to understand what the microfoundations of a grafting capability are.

In the next sections, while building up to our hypotheses, we will first provide some background information on relevant acquisition literature and then discuss how grafting can be enhanced. Second, a description of the methodology of our study will be given. Third, after discussing our study’s method, we will elaborate on the data and test our hypotheses. Finally, a discussion is provided.

## 2 Background

### 2.1 Acquiring to Learn: Grafting

Firms in the high-technology industries increasingly acquire other, often smaller, firms in order to gain access to their capabilities (Bresman et al., 2010; Kapoor & Lim, 2007; Makri et al., 2010). These firms are interested in highly tacit capabilities of the acquired firms, which are often in the heads of their employees and embedded in their routines and social relationships (Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Ranft & Lord, 2002; Schweizer, 2005). This is why such firms acquire a whole company instead of just buying, for example, patents or hiring certain individuals. These acquirers need to acquire the target firms in order to be able to learn what their employees know and how they conduct their activities. Acquiring to learn—that is, grafting—however, often does not lead to the desired objectives, given that such acquisitions are prone to failure (Finkelstein & Cooper, 2010; Graebner, Eisenhardt, & Roundy, 2010; Haleblian, Devers, McNamara, Carpenter, & Davison, 2009). Post-acquisition integration issues are commonly acknowledged to be the key source of such high failure rates. In other words, firms usually struggle when trying to transfer target capabilities post-acquisition (Bresman et al., 2010; Puranam et al., 2003).

Given the complexity and importance of post-acquisition capability transfer, a growing body of literature in strategic management has focused on gaining insight into how to transfer capabilities post-acquisition (Graebner, 2004; Kapoor & Lim, 2007; Ranft, 2006; Ranft & Lord, 2002; Schweizer, 2005). Prior research has addressed this question by taking into account various issues. For example, prior studies argue that the size of the firms involved matters, given that larger target firms tend to complicate the integration process. This is because firms need to retain more people, invest more in communication, and give the acquired firm more autonomy (Ernst & Vitt, 2002; Kapoor & Lim, 2007; Laamanen & Keil, 2008). In addition, the existence of common knowledge has been mentioned as an important ingredient for effective post-acquisition capability transfer, since it enables employees to better understand one another's expertise (Ahuja & Katila, 2001; Cummings & Teng, 2003; Puranam et al., 2009).

Furthermore, the various dimensions of acquisition integration such as speed, communication, autonomy, and retention of key employees, have been an issue of concern as well (Ranft, 2006; Ranft & Lord, 2002). In line with this, prior studies have found that post-acquisition capability transfer greatly depends on the degree of social integration achieved that involves a gradual process of getting to know each other and learning from one another, which leads to developing a new joint social community post-acquisition that is mentioned to be essential for creating value through capability-based acquisitions (e.g., Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Puranam et al., 2006; Schweizer, 2005; Verbeke, 2010).

Understanding how to socially integrate the companies post-acquisition while not disturbing existing relationships and giving the acquired firm the necessary autonomy has been considered vital for post-acquisition transfer of capabilities (Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Puranam et al., 2009; Puranam et al., 2006; Puranam & Srikanth, 2007; Verbeke, 2010). It is the effect of such social integration that creates value post-acquisition by enabling firms to access the capability of the acquired firm. In order to achieve such social integration, enhancing interaction among employees and having rich communication is critical, since getting to know and trust one another is a prerequisite to start collaborating and thus, transferring the highly tacit capability in question (Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Graebner, 2004; Graebner et al., 2010; Schweizer, 2005).

In other words, various aspects have been mentioned by prior research to play an important for transferring the capability in question, but what is essential is to have the companies socially integrated and thus, having a new joint social community in which the employees of both firms are involved (Bresman et al., 2010; Verbeke, 2010). This new social community, in turn, can be created by enhancing interaction among employees and having rich communication. However, knowing what the important variables are that affect post-acquisition capability transfer does not necessarily imply that this knowledge will actually be applied in practice. Research on grafting through acquisitions has predominantly focused on the implications of transferring capabilities and not on how firms can develop a capability for being successful in undertaking acquisitions. This is why

another stream of literature has focused on why certain firms are more successful in their post-acquisition endeavors than others and thus, how they have learned to acquire. Having an acquisition capability is considered vital in order to engage in acquisitions successfully. In the following section we will elaborate on the importance of such acquisition capability.

### **2.2 Learning to Acquire: Acquisition Capability**

A handful of active acquirers, such as Cisco Systems and General Electric, are widely praised for their acquisition capability. These firms are able to conduct their integration efforts in a way that many firms cannot or, more precisely, in a way that most firms are unable to (Heimeriks, Schijven, & Gates, 2012). Prior research attributes such firms' capabilities to the fact that they have the required deliberate learning mechanisms in place to accumulate experiences, and articulate and codify the knowledge gained from such experiences (Barkema & Schijven, 2008b; Heimeriks et al., 2012; Zollo & Singh, 2004). First of all, concerning their experience accumulation efforts, such firms have been conducting numerous acquisitions over the course of their lives, allowing them to have the requisite experience to know what is essential and what is not when involved in post-acquisition integration activities. In doing so, having done acquisitions in similar business areas could be of greater value, since related businesses enable firms to more directly draw conclusions from their experiences for future events (Hayward, 2002; Vermeulen & Barkema, 2001).

In addition to having accumulated the needed experience, successful acquirers tend to have certain organisational practices in place that, in combination with their experience, give rise to their acquisition capability. First, these firms usually have—on a corporate level—dedicated functions in place, such as an M&A department, team, or manager, which are responsible for the acquisition process and thus, for experience accumulation related to this process (Amiryany et al., 2012; Barkema & Schijven, 2008b; Helfat et al., 2007; Zollo & Singh, 2004). Second, these firms ensure that such dedicated functions articulate their experiences from previous acquisitions in order to learn from them, for example by conducting post-acquisition evaluations (Amiryany et al., 2012; Barkema & Schijven, 2008b; Helfat et al., 2007; Zollo & Singh, 2004). Third, codification of past experiences into documents to develop routines for subsequent events is another deliberate learning mechanism that such firms often have in place (Amiryany et al., 2012; Barkema & Schijven, 2008b; Helfat et al., 2007; Zollo & Singh, 2004). Furthermore, besides experience accumulation, articulation, and codification, recent research has shown that such firms also engage in what are called 'risk management' practices, which are meant to ensure that distributed knowledge across the firm, related to acquisition integration, is not applied to a deal at hand without being customized (Heimeriks et al., 2012). Hence, firms successful at acquisition integration apply what they have learned over the course of their lives in a highly systematic matter, while being cautious about not making incorrect inferences.

However, the literature focusing on the importance of such acquisition capability has been dealing with all types of acquisitions in general and not capability-based acquisitions in particular. Given the focus on transferring capabilities and the highly tacit nature of the capabilities that are meant to be transferred by means of such capability-based acquisitions, it is important to realize that such acquisitions require an acquisition capability that is distinct from the one that deals with integration issues in general. The specific capability required for fruitfully conducting capability-based acquisitions is called a 'grafting capability' throughout this paper, which is discussed in the following section.

### **2.3 Learning to Acquire to Learn: Grafting Capability**

The concept of grafting capability synthesizes the elements mentioned in the previous two sections, namely "acquiring to learn" (i.e., grafting) and "learning to acquire" (i.e., a generic acquisition capability). In other words, a grafting capability is a specific type of acquisition capability focused on integrating acquisitions that serve to gain access to new capabilities of the acquired firm. Given the typically tacit nature of the capability in question that is meant to be acquired when involved in capability-based acquisitions, having a grafting capability plays an important role, since gaining access to the target firm's unique capabilities requires different organisational practices than other types of acquisitions, such as those focused on, for example, accessing new clients and markets. A grafting capability needs to deal with the transfer of highly

tacit capabilities that are in the heads of individuals and embedded in the organisational routines and practices of the target firm. More precisely, such grafting capability ensures that the acquirer is able to transfer the capability of the acquired firm without disrupting the important routines and social relationships that underpin the acquired firm's capability. Hence, such grafting capability is meant to ensure that the acquisition process does not destroy the very reason for doing the acquisition in the first place. In the next section, we will elaborate on how grafting can be enhanced in order to make inferences on what the microfoundations of a grafting capability could be.

## 2 Theory and Hypotheses

### 3.1 Enhancing Grafting

In order to understand how to engage in successful grafting, one needs to know how such a complex organisational learning process takes place. As touched on in the introduction, the roots of the existing literature on organisational learning can largely be traced back to two foundational theories: the behavioral theory of the firm (Cyert & March, 1963) and evolutionary economics (Nelson & Winter, 1982). On the one hand, the behavioral theory of the firm focuses on firms' decision making (Cyert & March, 1963; Gavetti, Levinthal, & Ocasio, 2007). Organisational learning from this perspective assumes that that firms invest time and resources to search for a set of alternative courses of action for a given task, compare them, choose the most appropriate option given the task at hand, and learn from the resulting experiences to improve the odds of success of subsequent events. Thus, organisational learning from a behavioral theory of the firm perspective aims to reveal how such learning based on firm's decision making takes place. Understanding how the process of learning unfolds is a central theme in this research stream (Argote & Greve, 2007). Scholars from this tradition recognize the importance of both standard operating procedures and search activities for firms' decision making. This has resulted in subsequent related acquisition literature embracing the importance of close collaboration and interaction—when involved in grafting activities (Puranam et al., 2006; Puranam & Srikanth, 2007). Frequent interaction and close collaboration that include searching together for solutions, which are labeled throughout this paper as 'search activities', have been argued to have a positive effect on capability transfer and hence, on the performance of capability-based acquisitions (Birkinshaw et al., 2000; Bresman et al., 2010; Ranft, 2006; Ranft & Lord, 2002; Verbeke, 2010).

On the other hand, in contrast to the behavioral theory of the firm, evolutionary economics focuses on routinization of activities which ensures that firms can economize on the process of searching for solutions based on their past experiences, leading to these experiences becoming their routine way of doing things. This approach, in turn, allows routines to rise and get refined over time as firms keep accumulating experiences. In time, by having created the needed routines on which they can count, firms are able to develop certain organisational capabilities to outperform others. This is because such firms know what the best solutions are based on their experiences and can apply these solutions efficiently by means of their routines. In other words, the way that firms are able to carry out certain activities better than competitors is assumed to be captured by their routines. Thus, evolutionary theory highlights routines as the focus of attention to understand how firms learn and develop certain capabilities (Nelson & Winter, 1982, 2002). Hence, the aim of organisational learning from this perspective is to reveal how firms, given the stabilizing role of routines and the existence of search processes as generators of change in routines, learn to improve their performance by developing certain capabilities (Argote & Greve, 2007; Gavetti et al., 2007; Nelson & Winter, 1982, 2002). This important role of routines has led many firms involved in acquisitions to share their routines with each other in an attempt to gain access to the other firm's capabilities and thus to learn from each other, an activity labeled throughout this paper as 'routine sharing' (e.g. Zollo & Singh, 2004).

In addition to search activities and routine sharing, firms have been trying to develop an acquisition capability in order to enhance grafting by means of deliberate learning mechanism such as M&A departments for experience accumulation, post-acquisition assessments for articulation, and M&A repositories and retrieval systems for codification, which are labeled throughout this paper as 'institutionalized mechanisms' (e.g. Barkema & Schijven, 2008b; Zollo & Singh, 2004; Zollo & Winter, 2002). Having such institutionalized mechanisms in place, as part of a firm's grafting capability, is argued to have a positive effect on acquisitions performance (Amiryany et al., 2012; Helfat et al., 2007; Hitt et al., 2009). This is because such institutionalized mechanisms are assumed to embody—on a corporate level—firm's past learning related to acquisitions integration. The effect of such institutionalized mechanisms, however, should still be empirically tested, as is the case with search

activities as well as routine sharing when it comes to developing a grafting capability (e.g. Amiriany et al., 2012; Helfat et al., 2007). Finally, regardless of the mechanisms used to enhance capability transfer, it is argued that having common knowledge—“knowledge that is shared and known to be shared”(Puranam et al., 2009)—will be beneficial for this process. This is because the employees of the acquired and acquiring firm are more aware of what the other party knows and thus, better able to adjust their activities to one another. Therefore, this, in turn, means that when having common knowledge search activities and routines sharing will be more effective since employees are better able to understand each other and the documents that are being exchanged—while collaborating post-acquisitions.

In the following sections, while discussing the concepts that are depicted in our research model in Figure 1 and building up to our hypotheses, in line with the behavioral theory of the firm and evolutionary economics, we start off by discussing two distinct activities that firms use when trying to enhance grafting, that is, search activities and routine sharing, respectively. Subsequently, we will discuss how the process of grafting could be affected by institutionalized mechanisms that are proposed by strategy scholars and by having firms involved that have common knowledge.

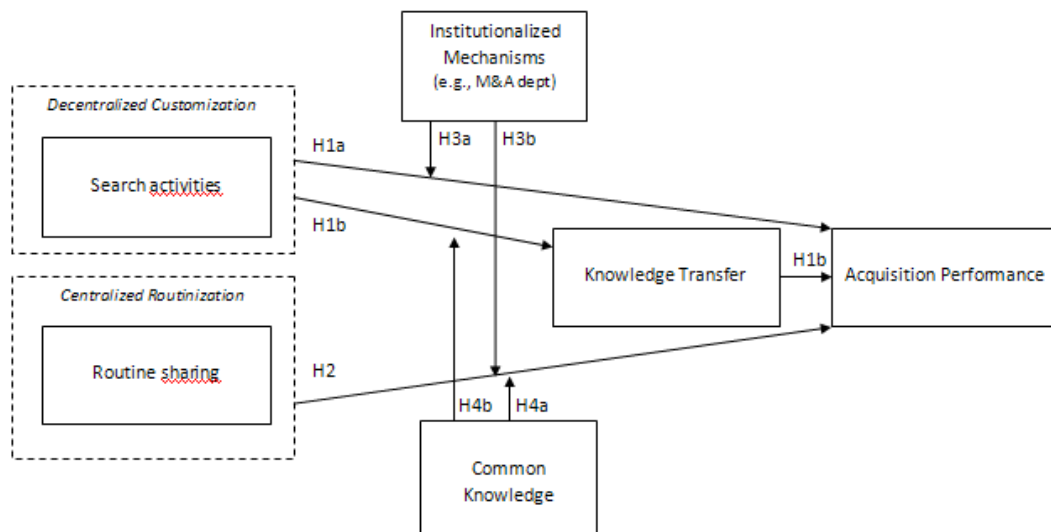

Figure 1 Research Model

*Independent Variables*

*Search activities*

From a behavioral theory perspective, the importance of understanding which activities can enhance learning, how to avoid myopic search given bounded rationality, and thus, how the process of learning unfolds, have been central (Argote & Greve, 2007). Scholars from this tradition have recognized the importance of problemistic search (i.e., ad hoc problem solving) for enhancing learning, which could help avoid myopic search when compared to working according to standard operating procedures. When it comes to grafting, it is about the capabilities based on highly tacit knowledge and skills of the employees that are able to carry out certain activities according to certain procedures. For transferring such highly tacit knowledge and skills, many scholars, whose learning roots could be linked to that of the behavioral theory stream of thought, have recognized the importance of close collaboration during post-acquisition, in order to gain access to the capabilities of the acquired firm (Bresman et al., 2010; Ranft, 1997, 2006; Ranft & Lord, 2002).

To transfer highly tacit knowledge, it is recognized that personal interactions are required (Haas & Hansen, 2007; Hislop, 2009). Engagement in practice in order to enhance learning by actually doing has been advocated by many scholars too (Cook & Brown, 1999; Gherardi, 2000; Orlikowski, 2002; Tsoukas, 1996). Even the founders of evolutionary economics have recognized the importance of observing or being actively trained for transferring such highly tacit knowledge and skills (Nelson & Winter, 1982). Surprisingly, however, strategy scholars, using the evolutionary economics lens, have not done much with the importance of such activities for transferring highly tacit capabilities. Thus, no attention has been paid to what the actual activities are that constitute such observing and active training efforts and what the impact of such activities could be on post-acquisition capability transfer and thus,

acquisition performance. This is remarkable, especially because such activities could be important components of a grafting capability that we seek to understand.

Instead, strategy scholars have been advocating the importance of the routinization of the activities that enhance the transfer of capabilities, in the form of deliberate learning mechanisms, as mentioned earlier (e.g. Zollo & Winter, 2002). However, when it comes to grafting, firms involved are in search of solutions from each other, in order to enhance, for example, their product development efforts, and thus, learn from each other. Given the rapid change in such high-technology environments, where grafting usually takes place, and the post-acquisition integration issues that come along with such grafting activities, there is usually no time and need for routinization of such activities. In addition, routines could create inertia and path-dependency, making such problemistic search even more necessary (Heimeriks et al., 2012; Teece, 2007). Thus, ad hoc problem solving usually seems to be a better plan for acting upon post-acquisition integration issues. This does not mean that there is no routine involved at all. As the director of a company that carries out multiple acquisitions per year mentioned during an interview:

“I think more according to a plan [instead of ad hoc] while being aware of what is happening in the world around us.”

Thus, firms could have a set of search practices that they use to deal with post-acquisition integration issues, such as having meetings or mentoring certain employees, but the content of these activities—and thus, that which such activities actually entail—is being dealt with on an ad hoc basis based on the situation at hand and hence, changes in the environment (e.g. Winter, 2003). In other words, firms decide ad hoc what it is that needs to be dealt with immediately during the meetings or taught to certain employees by means of mentoring practices. Hence, the ad hoc aspect concerns the content instead of the activity being used since firms do have an arsenal of best practices of which they know the use would be beneficial.

Such search practices could be, for example, project teams, job rotation, mentoring, briefing sessions, interviewing experts. These search activities entail a more decentralized customization approach towards acquisition integration, since firms ensure that employees collectively decide what to do next in order to enhance mutual collaboration and thus, capability transfer (Bresman et al., 2010; Ranft & Lord, 2002). In addition, such search activities enhance the overall acquisition performance as well, since the employees get to know each other and start developing social relationships which are beneficial to overall firm performance (Heimeriks et al., 2012). It is by means of such social relationships—enabled by search activities—that employees start developing a new joint social community post-acquisition which ensures that they are willing to collaborate with each other, in order to transfer the capability in question. However, the investment costs for such search activities are higher than those of routine sharing, since search activities require intensive involvement of employees (e.g. Haas & Hansen, 2007). This is because they demand more ‘hours’ to be spent by firms when compared to routine sharing, which we will elaborate on in the next section. On the other hand, Winter (2003) argues that the costs of such activities would be lower if the employees involved carry out these activities on top of their normal routine tasks. In other words, the costs of such search activities would be lower if the employees are not only expected to carry out acquisition-specific tasks and thus, are also able to conduct firm’s normal operational activities. In this case, when there are no problems—concerning capability transfer—to be dealt with on an ad hoc basis, such employees would go on and carry out their own tasks. Regardless of the costs, however, one could expect that for transferring highly tacit capabilities, search activities are more effective than routine sharing, since such capabilities are embedded in firms’ practices and require interaction among employees and thus, learning by doing (e.g. Bresman et al., 2010).

Furthermore, by enhancing interaction among employees while stimulating them to learn from each other how the target’s capability works, search activities ensure that knowledge is being transferred post-acquisition. This knowledge transfer, in turn, is of interest for the acquisition in order to transfer the capability in question and thereby also affects overall acquisition performance. Therefore, given the importance of knowledge transfer for capability-based acquisitions, one could expect that the positive effect of search activities on overall acquisition performance is also because of such activities’ effect on knowledge transfer. Hence, we expect that search activities enhance overall acquisition performance directly as well as indirectly through enhancing knowledge transfer. These arguments lead to the following hypotheses:

*Hypothesis 1a: Search activities have a positive effect on overall acquisition performance.*

*Hypothesis 1b: The positive effect of search activities on overall acquisition performance is*

*mediated by knowledge transfer.*

*Routine sharing*

As mentioned above, an evolutionary economics perspective highlights the importance of routines for the analysis of firm behavior. Scholars in this tradition have focused on intra-firm replication of routines (Szulanski, 1996; Szulanski & Jensen, 2006; Szulanski & Winter, 2002; Winter & Szulanski, 2001), inter-firm replication of routines (e.g., Becker, 2004; Madhok, 1997), or the importance of routinized activities such as deliberate learning mechanisms for enhancing inter- and intra-firm capability transfer (Zollo, 2009; Zollo & Singh, 2004). When it comes to grafting, the focus is on intra-firm transfer of capabilities, since firms involved in such activities aim to access capabilities of the target firm that has become a part of their own organization. Therefore, one could argue that in such contexts coordination mechanisms available for intra-firm activities can be used. Given the context-dependent nature of routines, which makes their replication difficult—indeed, often exceedingly difficult (e.g. Becker, 2004; Madhok, 1997)—firms involved in capability-based acquisitions try to find ways to transfer such routines. One such way is through routine sharing.

Firms oftentimes codify their understanding of internal operational routines in written tools such as manuals, blueprints, decision support systems, repository and retrieval systems, project management software, or even web 2.0 software, which is in line with deliberate learning mechanisms stream of thought, that is, knowledge codification (e.g. Haas & Hansen, 2007; Zollo & Winter, 2002). In order to gain access to capabilities of the acquired firm, an activity that requires minimal costs is to exchange such codified versions of firm's knowledge, an activity that we label here as 'routine sharing' (Enberg, Lindkvist, & Tell, 2006). Given the low investment efforts, firms involved in such capability-based acquisitions oftentimes opt for such routine sharing activities. By doing this, firms involved share their past codification efforts regarding their operational activities with each other. Hence, this approach is based on economics of reuse (Enberg et al., 2006). This is in line with what Grant (1996) calls "giving directions" or what Haas and Hansen (2007) call "exchanging documents." The focus here, however, is more on the fact that such exchange of documents is meant to share the routines, since firms involved in capability-based acquisition are interested in the way the other firm carries out its activities and thus, the capabilities of the acquired firm that are embedded in its routines. This approach by definition entails some form of centralized routinization, since firms try to steer the routines according to which activities are meant to be carried out from the top. The importance of such routine sharing and its impact on acquisition performance, however, has not had much attention.

Given that the capabilities of firms are embedded in their routines (e.g. Allatta & Singh, 2011; Sirmon, Hitt, & Ireland, 2007) and are usually of a highly tacit and causally ambiguous nature (Ranft & Lord, 2002), routine sharing by means of giving directions by definition entails a loss of tacit knowledge (Grant, 1996). Thus, it is expected that the knowledge the acquirer attempts to gain access to through grafting is not likely to be fully shared through routine sharing. As a corporate business development director of a company that carries out multiple acquisitions per year stated in an interview:

Interviewee: "No, let me say it this way: sending reports [and documents] is just not going to be it."

Interviewer: "No? So..you really need that interaction [that you mentioned]?"

Interviewee: "No you really need 'talking' for that."

In other words, firms might have difficulties finding relevant knowledge or acting upon it (Haas & Hansen, 2005, 2007). Therefore, routine sharing seems not to be an appropriate approach for enhancing grafting. On the other hand, however, such routine sharing activities do enhance the 'dating-process'—that is, they do make sure that firms get to know each other's activities faster and thus, enhance the process of getting acquainted with each other's way of working. They do also enable firms to coordinate their activities while not transferring knowledge. As the above mentioned interviewee shared with us:

"That [interaction among employees] goes actually based on the results. Like what have you achieved and how can we subsequently embed that in a new [airplane] engine program, but the knowledge..that still remains with us [and does not get transferred]."

For example, in the case of the above-mentioned quote routine sharing helps firms know how certain activities (e.g., developing a component for a new airplane engine) are being carried out in generic terms (e.g., based on results) and how such activities fit within their own operations (e.g., a new airplane engine program). This, in turn, helps these firms conduct their operations as efficient as possible by not spending much time on transferring the actual knowledge (i.e., what the exact micro-level activities are that lead to developing a certain component for a new airplane engine), but focusing on carrying out their own expertise—while coordinating the interdependencies among all these activities optimally. Thus, routine sharing entails a coordination and efficiency aspect (e.g. Enberg et al.,

2006; Grant, 1996; Haas & Hansen, 2007; Zack, 1999). Hence, one could argue that routine sharing could have a positive effect on the overall acquisition performance. These arguments lead to the following hypothesis:

*Hypothesis 2: Routine sharing has a positive effect on overall acquisition performance.*

*Moderators*

*Institutionalized mechanisms*

It is expected that institutionalized mechanisms such as an M&A department for experience accumulation, post-acquisition assessment for knowledge articulation, and an M&A repository and retrieval system for knowledge codification, have a positive effect on acquisition performance, as mentioned earlier (Amiryany et al., 2012; Barkema & Schijven, 2008b; Helfat et al., 2007; Zollo & Winter, 2002). Such institutionalized mechanisms affect the choice and use of search activities and routine sharing based on firms' past learning that has been captured and accumulated on a corporate level (Amiryany et al., 2012). In other words, institutionalized mechanisms such as an M&A department based on the firm's past experiences, which are partly in other existing institutionalized mechanisms such as an M&A repository and partly a result of knowledge articulation during evaluation sessions, determine which type of search activities and routine sharing to carry out in order to enhance grafting within a specific acquisition. Or as a vice-president of an active acquirer mentioned during an interview:

"Two functions I think sit at corporate level in our company [related to acquisition integration]. So, that is integration leadership and the integration project management office. They go through plans, tasks, mile stones, process and tools, definitions, standards, all that stuff that creates a homogenous integrated [acquisition] project plan."

By helping decide on search activities and routine sharing, institutionalized mechanisms moderate the effect that such search activities and routine sharing have on overall acquisition performance, in a positive way. Institutionalized mechanisms do this by functioning as guidance throughout the post-acquisition integration process. These arguments lead to the following hypotheses:

*Hypothesis 3a: Institutionalized mechanisms amplify the effect that search activities have on overall acquisition performance.*

*Hypothesis 3b: Institutionalized mechanisms amplify the effect that routine sharing has on overall acquisition performance.*

*Common knowledge*

As argued earlier, it is expected that for sharing such highly tacit capabilities as in the case of grafting, search activities are more appropriate than routine sharing. In addition, however, it is expected that the effect of search activities and routine sharing will be strengthened when common knowledge exists (e.g. Ahuja & Katila, 2001; Allatta & Singh, 2011; Argote & Greve, 2007; Hitt et al., 2009; Puranam et al., 2009). First, concerning search activities, having similar knowledge helps firms involved better understand each other such as by using the same jargon, leading to more effective usage of search activities. For example, when involved in brainstorming sessions or mentoring practices, having such common knowledge could help employees to better understand the point of view of the other party and thus, have more effective search activities. In addition, having common knowledge will enhance collaboration among employees, since experts are more willing to collaborate with their peers, leading again to amplifying the effect of search activities and thus, more effective search activities (Allatta & Singh, 2011). Second, the same holds for routine sharing too since when sharing the codified version of routines by means of, for example, manuals, having common knowledge could help employees to be better able to interpret the documents that are being exchanged. This is because, for example, certain codes that are being used in the documents would be obvious for the employees involved since they have some degree of common knowledge. In other words, the existence of common knowledge creates the needed absorptive capacity while decreasing the existing cognitive distance among employees and thus, amplifies the effect of routine sharing (Cummings & Teng, 2003; Lewin, Massini, & Peeters, 2011; Zahra & George, 2002). Hence, knowledge can be more easily assimilated when some degree of similarity exists (Allatta & Singh, 2011). As the director of a company that conducts multiple acquisitions per year mentions during an interview:

"They [experts of the acquired and acquiring firm] are complementary with each other. They can understand each other totally because they talk exactly in the same way and have exactly the same technique, but for totally different industries."

Thus, the existence of some homogeneous elements in the knowledge base of the firms involved in such grafting activities, could help stimulate the grafting process and thus, learning (e.g. Hitt et al.,

2009). These arguments lead to the following hypotheses:

*Hypothesis 4a: The positive effect of routine sharing on acquisition performance is amplified by the existence of common knowledge.*

*Hypothesis 4b: The positive effect of search activities on knowledge transfer is amplified by the existence of common knowledge.*

## 4 Data and Methods

### 4.1 Sample

This study is based on qualitative and quantitative data gathered by a two-phased research design aimed at gaining more understanding regarding the micro practices that enhance post-acquisition knowledge transfer and thus, the performance of capability-based acquisitions. First, we conducted a series of exploratory interviews with post-acquisition integration experts—that is, executives and front-line managers—in 2009, in order to understand their view of the post-acquisition implementation phase and the practices that they use to enhance the transfer of knowledge. These experts had been involved in both successful and unsuccessful acquisitions as well as small and big size acquisitions. Second, the interviews were used as input for the development of a survey in 2010. Subsequently, the survey was sent out to a large number of firms in 2011.

#### *Interviews*

In the first phase of our research, we conducted a total of 17 interviews with executives and front-line managers that were responsible for or involved in, an acquisition implementation process. These executives and managers were from a variety of large and small high-technology firms such as, for example, Cisco, Philips, Getronics, and Teva. These exploratory interviews provided us the needed stimulants for rethinking our perspective on acquisition implementation and thus, gaining a deeper understanding of what such managers are concerned with and how they try to deal with the issues they face when it comes to enhancing the transfer of knowledge and capabilities of an acquired firm. The interviews lasted approximately between 45 to 60 minutes and were semi-structured, containing questions on how the transfer of knowledge actually took place during post-acquisition phase, that is, by means of which practices, and the factors that affected this process. The interviews served as input for the development of our survey.

#### *Survey*

Based on the exploratory interviews, an extensive literature review, and advice from two academic experts, in the second phase of our research we developed a survey containing 17 practices aimed at enhancing grafting and an additional 7 institutionalized mechanisms meant to develop a grafting capability. This approach enabled us to combine existing knowledge in the literature regarding acquisition implementation and the current practices of the high-technology industry, in order to make sure that we could build upon prior research and inform it by the latest practices in the industry. Subsequently, we pre-tested and adjusted the survey based on feedback from one acquisition specialist and three industry experts.

After having refined the survey, the survey was sent out to 649 Cambridge Healthtech Institute (CHI) members with a senior R&D managing position. CHI is a network for leading researchers and business experts in the life sciences, providing conferences, event development and management, and industry reports for the life sciences industry. The life sciences industry—defined by the OECD as a high-technology industry (Hatzichronoglou, 1997)—is an industry with an active acquisition history in which technological learning has been mentioned to be key for gaining a competitive advantage (e.g., Cloodt, Hagedoorn, & Van Kranenburg, 2006; Schweizer, 2005). The senior R&D managers were selected as key respondents because the company that they were working at had been involved in an acquisition during the past five years according to SDC Platinum which is a worldwide M&A database. Using a five-year window allowed us to ask the respondents to reflect on those acquisitions that were still fresh in their memories—while the acquisition effects that we are interested in were visible since the needed time had passed (e.g., Desyllas & Hughes, 2010). Furthermore, given that capability-based acquisitions are meant to get access to the knowledge and capabilities of the acquired firm, senior R&D managers could function as the key respondents. Such senior R&D managers are involved in highly knowledge intensive work and are prominent figures which firms should and do involve in post-acquisition knowledge transfer activities. Thus, by choosing senior R&D managers as key respondents, we ensure that the survey is filled in by those who actually engage in the practices that are of interest for us (Heimeriks et al., 2012; Ray, Barney, & Muhanna, 2004). Therefore, having senior

R&D managers—that have been actively involved in the knowledge transfer process of the acquisition—as our respondents, could be seen as the strength of our study. However, using such single respondents' method could create common method bias. Therefore, while developing our research design we considered a few aspects, in order to avoid such concerns regarding common method bias. First, we assured respondents total anonymity. Second, the independent and dependent variable were psychologically separated, that is, qua proximity and methodology (Heimeriks et al., 2012; Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). In other words, we measured the independent and dependent variables in different sections of the survey and we used different types of scales. The former makes sure that respondents do not think that the independent and dependent variable are part of the same scale and thus, do not answer them accordingly. The latter, on the other hand, makes sure that respondents have to rethink when trying to answer questions, since the scales differ, and thus, they cannot automatically fill in the answers, which helps avoiding that same answers are given across the survey without thinking whether they are appropriate. In addition, we used a marker variable which is a theoretically unrelated variable, to be able test whether respondents also answered this question accordingly, and thus, were filling in the survey automatically without thinking about the answers (Williams, Hartman, & Cavazotte, 2010). Finally, it has been argued that common method bias makes it difficult to reveal interaction effects (Heimeriks et al., 2012; Siemsen, Roth, & Oliveira, 2010). Therefore, in case there is common method bias in our sample, its impact should be minimal on hypotheses 3 and 4

After sending out the survey, a total of 126 were filled in, being good for a response rate of 19.4 percent. Such response rate has been mentioned to be quite high for surveys that are targeted at senior managers (e.g. Capron & Shen, 2007; Heimeriks et al., 2012). Because of incomplete responses we had to drop 24 surveys, resulting in a total of 102 surveys to work with for the analyses. The resulting 102 responses contained 'I don't know-answers' by a few respondents, that is, less than 10 percent, regarding some variables. For these missing values we conducted an Expectation Maximization approach, since the missing values were missing at random (Little & Rubin, 2002).

The respondents of our survey had in total 181 experiences with acquisitions that had access to new knowledge and capabilities as their motive. The acquiring firms in these acquisitions were in 65 percent of the cases large firms consisting of more than 1000 employees while this was only the case for 46 percent of the acquired firms. On average 26 percent of the acquired firms had even less than 100 employees while this was only the case for 16 percent of the acquiring firms. In addition, approximately 63 percent of the acquiring firms were headquartered in North America and 25 percent in Europe. In case of the acquired firms, approximately 75 percent were headquartered in North America and 12 percent in Europe. All acquisitions took place within the life sciences industry with an aim to get access to new capabilities.

Furthermore, by comparing early and late responses we tested for non-response bias (Armstrong & Overton, 1977). The chi-square of two key variables, that is, acquisition performance ( $\chi^2 = 4.817, p > 0.05$ ) and knowledge transfer ( $\chi^2 = 12.516, p > 0.05$ ), did not show the existence of non-response bias. In addition, for assessing whether common method bias existed within our data, we also carried out a formal procedure once we had the data. By means of Harman's one-factor test we were able to find three distinct factors, all of them having an eigenvalue greater than one, while none of them accounted for a covariance greater than 50 percent, namely: 29.7, 25.4, and 17.3 percent (Podsakoff & Organ, 1986).

#### 4.2 Dependent and independent variables

Table 1 in the Appendix provides detailed information regarding our measurement approach concerning the dependent and independent variables. In line with existing research in the strategy field, we use a perceptual measurement method for our dependent variable (Heimeriks et al., 2012; Kale & Singh, 2007; Zollo et al., 2002). More specifically, the dependent variable acquisition performance was measured by using a multi-item five-point Likert-type scale that focuses on different dimensions of performance, that is, overall performance, financial performance, and innovation performance. Such multi-item measures are generally preferred since they capture more information (Heimeriks et al., 2012).

**Table 1. Measurement of the Variables <sup>a</sup>**

Construct	Measurement
Acquisition performance	“(1) To what extent was (is) your company satisfied with the overall performance of this acquisition (so far), (2) to what extent did this acquisition have a positive effect on the overall innovation performance of the combined entity (so far), (3) to what extent could this acquisition be seen as a success from a financial point of view (so far)?” The variables are measured on a five-point scale: (1) not at all, (2) a little, (3) somewhat, (4) to a great extent, and (5) to a very great extent.

<b>Search activities</b>	<p>“Please indicate if any of the following were used to enhance sharing of knowledge among the employees of the acquired company and your company? (Please note: it is possible to give more than one answer): (1) site visits or tours of the partner company, (2) interviews with experts of the partner company, (3) job rotation (employees get a position in the partner company), (4) mentoring, (5) brainstorming sessions, (6) team-based work design (project teams), (7) briefing sessions, (8) workshops and seminars, (9) training courses or skill development practices, (10) best practice exchange (companies exchange the best processes they have)?” The variables are measured as a sum ranging from 0 = none of the items to 10 = all items in place (e.g., Zollo &amp; Singh, 2004).</p>
<b>Routine sharing</b>	<p>“Please indicate if any of the following were used to enhance sharing of knowledge among the employees of the acquired company and your company? (Please note: it is possible to give more than one answer): (1) electronic forums, (2) exchange of documents, (3) repository and retrieval systems containing information regarding partner company’s knowledge, (4) intranet, (5) groupware technology (e.g., lotus notes), (6) blogs, (7) web 2.0 (e.g., wiki)?” The variables are measured as a sum ranging from 0 = none of the items to 7 = all items in place (e.g., Zollo &amp; Singh, 2004).</p>
<b>Knowledge transfer</b>	<p>“To what extent are the following statements correct: (1) your company has learned a great deal about the knowledge held by the acquiring/acquired company, (2) the acquiring/acquired company has learned a great deal about the knowledge held by your company, (3) the knowledge held by your company has been assimilated by the acquiring/acquired company, (4) the knowledge held by the acquiring/acquired company has been assimilated by your company.” The variables are measured on a five-point scale: (1) Strongly disagree, (2) disagree, (3) neither agree nor disagree, (4) agree, (5) strongly agree (adapted from Simonin, 1999).</p>
<b>Institutionalized mechanisms</b>	<p>“Please indicate if any of the following were used for this acquisition (Please note: it is possible to give more than one answer): (1) acquisition (M&amp;A) department, (2) acquisition (M&amp;A) team, (3) acquisition (M&amp;A) manager (a person responsible for the specific acquisition who watches over the whole process), (4) knowledge integration manager (a person responsible for enhancing the sharing of knowledge among the employees of companies involved), (5) M&amp;A collaboration site (a website accessible for managers from relevant business functions in order to enhance collaboration and guide the acquisition process), (6) acquisition repositories (a database storing knowledge, tools, and processes about acquisitions, which can be used for each new acquisition), (7) post-acquisition assessment (to discuss the lessons learned from this acquisition)?” The variable is measured as a sum ranging from 0 = none of the items to 7 = all items in place (e.g., Zollo &amp; Singh, 2004).</p>
<b>Common knowledge</b>	<p>“Given the overlap of the knowledge of the two companies, the acquiring/acquired company could independently develop the same outputs as your company.” The variables are measured on a five-point scale: (1) Strongly disagree, (2) disagree, (3) neither agree nor disagree, (4) agree, (5) strongly agree (adapted from Cummings and Teng, 2003).</p>

<sup>a</sup> A complete overview of the survey is available from the authors.

For our independent variable ‘search activities’ we sum up a total of 10 practices that firms use, an approach that is in line with existing literature (Heimeriks et al., 2012; Zollo & Singh, 2004). Second, for our independent variable ‘routine sharing’ we used the sum of 7 tools that were adopted by firms. Both of the independent variables measure how many of such practices were used during the acquisition in order to enhance grafting and thus, the performance of such capability-based acquisitions. For ensuring construct validity, we have used both insights from the existing literature as well as from our own fieldwork. Third, the mediating variable ‘knowledge transfer’ was measured by using an adapted version of an existing multi-item Likert-type scale of Simonin (1999). In addition, the moderating variable ‘institutionalized mechanisms’ was also measured by using existing practices that were mentioned in the literature and during our fieldwork and summing those practices up that were used by the firm during the focal acquisition (Barkema & Schijven, 2008b; Zollo & Singh, 2004; Zollo & Winter, 2002). Furthermore, we measured the moderating variable ‘common knowledge’ by using a single-item Likert-type scale, an adapted version of an existing scale of Cummings and Teng (2003). Even though multi-item scales are preferred, single-item scales have been mentioned to capture the needed information too, as long as the construct is specific enough (Heimeriks et al., 2012). Given that this scale only focuses on the similarity of the knowledge of both firms regarding the fact that employees of both firms are able to understand each other, it excludes any other factor that could have an overlap with the broader knowledge of the firm construct and therefore, we believe, it is specific enough to be measured by means of a single-item (Heimeriks et al., 2012).

Finally, an important aspect to note is that our measures of search activities, routine sharing, and institutionalized mechanisms are formative scales. In contrast to reflective scales, using formative scales

means that the items mutually affect and create the meaning of the construct that one wants to measure (Jarvis, Mackenzie, & Podsakoff, 2003). Using formative scales means that the items constituting such scale are not correlated, leading to the standard validity and reliability criteria for reflective scales not being appropriate to validate such formative ones (Jarvis et al., 2003). Therefore, in order to assess the validity and reliability of our formative scales we considered a few aspects, in line with requirements mentioned in the literature (Diamantopoulos & Winklhofer, 2001; Heimeriks et al., 2012). First, we ensured appropriate overall scope, that is, content specification, and that of the specific items, that is, indicator specification, by gaining detailed insights from our exploratory fieldwork and pre-testing the survey. Second, we also ensured content and indicator specification by relying on existing literature. Last but not least, we also conducted an inter-correlation test regarding each scale's items, that is, indicator collinearity, by using Variance Inflation Factors (VIF), which showed that there is no overlap among the items since all VIFs were far below the required threshold of 10. (Neter, Kutner, Nachtsheim, & Wasserman, 1996).

#### **4.3 Control variables**

In addition to our dependent and independent variable, we have also added a few control variables in our research model. These include cross-border acquisitions, hostile acquisitions, acquisition experience, codifiability of knowledge, and the level and mode of the integration. First, cross-border acquisitions are acquisitions within which one of the firms is headquartered in a different country. Such cross-border acquisitions could face more difficulties given cultural differences and geographical dispersion of firms involved. Therefore, controlling for cross-border acquisition could reveal interesting insights. Second, many times acquisitions have a hostile nature which could have consequences when it comes to transferring knowledge and capabilities that are of interest. Thus, hostile acquisitions could create a sense of resistant from the employees of the acquired firms, making it difficult to collaborate. Hence, controlling for such hostile acquisitions could reveal interesting findings. Third, acquisition experience concerns whether or not the firms has been involved in an acquisition before. It could be that firms with acquisition experience are better in solving certain acquisition implementation issues than those without experience. Thus, controlling for acquisition experience seems to be an important aspect for understanding performance variations across acquisitions.

Furthermore, it could be that the knowledge that the firms want to get access to is quite codifiable which makes it easy to transfer such knowledge via documents and manuals and thus, by means of routine sharing. In such cases, one could expect better acquisition performance given that the knowledge that is meant to be transferred is less ambiguous and thus, easier to transfer. Therefore, controlling for the degree of knowledge codifiability could reveal interesting insights too. By asking the respondents to what extent the knowledge in question that was being transferred could be explained in writing, we aimed to assess the codifiability of knowledge. Finally, the level of integration could have an effect on acquisition performance too. It could be that firms using a high level of integration disrupt the knowledge and capabilities of the acquired firm by not giving it the needed autonomy and thus, affecting acquisition performance in a negative way. On the other hand, it could also be that firms use different modes of integration such as on distance and physical integration, that is, virtually integrating the operational activities versus co-locating employees in the same physical space, respectively, in order to enhance acquisition performance. Thus, it could be that firms use a high degree of integration, but do not integrate the companies physically to make sure that the acquired firm has the needed autonomy. Hence, controlling for the level and mode of integration could reveal interesting insights too.

On a related note, for cross-border acquisitions, hostile acquisitions, acquisition experience, and integration mode, a dummy variable is used to capture whether or not the acquisition had a cross-border or hostile-nature, whether or not the firms had acquisition experience, and whether or not physical or on distance integration was used. For knowledge codifiability, however, a single-item Likert-type scale was used which is an adapted version of Levin and Cross's (2004) tacit knowledge scale. Finally, also a single-item Likert-type scale was used for assessing the integration level.

#### **4.4 Analyses**

For testing our hypotheses, we used OLS regression analysis. By mean-centering the non-categorical independent variables, we diminished multicollinearity that could exist due to use of interaction terms (Aiken, West, & Reno, 1991). Furthermore, in order to be cautious regarding our findings, we used two-tailed tests for all significant results. Finally, we used a Sobel test for testing the mediation in our research model (MacKinnon, Warsi, & Dwyer, 1995).

### 5 Results

As depicted below, Table 2 provides the descriptive statistics including the mean, standard deviation, and correlations of the variables of our research model. As shown in the table, the variables are not highly correlated, indicating that multicollinearity should not be a problem. We attempted to confirm this observation by calculating the VIF factors of the explanatory variables and comparing them to a threshold of 10 (Neter et al., 1996). Given that all the VIFs were below this threshold of 10, we could assume that indeed the existence of multicollinearity could be ruled out.

**Table 2 Descriptive Statistics and Correlation**

Variables	Mean	S.D.	1	2	3	4	5	6	7	8	9	10	11	12
Acquisition performance	3,161	0,950												
Knowledge transfer	3,615	0,788	0,4756*

The tests of our hypotheses are depicted in Table 3. Model 1 in Table 3 is a baseline specification including only the control variables. Model 2 through 4 include both controls and main effects, whereas model 5 and 6 also include the interaction effects. Model 2 tests hypothesis 1a and 2, that is, the direct effect of search activities and routine sharing on acquisition performance, respectively. Model 2 through 4 test for the mediating role of knowledge transfer concerning the effect of search activities on overall acquisition performance and thus, hypothesis 1b. Model 5 and 6 test for hypotheses 3a, 3b, 4a, and 4b, that is, the moderating role of institutionalized mechanisms and common knowledge, respectively. Concerning the results, first, model 2 shows that search activities have a significant positive effect on overall acquisition performance ( $b = .142; p < .01$ ). Thus, we find support for hypothesis 1a, suggesting that the more the employees engage in ad hoc problem solving activities post-acquisition, the better it is for the acquisition performance. Model 2 also illustrates that routine sharing has a significant effect ( $P < .01$ ) on acquisition performance, but this effect is negative ( $b = -.208$ ). Hence, our findings do not support hypothesis 2 which is that routine sharing has a positive effect on the overall acquisition

performance. On the contrary, our findings reveal that routine sharing even has a negative effect on the overall acquisition performance, suggesting that routines could be interpreted wrongly when transferred in an explicit form by means of routine sharing.

As mentioned above, model 2 demonstrates that search activities are positively related to acquisition performance. However, model 3 and 4 reveal that knowledge transfer partially mediates this effect. First, this is because search activities are positively related to knowledge transfer, as is depicted in model 3 ( $b = .099$ ;  $p < .01$ ). In addition, in model 4 it is shown that search activities remain having a significant effect on acquisition performance ( $b = .110$ ;  $p < .05$ ), but knowledge transfer has a significant effect too, when included in the model ( $b = .323$ ;  $p < .05$ ). Furthermore, the explanatory power of model 4 is quite higher than that of model 2 (Baron & Kenny, 1986). Finally, a Sobel test for mediation confirmed this observation too. Thus, we find support for hypothesis 1b, indicating that the effect of search activities on acquisition performance is partially mediated by knowledge transfer.

The moderating effect of common knowledge and institutionalized mechanisms are tested by model 5 and 6, respectively. Model 5 shows a weak but positive and significant effect ( $b = .043$ ;  $p < .10$ ) regarding the interaction between common knowledge and search activities. Thus, the existence of common knowledge moderates the relationship between search activities and knowledge transfer, suggesting that the more common knowledge the stronger the effect of search activities will be on knowledge transfer. Hence, our findings support hypothesis 4b. Furthermore, model 6 which is the most complete model with acquisition performance as dependent variable, demonstrates that the interaction effect of institutionalized mechanisms and search activities is not significant. The same holds regarding the interaction effect of institutionalized mechanisms and routine sharing. Thus, institutionalized mechanisms do not moderate the relationship between search activities and acquisition performance and routine sharing and acquisition performance, respectively. Therefore, we do not find support for hypothesis 3a and 3b, suggesting that institutionalized mechanisms such as an M&A department do not seem to affect the impact of search activities and routine sharing post-acquisition. In addition, model 6 also illustrates that common knowledge does not moderate the relationship between routine sharing and acquisition performance. Hence, hypothesis 4a is not supported, indicating that the knowledge that is meant to be transferred by means of such acquisitions is probably of such a highly tacit nature that even having common knowledge does not enable firms to transfer it by means of routine sharing.

Furthermore, concerning the control variables most results are in line with previous research. However, we find that the findings regarding the mode of integration are noteworthy. More specifically, our results show that on distance integration mode which entails that employees are not co-located but operational activities are virtually integrated also has a positive effect ( $b = .318$ ;  $p < .05$ ) on knowledge transfer, as it is depicted in model 5. This could indicate that creating interdependency between the firms by virtually integrating their operational activities could also lead to a certain degree of interaction which is beneficial for knowledge transfer.

#### **Supplementary Analyses**

In order to check for the robustness of our findings, we conducted a few additional tests. As mentioned in the literature section, prior research has highlighted the importance of size for acquisition performance. However, given that our sample is relatively small we did not add size as a control variable in our models, in order to avoid overfitting the models. Nonetheless, as part of our robustness checks we reran the models while adding size as a control variable. The results of this analysis showed that size is not significant. The inclusion of size in the models also did not lead to any major changes of our earlier results and thus, our results were qualitatively identical. Hence, this confirms once again the validity of our findings. In addition, we also reran the models while excluding all control variables in an attempt to decreasing the probability of overfitting the models. The results of this additional analysis also did not reveal any major changes in our findings. Thus, this analysis once again confirms the robustness of our findings.

## **6 Discussion**

In this present paper, we have built on existing literatures on learning, provided by strategy and organization theory scholars, in order to understand how organisational learning through grafting can be enhanced, and thus, how firms can learn to graft—that is, build a grafting capability. Based on the existing literature, we conceptualized such grafting capability as being constituted by institutionalized mechanisms which are meant to deliberately enhance learning (Barkema & Schijven, 2008b; Zollo &

Singh, 2004; Zollo & Winter, 2002). We did, however, probe a few questions, that is, whether such institutionalized mechanisms have a positive effect on post-acquisition process and if so, what should such institutionalized mechanisms advice and contain to enhance learning. Based on our fieldwork and an in-depth survey, our findings reveal that institutionalized mechanisms do not have a positive effect on the post-acquisition process. Thus, the question that remains is, how firms, then, should enhance learning when involved in grafting, and thus, what the microfoundations of a grafting capability should be.

Our findings demonstrate that the most important aspects that enhance grafting are the existence of common knowledge and the use of search activities. On the one hand, knowing that the existence of common knowledge enhances capability transfer enables firms to identify which targets to acquire and thus, focus on the right targets with which they have some overlap in knowledge, in order to increase their odds of success (e.g. Ahuja & Katila, 2001; Allatta & Singh, 2011; Argote & Greve, 2007; Hitt et al., 2009; Puranam et al., 2009). On the other hand, only knowing whom to acquire is not enough since firms still need to be able to adequately transfer target's capability post-acquisition and thus, build a grafting capability. In doing this, our findings show that search activities are vital (Bresman et al., 2010; Ranft, 1997, 2006; Ranft & Lord, 2002). In other words, the most important microfoundations of a grafting capability seem to be search activities.

Given the highly tacit nature of the capabilities that are meant to be transferred by means of capability-based acquisitions, having search activities that enhance collaboration among employees while searching together for solutions, is key for transferring capabilities post-acquisition. This is because such capabilities are often in the heads of employees and embedded in their routines and social relationships, and thus, embedded in practice (Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Ranft & Lord, 2002; Schweizer, 2005). Search activities, by enhancing collaboration and interaction, while being focused on the actual practices of the employees in question, enable employees to start solving problems together on an ad hoc basis, based on the situation at hand and thus, the changes in the environment (e.g., Winter, 2003). By doing this, employees start learning from each other the complexity of the capability in question and the way that specific activities are being carried out by the other firm. In other words, it is learning-by-doing in the actual practice that enables these employees to learn from each other, leading to the transfer of the capability in question (Cohen, 2007; Cook & Brown, 1999; Gherardi, 2000; Orlikowski, 2002; Tsoukas, 1996).

In addition, this learning-by-doing by means of search activities takes place when employees start building relationships and trusting each other, and thus, build the needed social relationships to be willing to collaborate. Search activities, by involving face-to-face interaction enhance the development of social relationships among employees and thus, social integration. Creating the needed social relationships for collaboration is what leads to the development of a new joint social community post-acquisition that stimulates capability transfer. The development of such new joint social community is mentioned to be vital for value creation post-acquisition—when involved in capability-based acquisitions (e.g., Birkinshaw et al., 2000; Bresman et al., 1999, 2010; Puranam et al., 2006; Verbeke, 2010).

Finally, our findings show that even when firms choose not to physically integrate the acquired firm and thus give it the needed autonomy, virtually integrating the acquired firm's operational activities on distance enhances acquisition performance too. In other words, it seems like even if it is only virtual integration, as long as the interdependencies among the firms are increased and thus, also interaction among the employees, the effects will be beneficial for acquisition performance. Hence, it could be that virtual integration also enhances social integration, to a certain degree, and therefore also capability transfer.

### **6.1 Theoretical contributions**

By synthesizing two streams of research on post-acquisition integration—that is, grafting through acquisitions and acquisition capability development—we conceptualized a distinct type of acquisition capability for capability-based acquisitions, namely: a grafting capability, in an attempt to understand how firms can enhance learning through grafting and thus, what the microfoundations of a grafting capability are. By doing this, our research, we believe, offers a number of theoretical contributions.

First, our study addresses recent calls for more research on the microfoundations of capabilities in general (Felin, Foss, Heimeriks, & Madsen, 2012) and knowledge sharing processes in particular (Foss et al., 2010). More specifically, our research addresses recent calls for empirically testing the effect of deliberate learning mechanisms such as an M&A department on post-acquisition performance (Amiryany et al., 2012; Barkema & Schijven, 2008b; Helfat et al., 2007), in order to find out whether

such institutionalized mechanisms could function as the microfoundations of a grafting capability. In an attempt to contribute to existing research, we have tested the effect of such institutionalized mechanisms. Our paper so far, has shown that the existence of institutionalized mechanisms does not affect post-acquisition performance. Therefore, in line with recent research, our findings reveal that routinization on a corporate level is probably not the answer when it comes to developing a grafting capability (e.g., Barkema & Schijven, 2008b; Schijven & Martin, forthcoming). In other words, it could be that firms' learning regarding acquisition integration is not captured at corporate level. Second, our research reveals that deliberate forms of organisational learning by means of routine sharing also do not enhance learning through grafting—in fact, they even harm performance (e.g., Enberg et al., 2006; Haas & Hansen, 2007; Zollo & Winter, 2002), suggesting that a centralized approach towards the use of routines for enhancing learning through grafting does not work too. Third, the findings of our study suggest that the microfoundations of a grafting capability are search activities (Bresman et al., 2010; Ranft & Lord, 2002), which are more effective when firms involved have some degree of common knowledge (Ahuja & Katila, 2001; Allatta & Singh, 2011; Puranam et al., 2009). Search activities stimulate interaction among employees in their actual practice while enabling them to conduct problem-solving activities on an ad hoc basis, based on the situation at hand. By means of such interactions, search activities enhance the development of social relationships among employees and thus, a new joint social community post-acquisition which enables capability transfer (Birkinshaw et al., 2000; Bresman et al., 2010; e.g., Puranam et al., 2006; Verbeke, 2010). Building a new joint social community has been mentioned as being the single most important dimension of capability-based acquisitions' success (e.g., Birkinshaw et al., 2000; Bresman et al., 2010; Verbeke, 2010). Having such new joint social community enables employees to have a mutual practice in which they all are involved, which is of utmost importance in order to understand how the target's capability functions and thus, be able to learn from one another (e.g., Levina & Vaast, 2005).

Indeed, our theory and results suggest that when it comes to learning through grafting, firms need to take into account the specific practices that have enabled the target to create its capability in the first place. This is because, firms involved in capability-based acquisitions want to know how the target carries out certain activities and why, which can only be done by being involved in the actual practice and having face-to-face interaction. In other words, firms involved in capability-based acquisitions are in search of target firm's past learning and thus, the trial and error process that it has been through that enabled it to build its capability. It is in practice—by means of search activities—that firms can do this (Cohen, 2007; Cook & Brown, 1999; Gherardi, 2000; Orlikowski, 2002; Tsoukas, 1996). Thus, our findings demonstrate that the importance of actively training and being involved in practice in order to transfer highly tacit capabilities—as mentioned in the seminal work of Nelson and Winter (1982)—should be taken into account by strategy researchers, when aiming to gain more understanding regarding the microfoundations of a grafting capability.

Finally, being involved in practice while enhancing learning by using search activities means that firms' knowledge related to acquisition integration is—for a great part—distributed within the firm among core knowledge workers. This is because core knowledge workers know how they can learn from each other optimally, given a certain situation, in order to transfer the capability in question. Therefore, our study partly reorients existing research on post-acquisition capability development by illustrating that the role of firm's core knowledge workers might extend far beyond that which previously has been thought.

## **6.2 Managerial implications**

What do our findings mean for firms involved in capability-based acquisitions? What should managers responsible for such grafting events do in order to improve such event's performance? Given that research on acquisitions has shown that acquiring a firm does not guarantee successful grafting (e.g. Bresman et al., 2010; Heimeriks et al., 2012; Ranft & Lord, 2002), knowing how to enhance grafting could help acquirers improve their odds of success. In line with this, first, we have shown in this study that in order to enhance grafting, firms should not rely on institutionalized mechanisms that are meant to deliberately enhance learning top-down. Thus, it seems that having, for example, an M&A department, does not mean that lessons learned from the past—at corporate level—are applicable to current events and thus, having such department does not increase the odds of success of future events. Therefore, post-acquisition integration managers should be aware that firm's acquisition integration experience is, for a great part, captured elsewhere within the firm (e.g., Barkema & Schijven, 2008b; Schijven & Martin, forthcoming).

Second, routine sharing which seems an efficient way of sharing existing knowledge, does not

improve acquisition performance too. Hence, managers involved in such acquisitions should be aware of the fact that there is more knowledge of importance than just that which such written tools capture (Cook & Brown, 1999; Haas & Hansen, 2007). More importantly, practitioners involved in such settings should be aware of the fact that routine sharing could even harm acquisition performance, since such activities even have a negative effect on overall acquisition performance. This is probably because such complex routines are interpreted wrongly when transferred by means of documents, leading to harming performance instead of being beneficial.

More specifically, our study shows that in order to enhance grafting, firms need to invest in search activities such as project teams, job rotation, mentoring, briefing sessions, and interviewing experts. These search activities stimulate interaction among employees and enhance the development of social relationships and thus, a new joint social community post-acquisition (Birkinshaw et al., 2000; Bresman et al., 2010; Ranft & Lord, 2002). For developing a new joint social community, involvement in the actual practice of experts has been mentioned to be vital (Levina & Vaast, 2005). Therefore, managers responsible for acquisition integration should not underestimate the effect of such search activities for developing a grafting capability. Search activities, on average, require more investment since they demand more effort and involvement from the side of the employees. However, such investments do not go without paying off, since investing in such search activities improves acquisition performance and thus, leads to higher returns.

Furthermore, managers involved in capability-based acquisitions should take into account the importance of having common knowledge when searching for new targets, since acquiring firms that have a common knowledge base increases the effect of search activities and thus, acquisition performance. Finally, our study has shown that virtual integration enhances knowledge transfer too. Therefore, given that acquirers usually need to retain target's autonomy, post-acquisition managers could consider to at least virtually integrate the companies, as a means to stimulate capability transfer. This is because such virtual integration increases the interdependencies among the firms, leading to more interaction between the employees and therefore, enhances capability transfer.

#### Limitations and Suggestions for Future Research

Regardless of our efforts and careful considerations, our study also has several limitations. First, our data consists of a small sample size. Despite of the extensive qualitative fieldwork that we have done in order to elaborate on the findings, it could be that larger sample sizes reveal other findings. Therefore, a task for future research is to test our findings with a larger sample size, in order to be able to generalize the findings, perhaps even in a different context—for example, other types of acquisitions and other industries. Second, our data includes single respondents per firm and therefore, also the chance of the existence of common method bias, even when we have tried to avoid this as much as possible. Future research, including multiple respondents per firm, could offer more robust evidence of our findings.

Furthermore, throughout this paper we have argued for the importance of search activities and a decentralized approach towards acquisition integration and thus, for developing a grafting capability. As mentioned earlier, the division of routines versus search activities for enhancing organisational learning, has been shown to be evident from organisational learning's early inception, that is, the roots of organisational learning that go back to a behavioral theory of the firm and evolutionary economics theory. Our findings have shown that search activities, advocated by behavioral theory scholars, are more effective for enhancing learning when involved in grafting and thus, for developing a grafting capability. The importance of such search activities for transferring highly tacit knowledge and skills, has been mentioned by the founders of evolutionary economics too (Nelson & Winter, 1982). Nevertheless, strategy scholars with a strong link with the evolutionary economics theory have not paid much attention to the importance of such search activities and of being involved in practice, for transferring highly tacit capabilities. However, putting the focus on the importance of such search activities for developing certain capabilities such as that of grafting would be a good step forward that could be taken into account by future research and strategy scholars in particular, in order to be able to enhance our understanding regarding organisational learning through capability-based acquisitions.

More specifically, when using such search activities the content of the activity itself is being dealt with on an ad hoc basis and thus, in a non-routinized way. Strategy scholars conducting future research could ask themselves how much non-routinization is non-routinization enough? Thus, how flexible should such search activities be? Addressing these questions could reveal interesting insights. Furthermore, in general, revealing answers for these questions is fundamental since organizations by definition try to formalize and standardize and thus, routinize their activities in order to control such

activities and gain benefits on efficiency aspects. Hence, future research interested in the field of strategy and organization theory should reveal, given the organisational desires, what would the best way of developing such grafting capability be, in order to be able to enhance learning through acquisitions and thus, acquisition performance.

On a related note, it is surprising that institutionalized mechanisms do not affect acquisition performance. Throughout this paper we have argued that firm's acquisition experience is probably captured by the experts involved in practice and thus, not by corporate. This has some implications for future research since researchers need to focus on a different level of analysis when trying to understand where firm's learning through acquisitions is taking place. Our findings demonstrate that this level of analysis is the practice of the actual employees that have created target's capability in the first place (Cohen, 2007; Cook & Brown, 1999; Gherardi, 2000; Orlikowski, 2002; Tsoukas, 1996). Future research should reveal how capability development in practice takes place and thus, what the actual micro-level activities are that enable such experts to develop a grafting capability.

## 7 Conclusion

Regardless of the increasing number of capability-based acquisitions in high-velocity environments and the high failure rates of such acquisitions, we still do not know how to enhance the process of learning through grafting and thus, how to improve these acquisitions' performance. One thing that all scholars would agree upon would be that it is about having a grafting capability which ensures that the acquirer is able to carry out such acquisitions successfully. However, what the microfoundations of such grafting capability should be, has been unclear to date. In this present paper, our attempt has been to unravel the microfoundations of such grafting capability. Surprisingly, in contrast with the existing literature on capabilities that focuses more on deliberate learning mechanisms, our findings have shown that in order to enhance learning through grafting, firms should engage in search activities and thus, ad hoc problem solving. In addition, in order to improve the odds of success, having firms involved in such capability-based acquisitions that have common knowledge, could increase the effect of such search activities too. By conducting this study, we hope to have contributed to the strategy field and more specifically that of organisational learning, by revealing that learning highly tacit capabilities requires intensive collaboration and ad hoc problem solving, aspects that cannot be taken into account by routine sharing and institutionalized mechanisms, only.

**Abstract:** With the development of economic globalization, transnational corporations gradually become the main carrier in world economic globalization and internationalization. The problems of cross-cultural conflicts and cross-cultural management arise along with the rapid increasing of international business. This paper, on the basis of Hofstede's theory of cultural dimensions, focuses on the differences and problems and issues relating to the effective management of different cultures in international business. Then, the paper analyzes the causes of cross-cultural conflicts and cross-cultural management between different cultures and some solutions to cross-cultural conflicts and integration in international business are put forward.

**Key words:** Cross-cultural management; Cross-cultural conflict; Transnational corporation; International business

### 1 Introduction

With the development of economic globalization, transnational corporations gradually become the main carrier in world economic globalization and internationalization. In order to achieve the optimal allocation of global resources, more and more multinational corporations invest their money in different countries. Joint ventures in China flourish and Chinese enterprises enter into the world markets to seek greater opportunities of development. International business is developing rapidly and the influences of cultural differences on the multinational business are various.

In one survey of the global business enterprises on the issue of "what is the business barrier in doing business in the world market?" in the famous American magazine *Electronic world*, cultural differences ranked first in all eight items including law, regulation, price competition, information, language, communication, foreign exchange, the jet lag and cultural difference. The research indicates that the main failure of multinational corporations is the result of ignoring the cultural differences. Cultural differences play a significant role and have great influence on the allocation of resources, system decision, interpersonal relationship, organizational, communications and incentive of leadership behavior. This shows that attaching importance to the cultural differences and conflicts and conducting cross-cultural management has become one of international operation strategies of the enterprises in international business.

### 2 Literature Review of Culture and Cross-Cultural Management

With the process of globalization, especially the increasing of global trade, it is unavoidable that different cultures meet, conflict, and blend together. In international business people from different cultures find their communication is affected by language barrier and culture styles as well.

Culture is ubiquitous, multidimensional, complex, and all-pervasive, which makes it hard to be defined. Different definitions reflect different theories for understanding, or criteria for valuing human activity. Among the over 200 definitions of culture, Hofstede's definition of culture and cultural dimensions are the most widely adopted theories in cross-cultural management studies. "Culture is like a kind of software in mind. A person's thinking pattern, feeling, and acting are programmed by it."(Hofstede, 2005) He defines culture as the collective programming of the mind which distinguishes the members of one human group from another. Moreover, he surveyed over a hundred thousand workers on work goals and values in subsidiaries of IBM in 53 nations and regions. Hofstede divided culture into five dimensions: individualism versus collectivism, uncertainty avoidance, power distance, masculinity versus femininity. Long versus short term orientation is the fifth dimension that Hofstede added in the 1990s after finding that Asian countries with a strong link to Confucian philosophy acted differently from western cultures. He argues that the dimensions of culture can be described as a

society's time horizon or, the importance related to the future comparing with the past and present.

On the basis of Hofstede's theory of cultural dimensions and the careful analysis of a large database of cultural statistics, this research focuses on the differences and problems and issues relating to the effective management of different cultures in international business. This paper analyzed correlation data of the government performance management in western countries and cultural dimension in China (See Table 1). It is worthwhile to point out that this table made a comparison of western countries and China in five cultural dimensions.

**Table 1 Correlation Data of the Government Performance Management in Five Cultural Dimensions**

country	Individualism (IDV)	Power Distance index(PDI)	Uncertainty Avoidance index(UAI)	Masculinity (MAS)	Long -term orientation (LTO)
America	91	40	46	62	29
United Kingdom	89	35	35	66	25
Canada	80	39	48	52	48
New Zealand	79	22	49	58	30
Australia	90	36	51	61	31
China	20	80	30	66	118
Average	43	55	64	50	45

It indicates that cultural difference is tremendous to the different countries and regions in five dimensions. In addition, culture influences people's way of thinking and behaving and as a result it leads to different understandings of cross-cultural communication and cross-cultural management in international business. It is obvious that people from different cultures use different styles of cross-cultural communication. Multi-culture difference will greatly influence the management of transnational corporations. Transnational corporations are bound to be confronted with unprecedented challenges because of different cultural backgrounds they belong to. Conducting effective cross-cultural management is the prerequisite and guarantee of the successful commence and cross-cultural communication.

Cross-cultural management is the management of people and things that involve a different culture background. Formed in America in late 1970s, cross-culture management mainly focuses on the behavior of people from different culture working together as a group or an organization (Adler,1983). Cross-culture management is a scientific study on how to overcome conflicts of the heterogeneous culture and actualize effective management. Most of cross-cultural management studies aim at dealing with the issue of organisational behavior, such as leadership style, motivational approaches, strategy, organisational structure. In short, cross-culture management refers to manage the people, thing and business of different cultural background.

### 3 Causes of Cross-Cultural Conflicts

The problems of the cultural conflicts of cross-cultural communication and cross-cultural management arise along with the rapid increasing of international business. The fusion and conflict of different cultures are imposing great influence on international business management, which is a severe problem that is always there but has frequently been neglected. The neglect of cultural conflicts, in most cases, results in great losses to a company. Such cases are countless in international business. According to the recent research the failure of approximately 35%-45% international joint ventures results from the ignorance of the impact of cultural differences in international business. To recognize the causes of cross-cultural conflicts is the prerequisite of the successful cross-cultural management. The main reasons which lead to cross-cultural conflicts in multinational business enterprises are: racial superiority, inappropriate management habits, misunderstanding of communication and the different values etc.

#### 3.1 Racial superiority

Racial superiority means that some people think their own race is superior to other races and their own cultural value system is superior to other cultural value systems. They are unwilling to accept the different ways of life, thinking and management mode, etc. Or while they are willing to accept or adapt to other cultures, they lack of deep understanding of the people and the heterogeneous cultures, they always have a sense of pride and superiority.

#### 3.2 Inappropriate management habits

The management mode which has been proved to be effective in a cultural environment is not necessarily effective in another cultural environment-this has become a cross-cultural management consensus. There is no mold that can be applied everywhere in this world. Because of the lack of understanding of other cultures and other management modes, some managers of the enterprises insisted on their own management mode. Regardless of other cultures, managers failed to set up the coordinative systems of mutual understanding and trust towards each other. The sound management should be adapted to different cultures according to different times, different places and different people.

### **3.3 Communication misunderstanding**

Communication refers to the process that people convey thoughts, emotions and share information communication in individuals and groups in order to set goals with certain symbol carriers. However, because the different people of different cultures have different views of time, space, customs, habits and view of values as well, they have different ways of communication verbally and nonverbally, which deepens the difficulty in their communication or leads to misunderstanding.

### **3.4 Different values**

Value is a kind of judgment, lasting beliefs of a person or society to a particular social behavior or state of being. With relative stability and continuity, it neither changes all the time nor remains rigid. Values include three parts: cognitive components such as life outlook and world outlook, emotional elements and behavior component. Cognitive components and emotional components influence and determine behavior components of the values. Behavior components of the values are determined by cognitive components and emotional component. The people coming from different cultural background have different values and their behavior and attitudes are different. The different cultural values lead to different patterns of behavior and attitude. In American culture, individualism is the strong power which encourages people to accomplish things. Personal performance is considered to be the most valuable. In contrast, the values of consistency and cooperative of the group of consistency is much greater than the individualism.

## **4 Cross-Cultural Management in International Business**

Achieving effective communication is a great challenging and rewarding task to managers worldwide. Most of the international business are operating on many different business areas and with several product groups and operates on markets in several countries. They must overlap both national cultures and business cultures. Therefore, how to conduct effectively cross-cultural management has become an important issue to face for multinational corporations and joint enterprises in international business.

The influences of cultural conflicts on multinational business enterprises are various. The core of the multinational business management is to solve the cultural conflicts in the management process, to find the objectives of the company beyond the cultural conflicts and to sustain the codes of the employees from different cultural backgrounds. Canada's famous cross-cultural management scholars Nancy J. Adler put forward three kinds of strategies: beyond, compromise and synergy.

Method of beyond should be avoided in solving the cultural conflicts in multinational business. Although it may form a "no conflict unified organization culture" in a short period of time, people of different cultures can't learn from each other. Furthermore, since the cultures of other people are suppressed, it is likely for the people of other cultures to show a strong dislike to different cultures and eventually it leads to intensified conflicts. On the other hand, method of compromise is undesirable, because crises often lurk behind this kind of harmony and stability. Only when the cultural conflict between them is small, can the method of compromise be taken.

Cultural integration refers to the process of combination and mutual absorption between the different forms of culture and cultural characteristics. It takes the assimilation of culture or mutual induction as its symbol. In the process of integration, all kinds of cultures change each other. The infiltration and mutual combination of different cultural characteristics finally becomes one as a whole. The cultural integration embodies the identity of the culture differences; the identity will promote harmony and make it develop interdependently. Still it can gather strength to make the culture differences integrate each other, which is beneficial to their development.

Collaboration is the optimal way to solve the cultural conflicts in international business.

### **4.1 Admitting cultural differences**

On the premise of admitting cultural differences, cultural communication and fusion is the key to the resolving cultural conflicts. Different nationalities have different values, legal systems, thinking

modes and moral standards. A joint venture enterprise is a complex of different ethnic groups. To find a balance point for the conflicts coming from different cultures, the point is that people who are involved in cultural communication and cross-cultural management should understand both themselves and their counterparts. As long as both parties of the corporations are highly aware of mutual communication and frequently exchange ideas, then the conflicts can be solved and an agreement can be reached. Otherwise, the old conflict has not been solved and new problems arise.

#### **4.2 Recognizing cultural differences**

Cultural conflicts are caused by cultural differences. Therefore it is necessary to recognize and analyze cultural differences. Obviously, culture conflicts and differences produced by different culture and criterions are different in degree and styles. When culture differences are recognized, we can integrate them then. The managers in cross-cultural multinational corporations must recognize and integrate culture differences so as to apply proper measures. It has been proved by many facts that avoiding cultural conflicts only keep conflicts piling up. As cultural conflicts exist objectively, we should recognize the inevitability of the cultural conflicts and treat different cultures equally with respect. And some scientific methods should be adopted to identify the different enterprise cultures and analyze the causes of conflicts in order to find out the methods of resolving cultural conflicts.

#### **4.3 Setting up cross-cultural training system**

It is necessary for transnational corporations to set up a sound cross-cultural training system and take it as a long-term strategy, which will help the enterprises to set up learning organization and operate cross-cultural management to attract and retain the talents. It is advisable for the managers of different cultures to communicate each other actively and to implement cross-cultural training. Cross-cultural training helps to strengthen the reaction and adaptability of the people from different cultures towards tradition and promote communication and understanding between the people of different cultures. Generally speaking, the main contents of the cross-cultural training include:

- 1) understanding of the culture of the parent country and the host country;
- 2) cultural sensitivity and adaptation training;
- 3) language training;
- 4) cross-cultural communication and conflict processing capacity training;
- 5) environmental simulation.

#### **4.4 Following the common market rules**

In international business activities, the enterprises from other countries have a set of business operation norms suitable for their own business. But in reality, there is a conventional international practice. In order to make cooperation successful with mutual trust and mutual understanding, a mutual recognition relationship condition, such as a mutually acceptable market communication protocols between each other must be clear. Although in the actual intercourse, it is very hard to avoid those differences in the association with the conditions of the market, the common market rules can be regarded as a series of countermeasures for the partners to make up for the cultural differences in the cooperation.

#### **4.5 Creating the mutual enterprise spirit**

Because of the tremendous cultural differences between different countries, transnational corporations cannot be seasoned with the operating environment in the host country in a short time. It is advisable for transnational corporations to create the mutual enterprise spirit in the way of coupling hardness with softness, not only keep the mutual enterprise spirit in the mind of the stuff but also make sure the stuff act it. In this way, the harmony and localization of cross-cultural management can be realized. Transnational corporations should set up common values system which is beyond their own one to realize the share and compliment of the cultural resources. Transnational corporations also should promote and update the mutual enterprise spirit through information channels such as newspaper, magazine, internet, conference and so on to enhance the cohesion, centripetal force and the power inside the enterprise, which will minimize the adverse impact of cultural conflicts.

## **5 Conclusion**

Cultural difference, existing objectively, is a kind of inevitable phenomenon in cross-cultural communication and cross-cultural management. Therefore, it is unable to avoid by any multinational enterprises. Multi-culture difference greatly influences the management of transnational corporations. Transnational corporations are bound to be confronted with unprecedented challenges because of different cultural backgrounds they belong to. Conducting effective cross-cultural management is the

prerequisite and guarantee of the successful commence and cross-cultural communication. The transnational corporations should utilize cultural resources and integrate their respective advantages together.

History and reality have witnessed that the mutual assimilation and blending of different social cultures are destined to become the main stream. Having a correct understanding of native culture and foreign culture differences and striving to promote the integration of different cultures to eliminating management conflicts are of great significance to promote the development of the transnational corporations in the international business.

**Abstract:** Based on profit, volume and continuity three-dimensional model (PVC), this paper analyzes main elements of financial and business process in the management of fashion enterprises through case study. It lays down the strategic goal for enterprises according to their current situation together with internal and external environment and makes causal analysis between enterprise performance (competitiveness) and PVC system. This paper attempts to provide sustainable managerial solution for fashion enterprises and enhance their market competitiveness.

**Key words:** Profit; Volume and continuity three-dimensional model (PVC); Luxury market; Enterprise management; Evaluation

### **1 Introduction**

In traditional enterprise management theory, the operating strategy is considered a planning process. Models usually used in developed countries include: Ansoff Product-market expansion grid (current product, new product, current market and new market, the four factors make up different kinds of enterprises' strategies), Michael Porter's Five Forces Model (threat of entrance, threat of substitute, challenge from opponent, the bargain ability of buyer and supplier), 4Ps, and SWOT. However, the models or theories above are mainly plan analyses and do not have a very close relationship with the financial performance of a company. So they are not efficient enough in evaluating the current situation of a company as a whole and predicting the future trends.

### **2 The Brief Conception of Profit, Volume and Continuity Model (PVC)**

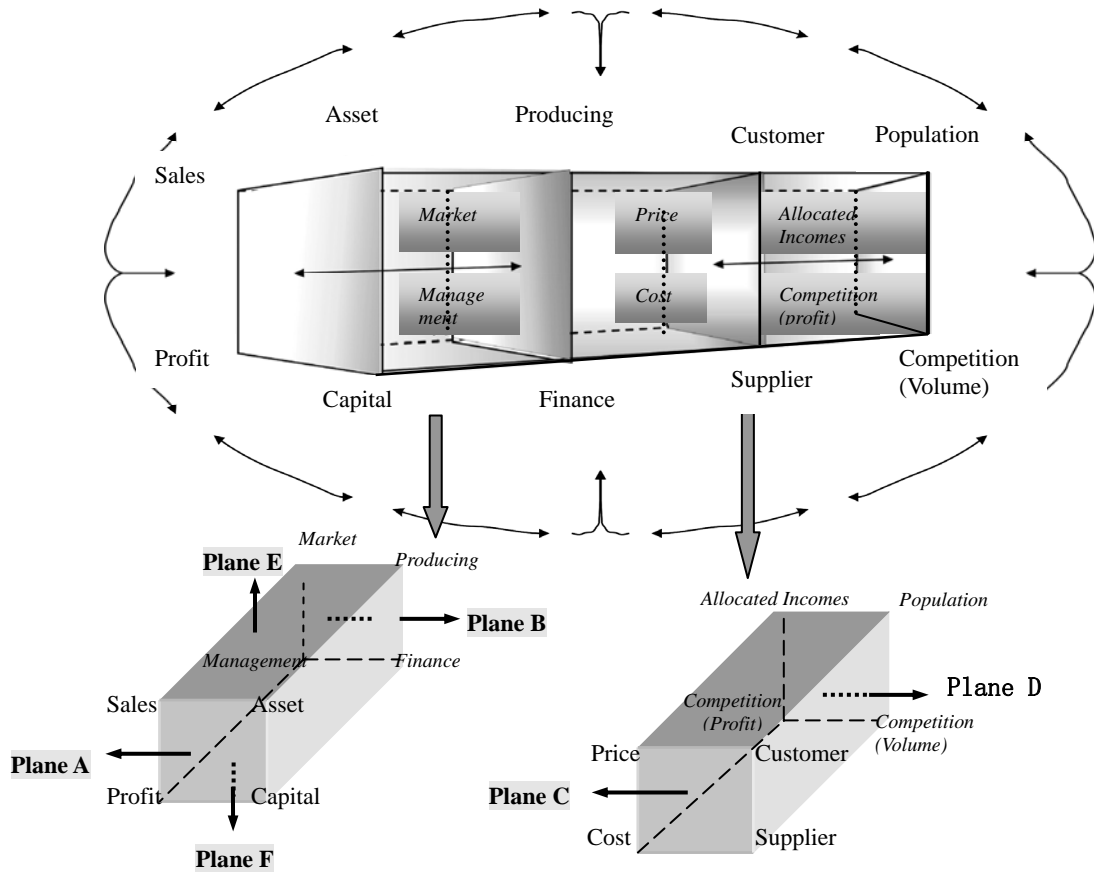

Figure 1 shows the profit, volume and continuity three-dimensional model (PVC) <sup>[1]</sup>. The cause-effect chain connects not only four factors in one plane but also all the planes as well. PVC is used as a compressive method to analyze the company combined with the financial performance, which can help to discover problems and solve them in an efficient way.

In PVC model, P stands for profit, V stands for volume, and C stands for Continuity.  $P \times V$  (PV) makes the profit performance of firm in a period of time. If PV is positive, the company can develop continuously. PVC model synthesizes the basic factors of enterprises' management and expresses it in a three-dimensional way.

PVC can evaluate the managing achievement of a company. It contains three parts: the performance analysis, environment analysis, and strategy formulating. In the paper, plane A and its cause-effect chains are cited as a sample of making the performance analysis for an enterprise.

---

\* This paper is supported by "excellent college young teachers cultivation fund in Shanghai"

Plane A—Financial Performance; Plane B—Resource Distribution; Plane C—Micro-Market Environment; Plane D—Macro-Market Environment; Plane E—Cause-Effect Chain; Plane F—Cause-Effect Chain

**Figure 1 PVC Three-dimensional model**

### 3 PVC Model and Performance Analysis

#### 3.1 Financial analysis

Figure 2 shows the financial performance that is the plane A in PVC model. The income Statement is displayed on the left (Profit/Sales), while the balance sheet is displayed on the right (Capital/Asset). The diagonal line connecting Sales and Asset represents Asset managing efficiency, while the other represents Capital return.

PVC financial analysis clearly presents lots of information in one plane, which makes it easier to see through the financial performance of a company.

#### 3.2 Managing efficiency analysis

In financial performance analysis, four functional costs represent resource distributions of a firm. In the system of PVC, the management means the methods used by the entrepreneur and the efficiency after, including the asset, market and finance.

**Figure 2 PVC Financial Analysis (Plane A)**

##### 3.2.1 Asset efficiency

Asset efficiency can be used to evaluate the relationship between the manufacture cost and sales and assets. It is presented by the capital turnover rate.

### 3.2.2 Market efficiency

Market efficiency is used to evaluate the sales efficient of the resource input in the market promotion. The related financial factor of market efficiency is the profit-making ability.

$$\text{Profit rate} = (\text{profit}/\text{sales}) \times 100\% = (\text{profit}/\text{promotion cost}) \times (\text{promotion cost}/\text{sales}) \times 100\% \quad (1)$$

### 3.2.3 Financial efficiency

In financial efficiency, the relationships between the debt and financial cost as well as the debt rate in the capital structure are considered to evaluate if a company could gain enough capital for its operation and development with a low cost.

$$\text{Asset} = \text{debt} + \text{Owner's Equity} \quad (2)$$

Proprietary rights and interest indicates the net asset's ownership of investors including their investment and the interest added, which is the asset mentioned in plane A.

$$\text{Debt rate} = (\text{debt}/\text{asset}) \times 100\% = (\text{debt}/\text{financial cost}) \times 100\% \quad (3)$$

## 4 Precedent of Enterprise Performance Analysis

Table 1 shows the financial performance from 2008 to 2011 of Milan Station Holding Limited corporation, a company focus on retail sales of second-hand luxury branded handbags. After analysis and calculation table 2 is gained.

**Table 1 Financial Performance of Milan Station from 2008—2011 (Unit: 1000HKD)**

Year	2008	2009	2010	2011
Incomes	511,998	611,273	730,259	879,802
Total Profit	57,148	48,194	66,636	64,083
Total Asset	139,832	157,152	165,894	399,970

**Table 2 Capital Turnover Rate of Milan Station from 2008—2011**

Year	2008	2009	2010	2011
Asset Turnover Frequency	3.66	3.89	4.40	2.20
Profit Rate (%)	11.16	7.88	9.12	7.28

### 4.1 Asset management efficiency

Asset turnover frequency reflects the capital managing ability of a company, the faster the asset turnover, the stronger sales ability a company has. Table 2 shows that asset turnover frequency rises steadily, which means the management efficiency is in good state; in 2011, because of listing, the increase of income is much higher than asset, thus the asset turnover frequency decreased 50% than former year. This shows that rational allocation and integration of additional resources are still in progress after list.

### 4.2 Market efficiency

Table 2 figures out that in 2008 Milan Station have a relatively high profit rate. In other years, though the incomes increase, the profit rate is not steady. Especially in the listing year, the profit rate is the lowest among four years; furthermore, the year with the highest profit rate is also the year with the highest asset turnover frequency, which indicates that there may be a relationship between the profits and the asset turnover rate. With this information, administrators can have a clear picture of the company's performance and make decision accordingly.

### 4.3 Financial efficiency

According to the annual report of Milan Station (Table 3) from 2008 to 2011, the debt state can be arranged as shown in Table 4.

**Table 3 Capital Structure of Milan Station from 2008—2011 (Unit: 1000HKD)**

Year	2008	2009	2010	2011
Floating Asset	132,925	139,756	144,862	365,105
Fixed Asset	6,907	17,396	21,032	34,865
Short-Term Debt	22,873	42,898	31,854	28,004
Long-Term Debt	20,587	20,710	445	340

**Table 4 Capital Debt of Milan Station from 2008—2011 (Unit: 1000HKD)**

Year	2008	2009	2010	2011
Total Asset	139,832	157,152	165,894	399,970
Total Debt	43,460	63,608	32,299	28,344
Owner’s Equity	96,372	93,544	133,595	371,626
Liability/asset Ratio (%)	31.08	40.48	19.47	7.09

After calculation from Table 3, the liability to asset ratio of Milan Station in 2008 is 31.08%, while in 2009 is 40.48%, which keeps a relatively high rate under the safe level (usually the safe level is under 50%). In 2010, after the 20 million HKD repayment of long-term liabilities, this rate decreased to 19.74%. Furthermore, in 2011, the listing year, the rate goes to the lowest among four years, which shows that Milan Station keeps in a high financial security level. While compared to its low profit rate and asset turnover frequency shown in table 2, it suggested that the operator adjust the debt structure reasonably, so that the improvement of financial efficiency can be expected.

### 5 PVC Cause-Effect Chain Analysis

Combined plane A and plane B, a cause-effect chain including commercial factors and financial results is made to build a logistic thinking method of the operating process for entrepreneur

Take management factors in plane B as the start of the commercial process, and extend to capital and asset in plane A through financial functions, then return to the production (products or services) in plane B and finally turn to the profit which is the end of the commercial process through market functions (promotion).

**Figure 3 Flow Chart of PVC Commercial System**

PVC cause-effect chain analysis supplies a systematic management method for the enterprise to find out the factors that affect profit performance. And the analysis operating process as a whole, in other word, is to analyze the efficiency and property of asset distributions and give out the basis for the entrepreneur to form judgments and to improve operating manners.

### 6 Precedent of cause-effect chain analysis

#### 6.1 Management—enterprise structure model

Milan Station is principally engaged in the retail of unused and second-hand luxury branded handbags and apparel products in Hong Kong, the main land China and Macau. Since the opening of its first “Milan Station” retail shop in 2001 in Hong Kong, it possesses nearly ten years operation history. Milan Station operates retail shops under the brand names of “Milan Station” and “France Station”. Milan Station carries over 20 brands of handbag products and over 30 brands of other products from international luxury fashion houses. In 2011, the Group was successfully listed at the stock exchange of Hong Kong Limited on 23 May 2011.

#### 6.2 Annual financial report analysis

After analysis and calculation of the annual financial report of Milan Station, table 5 is gained.

**Table 5 The financial report analysis of Milan Station from 2008—2011**

Event	Year	2008	2009	2010	2011
Revenues(1000HKD)		511,998	611,273	730,259	879,802
Stock(1000HKD)		46,855	69,007	89,007	154,163
Profit rate (%)		-	19.39	19.47	20.48
Floating Asset rate (%)		95.06	88.93	87.32	91.28
Fixed Asset rate (%)		4.94	11.07	12.68	8.72
Short-Term Debt rate (%)		52.63	67.44	98.62	98.80
Long-Term Debt rate (%)		47.37	32.56	1.38	1.20
Floating Ratio		5.81	3.26	4.55	13.04
Speed Ratio		3.41	1.50	1.16	6.67
Operating cash flow(1000HKD)		31,512	13,118	-2,595	-4,350
Liability/asset(1000HKD)		96,372	93,544	133,595	371,626
Owner's Equity		96,372	93,544	133,595	371,626

Through calculation, it shows that the revenues from 2008 to 2011 grow steadily, but in the listing year, the profit decrease 3.83% than 2010 with the revenue increase 20.48%.

The short term debt rates of the company are 52.63% in 2008 and 67.44% in 2009, which is in a proper state. But in 2010 and 2011, after the 20 million HKD repayment, the short term debt rates soared to over 98%; the floating ratio reflects the repay ability of a short-term debt, while the ratios from 2008 to 2011 were 5.81, 3.26, 4.55 and 13.04 respectively. And the speed ratio represents the repay ability of a short-term debt without selling out its stock products, while the ratios were 3.41, 1.50, 1.16 and 6.67 respectively during 2008 to 2011. The performance of the two ratios show that the company has no currency pressure and debt repayment risk in a short term, thus it has lots of financial space to improve.

According to the annual report above, the operating cash flow in 2008 and 2009 is positive. Since the repayment of long-term liabilities in 2010 and big stock purchase in 2011, the operating cash flow goes to negative. If Milan Station keeps a stable development, the operating cash flow will return to a normal state.

### 6.3 Capital- shareholder's property

In Table 5, it can be observed that from 2008 to 2011 the shareholder's property of Milan Station is nearly increase every year. In 2011 the growth rate soared to 178.17% after its list on the stock market in the same year.

### 6.4 Asset structure

Floating assets accounted for 95.06%, 88.93%, 87.32% and 91.28% respectively from 2008 to 2011, which presented a stable and reasonable asset structure of the company.

### 6.5 Production-product development

The business of Milan Station focuses on the sale of second-hand and unused luxury branded products, in particular, handbags, from international fashion houses. This business model is designed to aim at providing a platform for its customers to purchase second-hand and unused luxury branded products at its retail shops and sell such products to the company thereafter for cash.

### 6.6 Market-competition and feature

According to the Synovate report, in respect of the total sales of the overall market for new, unused and second-hand luxury branded handbags by all retailers including boutiques or retail shops of international fashion houses and independent retailers in Hong Kong, the main land China and Macau for each of the two years ended 31 December 2008 and 2009, Milan Station accounted for 6.5% and 6.3% of the total sales in Hong Kong; 0.04% and 0.3% of the total sales in the main land China; and 4.7% and 5.5% of the total sales in Macau respectively; What's more Milan Station accounted for over 50% of market share of the total sales of luxury branded handbags among approximately 174 luxury branded handbags independent retailers in Hong Kong and ranked number one in terms of both sales value and sales volume among luxury branded handbag independent retailers in Hong Kong in 2009.

### 6.7 Sales-channel integration

Milan Station is principally engaged in the retail of unused and second-hand luxury branded

handbags and apparel products in Hong Kong, the main land China and Macau by operating a total of 14 retail shops under the brand names of “Milan Station” and “France Station”. Until 31st December 2011, the Group has been operating 16 retail shops under the brand name “Milan Station” with 11 retail shops in Hong Kong, 2 retail shops in Beijing, 2 retail shops in Shanghai and one retail shop in Macau.

#### **6.8 Profit-risks avoiding and high added value**

It is shown in the annual report that there are several risks in the development of Milan Station. Firstly, given the business model of Milan Station, it is exposed to various legal risks which may adversely affect its operation, financial condition and reputation. Secondly, the total revenue of Milan Station increasingly relies on the sale of unused products and premium priced products of over HK\$50,000, but both the sale of unused products and premium priced products have lower profit margin than other products. Finally, if Milan Station unwittingly purchased stolen, forgeries, counterfeit or any other illegal products, such products would be written-off from its inventories and the financial results of the Group would be adversely affected.

All the three factors may restrain the company from gaining ideal profits so that the improvement of the factors in the cause-effect chain is needed to have a better profit return.

### **7 Conclusion**

Luxury market is a short-term one with fast changing and tense competition on which an enterprise should make quick response in accordance with the change of environment. Enterprise performance analysis in PVC model makes a clear picture for entrepreneurs to start with the finance and to analyze a company in an all-round way so as to find the main problems and make suitable developing strategies to improve its flexibility to outwards changes.

**Abstract:** The structure of air traffic control safety risk is very complex, which includes not only human factors, equipment element, environment element, management factors leading to the single factor risk, but also coupling risk after their forming, such as the single factor coupling risk, double factors coupled risk and more risk factors coupling. This paper illuminates the ATC risk flow, the connotation and classification of ATC risk coupling. It also discusses the adding process of the risk flow and heterogeneous homogeneous risk through the mathematical method to reveal ATC safety risk coupling law. In this way the paper can provide theoretical guidance and reference method for security departments to control risk with high efficiency.

**Key words:** Air traffic control; Safety risk; Coupling risk flow; Mathematical analysis

## 1 Introduction

Air traffic control (ATC) is a large complicated system, involving the operating personnel, equipment, internal and external environment, the operation safety management, and other aspects. The principal task of ATC is safety risk control. American scholars Haynes in 1895 put forward the concept of risk for the first time, he defined risk as the opportunity or possibility of loss, showing that risk is a kind of possible situation of facing loss<sup>[1]</sup>. Risk usually use loss or profit expectations and standard deviation to measure. The greater variation indicates the greater risk; the smaller the variation is, the smaller the risk is. Therefore, the size of the risk depends on the probability of accident loss rate. In the basis of the definition of the risk, ATC safety risk refers to the possibility and the degree of loss of the unsafe incidents caused by the relevant factors from internal and external ATC system in particular conditions. Sven Ternov and Roland Akselsson introduced the analytical method of disrupting the effective obstacles to the air traffic control risk analysis; program model based on the accidents was constructed to identify the risk of the air traffic control quickly in complex systems using the DEB method<sup>[2]</sup>. Lee W K studied on aviation safety risk assessment; quantitative aviation risk assessment model was built using the fuzzy mathematical methods and the risk degree analysis principles. The prospective was proposed that the safety assessment approach can be used to manage and control aviation safety<sup>[3]</sup>. G.M.Sandquist, D.M. Slaughter and Y.kimura proposed the risk assessment model of the flight operations in high altitude areas through the analysis of the U.S. air traffic control situation combined with the free flight plan and risk assessment model theory<sup>[4]</sup>. Foreign scholars conducted depth study of the theoretical model of air traffic control safety risks; there are many qualitative analysis, but little for the quantitative analysis of air traffic control safety risks, especially the mathematical analysis of air traffic control safety risks.

Though the definition of risk is various, in essence, risk refers to the uncertainty of a variety of possible results which may occur in a certain period of time and condition, and the degree of the uncertainty can be estimated<sup>[5]</sup>. Due to a variety of uncertain factors, the expecting result is usually an interval or some points. Risk is the probability of failure by the consequences of failure and the two aspects of the variables of the decision, so the estimation for the occurrence probability and the loss is the process of qualitative judgment and quantitative analysis. Qualitative analysis is a relatively emotional, intuitive and easy analytical method; quantitative analysis is a scientific, objective and rational analysis. Qualitative and quantitative analysis can not be completely separated in the course of study, and the study on analysis and management of ATC safety risk should also comply with the general principle. This article analyzes the coupled air traffic control safety risks using the method of qualitative analysis, and conducts in-depth analysis and research on the coupling between the risk flows in the conduction process of the air traffic control safety risks applying the quantitative analysis method

---

\* This paper is supported by the national natural science found: “study on risks coupling mechanism of air traffic safety and the early warning decision support system” (authorized number70971104).

from a mathematical point of view.

## **2 Connotation and Classification of ATC Safety Risk Coupling**

### **2.1 Definition of ATC risk flow**

Risk flow refers to physics, electronics, and other disciplines research method, the risk as a kind of specific economic energy, the energy contained in risk source, because the outbreak of risk events and the impulse to release from risk source, attached to all kinds of risk carrier, to all the processes and functions node conduction and spread risk energy and function node together in the nature of the corresponding change happened, and finally form the different nature of the risk state<sup>[5]</sup>. ATC risk flow is to point to the ATC safety risk as a kind of special economic energy, can be in ATM safety system internal to follow certain rules flow and coupling, in ATC safety risk the risk of coupling flow contained in the risk source, because the interactions of risk events triggered. Risk source to burst out risk flow, because the risks event trigger ATC internal and external environment system state of being if the change as a result of. When ATC internal system and external environment condition is in equilibrium, risk source in its ideal quiet state, this time the risk is contained in flow in risk source, forming no real dynamic risk, not for aviation security threats; But along with risk events, when ATC system and the external environment within existing equilibrium state once change or is broken, risk source will deviate from its ideal state, burst risk flow, then began to flow in the ATM safety risk in the system and the coupling dynamic spread.

The essence of the research on ATC safety risk is to discuss each risk flow's changes in "quantity" and "quality" in the coupling process. Risk flow is the key factors in the process of the ATC safety risk coupling, and it is also the main research object in the study of ATC safety risk coupling. The data of characterization risk stream must be got to analyze ATC safety risk flow in the coupling process, the data mainly includes two kinds: (1) Data reflecting the state, including reflect internal system and the external environment the state data and reflect the risk of ATC safety state data, these data with the flow of risk is characterizing the value; Reflect ATC safety risk state data (including risk of produce, sudden flow, coupling conditions) use system and turn its state characterized. (2) Data reflecting the possibility of state, this kind of data are based on the risk of the parameters in the model the probability distribution of the data to value characterized.

### **2.2 Types of ATC risk coupling**

"Coupling" is derived from physics, refers to the phenomenon that two or more systems or two movements join together through interacting with each other. In the field of risk management, there exist the phenomenon that the occurrence and influence of certain risk depend on the extent of other risks, and the certain risk also influence the occurrence and extent of other risks. The interaction, mutual dependencies among the risks is called risk coupling. Therefore, ATC safety risk coupling is the relations of the mutual dependence and mutual influence formed among the various of risk factors in the process of the whole safety activities of the ATC safety system<sup>[6]</sup>. With China's civil aviation ATC and the international community, and air traffic increasingly busy, the composition of the ATC risk is more and more complex, including not only the single factor risk of human factors, equipment factors, environmental factors and management factors, including four of these risk factors between the risks of coupling form. Due to the existence of the ATC safety risk coupling, according to the size of the risk factors participating in the coupling, the risk of ATC safety coupling can be divided into three categories: single factor risk coupling, double risk factors and more risk factors coupling. The coupling of single-factor risk refers to the interactions and relationships between the respective individual risk factors in air traffic control safety system, the coupling factors include human ,equipment ,environment and management .Coupled risks caused by single-factor risk coupling only change the risk flow ,its nature does not change, so single factor coupling is also called "homogeneous risk coupling". Double risk factors coupling refers to the interactions and relations between the two risk factors in air traffic control safety systems, including people-machine, people-ring, people-tube, machine-ring, machine-pipe, ring-tube this several aspects of the coupling risk; More risk factors coupling refers to the interactions and relations among three or four risk factors in the ATC safety system, such as people-environment -machine risk coupling, people-machine-management risk coupling etc.The double risk factors and more risk factors coupling not only make the flow changed ,the nature of the risk flow are also changed, so it will double the risk factors and more risk factors coupled coupling is called "heterogeneous risk coupling".

### 3 Mathematical Analysis of ATC Risk

According to the risk classification, this paper discusses the superposition process of risk flow of homogeneous and heterogeneous risk coupling and carries on the mathematical description. Supposing ATC four single risk factors are A, B, C, D, including  $\alpha_1, \alpha_2, \alpha_3$  are risk correlation coefficient of A and B, A and C, A and D,  $\alpha_1', \alpha_2', \alpha_3'$  for risk corresponding conversion;  $\beta_1, \beta_2, \beta_3$  are risk correlation coefficient of B and A, B and C, B and D,  $\beta_1', \beta_2', \beta_3'$  are for risk corresponding conversion;  $\theta_1, \theta_2, \theta_3$  is respectively risk correlation coefficient of C and A, C and B, C and D,  $\theta_1', \theta_2', \theta_3'$  are risk of for corresponding conversion;  $\gamma_1, \gamma_2, \gamma_3$  are the risk of correlation coefficient of D and A, D and B, D and C,  $\gamma_1', \gamma_2', \gamma_3'$  are the risk of for corresponding conversion rates.

#### 3.1 The risk of the coupling mass flow

There are two identical factor (A) risk flow at time t recorded as  $Ra[1](t), Ra[2](t)$ , when  $Ra[1](t)$  and  $Ra[2](t)$  computed, the two strands of risk superposition merged into a stream of abandoned risk flow  $Ra[A]$ . Now An don't change risk nature,  $An = A$ ; Risk flow change size,  $Ea[A](t) = Ea[1](t) + Ea[2](t)$ . By analogy, along with the ATM safety that process continuously and thorough, have more of the same nature risk flow happen coupling stack, with  $Ra[i](i= 3, 4, \dots, N)$  to say, have the  $Ra[A]$  and  $Ra[i]$  mergers create  $Ra[Ai]$ . and every time the formation of coupling stack has  $Ai = An$  condition of this kind of homogeneous risk flow coupling process can be expressed as:

$$Ea[A_i](t) = Ea[1](t) + Ea[2](t) + \dots + Ea[i](t) = \sum_j^i Ea[i](t) \quad (A_i = A_n) \quad (1)$$

When i = N, are

$$Ea[A_N](t) = Ea[1](t) + Ea[2](t) + \dots + Ea[N](t) = \sum_j^i Ea[i](t) \quad (A_N = A_n) \quad (2)$$

That is when the N kind of the same type of risk flow coupling and merged into a stream of risk flow:

$$R_a(t) : \{E_a(t), A\} = R_a[N](t) : \{E_a[N](t), A_N\} \quad (3)$$

So, the t moment when ATC internal system state and external environment condition meet conditions, properties for An attribute of the  $Ra[i](t) : \{Ea[i](t), An\}$ , i happened  $\in N$  coupling, for the same kind of properties of the merger risk flow  $Ra(t) : \{Ea(t), A\}$ , the risk of the coupling stack process:

$$E_a(t) = \sum_{i=1}^N Ea[i](t) \quad (A_i = A_n) \quad (4)$$

#### 3.2 The risk of heterogeneous flow coupling

When different risk flows are coupled, the virtue of the risk flow will produce some degree of transformation. How many of the transformation between risk and the correlation coefficient, related to the size of the conversion rate. Risk associated coefficient refers to the risk of relevance between size, by risk the dependent each function of the correlation between nodes business decision; Conversion rate risk is a risk into another kind of risk proportion, the flow of nature by risk their properties and suitability decided to risk, the risk that the significance of the conversion efficiency can be, its value is less than or equal to 1.

The ATC heterogeneous risk flow coupling can be divided into two factors risk flow coupling, three factors risk flow coupling and four factors risk flow coupling according to the number of risk factors involved in the coupling .the first two kind of coupling are a special case of the four factors risk flow coupling . Therefore, if the calculation formula of the four factors risk flow coupling can be deduced , the other two special case can be solved easily. The hypothesis in t moment, when ATC internal system state and external environment condition of state meet, ATM safety system in four different nature risk notes for A, B, C, D. The risk flow of them were recorded as  $Ra[h](t), Rb[i](t), Rc[j](t), Rd[k](t)$ , when they coupling is  $Ra[h](t)$  risk of traffic will into  $Rb[i](t), Rc[j](t), Rd[k](t)$  of the flow and  $Rb[i](t)$  part of the energy into  $Ra[h](t), Rc[j](t), Rd[k](t)$  of energy,  $Rc[j](t)$  part of the energy into  $Ra[h](t), Rb[i](t), Rd[k](t)$  of energy.  $Rd[k](t)$  part of the energy into  $Ra[h](t), Rb[i](t), Rc[j](t)$  of energy, namely:

$$\begin{cases} E_a'[h](t) = E_a[h](t) + \Delta E_a(h) & (A_h' = A_h) \\ E_b'[i](t) = E_b[i](t) + \Delta E_b(i) & (B_i' = B_i) \\ E_c'[j](t) = E_c[j](t) + \Delta E_c(j) & (C_j' = C_j) \\ E_d'[k](t) = E_d[k](t) + \Delta E_d(k) & (D_k' = D_k) \end{cases} \quad (5)$$

Hypothesis  $Ra[h](t)$  part of the energy into  $Rb[i](t)$  source of energy for  $E_1$ , target energy  $\alpha_1 E_1$ , into  $Rc[j](t)$  source of energy for  $E_2$ , target energy  $\alpha_2 E_2$ , into  $Rd[k](t)$  source of energy for  $E_3$ , target energy  $\alpha_3 E_3$ ;  $Rb[i](t)$  part of the energy into  $Ra[h](t)$  source of energy for  $E_4$ , target energy  $\beta_1 E_4$ , into  $Rc[j](t)$  source of energy for  $E_5$ , target energy  $\beta_2 E_5$ , into  $Rd[k](t)$  source of energy for  $E_6$ , target energy  $\beta_3 E_6$ ;  $Rc[j](t)$  part of the energy into  $Ra[h](t)$  source of energy for  $E_7$ , target energy  $\theta_1 E_7$ , into  $Rb[i](t)$  source of energy for  $E_8$ , target energy  $\theta_2 E_8$ , into  $Rd[k](t)$  source of energy for  $E_9$ , target energy  $\theta_3 E_9$ ;  $Rd[k](t)$  into  $Ra[h](t)$  source of energy for  $E_{10}$ , target energy  $\gamma_1 E_{10}$ , into  $Rb[i](t)$  source of energy for  $E_{11}$ , target energy  $\gamma_2 E_{11}$ , into  $Rc[j](t)$  source of energy for  $E_{12}$ , target energy  $\gamma_3 E_{12}$ . Four kinds of risk factors between the flow transformation process as shown in figure 1 below.

Figure 1 Four Factors Between Risk Flow Transformation

So the quantity changes between them are:

$$\begin{cases} E_a'[h](t) = E_a[h](t) - E_1 - E_2 - E_3 + \beta_1 E_4 + \theta_1 E_7 + \gamma_1 E_{10} & (A_h' = A_h) \\ E_b'[i](t) = E_b[i](t) - E_4 - E_5 - E_6 + \alpha_1 E_1 + \theta_2 E_8 + \gamma_2 E_{11} & (B_i' = B_i) \\ E_c'[j](t) = E_c[j](t) - E_7 - E_8 - E_9 + \alpha_2 E_2 + \beta_2 E_5 + \gamma_3 E_{12} & (C_j' = C_j) \\ E_d'[k](t) = E_d[k](t) - E_{10} - E_{11} - E_{12} + \alpha_3 E_3 + \beta_3 E_6 + \theta_3 E_9 & (D_k' = D_k) \end{cases} \quad (6)$$

When  $Ea[h](t)$  indicates a 0,  $Eb[i](t)$  indicates a 0,  $Ec[j](t)$  indicates a 0, and  $Ed[k](t)$  indicates a 0, make :

$$\begin{aligned} \alpha_1' &= \frac{E_1}{E_a[h](t)} & \alpha_2' &= \frac{E_2}{E_a[h](t)} & \alpha_3' &= \frac{E_3}{E_a[h](t)} \\ \beta_1' &= \frac{E_4}{E_b[i](t)} & \beta_2' &= \frac{E_5}{E_b[i](t)} & \beta_3' &= \frac{E_6}{E_b[i](t)} \\ \theta_1' &= \frac{E_7}{E_c[j](t)} & \theta_2' &= \frac{E_8}{E_c[j](t)} & \theta_3' &= \frac{E_9}{E_c[j](t)} \\ \gamma_1' &= \frac{E_{10}}{E_d[k](t)} & \gamma_2' &= \frac{E_{11}}{E_d[k](t)} & \gamma_3' &= \frac{E_{12}}{E_d[k](t)} \end{aligned}$$

The calculation fomula are as follows:

$$\begin{cases} E_a[h](t) = (1 - \alpha_1' - \alpha_2' - \alpha_3') E_a[h](t) + \beta_1 \beta_1' E_b[i](t) + \theta_1 \theta_1' E_c[j](t) + \gamma_1 \gamma_1' E_d[k](t) & (A_h' = A_h) \\ E_b[i](t) = (1 - \beta_1' - \beta_2' - \beta_3') E_b[i](t) + \alpha_1 \alpha_1' E_a[h](t) + \theta_2 \theta_2' E_c[j](t) + \gamma_2 \gamma_2' E_d[k](t) & (B_i' = B_i) \\ E_c[j](t) = (1 - \theta_1' - \theta_2' - \theta_3') E_c[j](t) + \alpha_2 \alpha_2' E_a[h](t) + \beta_2 \beta_2' E_b[i](t) + \gamma_3 \gamma_3' E_d[k](t) & (C_j' = C_j) \\ E_d[k](t) = (1 - \gamma_1' - \gamma_2' - \gamma_3') E_d[k](t) + \alpha_3 \alpha_3' E_a[h](t) + \beta_3 \beta_3' E_b[i](t) + \theta_3 \theta_3' E_c[j](t) & (D_k' = D_k) \end{cases} \quad (7)$$

Double risk factors flow coupling, three factors flow coupling calculation formula of risk only participate in the coupling of the selection risk flow, the generation into the formula (7) can draw their own risk flow coupling formula.

#### 4 Conclusions

Through the behavior analysis of the air traffic control safety risk couplings and the mathematical analysis of risk flows, main conclusions are drawn as follows:

(1) The risk of coupling flow size depends on three main factors, namely primitive risk flow, the correlation coefficient between risk and risk conversion.

(2) In the risk coupling analysis, each time the risk couplings happen, the changes of the corresponding risk flow is not sure and unpredictable. But the risk coupling in the same condition accord with certain law, through the probability and mathematical statistics the rule can be approximately deduced. Risk correlation coefficient and approximation of the risk of conversion rates can be got through statistics and calculation of the data, and then the risk of flow values of different risk factors coupling can be calculated.

(3) The risk of coupling flow state has a close relationship with ATC security defense system. When risk flow value is less than the maximum security system threshold, the risk of flow is in a stable state and easy to control; When the value of risk flow of security system is greater than the biggest threshold, the risk of flow is active state and easy to cause new risks.

Therefore, the air traffic control department should on the one hand enhance the construction of the ATC safety risk management information system which can increase the risk threshold of the security system directly; on the other hand, the awareness of risk prevention should be raised to block the path of the risk coupling, reducing the value of risk flow indirectly to enhance the system's ability of resisting risks.

# Research on Credit Risk Management in Industrial and Commercial Companies Based on RAROC

Dong Chengyi

School of Finance, Zhongnan University of Economics and Law, Wuhan, P.R.China, 430070  
(E-mail:dcy1992@126.com)

**Abstract:** The credit risk management in industrial and commercial companies in our country is weak, and credit risk management has become one of the most important problems which must be dealt with. The paper gives a proposal that applying the RAROC (Risk Adjusted Return on Capital) to the industrial and commercial companies in our country, which is based on some risk manage theories and methods in financial area and take the characteristics and present situation of the companies into account. The paper proves that RAROC performs well in providing basic information for credit decision and makes a balance between risks and benefits, and will improve the level of credit risk management and promote the development of the enterprise.

**Key words:** Credit risk management; Commercial and industrial companies; Risk adjusted return on capital; Feasibility Analysis

## 1 Introduction

Credit is the basic characteristic in the modern market economy. Not only the financial sector cannot exist without credit, but also credit in the market economy of every area plays a great role<sup>[1]</sup>. Although industrial and commercial companies gradually build credit risk management mechanism in recent years, most Chinese industrial and commercial companies still adopt the traditional, qualitative customer credit evaluation method. None scientific evaluation and measure credit risk model framework and the corresponding performance evaluation system have been set up. According to the National Institute of the Ministry of Commerce Statistics, because Chinese industrial and commercial companies fail to establish a scientific credit management system, companies' credit sales of bad debts become serious and the default payment last for a long time. Bad debts take up on average 5%-10%, comparing the American 0.25%-0.5%, which is 10 times as much difference. This exposes several phenomena of weak credit risk management in industrial and commercial companies. Credit risk management has become one of problems that should be solved urgently. This paper refers to the financial area of some credit risk management concepts and methods, combined with industry and commerce of the characteristics and present situation of industrial and commercial companies. It puts forward RAROC model that can be applied to credit risk management in industrial and commercial companies for credit granting decision, provides data support, correct guidance of company credit business development and the balance of risks and benefits. Finally it enhances the level of credit risk management and promotes the development of companies.

## 2 Model Description

### 2.1 RAROC model

RAROC is short for Risk Adjusted Return on Capital. Its core idea is to quantify the risk of loss which can be expected in the future as the current cost, and to adjust current earnings, for measuring the size of the risk-adjusted revenue<sup>[2]</sup>. After the 1990s, the application of RAROC model continues to improve and becomes the primary means of management in international commercial banks. The specific calculation and analysis process can be shown in formula 2.1:

$$\text{RAROC} = (\text{Revenue} - \text{Operating Cost} - \text{Expected Loss}) / \text{Economic capital} \quad (1)$$

For the financial institutions, the revenue can be spread income and non-interest income (such as service charges, etc.). Operating cost is the cost of bank management. Expected loss of the different types of risk has different measurement methods, but its elements are four aspects, that is Probability of Default, Loss Given of Default, Exposure at Default and Maturity. Economic capital is the minimum need of risk banks take.

### 2.2 Metrics

For the present model, the main metrics include total revenue, operating cost, expected loss and economic capital. For industrial and commercial companies, total income and operating cost are relatively clear of its overall sales revenue and operating procedures of the expenditures. What's more,

the calculation of operating costs can be done through the pooling and sharing of cost afterwards to predict future costs. In addition, by track recording single business operating costs for different types, various types of average operating cost could be calculated through the historical average costs.

Expected losses (EL) usually refers to an average loss during the loan, which is the focus should be measured in the RAROC. It can be determined by statistical methods and it's the amount of loss can be expected in the course of business, being an indicator to reflect the credit risk. It can be expressed as shown in formula 2.2:

$$\text{Expected Loss} = \text{Exposure at Default} \times \text{Probability of Default} \times \text{Loss Given of Default} \quad (2)$$

Economic capital (EC) is the minimum amount of capital bank needs calculated by the bank's internal management personnel according to the risk assumed. Because it is directly linked with the bank to take risks, it also becomes a Capital at Risk<sup>[3]</sup>. In actual measurement, the unexpected loss caused by credit risk can be used to approximate the economic capital. Unexpected loss(UL) corresponds to expected loss. Understanding from the statistical significance, expected loss is the loss distribution of the mean, while unexpected loss is the standard deviation of the loss distribution. Unexpected loss can be released by economic capital to, in order to prevent bank failures.

This paper draws on the measure based on experience or historical data developed by the Bank of America. This method only considers the unintended risk of default factors. Under the conditions of only two states, which is breach of contract and not breach of contract, unexpected losses can be calculated as formula 2.3<sup>[4]</sup>:

$$UL = EAD \times \sqrt{EDF \times \sigma_{LGD}^2 + LGD^2 \times \sigma_{EDF}^2} \quad (3)$$

If the  $LGD$  is determined, that is  $\sigma_{LGD} = 0$ , the above equation can be simplified to formula 2.4:

$$UL = EAD \times LGD \times \sigma_{EDF} \quad (4)$$

$\sigma_{EDF}$  can be calculated by a simple method, using the binomial model. Based on the data of  $N$  years, suppose  $EDF_i$  is the default rate of year  $i^{\text{th}}$ , then  $\sigma_{EDF}$  can be gotten:

$$\sigma_{EDF} = \sqrt{\frac{\sum_{i=1}^N EDF_i(1-EDF_i)}{N}} \quad (5)$$

If default is a two state event, default rate, namely variance of  $EDF$  can be calculated:

$$\sigma_{EDF}^2 = EDF \times (1-EDF) \quad (6)$$

After getting unexpected loss, some kind of risk control is needed when banks decide to use how much economic capital to make up for unexpected loss. Thus, there is a necessity to multiple the result of unexpected loss by  $\alpha$ . Economic capital can be gotten as following:

$$EC = \alpha \times UL = \alpha \times EAD \times LGD \times \sigma_{EDF} \quad (7)$$

Is not only related to the attitude banks own faced with risk, but also combined with loss distribution. According to the report<sup>[5]</sup>, capital multiplier used by the banks of America is six, and during the next applications, most take this data. If banks have higher risk control requirements, the multiplier increases accordingly.

### 3 Design

#### 3.1 Feasibility analysis

Credit is not a dedicated transaction in financial institutions. Due to its transaction efficiency as well as its benefits to businesses and society as, credit is widely used in all aspects of the market, while the credit risk faced by commercial companies and financial institutions, which have highly similarity. Its credit risk comes from the debtor's default. However it is essentially a possibility of loss, and credit risk can be measured via a similar method. Its credit risk is made up with several major factors: expected default, expected loss rate of given default, risk exposure and duration. Increasing credit cases to trade on credit risk management has led to higher significance to the survival and development of companied. Thus, the requirements for credit risk management must be increasingly high.

The core idea of RAROC model is to measure the size of the return per unit of capital, efficiently combine the benefit and risk companies faced with so as to let decision-makers make better decisions weighing against the risks and benefits. RAROC can be applied to loan pricing, capital allocation, comprehensive risk management and performance appraisal in financial institutions, etc.. In addition, it can be applied to credit risk management of industrial and commercial companies. So using RAROC

model in credit risk management of industrial and commercial companies can enhance the strong feasibility of the existing credit risk management system, and help play larger role in promoting long-term survival and development of companies.

Given the above analysis, based on the status of business credit risk management, "three-stage program" of RAROC model used in industrial and commercial companies has been put forward: the first stage is standardizing business credit management data in accordance with the requirements of the RAROC model; the second stage is accumulating a certain amount of historical data in accordance with the standardized data in order to provide sufficient data to support decision-making; the third stage is the RAROC model officially used in enterprise risk management to help enterprise decision-making.

### 3.2 Data comparative analysis

#### 3.2.1 Numerical example

Because RAROC model's effective application cannot leave reliable and targeted credit rating system, this paper's example simulation analysis is based on a certain industry and commerce enterprise which has set up effective credit rating system assumption, and then chooses a business objects to conduct the analysis of the application. Referring to the international famous institution Moody's "Different Credit Rating Customers Expect Default Weight Level Table", the value can be calculated.

Supposed an industrial and commercial company proceeds credit transactions and sells its credit products to a client which named X, predicted the sales value is expected to 100 million which is not including tax, and the gross profit margin is 3%. According to the client X draft, the enterprise confirms the line of credit is 20 million, credit granting deadline is 60 days and the validity period is 360 days.

Client X is a registered customer to this industry and commerce enterprise, credit risk management departments has its credit record. Because of several overdue payment behavior, and through the analysis of this distributor financial situation, it's found that its operating condition is deteriorating and recently its credit rating is BB. Consulting "transaction object credit rating table", its EDF is 7.00%, LGD is 39%.

Supposed this industrial and commercial company sets its benchmark management cost rate to 0.2%, funding opportunity cost to 5.4%(China's inflation rate in 2011), EAD accounting for 70% of credit line and benchmark rate of return to 27%. The loss rate of credit rating expected default can be shown in the table 1.

**Table 1 Different Credit Rating Customers Expect Default Weight Level**

Credit rating	Anticipatory breach of contract	Anticipatory loss breach of contract
AAA	2.00%	0%
AA	2.70%	16%
A	3.10%	24%
BBB	4.70%	33%
BB	7.00%	39%
B	8.10%	38%
CCC	23.45%	55%

$$\text{Revenue} = \text{Sales Amount} \times \text{Gross Profit Rate} = 10000 \times 3\% = 3 \text{ million}$$

$$\text{Operational Cost} = \text{Sales Amount} \times \text{Benchmark Management Cost Rate} = 10000 \times 0.2\% = 0.2 \text{ Million}$$

$$\text{Opportunity Cost of Capital} = \text{EAD} \times \text{Opportunity Rate of Capital} = 0.756 \text{ million}$$

$$\text{EAD} = \text{Credit Line} \times 70\% = 2000 \times 70\% = 14 \text{ million}$$

$$\text{EDF} = 7.0\% \times \text{LGD} = 39\%$$

$$\text{EL} = \text{EAD} \times \text{EDF} \times \text{LGD} = 1400 \times 7.0\% \times 39\% = 0.3822 \text{ million}$$

$$\text{Economic capital multiplier } \alpha = 6$$

$$\sigma_{\text{EDF}} = \sqrt{\text{EDF} \times (1 - \text{EDF})} = \sqrt{270\% \times (1 - 270\%)} = 0.0651$$

$$\text{EC} = \alpha \times \text{UL} = \alpha \times \text{EAD} \times \text{LGD} \times \sigma_{\text{EDF}} = 2.132676 \text{ million}$$

$$\text{RAROC} = (\text{Revenue} - \text{operational cost} - \text{EL}) / \text{economic capital} = 77.92\%$$

According to above calculation, we can found this credit granting value is 77.92%, greater than benchmark rate of return, illustrate that this credit granting can produce profit, and so approves this credit granting.

#### 3.2.2 Data analysis

Applying for 2010 credit business data of a large steel enterprise and put RAROC model into use simulation decision-making, by contrast the general profit difference between before and after benefit to

enterprise through RAROC model, it can be determined whether the RAROC model is beneficial to enterprise risk management decision-making. Due to the steel enterprise not yet set up its own credit rating system, its risk management largely cooperates with Dunn & Bradstreet, and the enterprise's report provides risk early warning scale, which is put forward to analysis and assess transaction objects as follow:

**Table 2 Risk Early Warning Scale**

Risk early warning rating	Risk zone	Possibility of appearing high risk enterprise	Risk early warning score meaning	enterprise ratio in database
1	Low risk section	2%	Lowest risk	10.50%
2		2.70%	Low risk	8.60%
3		3.10%	Lower risk	10.80%
4	Medium risk section	4.70%	Low average risk	16.30%
5		7.00%	Slightly lower than average risk	15.90%
6		8.10%	Average risk	11.40%
7	High risk section	10.90%	High average risk	7.10%
8		16.50%	High risk	6.80%
9		24.50%	Higher risk	6.50%
10		41.90%	Highest risk	6.10%

Dunn & Bradstreet's risk early warning scale report reveals the level of transaction objects' credit rating and transaction risk, risk early warning scale can be used to structure transaction objects' credit rating table 3:

**Table 3 Transaction Objects' Credit Rating**

Dunn & Bradstreet risk early warning rating	Corresponding credit rank	Credit condition overall evaluation
1	AAA	Nice
2	AA	
3	A	
4	BBB	Common
5	BB	
6	B	
7-10	CCC and lower	Worse

Choosing 20 trade samples in the credit extension business happened in 2010, samples as table 3-4 follows:

**Table 4 20 Trade Sample Analysis**

Sample	1	2	3	4	5	6	7	8	9	10
Credit line	3000	8000	10000	4000	6000	9500	4000	7000	6500	5000
Transaction sum	20000	12000	21500	10500	12500	15000	12500	12300	11400	9500
Gross profit ratio	4%	3%	3%	5%	3%	3%	4%	3%	4%	3%
Credit rating	AAA	AAA	AAA	AAA	AA	AA	AA	AA	A	A
Default or not	no	no	no	no	no	no	no	no	no	no
Profit	800	360	645	525	375	450	500	369	456	285
Default loss										
Sample	11	12	13	14	15	16	17	18	19	20
Credit line	5000	4500	4000	4000	3500	3000	1000	3000	1000	2000
Transaction sum	8600	12000	9800	8700	9400	5600	3900	7800	3900	5400
Gross profit ratio	3%	4%	3%	3%	3%	3%	4%	3%	3%	3%

Credit rating	A	A	BBB	BBB	BBB	BBB	BB	BB	BB	BB
Default or not	yes	no	no	yes	no	yes	no	no	yes	yes
Profit		480	294		282		156	234		
Default loss	260			434.3		325.7			97.4	347.3

Putting the 20 samples into RAROC model, conducting simulation decision-making, and then contrasting to the former decision, it can be found cost rate of capital is 5.4% and benchmark operation cost rate is 0.2%. Its result as table 5:

**Table 5 20 Sample Transaction Reckoning**

Sample	1	2	3	4	5	6	7	8	9	10
RAROC value					0.9918	0.1918	4.4140	0.474	0.780	0.3366
Base earnings ratio	27%	27%	27%	27%	27%	27%	27%	27%	27%	27%
Reaching the standard or not	yes	yes	yes	yes	yes	no	yes	yes	yes	yes
Default or not	no	no	no	no	no	no	no	no	no	no
Profit	800	360	645	525	375	450	500	369	456	285
Default loss										
Sample	11	12	13	14	15	16	17	18	19	20
RAROC value	0.1701	1.9262	0.3212	0.1972	0.4276	0.0581	0.8561	0.1490	0.490	0.1753
Base earnings ratio	27%	27%	27%	27%	27%	27%	27%	27%	27%	27%
Reaching the standard or not	no	yes	yes	no	yes	no	yes	no	yes	no
Default or not	yes	no	no	yes	no	yes	no	no	yes	yes
Profit		480	294		282		156	234		
Default loss	260			434.3		325.7			97.4	347.3

In fact, the above samples are the credit business through the enterprise audit credit extension, but its decision-making degree of accuracy is not so high. Among 20 samples, there are 5 samples owning default phenomena and its default loss is so big. By contrast in the 5 default samples, applying for RAROC model has correctly forecasted 4 default phenomena, so it can be suggested to refuse this object's credit applies. According to the reckoning result of RAROC model, refusing 6 credit applies among 20 sample and 2 samples doesn't have default phenomena, but in the refuse samples of RAROC model, 1 sample produces default phenomenon. According to the former decision, 20 samples' profit sum is 53.373 million. If adopting the credit decision advice, its profit sum is 60.206 million. Thus, although RAROC model cannot forecast future default phenomenon accurately, it can better control transaction risk and enlarge enterprise's overall profit.

#### 4 Conclusion

Based on the understanding existing credit risk management concepts and methods, combined with widely used advanced method in the financial field, this paper puts forward the plan that RAROC model can be applied to Chinese industrial and commercial company credit risk management. According to the actual situation, focused on feasibility, this paper creatively proposes three-step strategy RAROC model of applied by Chinese industrial and commercial companies: data standardization, data accumulation,

and model application.

This paper tracks a large Chinese steel company which has completed the credit business, uses the RAROC model to make a second decision of the credit business, and compares the different effect of decision by using RAROC before and after. Finally the result shows that using RAROC model can better control the credit risk, improve company's whole benefit, which means that the usage of RAROC model in Chinese industrial and commercial companies can help them to solve weighing problem between risk and profit. What's more, RAROC model can quantify risk as currency index, solve the arbitrary and subjectivity in decision-making of company risk, and improve the management efficiency, which can enhance the competitiveness of companies.

**Abstract:** Although incomplete contracts are generally viewed as inefficient governance mechanisms, some authors suggest that a specific type of incomplete contract, namely, the performance-based contract, fosters innovation. A performance-based contract is characterized by low term specificity (i.e. contractual incompleteness) and rewards being tied to performance. Based on an integration of transaction cost economics and agency theory we hypothesize how PBCs affect innovation. We argue that low term specificity, i.e., not stipulating how the partner should deliver the performance and which resources to use, enhances a partner's autonomy, which in turn fosters innovation. However, too low term specificity inhibits innovation. Furthermore, we state that tying rewards to performance positively affects innovation. This relationship is, however, negatively moderated by the partner's degree of risk-averseness.

**Key words:** Innovation; Inter-organisational relationship; Contracts; Performance based contract

### 1 Introduction

Innovation (both radical and incremental) in products, process and services, is critical for firms to gain and sustain competitive advantage (Brown & Eisenhardt, 1995; Roberts, 1999; Tether & Tajar, 2008). Inter-organisational relationships (IORs) (Phelps, 2010) are an increasingly important way to engage in innovation. More specifically, IORs are thought to enhance (Faems, Looy, & Debackere, 2005; Goes & Park, 1997; Teece, Pisano, & Shuen, 1997) or even drive (Hamel, 1991; Leonard-Barton, 1995) innovation. IORs are quasi-integrated structures between markets and hierarchies (Im & Rai, 2008) used for product and service development, market access, and leveraging process capabilities of partners (Lavie & Rosenkopf, 2006). At the same time, inter-firm collaboration may lead to exploitation by an opportunistic partner (Malhotra & Lumineau, 2011; Walker & Weber, 1984; Williamson, 1985) and may suffer from coordination failures that impede the efforts of even well-intentioned parties (Gulati, Lawrence, & Puranam, 2005; Malhotra & Lumineau, 2011). These hazards pose a threat to organisational performance, as they can inhibit innovation if not governed properly (Mellewigt, Madhok, & Weiber, 2007; Ryall & Sampson, 2003).

In response, organizations use governance mechanisms such as contracts to mitigate these hazards (Lumineau & Malhotra, 2011; Ring & Van de Ven, 1992). Transaction cost economics theory prescribes that organizations should design contracts that are highly complete in order to minimize the hazards and maximize transaction gains (Williamson, 1979; Saussier, 2000). However, as organizations are unable to foresee all future events and consider both ex ante and ex post transaction costs, organizations frequently write contracts that are incomplete (Mayer & Argyres, 2004).

Unfortunately, incomplete contracts are deemed poorly designed governance mechanisms, since they do not sufficiently address the transaction characteristics that may result in opportunistic behavior (Goldberg, 1976; 1985; Williamson, 1985). Nevertheless, incomplete contracts do offer some benefits: for example, incomplete contracts are more flexible (Bernheim & Whinston, 1998; Crocker & Masten, 1991) in comparison with detailed contracts, the rigidity of which is argued to inhibit innovation (Hart, 1989; Wang, Yeung, & Zhang, 2011). More specifically, performance-based contracts (PBCs), an incomplete contracting type used in the context of partnering with an organization that delivers services, are suggested to positively affect innovation (Gates, Klein, Akabas, Myers, Schwager, & Kaelin-Kee, 2004; Kim, Morris & Netessine, 2007; Martin, 2002; Ng & Nudurupati, 2010; Ng, Maull, & Yip, 2009).

PBCs are characterized by low term specificity and rewards being tied to performance. Low term specificity refers to the fact that PBCs underline the outcome of the transaction rather than prescribing *how* to deliver it or which resources to use; as such, they promote new and improved ways of delivering a certain performance (Kim et al., 2007).

Thus, on the one hand, incomplete contracts are viewed as inefficient governance mechanisms. On the other hand, incomplete contracts, or more specifically PBCs, are suggested to foster innovation. This raises questions with regard to how these two issues are related: (when) do the positive effects on innovation outweigh the inefficiency in terms of governance? In the current paper, we contribute to this debate by focusing on PBCs as a specific type of incomplete contract and developing a conceptual model which explains how PBCs affect innovation. By linking these concepts we hope to take a first step towards enhancing our understanding as to how incomplete contracts could affect relationship outcome (i.e. innovation), as extant literature mainly focuses on the negative effects of incomplete contracts on relationship outcome (Williamson, 1985). Only few studies link contracts to positive relationship outcomes (Anderson & Dekker, 2005).

Our theoretical model is based upon an integration of agency- and transaction cost theory of contractual governance. The values and limitations of these established theoretical perspectives are well understood (Johnson & Medcof, 2007) and have extensively been used in research into the design of contracts and their effects on performance (Argyres, Bercovitz & Mayer, 2007; Argyres & Mayer, 2007; Eisenhardt, 1989; Luo, 2002; Reuer & Arino, 2007; Saussier, 2000; Williamson, 1985)<sup>1</sup>. Nevertheless, none of these papers has yet attempted to combine these two theories to understand the effects of (incomplete) contracts in general, and PBCs in particular, on innovation. Such a combination has merits, as both theories have traditionally been used to address issues of formal control. Freedom to innovate can be viewed as the opposite of formal control (Johnson & Medcof, 2007); therefore, these control-based theories offer a framework within which to address situations of alleviated control (Johnson & Medcof, 2007).

The remainder of this paper is organized as follows: first, we review literature on incomplete contracting and performance-based contracting to enhance our understanding of incomplete contracts in relation to innovation as a specific type of relationship outcome. We then develop hypotheses on how characteristics of PBCs affect innovation. We ground our hypotheses in literature and also use a number of actual contracts and interviews to strengthen and illustrate our arguments. These contracts and interviews concern two IORs involving a large financial services firm (Alpha) and two of its IT partners, Sigma and Kappa, whose names we were asked to disguise. Sigma, a small IT services firm, is responsible for the IT infrastructure of Alpha's asset management division. Kappa, a large telecommunication and IT services firm, is responsible for Alpha's telecommunication and IT infrastructure. The paper concludes with implications and avenues for future research.

## 2 Governing Inter-Organisational Relationships

In order to ensure successful inter-firm collaboration, organizations make use of formal controls, such as contracts, to govern IORs (Das & Teng, 2001). Whereas formal agreements may take various forms (written or verbal, implicit or explicit), contracts refer to written agreements which are legally binding (Lyons & Mehta, 1997; Woolthuis et al., 2005). Contracts provide safeguards against ex post performance problems by inhibiting the partner to pursue its individual objectives at the expense of mutual benefits (Luo, 2002). To maximize relationship gains, contracts should be as complete as possible (Williamson, 1979; 1985) and contain clauses that address all sources of opportunistic behavior. Complete contracts are contingent on all events that are relevant to the fulfillment of the contract and they represent what organizations could write in a world in which all future events can be foreseen (Saussier, 2000). As a result, the parties' obligations are specified in every possible eventuality (Crocker & Masten, 1991; Saussier, 2000). Complete contracts attain two objectives: 1) they inhibit opportunistic behavior; and 2) they stipulate responses to all possible future events. Hence, parties can deal with such events without renegotiation (Al-Najjar, 1995).

Despite the complexity inherent in drawing up complete contracts, the risk of ex-post hazards is such that organizations are likely to create contracts that are close to complete (Carson, Madhok, & Wu,

---

<sup>1</sup> This paper will not discuss the basic traits of these theories. There are several well established introductions into these theories, such as Williamson (1985) for transaction cost theory and the foundations of agency theory by Arrow (1985) and Eisenhardt (1989).

2006; Lyons, 1996). At the same time, as complete contracts explicitly prescribe roles and obligations, determine the content of the transaction, and specify rules for violating contractual agreements (Argyres & Mayer, 2007; Poppo & Zenger, 2002), they may result in a rigid relationship which hinders innovation (Arad, Hanson, & Schneider, 1997; Wang, Yeung, & Zhang, 2011). Furthermore, detailed contracts can be considered as a sign of distrust (Goshal & Moran, 1996), resulting in a barrier to knowledge transfer, which also inhibits innovation. Overly specified contracts may also hamper information exchange between the parties due to clear contractual specification of what is and is not allowed (Wang et al., 2011). Hence, detailed contracts may reduce uncertainty, but also flexibility (Argyres & Mayer, 2007), as they restrict the partner in adjusting to changes and to innovate (Wang et al., 2011). This suggests that, while protecting the organization against ex post problems by drafting more detailed agreements, many contracts fail to enable innovation.

In reality however, one frequently observes contracts that are incomplete (Al-Najjar, 1995; Hart & Moore, 1988; Kloyer & Scholderer, 2012; Mayer & Argyres, 2004). Incomplete contracts do not specify observable obligations and actions for the parties (Bernheim & Whinston, 1998). This degree to which observable obligations and actions are specified in the contract is coined 'term specificity' (Luo, 2002). Two common views explain the observation that contracts are inevitably incomplete. First, incomplete contracts relax the extreme rationality assumption which holds for complete contracts. Parties are subject to bounded rationality; that is, they are not able to foresee all future contingencies (Aghion & Holden, 2011; Tirole, 1999). Hence, parties may not identify some contingencies, or not acknowledge the need to specify certain dimensions of contractual performance (Bernheim & Whinston, 1998). Even if it were possible to foresee future contingencies, some actions are only observable by one party, or cannot be written in a way which can be legally enforced by a third party (i.e. court) (Lyons, 1996). Second, organizations balance the ex-ante costs of designing complete contracts with the ex-post costs of less exhaustive arrangements (Crocker & Masten, 1991). Whereas ex-ante costs may include time-, negotiation- and management costs in searching for information to craft a detailed contract, ex-post costs include opportunistic behavior and renegotiation costs. However, even in cases of low ex-ante costs of drafting detailed contracts, contracts may still be incomplete. This incompleteness is purposeful (Bernheim & Whinston, 1998): these contracts contain gaps that could have easily been covered, but have been left open for purposes of flexibility. Thus, incomplete contracts do not stipulate all obligations and actions and therefore are characterized by flexibility in the arrangements (Al-Najjar, 1995; Argyres, Bercovitz, & Mayer, 2007; Bernheim & Whinston, 1998; Crocker & Reynolds, 1993), which can be favorable for innovation.

The PBC is one such agreement in which the parties have intentionally left the contract incomplete. As the parties focus on the performance rather than the inputs and processes, PBCs are faced with lower term specificity than for example a behavior-based contract, which describes how to deliver the transaction (process) and which resources to use (inputs). Further, with PBCs, partners are rewarded based on the performance they deliver. The behavior-based contract in contrast rewards the partner for the processes they carried out and the resources they used in these processes. As such, PBCs are characterized by two dimensions, *low term specificity* and *rewards that are linked to performance*, which are viewed by various scholars as the key underlying characteristics of a PBC (Ng & Nudurupati, 2010; Else, Groze, Hornby, Mirr, & Wheelock, 1992; Martin, 2002; Lamonthe, 2004; Hypko, Tilebein, & Gleich, 2010). For example, studies from the logistics sector, also known as performance-based logistics (like Doerr, Lewis, & Eaton, 2005; Ng et al., 2009; Ng & Nudurupati, 2010), define a PBC as a contract that 'describes and communicates measurable outcomes rather than direct performance processes' (DoD, 2002, p. 1). Studies in healthcare underline the importance of an additional, above-the-baseline (i.e. fixed pay) compensation based on measures of quality of care and treatment outcome (Lindkvist, 1996; Lu, Ma, & Yuan, 2003; Shen, 2003). Hence, the focus of the contract is on the performance and rewards are in turn linked to the performance. In the following section we will outline how such contracts affect innovation.

### 3 The Role of Performance Based Contracts in Innovation

Our review of extant literature did not reveal any papers that specifically focus on how performance-based contracts affect innovation. We therefore turned to general contracting literature and found two papers that relate contractual detail to innovation (Johnson & Medcof, 2007; Wang et al., 2011). For example, Johnson and Medcof (2007) state that specification of outcomes to be accomplished leaves agents with latitude for innovation. Wang, Yeung and Zhang (2011) argue that contracts provide a

legal and institutional framework, which curbs opportunism and improves innovation performance. We build on these two contributions to argue how term specificity affects innovation. Furthermore, Johnson and Medcof (2007) also discuss the effects of rewards on innovation, albeit in an *intra-firm* setting where the principal is the firm and the agent is a separate division of the organization. Research on the effects of rewards on innovation in an *inter-firm* setting is limited. Nevertheless, management pay literature contains a significant number of papers that use agency theory to study the effects of rewards on relationship outcome, such as performance and innovation (e.g., Bloom & Milkovich, 1998; Makri, Lane, & Gomez-Mejia, 2006; Roth & O'Donnell; Stroh, Brett, Bauman, & Reilly, 1996). As such, in order to outline the effect of the second dimension of a PBC (i.e., partner pay) on innovation in an IOR context, we lend our arguments from the management pay literature by using only those papers whose reasoning can naturally be interpreted in terms of inter-firm transactions.

According to Wang, Yeung and Zhang (2011), innovation is a structured, knowledge-intensive activity which is embedded in networks that span across organisational boundaries. Moreover, these authors emphasize the role of co-creation with the partner in innovative activities. Johnson and Medcof (2007) define innovation as discrete, proactive undertakings by agents that advance new ways for organizations to use or expand their resources. Whereas the focus of Wang et al., (2007) is on the process of getting innovations and the role of co-creation with the partner, Johnson and Medcof (2007) emphasize innovation as an outcome of the relationship. As such, in line with Johnson and Medcof (2007), we define innovation as proactive initiatives taken by a partner to improve or advance new ways of delivering the transaction as perceived by the contracting organization. In the following sections we will outline our reasoning as to how the effects of the two characteristics of PBCs on innovation occur.

### **3.1 Low term specificity**

Low term specificity resonates with the contractual incompleteness dimension of not specifying all verifiable obligations and actions of the parties. Term specificity is the extent to which terms and clauses are specified in detail (Luo, 2002). Wang et al. (2011) refer to this as contractual detail, and argue that well-specified contracts reduce the costs and risks associated with knowledge exchange and collaborative innovation. Viewing this line of reasoning in the light of incomplete contracts, we argue that contracts that are less complete foster innovation. The PBC is characterized by *low* term specificity as the focus in these contracts is on the desired performance, not on prescribing specific actions or resources to be used by the partner. Partners therefore have the freedom to do their work in whatever way they consider best, and to determine their procedures within certain boundaries (Johnson & Medcof, 2007; Wang et al., 2011). These boundaries relate to achieving the desired performance, possibly complemented by certain conditions.

As such, an important element in PBCs is the clear separation between the organization's expectations (i.e. performance goal) and the partner's implementation (i.e. how it is achieved) (Kim et al., 2007). This focus on performance, rather than the processes and resources to be used, can be understood as an attempt to allow for greater flexibility (Al-Najjar, 1995) and latitude (Johnson & Medcof, 2007). For example, a PBC in the maintenance industry might describe such things as the timing of the maintenance, amount of payment for the uptime of the machine, what to do in case of breach of contract, and so on. However, the contract may e.g., not describe which resources to use to maintain the machine, nor does it state which activities to undertake. Therefore, when event *x* occurs, the partner has the flexibility to adjust to event *x* and maintain the machine in any way (e.g., in a less expensive or more innovative way), as long as they meet the specified performance. Hence, the contract is incomplete in the sense that it specifies only the desired performance that the partner should achieve. The partner in turn determines *how* to achieve the desired performance, thereby maximizing provider autonomy in attaining the performance (Gruneberg, Hughes, & Ancell, 2007; Macfarlan & Mansir, 2004 as in Kim et al., 2007). Intuitively, low term specificity allows the partner more freedom in decision-making regarding the delivery of the transaction. The partner can, thus, choose which activities to engage in and which resources to use at their own discretion. As such, for contracts that are characterized by low term specificity, partners have a higher degree of autonomy.

In order to effectively engage in innovation, partners should not be hindered by formal and rigid rules and obligations (Wang et al., 2011). As such, autonomy is essential to the process of leveraging existing strengths and identifying opportunities that are beyond the partner's current capabilities. By granting autonomy, the degree to which a partner can shape and influence matters increases and they can quickly respond to changes. As a result, the partner can shape and influence the way the service is delivered, they can, thus, make changes to the transaction. As such, autonomy provides the partner with the freedom and flexibility to initiate innovative activities (Abbey & Dickson, 1983; Arad et al., 1997;

Morris, Kuratko, & Covin, 2007; Paolillo & Brown, 1978) and to approach problems and performance metrics in a way which makes the most of their expertise and creative thinking (Amabile, 1998; Liao, Liu, & Loi, 2010; Woodman, Sawyer, & Griffin, 1993). In addition, not stipulating how to deliver the service, or which resources to use, is important in helping to adjust to the environment, and hence, being flexible and doing things differently. The partner, who is more knowledgeable about the contracted transaction than the organization, can draw on its own experience and ideas, rather than having to conform to the actions and resources stipulated by the, possibly less knowledgeable, principal. From the various ideas generated by the partner for delivering the performance in new and improved ways, a promising activity may be identified and implemented which can result in performance improvement. Even when an innovative activity fails, both parties can share the experience and learn from it for future engagements in innovative activities (Dess et al., 2003; Shimizu, 2011).

However, too low term specificity in the contract also creates the potential for the partner to act opportunistically (Eisenhardt, 1989). Hence, even reliable partners, who are incentivized to behave appropriately through rewards being tied to performance, may not be able to resist the temptation to act opportunistically when autonomy is very high (Shimizu, 2011). Thus, the overall quality and value of the innovative activities is lower when the partner has a very high degree of freedom in deciding how to deliver the transaction or which resources to use (Shimizu, 2011). Such opportunistic activities in light of a high degree of autonomy are e.g., preparation of own competitive activities or selling the generated (innovative) knowledge to a competitor (Kloyer & Scholderer, 2012). So, similar to Wang et al. (2011) who note that too little contractual detail is not conducive for innovation, we argue that too low term specificity also hinders innovation.

Thus, low term specificity makes the partner engage in innovation as they have a certain degree of autonomy in deciding how to deliver the transaction or which resources to use. However, when term specificity is too low, partners might focus their innovative activities on their own individual objectives, thereby negatively affecting innovation (Guth & MacMillan, 1986; Shimizu, 2011). Hence, we argue:

*H1: There is an inverted U-shaped relationship between low term specificity and innovation.*

### **3.2 Rewards linked to performance**

The second characteristic of a PBC is that the partner is paid based on the performance they deliver (Kim et al., 2007). In such cases, the contract rewards the partner based on outcomes that are highly related to their efforts by incorporating incentives to meet (higher levels of) performance goals (Argyres & Mayer, 2007; Lyons, 1996). Agency theory is used as a principal theory in guiding organisational research on the effects of pay on relationship outcome (such as performance) (e.g., Bloom & Milkovich, 1998; Roth & O'Donnell; Stroh et al., 1996). Agency theory is concerned with the structuring of monitoring and compensation systems in principal-agent relationships in order to induce self-interested, utility-maximizing, risk- and effort averse agents (i.e. partners who want to maximize their compensation and minimize efforts and expenditures) to meet the goals of their principals (organizations that seek to maximize their performance) (Eisenhardt, 1989; Bloom & Milkovich, 1998).

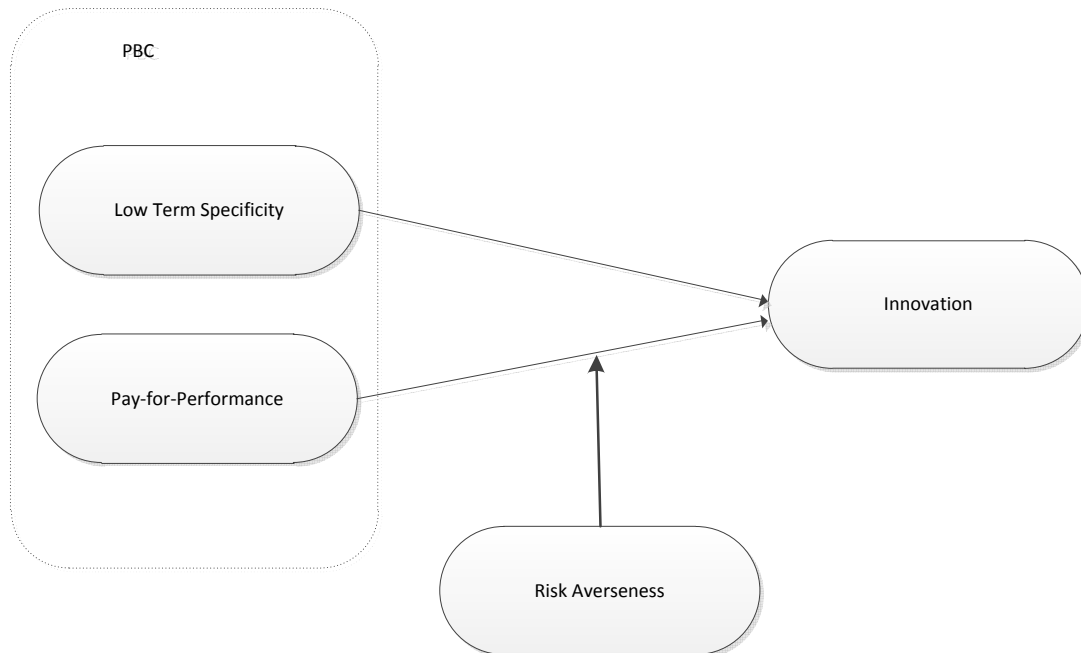

Compensation systems are a contractual mechanism through which many goals are pursued. They provide incentives to adopt efficient behavior, promote efficient adaptation, and balance different types of hazards (Furlotti, 2007). According to agency theory, if rewards are linked to behavior or resources that are used, partners will be discouraged to engage in activities that will not be explicitly rewarded (Eisenhardt, 1989; Deckop, Mangel, & Cirka, 1999), such as innovations. In these cases, the partner limits themselves to perform only those activities and behaviors that are specified in the contract for which the partner is being paid. In the most extreme case, any new initiative would be a breach of contract (Johnson & Medcof, 2007). On the other hand, when rewards are linked to performance, such as is the case in PBCs, it induces the partner to exert more effort and creates incentives to engage in (new) activities to improve performance. There is an incentive to innovate because if the partner accomplishes the contracted performance through innovative activities (e.g., by using other resources or different ways of delivering the service), the increased net profits of the activity accrue to the partner. As such, under a PBC, partners will exhibit activities that are in favor of reaching the contracted performance; they will find new and improved ways of delivering the performance to maximize their returns. They will, thus, engage in innovative activities to deliver (a higher level of) performance. Researchers agree on this and have shown that there is a positive relationship between financial incentives and opportunity identification and innovation (Abbey & Dickson, 1983; Johnson & Medcof, 2007; Shepherd & DeTienne, 2005). Put differently, the partner invests in the improvement of the performance via innovative activities, anticipating that the incentive payment will offset the investment costs (Heinrich & Choi, 2007). Hence, on the premise of the above, we hypothesize the following:

*H2a: Linking rewards to performance positively affects innovation.*

However, if the partner, for whatever reason, is not able to deliver the agreed performance, they will still bear the costs. As a result, with an emphasis on performance, rather than the process to achieve a certain result, the partner’s liability increases (Gates et al., 2004). The partner has more responsibilities and authorities and bears more risk as they are faced with uncertain income streams (Gates et al., 2004; Guajardo, Cohen, Kim, & Netessine, 2012; Gruneberg et al., 2007; Kim, Cohen, Netessine, & Veeraraghavan 2010; Ng & Nudurupati, 2010). Risk here includes among others the risk of defects, failing to meet completion deadlines, financial risk, and quality issues. As attitudes toward risk differ among organizations, the relationship stated in H2a is negatively moderated by the risk-averseness of the partner. Risk-averse organizations are willing to sacrifice some of the expected return in order to minimize their risk in outcomes (March & Shapira, 1987; Singh, 1986). They will, therefore, opt for status-maintaining decisions, by favoring solutions that have been proven to work well in the past over high-risk decisions to meet performance goals (Florian & Gustavo, 2009). Put differently, when a risk-averse partner’s payment is linked to performance, the partner may take conservative decisions and establish greater cost control at the expense of creative freedom in reaching the performance. Eventually, this may result in fewer resources being devoted to innovative activities, as innovation is inherently risky (Bloom & Milkovich, 1998; Makri, Lane, & Gomez-Mejia, 2006). To put it in Eisenmann’s (2002) words; to improve the odds that agents (i.e. partners) will meet performance targets, agents choose to avoid risky projects (i.e. innovative activities). On the premise of the above we expect that the more risk-averse a partner is, the weaker the positive effect of rewards-linked-to-performance on innovation. Accordingly, we propose the following hypothesis:

*H2b: The positive effect of rewards linked to performance on innovation is weaker for risk-averse partners.*

Figure 1 shows our conceptual model, which describes the more subtle processes that we expect to lie at the root of the causal relationship between PBCs and innovation. We argue that PBCs are characterized by low term specificity and rewards that are linked to performance. By having low term specificity, i.e., not stipulating how the partner should deliver the performance and which resources to use, the partner is faced with a certain degree of autonomy which positively affects innovation. It is important to note however that the relationship between term specificity and innovation follows an inverted U-shape: when term specificity is too low, its positive effect on innovation will be reduced. Furthermore, we argue that when the partner is paid based on the performance, the partner will engage in improvement and innovation activities. However, though paying for performance positively affects innovation, we postulate that this effect decreases when the partner is risk-averse.

**Figure 1 Conceptual Framework**

Although extant research has mostly addressed the negative effects of incomplete contracts on relationship outcomes, this research focuses on a positive effect of incomplete contracts, i.e., innovation. More specifically, we argue why and how a specific type of incomplete contract, namely the performance-based contract (PBC), fosters innovation. Various authors have suggested this effect (Kim et al., 2007), yet have failed to uncover why and how this effect may occur.

In contrast to prior studies, which usually have been grounded in a single theoretical perspective, we draw on both agency- and transaction cost theory of contractual governance to understand the effects of (incomplete) contracts in general, and PBCs in particular, on innovation. Building on transaction cost- and agency theory, we argue that PBCs are characterized by low term specificity and rewards being linked to performance and put forward a conceptual model that links these two characteristics to innovation. We hypothesize that there is an inverted U-shaped relationship between term specificity and innovation. Low term specificity induces the partner to take its own decision concerning how to deliver the transaction and which resources to use. By granting this autonomy, the partner enjoys the freedom and flexibility to engage in innovative activities. However, too much autonomy may lead the partner to modify their innovative activities in their own interest, which could result in lower value for the organization. We draw on agency theory to argue that linking rewards to performance positively affects innovation as the partner induces more effort to engage in (new) activities to deliver (a higher level of) performance. We also argue that this relationship is negatively moderated by the partner's degree of risk-averseness.

One implication of this model that seems worthy of future research is that there is an optimum level of term specificity that maximizes innovation. Thus, while organizations should be willing to invest in designing a contract that is conducive for innovation rather than a maximum shield from hazards, term specificity should not be too low, as that would lead partners to employ their innovative activities for their own individual objectives. Future research could seek to determine the optimal level of term specificity, in relation to possible contingencies like, for example, service type and type of industry. More specifically, throughout this paper we have strengthened and illustrated our arguments with evidence from a number of actual contracts and interviews from the IT industry. The relative importance and relevance of the issues revealed by the contracts and emphasized in the interview may differ across industries. Therefore, the conceptual model first needs further testing. Furthermore, we state that the effect of PBCs on innovation is lessened the more risk-averse the organization is. Hence, an important extension of this research would be to test whether the gains of innovation outweigh the risks the partner is faced with, as PBCs are unlikely to foster innovation if this is not the case. Finally, another important aspect of contracts in general is the use of specific incentives to motivate the partner to engage in innovation. Such mechanisms, which are independent of pay-for-performance, were not considered in our framework. Such incentives are e.g., financial bonuses, the possibility to extend the contract if the partner engages in innovation and the use of innovation budgets. Such incentives could offset the risk the partner is faced with when engaging in innovative activities. This could have important implications for the effects of contracts on innovation and is thus worthy of future research.

One important limitation of our research relates to the fact that it focuses on the effects of formal control on innovation and therefore does not address other important factors that may influence innovation in an IOR, such as relational governance modes. More specifically, IORs in which incomplete contracts, such as PBCs, are used rely on complementary instruments of governance, such as relational governance (Al-Najjar, 1995). Relational governance can be used to overcome ex-post problems resulting from incomplete contracts. Thus, next to having a sound contract governing a relationship, relational attributes like trust, communication and commitment should be emphasized as well (Mohr & Spekman, 1994; Morgan & Hunt, 1994). These attributes could affect innovation. To illustrate; communication involves close interaction between individuals across the collaboration interface that might result in the sharing of know-how (Kale, Singh, & Perlmutter, 2000). This knowledge sharing can positively affect innovation (Im & Rai, 2008). Future research could therefore seek to explore in a more detailed manner the interaction between (performance-based) contracts and relational governance elements, such as trust.

#### **4 Conclusion**

A second limitation regards the fact that this research does not address partner selection. That is, we focus on the effects of contracts on relationship outcomes whereby the organization and its partner are given. However, the characteristics of this partner may strongly influence outcomes such as innovation.

For example: one partner may engage in innovation more often than others, or a partner's workforce may be highly used to continuous innovation. These phenomena may occur irrespective of which type of contract is governing the IOR. Hence, future research could include partner selection in studies of incomplete contracts on relationship outcome.

As more and more organizations are moving toward the use of incomplete contracts to capture the benefits of innovation, a better understanding of how to design, implement, manage, and control contracts that are conducive for innovation, is critical for today's business. Nevertheless, such contracts require different governance mechanisms. Being able to manage and control the inter-organisational relationship by means of an incomplete contract, such as the PBC, is a valuable source for capitalizing on a partner's innovation capabilities. This research provides a valuable first step towards managing inter-organisational relationships through an incomplete contract by postulating how contractual characteristics may affect relationship outcomes.

# The Present Situation, Problems and Countermeasures of High Level Science-Technology Talents: A Case Study of Wuhan City of China\*

Xu Aiping, Gao Shuang

Higher Education Institution of WHUT, Wuhan ,P.R. China , 430070

(E-mail: xuaiping@whut.edu.cn, songsongshuangshuang@126.com)

**Abstract:** It is a strategic task to construct a team of high level science-technology talents today. As a case of Wuhan, taking the national related document materials and empirical data, the paper analyses the current situation and present problems of high level science-technology talents. Finally, as a guide of today talent policies and talent planning some development countermeasures of high level science-technology talents in Wuhan city of China i.e. being-three-in-one solutions of introducing, training and using talents have been proposed.

**Key word:** High level Sci-Tech talent ; Statistical analysis-comparative method; Development solution

## 1 Introduction

High level science-technology talents with rich professional knowledge and higher academic achievements, are engaged in creative work, play the leader or the leading role, and make outstanding contributions to scientific and technologic development and progress<sup>[1]</sup>. They are the core force of scientific and technological progress, and the intellectual support of building a comparatively well-off society.

Wuhan is a center city in the central area of China. In the period of the “Eleventh Five-Year”, some opportunities have been firmly grasped, such as the strategies that central area should develop first, Wuhan city circle’s TWO TYPE society; the Power City of Talents Strategy has been vigorously implemented, the talents has achieved remarkable development. However, with more intense competition between countries and regions, talents become more and more important. Now, there is still a large distance of high level science-technology talents between Wuhan and the first-tier benchmark cities i.e. Beijing, and can not meet the needs of economic and social development. In the next ten years there are many strategic opportunities in Wuhan to build a moderately prosperous society and take the lead in realizing modernization; It is also a critical period to develop talents for Wuhan. The current treasury plan is to build a high-quality science-technology talent team, agglutinating a number of strategic scientists, high-end innovative entrepreneurs and leaders. So followed the law of science-technology talent growth and the path from introducing, training, developing and managing talents, high level science-technology talent countermeasures in Wuhan should be studied.

## 2 The Current Situation of High Level Science-technology Talents in Wuhan

### 2.1 Overall development scale

From the end of “Tenth Five-Year” to the end of 2009, all kinds of talents in Wuhan from 1.07 million to 1.512 million; the average annual growth rate was 10.3 percent, over 3.6 percent of the expected goal. Professional and technical talents grew from 598.3 thousand to 921 thousand . Highly skilled talents grew from 197.3 thousand to 212 thousand. In the end of 2009, In Wuhan there were 101 independent research institutions, 139 post-doctoral research stations; 80 thousand scientific and technological activities people, 57 academicians, and 99.4 thousand graduate students . At the end of 2007, In Wuhan there were 467 young experts who had made outstanding contributions, 1988 people who shared special government allowances, 218 talents who were the candidates of national, provincial and municipal high level talent project.

### 2.2 Overall development trend

The proportion of Wuhan’s talent resources dividing the total human resources was 23.4 percent in 2009; the proportion of the high-educated people in all the labor population was 25 percent, the contribution rate of talents was 25 percent, the proportion of highly skilled talents among skilled workers was 25 percent. In 2009, in Wuhan there were 72 thousand R&D people, in which 33

---

\* The fund project of soft science research plan of Wuhan in 2010: the mechanism and development countermeasures of introducing-training-managing high level science-technology talents in Wuhan (201040333112-03)

thousand people had bachelor's degree and above, accounted for 46.1 percent; measured by the actual working hours, the R&D people had 46.4 thousand years, the researchers with intermediate professional titles and above or doctoral degrees had 26.5 thousand years, accounted for 57.1 percent. In 2009, in Wuhan there were 703 R&D institutions, 22.5 thousand years people engaged in R&D activities in institutions, they were 2.1 times of 2000; there were 8.5 thousand doctoral and master talents, accounted for 38.0 percent <sup>[2]</sup>.

In 2010, there were 1450 national science-technology projects, 665 municipal science-technology projects, 15 municipal registered science-technology achievements, and 376 awarded science-technology achievements, 28 national prizes <sup>[3]</sup>; applied and granted patents, technology turnovers were higher than Zhengzhou and Changsha. (Table 1)

**Table 1 Scientific and Technological Achievement Situation of 4 Province Capital Cities In 2010**

city	patent applications (thousand pieces)	patents granted (thousand pieces)	technology contracts (million Yuan)
Wuhan	15.045	10.165	8887
Nanjing	19.275	9.150	7689
Zhengzhou	8.000	5.600	4300
Changsha	9.071	6.209	2354

Note: table data from national economic and social development statistical bulletin of each city in 2010.

### 2.3 The sustainable development supporting ability

Until the end of 2010, in Wuhan there were 78 colleges, ranked 2, second only to Beijing; graduate students, an important scientific research force, had increased from 80.1 thousand in 2008 to 99.4 thousand in 2010, the scale was larger than such capital cities as Nanjing, Guangzhou, Changsha, Zhengzhou and Xi'an; the growth rate of graduate students was 13.6 percent, it was in the first place in eight cities (Table 2). Vigorous development of higher education and rapid growth of graduate students significantly support sustainable development of human resources in Wuhan.

**Table 2 Universities and Graduate Students of Some Cities in 2010**

city	university	the number of graduate students (thousand people)	the growth rate of graduate students
Beijing	89	225	7.65%
Shanghai	66	111.7	7.92%
Guangzhou	77	65.9	9.65%
Nanjing	53	87.3	9.1%
Zhengzhou	48	16.8	7.1%
Changsha	48	46.3	7.2%
Xi'an	49	77.0	6.35%
Wuhan	78	99.4	13.6%

Note: table data based on the economic and social development statistical bulletin of each city in 2010.

### 2.4 Innovative platforms and favorable policies

Wuhan has always attached great importance to science-technology innovation; the strategy of "Technology-built City" was firstly proposed in 1987. In Wuhan the capital generously supports the introduction of high level science-technology talents, and livelihood security highlighted in such full range as housing, living allowance, spouse placement and their children to school, the "green channel" for high level talents to own senior professional titles has been opened, entrepreneurial talents could enjoy the favored policies of "low threshold, zero down payments, no rules". And then, many R&D carrier platform, the "Special Administrative Region of Talents", i.e. East Lake High-tech Zone, are playing the aggregation function of chief scientists and R&D talents at home and abroad.

After some years' accumulation, some high-tech industries and the industrial groups, based on electronic information, new materials, biotechnology and new medicine, the integration of optical, mechanical and electronic, and modern equipment manufacturing have initially formed and affect great impact on the whole country in Wuhan. At the end of 2008, East Lake High-tech Zone had totally attracted more than 1300 overseas talents, founded more than 520 enterprises that involved more than 200 high-tech projects' research and business. The first batch of "3551 Talents Scheme" has attracted 14 high-level overseas talents since 2010, and the amount of subsidy is up to 36 million Yuan.

## 3 The Main Problems of High Level Science-Technology Talents in Wuhan

### 3.1 The insufficient total amount

Science-technology people are the main body of science-technology talents. In 2008 there were 73 thousand science-technology people in Wuhan, in Beijing 486 thousand, 6.7 times of Wuhan; and in Shanghai 288 thousand, 3.9 times of Wuhan; in Guangzhou 82 thousand, 1.1 thousand more than Wuhan. Scientists and engineers are the main force of science-technology people. In 2008, there were 55 thousand in Wuhan, 389 thousand in Beijing, 7.1 times of Wuhan; and 179 thousand in Shanghai, 3.3 times of Wuhan; 179 thousand in Guangzhou, 4 thousand more than Wuhan. In Beijing there were 732 Academicians in 2008, 72 in Shanghai, and only 56 in Wuhan, a wide gap between Wuhan and other developed cities.

### **3.2 The unreasonable talent structure and unbalanced distribution**

Firstly, the structure of ability level is irrational, severe shortage of strategic scientists, high-end innovative entrepreneurship, leading talents and top-notch creative talents. Secondly, the knowledge structure and professional structure are unbalanced, especially shortage of specialized talents in the characteristic key industries i.e. advanced manufacturing, modern services and strategic emerging industries in Wuhan. Thirdly, the industry distribution is irrational, and the structural contradictions are prominent. A large number of high level researchers are in universities and research institutes, many enterprises, especially small and medium private enterprises are lack of qualified technical staff and high level key personnel. Fourthly, talents are aging. At the end of 2009, In Hubei province there were 56 academicians, in which 49 people over the age of 60, accounted for 87.5 percent, only 3 young academicians in the age of 50, accounted for 5.36 percent.

### **3.3 The not strong talent innovative ability**

It is mainly reflected in the independent innovation and independent R&D capabilities of enterprises. Now, most high-tech enterprises' development tasks in Wuhan have been finished by the co-operation with domestic universities and research institutes. It is not obvious to play a leading role of Enterprises' intellectual rights, core technological products, high-tech products and output value in industry development.

### **3.4 The not strong ability of gathering and recruiting talents**

GDP is a common indicator to measure a country's or an area's economic comprehensive level. Wuhan's comprehensive level reflects its ability of science-technology input and contribution to some extent. GDP of Beijing in 2010 was 1.37 trillion, Shanghai was 1.68 trillion and Guangzhou was 1.06 trillion, but Wuhan's GDP was only 551.57 billion. Visibly, Wuhan's GDP was far below some first-tier benchmark cities. At present, in Wuhan more favorable talent policies with preferential treatment and good working environment have been presented to introduce talents, but due to the gap of economic development level high level science-technology talents still give priority to first-tier benchmark cities.

### **3.5 The imperfect talent management system and mechanism**

In the geographical conditions, there are advantages in Wuhan about universities, research institutions and the amount of all kinds of talents among big cities of the whole country. However, the phenomenon, that outflow of science-technology talents is more than the inflow, is objective. Besides the differences in the level of economic development from the benchmark cities, the old concept, the inadequate system, the not live mechanism, the uncomfortable environments and the not enough services, restrict the development of talents, especially the imperfect management system and mechanism of talents. The flow of talents lacks regulated policies and effective balanced mechanism, talent selection and appointment competition mechanism are not perfect, the talent evaluation system is still not established fully, talent planning of all trades and professions has such inferiorities: not accurate positioning, unclear target, unfit with the actual and economic standard, not pragmatic policy.

## **4 The Development Countermeasures of High Level Science- Technology Talents in Wuhan**

### **4.1 The establishment and perfection of a policy and institutional system based on the trinity of introducing-training-using talents**

The policy and institutional systems include the access policy, the favored policy and the reuse policy for the introduction; financial support, preferential taxes and insurance policy for talents' innovation and entrepreneurship; rational flow policy; the public service policy; development and management policy; training and encouragement policy for backup high level science-technology talents; the policy of selecting high level talents at home and abroad; innovation performance oriented and quality oriented scientific research evaluation system and science- technology talents evaluation system; the distribution system based on the production factors such as labor, capital, technology, management

by their contribution.

## **4.2 The optimization of growth environment based on the trinity of introducing-training-using talents and the creation of atmosphere to satisfy talents near and far**

### 4.2.1 The optimization of business environment

Positively providing opportunities and conditions for the high level science-technology talents can make them do their best to work and achieve their value. The specific measures are as follows: establishing talents' funds in government budget to give priority to ensuring the input of talents' introduction, training, selection and motivation; paying attention to the key positions and excellent top-notch talents in terms of R&D funds, equipment and staffing; helping science-technology talents in terms of market access, business platform, finance and taxation support, and finance guarantee service system<sup>[4]</sup>; improving the systems of research management, technology evaluation and rewarding regulations in accordance with the laws of scientific research.

### 4.2.2 The improvement of living and cultural environment

1) The optimization of living environment. In the way of combining rental and monetary subsidies, different levels and forms of housing support system should be established to meet the housing need of the outstanding talents, industrial leading talents and young talents in Wuhan. In 5-10 years, by the way of buying back, vacating, transformation and leasing, 100 sets of "celebrity home" free of charge for world-class outstanding talents to live in; 1000 units of "elite community housing" to rent for industrial leading talents; by the policies of limiting commercial houses and public rental housing, and providing appropriate monetary subsidies, 10000 sets of "talents apartment" for young talents to rent and turn over.

2) The optimization of medical environment. The public health and medical service system should be strengthened; excellent medical and healthy talents and the backbone of general practitioners should be cultivated. The others include improving the level of medical services, increasing talents' medical insurance, encouraging enterprises to give healthy and accident insurance to science-technology talents.

3) The optimization of educational environment. The key way should solve the problem of children's education of all kinds of talents. That needs actively creating conditions to foster high quality educational resources to facilitate all kinds of talents, especially overseas children to study.

4) The optimization of cultural environment. City cultural atmosphere should be innovative, tolerant, unity and harmony, healthy and livable.

### 4.2.3 The optimization of service environment

That includes establishing a unified and standardized labor resources market to play the basic role of allocating talents to a greater extent; perfecting information-sharing mechanism of talents; improving registration, statistics, and releasing mechanism of talents' supply and demand information, and the discovery and evaluation mechanisms of talents; energetically developing the human resources service industry to provide human resources market's allocation with full service carrier and platform; effectively playing the role of the talents service industrial associations; deepening the reform of household registration system to play the positive role of a census register and residence permit in attracting talents.

## **4.3 The establishment of mechanism based on the trinity of introducing-training-using talents**

### 4.3.1 The establishment of mechanism of introducing *rigidly* and flexibly

(1) The innovation of the way of high-end talents' introduction, combining flexible introduction and rigid introduction. That includes lowering the entering threshold, opening up the "green channel" for the flexible introduction, playing the main role of enterprises and other employing units, broadening the channel of the social groups and talent intermediary service agencies, encouraging domestic and foreign senior talents to work in Wuhan for a long or a short term in project cooperation, investigation, lectures and other forms, and supporting the enterprises and institutions to introduce talents at home and abroad flexibly by the way of consultation, lecture, part-time, short-term employment, technical cooperation and talents leasing.

(2) The innovation of the way of high-end talents' communication and cooperation and selecting talents in the international and domestic markets. That includes aiming at the forefront in the world; promoting the local professionals and technical talents to participate in the international cooperation, training and exchanging; implementing the "Yellow crane Talent Plan" and establishing liaison station to introduce foreign high level talents; introducing and breeding a lot of international talent intermediary service agencies.

(3) The building of the displaying platform to attract and keep high level talents. For instance,

implementing preferential entrepreneurship policies for high-level talents at home and abroad, strengthening the construction of future science-technology city and Chinese science-technology industrial park, establishing distinguished experts system, perfecting the honor system such as “Yellow Crane Friendship Award” and “Honorary Citizen” in Wuhan.

#### 4.3.2 The establishment and improvement of development mechanism of high level scientific innovative talents

1) The highlight of training focus. That includes implementing the training plans of urgent professional technical talents; starting the development plans of some high-end talents in the field of advanced manufacturing, modern services, strategic emerging industries and other key industries; drawing and implementing the constructive views of innovative science-technology talent team; setting up the innovative science-technology talent policy systems with a definite target, clear layer, close convergence; constructing a number of high level innovative talent training bases by the key enterprises, major projects and technical tasks; training a number of independent innovative leading talents and high level innovative teams with significant influence.

2) The combination of the echelon culturing and team training, and optimization of talent ecological structure. It includes improving young talents' training program, the morning program and academic leaders plan; training young innovative technological professionals; speeding up the construction of high level innovative teams to form a joint force's advantage; shortening the growth process of innovative science-technology talents.

3) The combination of the educated training and practice, and the improvement of talents' capacity and quality. That is establishing and improving multi-level, multiple types of high-quality talents' training system and lifelong learning educational systems, taking a variety of developing measures of combing job training and off-job training, international and domestic training; Strengthening the cooperation of enterprises, universities and research institutions in talent training and constructing various strategic alliances with the main bodies of enterprises and the guidance of markets; implementing the cultural model of talents project, developing high level innovative science-technology talents by the way of building laboratories and research centers together, cooperating in education and jointly implementing major projects; encouraging enterprises, universities and research institutions to construct post-doctoral research stations (industrial bases) and technical centers; encouraging academicians to cooperate in research projects and train talents.

#### 4.3.3 The establishment and perfection of an efficient management system of high level innovative science-technology talents

1) The Innovation of the mechanism of using talents and monitoring status, and improvement of talent using efficiency. That includes updating the concept of employing talents, in the people-oriented concept, respecting knowledge and talents, using talents flexibly; making evaluation and assessment standards of scientific talents; creating dynamic information database of talents' inflow and outflow; keeping talents by the feeling and cause, improving the system of major decision consulting experts, knowing talents' working and living conditions; establishing an open and flexible talents' flowing and configuration mechanism.

2) The improvement of the talents' incentive mechanism. The main way is allowing to take the negotiation wage system between talents and employers, strengthening the talent wage decision right of employers, especially taking annual salary system, agreement wage system, the rewards system of science-technology achievements and other forms, i.e. the wage closely associated with the performance and contribution.

3) The improvement of the personnel service mechanism and efficiency. A public service platform about the employment registration of enterprises, management of talent records, mediation and arbitration of labor and personnel dispute, employment services should be set up; an information resource statistics and database should be constructed; The laws of talent protection, talent market management and talent developing management should be perfected.

## 5 Inclusion

The high level innovative scientific and technological talent, an important part of talent team, is the creator of new discipline and the inventor of new technologies, is the pioneer and leader in science and technology innovation, has great significance to national economic and social development. Only first does a high level innovative scientific and technological talent team be set up, the effect of a point to affect the whole situation can rise. The study in the paper on the current situation, problems and

development countermeasures of high level science-technology talents will be a guide and greatly benefit to the talent progress of Wuhan.

**Abstract:** First, the thesis generalizes the relevant literature about psychological capital home and abroad. Secondly, the author brings out the thesis's research conceptualization and hypotheses, and then the thesis sets the Chinese workers as the research object, using questionnaire survey and statistic analysis, verifies the follow relations: the employees' psychological capital and resiliency have significant negative correlation with turnover intention; The employees' hope level and optimistic level have negative correlation with turnover intention, but not significant.

**Key words:** Psychological capital; Turnover intention; Hope level; Optimistic level

## 1 Introduction

The research on psychological capital in the domestic and foreign has just started, especially in domestic. In foreign, the concept of psychological capital first appeared in documents involved economics, investment and sociology. Summarizing all kinds of scholars' points, we can find there are three aspects about the concept of psychological capital: Trait theory, namely psychological capital exist as individual inner qualities, with Hosen(2003), Letcher(2004), Cole(2006) as its leading exponents; State theory, namely psychological capital is a kind of specific positive psychological state, with Goldsmith(1997), Tettegah(2002), Luthans(2005) as its leading exponents<sup>[1]</sup>; Comprehensive theory, namely psychological capital is a kind of psychological quality which both has trait characteristic and state characteristic, with Snyder(2000), Bandura(2003), Avolio(2006) as its leading exponents<sup>[2]</sup>.

The author believes that there are inner connections between psychological capital and turnover intention based on the existing research results. So the author uses the concept of the psychological capital and the questionnaire designed by Luthans(2005) and his fellows who defined psychological capital as "The core mental element of individuals which is beyond the human capital and social capital to arise general enthusiasm, shown in details like mental statements in accordance with the standard of the optimistic behavior. One can obtain advantages through this by targeted investment and development." <sup>[3]</sup> brings out the thesis's research hypotheses, tries to analyze the connections between hope level, optimistic level, resiliency, psychological capital and turnover intention.

## 2 Research Hypotheses

According to research the author raise the following hypotheses:

Hypothesis 1: Employees' hope level has negative correlation with their turnover intention, but not significant.

Hypothesis 2: Employees' optimistic level has negative correlation with their turnover intention, but not significant.

Hypothesis 3: Employees' resiliency has significant negative correlation with their turnover intention.

Hypothesis 4: Employees' psychological capital has significant negative correlation with turnover intention.

## 3 Questionnaire Design and Survey

The author adapts the scale from the psychological capital questionnaire by Fred Luthans (2005) in the research of Chinese staffs which is translated and modified independently<sup>[4]</sup>. then designs the scale of the psychological capital which consists of three parts: hope, optimism and resiliency. The hope part consists of 6 questions which are developed by Snyder, Higgins, Symptom etc and have been widely used in all kinds of different background. The optimism part consists of

10 questions which are from Life Orientation Test (LOT) which are developed by Scheier and Carver in 1985. The resiliency part consists of 14 questions are developed by Blcok and Kremen in 1996. According to the needs of statistics and analysis, the standard-scored sum of the 3 variables including hope, optimism and the resiliency is supposed to be the measured value of psychological capital. The questionnaire is evaluated by a 5-Likert scale<sup>[5]</sup>. These scales have been so widely used that we believed in the validity of it. We test the reliability of the questionnaire by using the Cronbach internal consistency and Reliability coefficient and split-half reliability. Generally speaking, a reliability coefficient above 0.90 is very good and the basic level is above 0.70. It has been tested that the split-half reliability and the coefficient of Cronbach's  $\alpha$  of these three questionnaires are both above 0.70, it is obviously that the consistency has been good.

**Table 1 The Reliability of The Psychological Capital Questionnaire**

	split-half reliability	the coefficient of Cronbach's $\alpha$
hope level	0.787	0.787
optimistic level	0.763	0.763
resiliency	0.705	0.705

The Turnover Intention Scale is based on the questionnaire of turnover study which is designed by Mobley(1978),and it has 8 questions in total. The questionnaire is evaluated by a 5-Likert scale. The main test indicators are the KMO sample measure and the Bartlett's sphere inspection square which are used to analyze the exploratory elements about the turnover intention. The test results showed that the KMO of The Turnover Intention Questionnaire is 0.592 while the significance of the Bartlett's is 0.0001, which is in accord with the standard of performing the elements analysis perfectly. It has been tested that the coefficient of Cronbach's  $\alpha$  of The Turnover Intention Questionnaire is 0.724, it is obviously that the consistency has been good.

To make sure of the convenience of collecting the questionnaire and the accuracy of the results, The author distributed the questionnaires via email. In total,150 questionnaires were distributed, among which 138 were returned and 127 were valid.

#### 4 Analyses of Relationships between Hope level, Optimistic level, Resiliency, Psychological Capital and Turnover Intention

##### 4.1 The correlation analysis between hope level, optimistic level, resiliency, psychological capital and turnover intention

Studies show that Employees' psychological capital has significant negative correlation with turnover behavior on their initiative, namely the higher level of the positive psychology capital, the lower rate of the initiative turnover behavior, but the Employees' psychological capital has not significant correlation with turnover involuntarily(Avey,2006). Now we are trying to analyze the connections between hope level, optimistic level, resiliency, psychological capital and turnover intention. The SPSS13.0 has been used and the correlation matrix of each variable is shown below:

**Table 2 The Correlation Matrix of Each Variable**

	hope level	optimistic level	resiliency	psychological capital	turnover intention
hope level		0.07	0.259(*)	0.544(**)	-0.109
optimistic level	0.07		0.032	0.449(**)	-0.048
resiliency	0.259(**)	0.032		0.812(**)	-0.302(**)
psychological capital	0.544(**)	0.449(**)	0.812(**)		-0.285(**)
turnover intention	-0.109	-0.048	-0.302(**)	-0.285(**)	

\*. Correlation is significant at the 0.05 level (2-tailed).

\*\* . Correlation is significant at the 0.01 level (2-tailed).

We can come to the following conclusions from the above table:

1) The hope level of staffs has negative correlation with their turnover intention, but not significant, and the Correlation coefficient is -0.109, hypothesis 1 has been proved.

2) The optimistic level has negative correlation with their turnover intention, but not significant, and the correlation coefficient is -0.048, hypothesis 2 has been proved.

3) The resiliency has significant negative correlation with their turnover intention, and the correlation coefficient is -0.302, hypothesis 3 has been proved.

4) The psychological capital has significant negative correlation with their turnover intention, and the correlation coefficient is -0.285, hypothesis 4 has been proved.

#### 4.2 The regression analysis between hope level, optimistic level, resiliency, psychological capital and turnover intention

And now we continue to certify the connections between hope level, optimistic level, resiliency and the combination of those three. We are still doing analysis of regression with those four variables. The analysis of regression is divided into two parts: first, the three variables which are all integrated of order one will be put into one model; next, the hope level, optimistic level, and resiliency will be replaced by psychological capital in the model. We wish to find out whether the hypothesis 4 is true. And the analysis results are shown in the table below:

**Table 3 The Regression Analysis Results of Organisational Identity**

model	variables	unstandardized regression coefficient	standardized regression coefficient	t	Sig.	R	R <sup>2</sup>	F	Sig.
		B	Beta						
1	constant	23.863		6.405	0.000	0.306	0.093	3.369	0.022
	hope level	-0.030	-0.030	-0.302	0.763				
	optimistic level	-0.032	-0.037	-0.380	0.705				
	resiliency	-0.139	-0.293	-2.942	0.004				
2	constant	24.928		7.537	0.000	0.285	0.081	8.847	0.004
	psychological capital	-0.095	-0.285	-2.974	0.004				

In the first model from the chart above we are trying to put the three variables into one regression equation, after that we will notice the model works well with the coefficient of determination R<sup>2</sup> to be 0.093, F to be 3.369 and significance level to be 0.022<(0.05), which has statistical significance. The standardized coefficients of the three variables are -0.03,-0.037 and -0.293. After test the variable t we find that the resiliency is quite obvious while hope level and optimistic level are not obvious which is in accordance with the results from above the correlation analysis. Therefore, it just further proofs that the resiliency has significant negative correlation with their turnover intention, hypothesis 3 has been proved.

In the second model, the hope level, optimistic level and resiliency had been replaced by psychological capital and we may find out the coefficient of determination R<sup>2</sup> in the model is 0.081, figure F of statistical test is 8.847 and significance level is 0.004<(0.05), which has statistical significance. Meanwhile, the standardized coefficient of psychological capital is -0.285, the significance level of t is 0.004< (0.01) which means that psychological capital has significant negative correlation with their turnover intention, hypothesis 4 has been proved, and psychological capital could be a explanatory variable to staffs' organisational identity as a macro-variable.

## 5 Conclusion

This study emphasizes the state of mind of employees about the influencing factors of their turnover intention, which is the most difficult factor to catch of all influencing factors of employees' turnover intention. So, the research is aimed at attention to the factor, this is also the significance of this paper. This study shows employees' psychological capital and its structural elements are observably correlated with turnover intention. Therefore, enterprises should pay high attention to the capital characteristics of employees' psychological capital, and use methods of training, making rules, setting up reasonable tasks and etc to improve the staff's overall psychological capital level by the employees' hope level, optimistic level and resiliency. Our research also has many shortcomings, like numbers of subjects are not enough and questionnaires are the translations of foreign scale.

# Analyzing Organisational Innovation and Deviation Phenomena by Agent Based Simulation and Case Design

Tomomi Kobayashi, Satoshi Takahashi, Masaaki Kunigami, Atsushi Yoshikawa, Takao Terano.  
Tokyo Institute of Technology, 4259 Nagatsuda, Midori-ku, Yokohama 227, Japan  
(E-mail: kbys@triton.ocn.ne.jp)

**Abstract:** This paper describes a new methodology for analyzing organisational innovation and deviation phenomena by combination of agent based simulation and case design. Organisational deviation is inextricably linked to innovation, because they are activities in business firms to break standards in operations. However, it is assumed that the former and the latter are different in terms of external utilities. Under the assumptions, we have developed a unified agent based model and have made simulation for analyzing the emergence process of innovation and deviation. The simulation results are confirmed through manual simulation and case analysis in order to obtain an in-depth understanding of inextricably linked organisational phenomena, and to distinguish the similarities and differences between innovation and deviation.

**Keywords:** Agent based model; Organisational simulation; Organisational Deviation; Case study

## 1 Introduction

Companies tend to control organisational deviation strictly because they would get serious damage when it has been revealed. Direct control of deviation may, however, reduce the power of Innovation, because both deviation and innovation have similar mechanisms of breaking standards.

### 1.1 Similarity of innovation and deviation

In sociology, deviation is classified into three categories<sup>[1]</sup>. First is criminality, second is violating conduct norms, and third is labeling. This paper is based on the concept of the second category, because it contains similar notions to innovation which is achieved from organisational improvement by breaking standards. Our model is built from the belief that organisational deviation and innovation have similar mechanisms, but they are only different in the external utility or disutility.

Organisational deviation does not always occur according to immoral agents' wrongdoing<sup>[2]</sup>. It may emerge from unintentional behaviors of the agents with the bounded rationality, because they tend to act shortsightedly and to converge to local optima<sup>[3]</sup>. It means that if agents have behaved in order to conduct Innovation, they would commit deviation unintentionally by producing disutility to the society. The shortsighted behavior is enhanced by the difficulty with recognizing the utility landscape. Therefore, we incorporate a hierarchical utility landscape into our model by expanding the landscape theory<sup>[3][4]</sup> in order to increase complexity.

### 1.2 Cases of Japanese companies: Toyota and a Pastry company

To convince the idea of the unified framework, we will show cases of Japanese companies. First case is about Toyota, which conducted huge amount of recalls with brake system failure. It is said that increasingly sophisticated brake systems sometimes have problems with unpredictable handling by users. In other words, excessive Innovation may be a cause of this trouble.

In another case, a Japanese pastry company, Akafuku Corp. was accused on suspicion of falsifying the expiration dates of its products. By the analysis, it was revealed that the excessive effort to avoid disposing products was one of the causes of this case. The pastry company possibly did not falsify the expiration dates intentionally. They attempted Innovation activities excessively in order to extend product expiration, and that led them to the violation of law as a result. This case explains that the border between Innovation and deviation is subtle in some cases, and both phenomena can emerge by slight changes in circumstances.

### 1.3 Purpose of this paper

The inextricably linked phenomena such as innovation and deviation are difficult to acquire comprehensive understanding by single method, because they are complicated and ambiguous. Therefore, this paper proposes the approach to inextricably linked phenomena with unified model and multiple methods such as computer simulation, manual simulation, and fictional case description based on the model as shown in figure 1. It enables to get comprehensive and deep understanding of inextricably linked phenomena with distinguishing the common elements and different elements of innovation and deviation

The rest of the paper is organized as follows: Section 2 explains our unified model of Innovation and

deviation; Section 3 shows the simulation experiment settings and results; Section 4 presents case design and analysis approach, and from section 5 to section 9, the details and sample outputs of this approach are explained; Section 10 presents our findings and remarks as a conclusion.

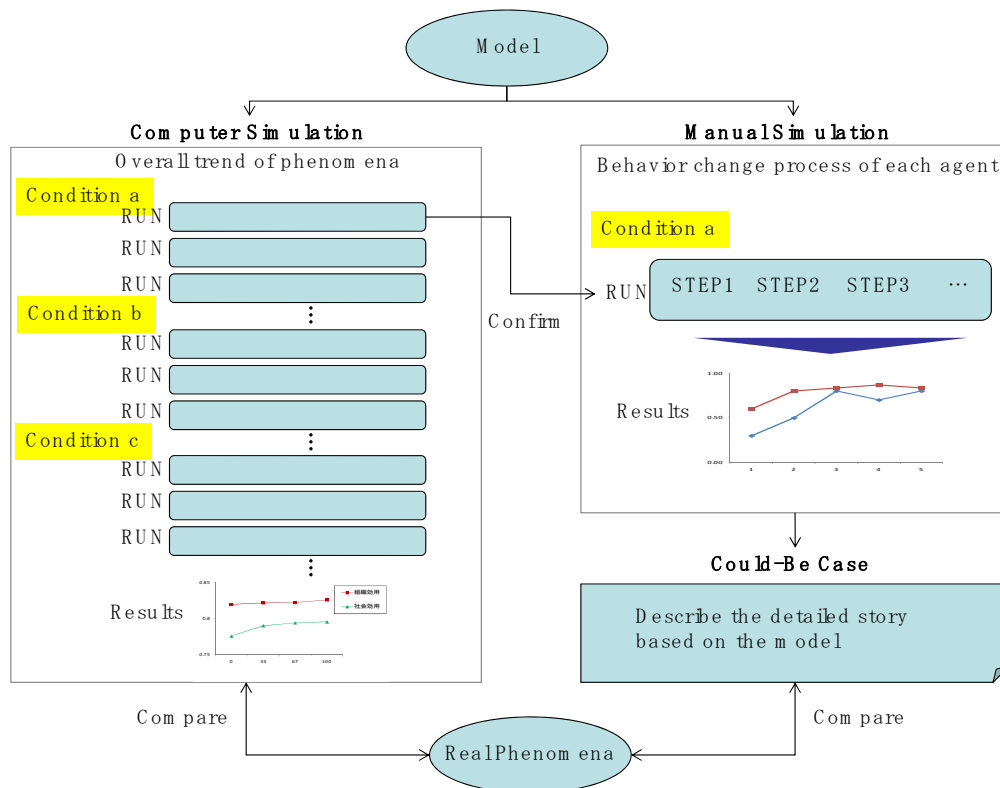

Figure 1 Proposed Approach by Simulation and Case Design Method

## 2 A Unified Model of Innovation and Deviation

### 2.1 Structure of the model

This section describes our unified model of deviation and Innovation, which simplifies a real structure of an organization and the relation between an organization and a society. In this model, hierarchical utility landscape is implemented that consists of three classes: individual, organisational and social utility.

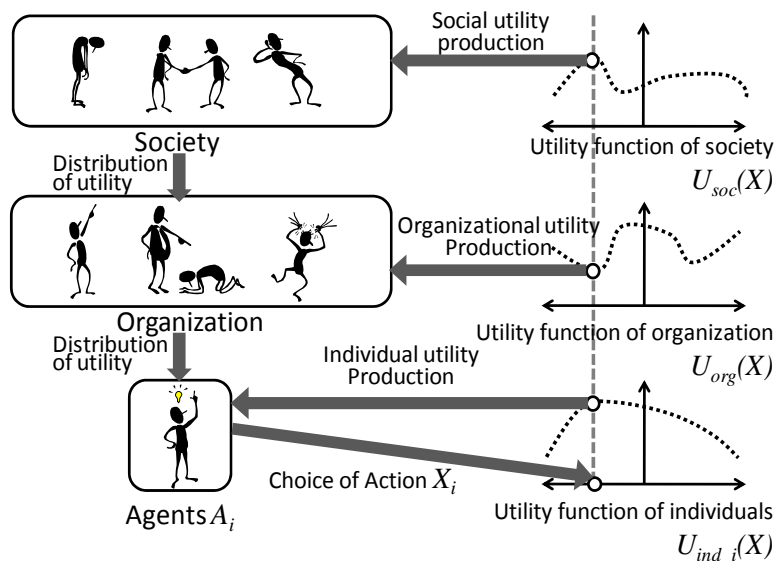

Figure 2 Structure of the Agent Based Model

Figure 2 shows outline of hierarchical utility landscape in our model. Utility function of individuals means experience and values of each agent. Utility function of organization means strategy and business model of a company. Utility function of society means social norms.

In this model, agents choose their actions according to the rewards from organization and information from neighbors. As a result, their utility production amount for an organization and a society is determined based on utility landscape. Agents can recognize their own utilities, however, they cannot recognize organisational and social utility landscape completely. Therefore, both deviation and Innovation may emerge depending on experiment conditions in this model.

For example, in the previous pastry company case, employees could recognize their individual utility: the reduction of product disposals is consistent with their beliefs. On the other hand, they could neither recognize the social regulations, nor company’s damages due to consideration of violating law. In other words, they could neither recognize social utility nor organisational utility landscape thoroughly. As a result, they conducted organisational deviation despite of aiming at Innovation.

Based on the above understanding, we define two types of phenomena as shown in table 1 according to our model: a) Innovation is the increase of both organisational and social utility production, b) Organisational deviation is the decrease social utility production.

**Table 1 The Definition of Innovation and Deviation**

Definition	Organizational utility production	Social utility production
a) Innovation	increase	increase
b) Deviation	increase/decrease	decrease

**2.2 Utility function**

The Utility functions which are described in the previous section, are based on the NK fitness landscape model by Kauffman [5] [6]. NK model determines the values of N integer sequences, and utility landscape is defined by the combinations of K integers.

Figure 3 describes a sample of integer combinations and their values, in case of N=6 and K=1. The variation of utility functions is described by number sequences and their evaluation values. Evaluation value is given between 0 to 1 depending on combinations of integers. The complexity of utility landscape depends on the number of integers and their combinations.

**Figure 3 NK Fitness Landscape Model**

**2.3 Choosing actions of agents**

Each agent changes their action in order to increase their satisfaction according to the following formula. The degree of satisfaction of agents increases along with the rising of their individual utilities:  $U_{ind\_i}(X)$ , rewards from organization:  $Re$ , and contributions for social utility:  $U_{soc}(X)$ .

$$S(U_{ind\_i}(X), Re_i) = U_{ind\_i}(X) + Re_i + U_{soc}(X) \tag{1}$$

Agents imitate the actions of other agents whose actions are similar to them and receiving more rewards from organization, according to the following formula.  $L_{ij}$  means the similarity of action between agents. Agents evaluate their satisfaction after imitation, and then return to original action when their degrees of satisfaction have been declined by the imitation.

$$P_j = \frac{Re_j \times L_{ij}}{\sum_{k \neq i} Re_k \times L_{ik}} \tag{2}$$

The agents produce their own utility, and contribute to organisational and social utility as the result of their actions. The contributions of agents are accumulated in an organization and a society.

**2.4 The variation of reward distribution**

The accumulated external utility is distributed to agents based on their amount of contribution through the system of rewards. The degree of result-based reward is strengthened progressively as shown in figure 3.

**Figure 4 Variation of Reward Distribution**

**2.5 Organisational structure**

Hierarchical organisational structure which consists of three layers is brought into our model, because hierarchical structure is seen in many companies. Figure 5 shows the structure of organization and the number of agents in each layer. There are 39 agents in total.

**Figure 5 Organisational structure**

**2.6 Elements of the model**

Table 2 lists the elements of our model which are described in previous sections. The elements are defined based on description standard of agent based modeling [7] [8] and categorized in four groups; Landscape, Characteristics of Organizations, Behavior of Organization Members, Result of Behavior.

**Table 2 Elements of the Model**

Category	Elements of Agent Based Model
Landscape	Hierarchical Landscape: Social Utility, Organizational Utility, Individual Utility
	NK Model: Conflict between Social Utility and Organizational Utility
Characteristics of Organizations	Utility Distribution
	Diversity of Individual Utility
	Network Structure
Behavior of Organization Members	Network Setting Up Rule
	Behavior Status Change of Agents
	Structure of Agent's Satisfaction
	Hill Climb and Imitation Learning Algorithm
	Incomplete Information Environment
Result of Behavior	Variation in Social Utility, Organization Utility, Individual Utility Production

### 3 Simulation Experiment

Based on the descriptions of the model in previous section, we have developed the simulator according to agent based computational architecture [9] in Java language. This section describes settings and results of the agent based simulation experiment. Those results are confirmed by manual simulation and case description in following section.

#### 3.1 Experiment settings

In this experiment, we set the two types of parameters. Those are 1) diversity of agents, and 2) conflict of utility function as shown in table 3. We set each experimental condition, and investigate the changes in utility production amount of an organization and a society by altering the combinations of those parameters. In the next subsections, simulation experiments are organized according to those parameters.

**Table 2 Experiment condition**

Parameters	Conditions		
1 Diversity of agents	0% uniform	↔	100% diversified
2 Conflict between social utility function and organizational utility function	0 synchronized	↔	1 contrary

#### 3.2 Experimental results of diversity of agent's characteristics

Figure 6 shows the result that is emerged when improving diversification in agents. We control the diversity by increasing and decreasing the number of agents who have same individual utility function. All agents have unique utility functions in the organization with 100% diversity, while they have common utility functions in the organization with 0% diversity. The other conditions are fixed; conflict degree between utility functions is 0.4 and result-based reward is second degree.

In figure 6, both social utility and organisational utility productions are increasing with improving diversification. This result suggests that the diversification in agents prompts Innovation type activities according to the definitions in Table1, and the result is corresponding to previous study [10].

**Figure 6 Utility production change that occurs with diversification**

This result means that mutual imitation in diversified organization makes individual utility production decline, because individual utility functions of agents are different from each other. As a result, agents tend to increase organisational utility and social utility production amount in order to complement the lowering of individual utility production, and to maintain their satisfaction which is determined by the formula (1).

**3.3 Experimental results by the conflicts between utility functions**

Figure 7 represents the result of changing conflict degree between social utility and organisational utility functions. The other conditions are fixed; diversity of agents is 100% and result-based reward is second degree.

In figure 7, both social utility and organisational utility production are declining with strengthening of contradiction in social and organisational utility function.

This result means that conflict in the utility landscape prompts organisational deviation and also causes stagnation phenomenon according to the definition in Table2.

**Figure 7 Utility Production Change Occurs with Strengthening of Contradiction in Utility Functions**

**4 Case Design and Analysis Approach**

Figure 8 presents the steps of case design and analysis. The simulation results in previous section are confirmed through these steps moreover innovation and deviation phenomena are analyzed from different point of view. The overview of case design and analysis approach is as follows.

The first section is Case Settings. In this section, the model elements are converted to the elements of business management. Then case story template and utility landscape are developed according to those elements. The second section is Could-Be Case Development. In this section, manual simulation is conducted based on utility landscape. And could-be cases are developed in line with the case story template. The third section is Confirmation of Simulation Results. The results of agent based simulation are confirmed by the manual simulation in this section. The fourth section is Case Analysis. The could-be cases based on the agent based model are compared to relative real cases, and differences in description are analyzed.

The details and sample outputs of each section are explained in following chapters.

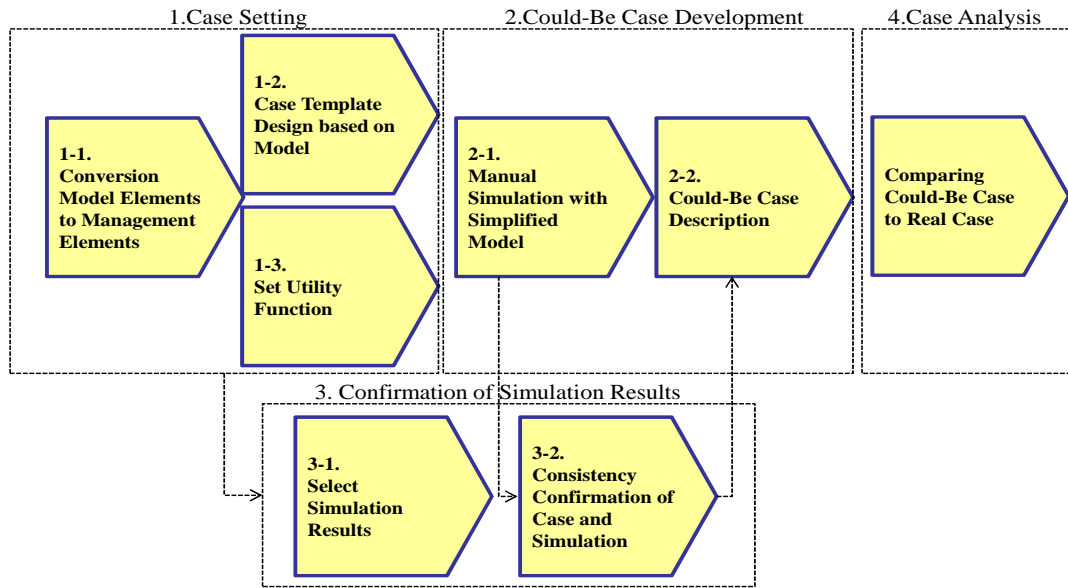

Figure 8 Case Design and Analysis Approach

## 5 Case Settings

### 5.1 Conversion model elements to management elements

The elements of the model which are shown in table 1 are converted to the elements of business management in order to develop the template for case description. Table 3 shows the result of conversion.

Table 3 Comparison of Model Elements and Business Management Elements

Category	Elements of Agent Based Model	Elements of Business Management
Landscape	Hierarchical Landscape: Social Utility, Organizational Utility, Individual Utility	Social Norms, Business Model, Individual Value
	NK Model: Conflict between Social Utility and Organizational Utility	Conflict between Social Norms and Business Model
Characteristics of Organization	Utility Distribution	Personnel System
	Diversity of Individual Utility	Diversity of Organization
	Network Structure	Communication Environment in Organization
Behavior of Organization Members	Network Setting Up Rule	Encounter among Employees
	Behavior Status Change of Agents	Behavior Change of Employees
	Structure of Agent's Satisfaction	Source of Employee's Motivation
	Hill Climb and Imitation Algorithm	Learning Mechanism of Employees
	Incomplete Information Environment	Cognitive Limit
Result of Behavior	Variation in Social Utility, Organization Utility, Individual Utility Production	Variation in Legal Compliance, Corporate Earnings, Employee's Motivation

### 5.2 Case template design based on model

The elements of business management listed in table 3 are organized and mutually interrelated in figure 9 as a template for case description. The common template shown in figure 9 is customized according to specific situations, and case stories are developed based on the template.

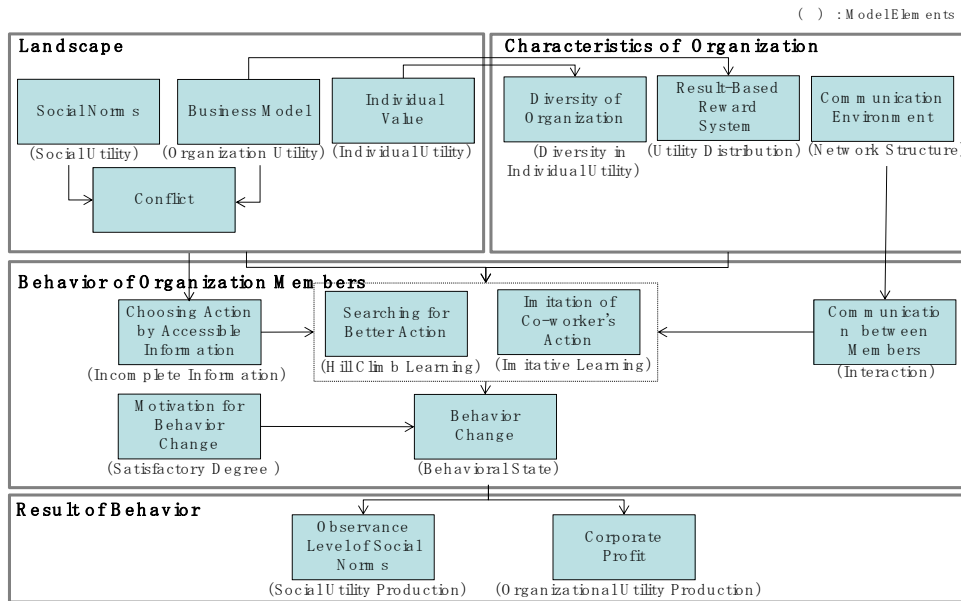

Figure 9 Case Story Template

5.3 Set utility function

A specific case situation is set in table 4 and table 5 using NK model which is described in 2.2. We have set N=3 and K=1 for case settings and manual simulation.

A fictional food maker is assumed in this paper. We assume that this food maker is required to reduce the production cost because of increasing competition however there are strict regulations in food industry.

Table 4 Case Situation Settings on NK Model

Options	Alternatives of manufacturing control (N=3)		
	1. Cost Reduction	2. Use-By Date Setting	3. Quality Control
0	Production Process Efficiency	Based on Guidelines	Bacteria Test by Devices
1	Waste Prevention of Raw Materials	Based on Judgments in Manufacturing Premise	Flavor Test by Human Work

Table 5 Dependence Relationship between Alternatives

Combination of Alternatives	00	01	10	11
Safety of Products	High	Medium	Medium	Low
Cost Reduction Effect	Low	Medium	Medium	High

6 Manual Simulations with Simplified Model

Before case development, utility landscapes are set based on NK model, and manual simulation based on simple NK model is conducted. Table 6, 8, and 9 show the utility landscapes which mean social norms, the food maker's policy of manufacturing control, and each assembly leader's policy. The situation of case A is that all assembly leaders have same management policy, so that means uniform organization. The case B is that each assembly leader has different management policy, so that means diversified organization. In the case C, diversified organization is set as same as case B, however the conflict between social norms and food maker's policy is more significant.

The landscape settings, the process, and results of manual simulations of those three cases are

describes in following subsections. The manual simulation enables the confirmation of computer simulation results by tracing the behavior changing of each agent particularly.

**6.1 Manual simulation: case A**

In case A, there is a certain degree of conflict between social norms and food maker's policy, and all assembly leaders have same cost-conscious management policy as shown in table 6. Table 7 describes the process of manual simulation of case A, which is conducted according to landscape settings and model rules. Each assembly line leader conducts behavior change by searching for more satisfactory action, and also imitating of another leader's action according to NK model settings as shown in table 7.

Figure 10 shows the transition of utility production by assembly leaders as the results of behavior change. The social utility production means contribution to society by protecting of food safety. The organization utility means contribution to corporate objectives such as cost reduction. Assembly leaders receive rewards by their contributions. The individual utility means comfort of leaders which are achieved by the consistency with their management policies. As shown in figure 10, deviation type phenomenon emerges because social utility production amount is decreasing while organization utility production is increasing. It is because that all assembly leaders have cost-conscious management policy, and the food maker has also cost-conscious management policy while balancing with food safety.

**Table 6 Utility Landscape Setting: Case A**

Combination (K=1)	Evaluation Value				
	Society	Company	Assembly Line Leaders		
	Safety-Conscious	Safety and Cost Balance	Leader1 Cost-Conscious	Leader2 Cost-Conscious	Leader3 Cost-Conscious

	Organization Utility Production	0.27	0.30	0.30	0.30	0.30
	Individual Utility Production	0.20	0.30	0.30	0.30	0.30
	Reward	0.24	0.33	0.30	0.30	0.30
Satisfaction	0.74	0.83	0.80	0.80	0.80	

Figure 10 Manual Simulation Result: Case A

6.2 Manual simulation: case B

In case B, there is a certain degree of conflict between social norms and food maker's policy, and each assembly leader has different management policy as shown in table 8. The management policy of leader 1 is safety conscious, leader 2 is balance of safety and cost, leader 3 is cost conscious.

Figure 11 shows the transition of utility production by assembly leaders as the results of behavior change. As shown in figure 11, innovation type phenomenon emerges because social utility production and organization utility production amount are increasing. It is because that leader 1 and 2 have found the appropriate action which enable the increasing of both social utility and organization utility by own searching. And in addition, leader 3 who has cost conscious policy, has imitated their actions although he could not find the appropriate action by himself.

The explanation of manual simulation process of case B is omitted.

Table 8 Utility Landscape Setting: Case B

Combination (K=1)	Evaluation Value				
	Society	Company	Assembly Line Leaders		
	Safety-Conscious	Safety and Cost Balance	Leader1 Safety-Conscious	Leader2 Balance	Leader3 Cost-Conscious
00	0.4	0.1	0.4	0.1	0.1
01	0.3	0.4	0.1	0.4	0.1
10	0.2	0.3	0.1	0.4	0.1
11	0.1	0.2	0.1	0.1	0.4
000	0.40	0.10	0.40	0.10	0.10
001	0.30	0.27	0.20	0.30	0.10
010	0.30	0.27	0.20	0.30	0.10
100	0.30	0.27	0.20	0.30	0.10
011	0.20	0.30	0.10	0.30	0.20
110	0.20	0.30	0.10	0.30	0.20
101	0.20	0.30	0.10	0.30	0.20
111	0.10	0.20	0.10	0.10	0.40

Figure 11 Manual Simulation Result: Case B

6.3 Manual simulation: case C

In case C, each assembly leader has different management policy as same as case B, however there is significant degree of conflict between social norms and food maker's policy as shown in table 9.

Figure 12 shows the transition of utility production by assembly leaders as the results of behavior change. As shown in figure 12, social utility production is kept low level compared to organization utility. As a result, innovation type phenomenon does not emerge in case C even though the organization is diversified as same as case B. It is because that the food maker applies the highly cost conscious policy, so that assembly leaders do not select the action of increasing product safety which leads them to reward decreasing because of result-base reward system. The significant conflict between social norms and corporate policy inhibits the searching ability of diversified organization.

The explanation of manual simulation process of case C is omitted.

Table 9 Utility Landscape Setting: Case C

Combination (K=1)	Evaluation Value				
	Society	Company	Assembly Line Leaders		
	Safety-Conscious	Cost-Conscious	Leader1	Leader2	Leader3
			Safety-Conscious	Balance	Cost-Conscious
00	0.4	0.1	0.4	0.1	0.1
01	0.3	0.2	0.1	0.4	0.1
10	0.2	0.3	0.1	0.4	0.1
11	0.1	0.4	0.1	0.1	0.4
000	0.40	0.10	0.40	0.10	0.10
001	0.30	0.20	0.20	0.30	0.10
010	0.30	0.20	0.20	0.30	0.10
100	0.30	0.20	0.20	0.30	0.10
011	0.20	0.30	0.10	0.30	0.20
110	0.20	0.30	0.10	0.30	0.20
101	0.20	0.30	0.10	0.30	0.20
111	0.10	0.40	0.10	0.10	0.40

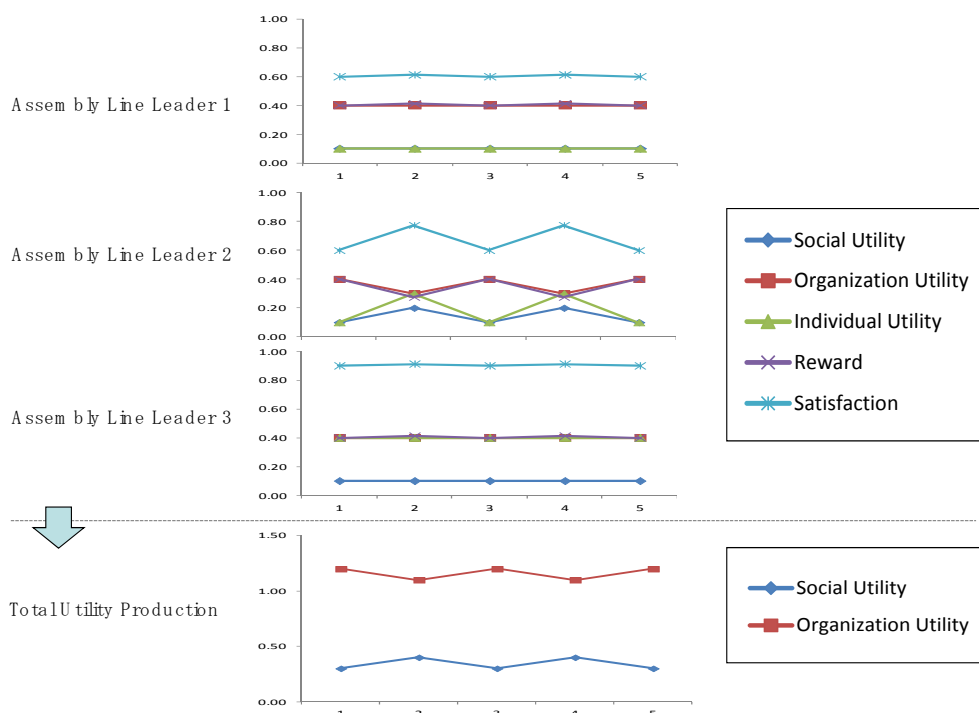

Figure 12 Manual Simulation Result: Case C

## 7 Confirmation of Simulation Results

In section 3.2, the computer simulation result is shown in figure 6 which is suggesting that the diversification in agents prompts Innovation phenomena. This result is confirmed by manual simulation in section 6.1 and 6.2 by observing the behavior change of each agent. The results of manual simulation show that diversified organization tends to emerge innovation type phenomena in case B while uniform organization tend to emerge deviation type phenomena in case A.

In section 3.3, the computer simulation result is shown in figure 7 which means that conflict in the utility landscape prompts organisational deviation even though diversity of agents is 100%. This result is confirmed by manual simulation in section 6.2 and 6.3. The results of manual simulation show that agents do not select the action of increasing product safety, for avoiding reward decreasing in case C.

## 8 Could-Be Case Description

A fictional case is described in this chapter based on the case story template (figure 9) and the results of manual simulation. There are two purposes of model based case description. The first is to understand the emergence process of innovation and deviation at more detailed level than simulation. The second is to compare the description level of model based case with that of actual case which describes real innovation and deviation phenomena.

The underlined portions are model elements and the italic words in parenthesis are the name of model elements. Only the story of case A is described in this paper. The stories of case A and B are omitted due to space limitation.

### 8.1 Story of case A: uniform organization

A food maker applied the product cost reduction policy because of severe competition in food industry. The company intended to balance cost reduction and product safety (*Organization Utility Function*), however its policy was not completely fit to the requirements from consumers (*Conflict between Social Utility and Organisational Utility*).

In the food maker, the education programs were conducted for employees in order to strengthen their sense of cost reduction. As a result, most employees shared strong cost-consciousness (*Individual Utility Function*) in that company. Under the situation, cost reduction activities were executed in one of the factory in the food maker as follows.

There were three assembly line leaders in the factory whose cost reduction policies were different from each other at the beginning. The assembly line leader 1 applied the safest way in three leaders. He

sought production process efficiency, set use-by date based on guidelines, and conducted bacteria test for quality control (*Behavior Status*). The leader 2 applied same method of cost reduction and use-by date setting as leader 1, however he conducted flavor test instead of bacteria test (*Behavior Status*). The leader 3 pursued waste prevention of raw materials, but ensured product safety by set use-by date based on guidelines, and conducted bacteria test (*Behavior Status*).

In that situation, the assembly line leader 1 who applied the safest policy received the least reward according to the result-based reward system (*Utility Distribution*). The leader 1 was frustrated at less reward and changed his way of quality control from bacteria test to flavor test by imitating the way of leader 2 (*Imitation Learning*). At the same time, the leader 2 and 3 applied the method of setting use-by date based on case-by-case judgments for more cost reduction achievement through their trial and errors (*Hill Climb Learning*). This method had a risk of product safety decreasing, however it was consistent with their cost-conscious policy (*Individual Utility Function*). Therefore the leader 1 received less reward again because the leader 2 and 3 applied more effective cost reduction method (*Individual Utility Function*), even though he imitated the method of leader 2 previously. So that, the leader 1 imitated the method of leader 2 again (*Imitation Learning*), because leader 2 received more reward than him.

As described above, all three leaders applied more effective cost reduction method while sacrificing the safety of products. They recognized the methods which are effective for product safety, but they were not satisfied with those methods because of inconsistency with their cost-consciousness and less reward (*Structure of Agent's Satisfaction*). As a result of assembly line leader's behavior change, the factory achieved cost reduction target (*Organization Utility Production*), however its risk of reducing the product safety increased significantly (*Social Utility Production*).

### 9 Case Analysis

Three case stories are compared with each other and common elements and different elements by cases are distinguished in figure 13. According to the computer simulation, it is detected that diversity of organization and conflict between social norms and corporate policy may be the branch condition of innovation and deviation. Moreover, not only the branch conditions of innovation and deviation but also their impacts on the behavior of agents are detected by the manual simulation and case description.

Figure 13 Common Elements and Different Elements by Cases

### 10 Conclusion

This paper presented a methodology for analyzing inextricably linked phenomena such as organisational innovation and deviation by combination of agent based simulation, manual simulation and case description.

As described in the beginning of this paper, both Toyota and the pastry company intended to conduct innovation in order to increase their organisational utilities, however they fell into deviation by unintentional decreasing of social utility. For example, Toyota conducted huge amount of recalls with brake system failure and the pastry company falsified the expiration dates of products. According to the results of simulation and case description, it is detected that the emergence of deviation or innovation depends on those conditions; diversity of organization, and conflict between social and organisational landscape. It is also detected that innovation phenomena emerges in the diversified organization on consistent utility landscape, and that how these conditions impact on behavior and learning activity of agents.

The advantage of this method is that it enables to approach toward inextricably linked phenomena with unified model and the combination of multiple methodology for analysis .

In the further work, we would refine the method of manual simulation and model based case description with applying this method to another type of inextricably linked phenomena.

## Logistics Management Innovation of Tobacco Industry Based on Green Supply Chain Management

Zheng Zilin

Tobacco Monopoly Bureau (Co.), Huhhot, P.R.China, 010070

( E-mail: embanmg@163.com )

**Abstract:** With the strategy of sustainable development, environmental impact and the optimization of resources utilization has been considered in supply chain management, the concepts of green supply chain management begin to arise, therefore, reforms and innovations become necessary for logistics management which is an important link of supply chain, this is the same truth for tobacco industry in which logistics is one of the core business. This paper makes clear the concepts and intension of green supply chain management, summarize the present research status of logistics management innovation of China and international tobacco industry, under the circumstances of green supply chain, using the exploratory research method, analyzes the problems existed in tobacco industry logistics management, with the intent of sustainable development, puts forward the logistics management innovation of tobacco industry through thought, methods and system innovations which on the basis of green supply chain management, to achieve the win-win situation of both economic and social benefits of every member in tobacco industry supply chain.

**Keywords:** Green Supply chain management; Exploratory research method; Tobacco; Logistics management; Innovation

### 1 Introduction

With the opinion of sustainable development strengthened in the field of logistics management and supply chain, green supply chain management arose at the moment. It is the Manufacture Research Committee (MRC) of Michigan State University who first proposed the concepts of green supply chain, they put forward this brand-new concept in 1996 when they were doing the research of “Environment Responsible Manufacture” (ERM), they thought that green supply chain is a kind of crossing and integration between environmental awareness, the effective utilization of resources and energy with every link of the supply chain, its aims are the highest resources utilization, the smallest impact for environment and the optimization of system benefits. The scholars in China also gave their own definitions for green supply chain: green supply chain management is a new kind of management thought, method and technology formed on the basis of traditional supply chain management which further emphasizes the basic thought of green manufacture, it requires that every link in supply chain including all supplier, manufacturer, wholesaler, retailer, consumer and recycle merchant should emphasize environment protection and resource utilization, to promote harmonious development of economy with environment and finally achieve the win-win situation of economic and social benefits.<sup>[1]</sup> According to the above definitions, the intension of green supply chain management includes two aspects: one is that green supply chain management which aims to sustainable development is strategy management; the other is that the effective practice of green supply chain management is a system engineering, the cooperation of every link member in supply chain is necessary, the final purpose is not only the win-win situation of each link member, but also for the entire supply chain.

In China, tobacco industry is one of the main industry and is a controversial industry, too. As one of the core business of tobacco industry, logistics is bound to be the core competitiveness of tobacco industry in future, therefore, the research on logistics management innovation of tobacco industry will become the hotspot of research in logistics field.

In 1998, The Center for Advanced Purchasing Studies of America published “Environmental Green Supply Chain Management”, mainly introduced some analysis tools and cases. In 2008, the special issue “Greening Supply Chain Management” is published by the international journal Greener Management International. In recent years, most related references abroad are qualitative analysis on the basis of investigation research and international comparison, most research focus on green purchasing, environmental assessment system and transverse logistics, there is few system theories and methods research of logistics management innovation from the point of view of green supply chain management, there is even fewer research paper on logistics management innovation of tobacco industry from the point of view of green supply chain management.

In China, the research on logistics management and green supply chain management has just

started, some scholars in academic field has done a series of research. In 2004, in the book of “Green Supply Chain Management”, Zhu Qinghua comprehensively introduced and analyzed the generation, content, analyzing tools, related technology and strategy of green supply chain management from theory and application, some cases are introduced and analyzed, too. In 2009, in the book of “The Innovation of Enterprise Logistics Management”, Gu Hanwen made some probes on how enterprises to achieve the integration and centralization of logistics management innovation, and deeply discussed the logistics innovation of enterprise logistics cost management, service management, logistics outsourcing and logistics alliances, etc. Most research papers on logistics management innovation of tobacco industry are seen in some periodicals, such as “Logistics Operation Status and Direction of Tobacco Commercial Enterprise” of Dong Xiangjun in “Logistics Engineering and Management”, “Exploration of Tobacco Logistics Management Based on Green Logistics” of Zhao Jingyuan in “Logistics Technology”, etc, but, the starting point of these papers is how to increase enterprise economic benefit, there are few papers discussing logistics management innovation from the point of view of green supply chain management and with the purpose of sustainable development.

This paper takes the sustainable development as guidance, views ecological economy and economic development as a cause-and-effect organic whole, puts supply chain as the background of tobacco industry logistics management, makes green supply chain management as the basis of tobacco industry logistics management innovation, discusses the methods of logistics management innovation to achieve the win-win situation of both economic benefits and social benefits in tobacco industry.

## 2 The Problems Existed

As the largest tobacco production and consumption country in the world, there are 30% of global cigarette consumers in China, tobacco industry takes crucial position in China national economy. With China being a member of WTO, tariff of tobacco products is reduced, quota and license control is loosened and even canceled, abroad tobacco products pour in, there will be bitter competition and challenges in China tobacco market from abroad tobacco magnate, logistics which is called “The third profit source” will become important method for enterprises facing competition. However, the research of logistics management in China has just started and the research on logistics management of tobacco industry is only in the past few years, there are many problems existed in the thought, theoretical research and practical works of logistics management.

First, the thought of logistics management falls behind. For a long period, the understanding of tobacco industry to logistics commonly limited on the value-added practice such as transportation and storage, lacking of understanding and research on high value-added practice such as design of logistics system, logistics service and logistics information system which considering logistics of the tobacco industry under the background of supply chain, not even to mention the research on the environmental and resources cost of logistics activities from the point of view of sustainable development, lacking of the thought that modern logistics is “the third profit source”, not able to consider logistics management as the key to promote manufacture process and strengthen market management, but to put logistics activities on subordinate position. All these backward thought definitely lead to the situation that logistics system and logistics management fall behind.

Second, the methods of logistics management fall behind. In developed countries, from 1970s, the computer technology, information technology, bar code and satellite position system and so on has gradually become the effective auxiliary methods in tobacco enterprise logistics management, the advanced technology such as MRP, MRPII, ERP and JIT and advanced management methods such as activity-based costing, supply chain management have been introduced, applied and spread in logistics management. In China, although computer management has been basically achieved in tobacco industry enterprise, the development and application of professional logistics information system still fall far behind. For time being, tobacco industry lacks the unified logistics management information platform on the two levels of municipal and provincial, there are many types of logistics software, the system integration is not high, the integrated information network of production, commerce and retail has not been fully linked up; logistics center location, the route optimization of transportation and optimization of storage are still in the stage of half-human decision; the technology content of logistics practice is not high, inefficient human work is in the majority, forklift truck, guided crane, automated guided vehicle and automatic sorting machine are not widely used in logistics practice; logistics cost information system is not formed, the operation of logistics management is rather empirical. All these factors seriously restrain the effectiveness of logistics management.

The third, the standardization of logistics management falls behind. After China being a member of WTO, logistics globalization is the inevitable tendency, the key is the logistics standardization for China tobacco industry logistics system to integrated with the standards of international logistics system. For recent years, a considerable progress has been achieved in China tobacco industry logistics standardization process, there are a dozen of logistics or related standards released, but there is still huge distance from the real standardization, mainly including: The first, there is little consciousness of logistics standardization, socialized division of specialty is not scientific, the degree of standardization is low, the broken rate is high, the speed of logistics is greatly reduced, the cost of logistics increases; the second, there are many logistics standards but few precise, the revision of logistics standards can not keep the pace with the requirement of industry development, every region, every industry and even every enterprise works on their own, diversified differences and flaws of logistics standards restrain the coordinate operation of logistics, the complete and fluent supply chain can hardly be formed for goods flow through every link of manufacture, circulating and consuming, there exist huge waste of human resources, time and space resources, the cost of logistics keeps high, as the logistics cost data from 2009 to 2011 of a provincial tobacco company shown in table 1, we can see the tobacco industry logistics cost increases with yearly; the third, the percentage of international standards adopted is low, for national standard, industry standard or enterprise standard, the percentage of standards which can be the same with international standards is low, that is even fewer for considering international environmental standard in logistics standards or directly applying the international environmental standard in logistics management, all these factors certainly will be the barriers for modernization and globalization of logistics management.

**Table 1 The Logistics Cost From 2009 To 2011 Of A Provincial Tobacco Company**

Category \ Year	2009	2010	2011
logistics cost	262 million yuan	2627million yuan	302 million yuan

### 3 Basic Contents and Specific Measures

Tobacco industry logistics management runs through the whole process of cigarette production and sale of tobacco industrial and commercial enterprise, according to industry standard, there are three kinds of tobacco logistics: tobacco raw materials logistics, tobacco production enterprise logistics and tobacco transportation and distribution logistics. For logistics of different stages in supply chain, although the operation procedures are different, the thought, methods and system of logistics management can be referred to each other and even be shared. Therefore, this paper aims at the above problems existed in tobacco industry logistics management of China, under the circumstances of green supply chain, take the sustainable development as purpose, proposes logistics management innovation of tobacco industry in the aspects of thought, methods and system.

#### 3.1 Thought innovation

Thought revolution is the premise of material revolution and social revolution. Thought innovation is a field of innovation that can not be disregarded, it is of great importance to the economy development and promoting social progress. Logistics management thought innovation of tobacco industry based on green supply chain includes two aspects: one is to establish the thought of tobacco industry logistics strategy management based on supply chain, the other is to establish the thought of tobacco industry green logistics based on green supply chain.

##### 3.1.1 Establish the thought of logistics strategy management

The so-called logistics strategy management is a kind of comprehensive management for enterprise logistics activities, includes a series of management decisions and actions of enterprise to draw up, carry out, control and evaluate logistics strategy, its core question is making enterprise logistics activities compatible with environment, to achieve the long-term and sustainable development of logistics.<sup>[2]</sup>Based on this notion, to establish the thought of tobacco industry logistics strategy management based on supply chain requires taking the view of supply chain, carrying out the comprehensive management for tobacco industry enterprise logistics activities which includes activities between industrial enterprises, between industrial with commercial enterprises and between commercial enterprises, its core question is making enterprise logistics activities compatible with environment and the development of supply chain, to achieve the long-term and sustainable development of logistics. Under the guidance of this thought, tobacco industry enterprises should emphasize the reforms on these two aspects:

The first, enterprises should think logistics management as the strategy management. Under the

circumstances of supply chain, the effective proceed of logistics activities is helpful not only for the efficiency of enterprise daily operation, but also for promoting the competitiveness of enterprise, the more important is that it can speed up all kinds of flows (capital flow, information flow, material flow) in supply chain, promote the operation efficiency of the whole supply chain. Therefore, enterprises have to think logistics strategy as an important part of total strategy, even the same with operation strategy.

The second, enterprises should carry out coordinate logistics strategy in supply chain. Coordinate logistics means that breaking results limit of each enterprise, through coordination and union, creating the most suitable logistics operation structure. The tobacco industry coordinate logistics strategy is based on two reasons: the personalization and diversification of cigarette consuming demand cause the distribution of various of kinds, small volume and frequently; on the other hand, some small and medium-sized enterprises do not have the capacity of just-in-time distribution and associated logistics system, they can not meet the distribution requirement of frequently and small volume. For the time being, coordinate logistics strategy is classified as transverse coordinate logistics strategy, longitudinal coordinate logistics strategy and the third party coordinate logistics strategy, for tobacco industry, between industrial enterprises or between commercial enterprises, they can select transverse coordinate logistics strategy according their own condition, between industrial enterprise and commercial enterprise, they can select longitudinal coordinate logistics strategy, for some smaller size municipal enterprise, the clients dispersed and sale volume is small, if they operate logistics independently, the cost generated will largely offset enterprise profit, they may consider the third party coordinate logistics strategy with the third party such as postal logistics.

### 3.1.2 Establish the thought of green logistics

The concepts of green logistics arose in the 1990. For the time being, there is not an internationally accepted definition for green logistics, different scholars all have their own opinions. Wu and Dunn think green logistics is a kind of environment-oriented responsible logistic system, including green forward logistics from purchase of raw materials, production, packaging, transport and storage to delivery to users as well as green management of waste recycling and reverse logistics.<sup>[3]</sup> Jorn and Palle think green logistics is Eco-Management for forward logistics and reverse logistics.<sup>[4]</sup> The logistics management innovation based on green supply chain management inevitably requires the sustainable development as the final purpose, to establish the thought of green logistics is also the inevitable choice of this requirement. Green logistics of tobacco industry includes two aspects:

The first is to control the pollution of logistics system, it means that adopting the scheme which has the lowest environmental pollution in the planning and decisions for physical system and logistics activities. To control logistics pollution requires enterprises think from the point of view of supply chain, through every stage of supply chain, keep the though in mind of environmental protection and resources effective utilization. In raw material stage, tobacco industrial enterprise should be strict with the selection of raw material such as cut tobacco, cigarette paper and filter rods, as far as possible select harmless environmental protection material for production, select recyclable or pollution-free disposable material for cigarette packing products and strictly eliminate the phenomenon of cigarette excessive packaging; in tobacco production logistics stage, as far as possible select the production mode with noise-free and smallest resources waste; in cigarette circulation and distribution logistics stage, select the truck model of smallest discharge, distribute in short distance and at night time for avoiding traffic jam and to save fuel and decrease emissions; in recycle and waste material logistics stage, deal with responsibility for cigarette packing materials such as paper box and plastics, making money and also care about the aftermath.

The second is to establish scientific disposing procedure for cigarette waste and confiscation of fake cigarette. In the production and operation process of tobacco industrial enterprise, there is a lot of cigarette waste such as waste cut tobacco, cigarette paper, filter rods and packing materials, and there is a huge amount of fake and low-quality cigarette confiscated in the anti-counterfeiting activities of commercial enterprise. For a medium size prefecture-level city, there are about 400—600 pieces, or 20000—30000 items, of fake and low-quality cigarette confiscated yearly, the traditional disposing method is burning to destroy for these waste and fake cigarette, the burning process mostly locate at garbage field out of city, about ten ships of huge container are needed for transporting these waste to garbage field, a large amount of fire-assistant such as diesel need be transported, too. It is clear that, the logistics process of these waste is time-consuming and expensive, there is a great potential safety hazard, too, more than this, there are a huge amount of dense smoke and nitrogen oxide generated in the disposing process which makes great pollution. For the purpose of sustainable development, the logistics department of tobacco industrial and commercial enterprise have to establish the specific and

pollution-free logistics and disposing process, to avoid environmental pollution resulted from mismanagement.

### **3.2 Methods innovation**

Although the logistics management methods of enterprises in different supply chains are not the same, the field of management informationization and socialization requires all enterprise to set foot in, tobacco industry is no exception, this paper probes into the methods innovation of tobacco industry logistics management from the point of view of the informationization and socialization of logistics management.

#### **3.2.1 Informationization of logistics management**

Logistics activities must be accompanied with a lot of information flow activities, in-time, accurate and plenty of information greatly increase the effectiveness of logistics activities. The sustainable development of tobacco enterprise and supply chain depend on advanced information system, the same as well, the sustainable development of logistics management can not be without advanced information system. Informationization of tobacco industry logistics management includes two aspects:

The first is to set up logistics information platform based on supply chain. The enterprises in supply chain need to break the situation that they work on their own, through information technology, enterprises should integrate logistics resources, to achieve information sharing, keep the information channels open of supply chain, make information acquirement and update in-time and effective. The establishment of logistics information sharing platform in tobacco industry should be based on the common information platform from all parts of the country and National Bureau. China Tobacco E-commerce Company or Tobacco Standardization Committee should take the lead to use XML and Web Service technology to determine resources sharing integration construction standard, and then use the standard to integrate the information platforms under the jurisdiction of all provincial units, so as to form industrial resource information sharing platform. Through the information platform, the production and sales enterprises can achieve dynamic real-time query and visual functions; they can master merchandise sales trend in real time; they can master the varieties, amount, quality and store time of warehousing in real time; they can query the dynamic situation of transporting capacity resources in specific line, and select suitable transport enterprise and carrier; they can select the redundant store capacity of union enterprise, and automatically connect to the warehousing management system of warehouseman, so as to achieve dynamic management on merchandise inventory.

The second is using advanced technology to optimize the information platform. For the time being, a lot information technology has been used in logistics management, there are electronic data interchange system (EDI), barcode technology, point of sale information system (POS), electronic order system (EOS), wireless radio frequency technology (RF), satellite position system (GPS), geography information system (GIS) and data storage technology, etc. For time being, the technology of wireless radio frequency electrical ID(RFID), EOS and data storage have been widely used in some large-scale tobacco industrial and commercial enterprises, but, there are very few tobacco enterprises using the technology of GPS and GIS which are most important for the completion of tobacco industry logistics system.

#### **3.2.2 Socialization of logistics management**

The socialization of logistics management referred in this paper means logistics outsourcing. Logistics outsourcing can be part of enterprise logistics function, also can be the whole logistics function, it can be one-time trade relationship and also can be long-term partnership. For the time being, the models related with logistics outsourcing are the third party logistics and the fourth party logistics.

If logistics capacity can not be the enterprise core competitiveness, or logistics management is not in the high level, outsourcing logistics function to the third party logistics enterprise would decreased enterprise operation cost or improved customer service quality. Stated as above, some smaller-scale tobacco commercial enterprise may decrease their operation cost through selecting the third party logistics.

The idea of the fourth party logistics management is born out of the third party logistics, generally, the fourth party logistics is: focused on the contract, establish a new kind of relationship between enterprises(consignor or consignee) with some third party logistics supplier and technology service supplier, and give comprehensive management and guidance for the logistics activities of the series of supplier and clients(consignor or consignee) in supply chain with a few third party agents in the network of "vertical integrated" or "horizontal integrated". As the integrator of supply chain, the fourth party logistics is not a simple integration of the third party logistics, but melting organically the functions of consultation, finance and information technology into the third party logistics, so it has stronger logistics

management capacity than the third party logistics, capable to afford specific technology service such as technology, supply chain techniques, marketing and project management. For example, American Ryder Integrated Logistics became strategic allies with information technology magnate IBM and Accenture Consulting, it makes Ryder Logistics having special capacity in technology and supply chain management. China tobacco industry may learn from the experience of Ryder, introducing the fourth party logistics, become strategic allies with domestic and abroad famous logistics consulting company, acquiring the management ability of logistics and supply chain, to promote their own comprehensive competitiveness.

### **3.3 System innovation**

The logistics management system provides standards for all kinds of enterprise logistics activities, to make innovation for enterprise logistics management activities, the innovation of correspondent logistics management system is becoming inevitable. This paper puts forward logistics management innovation of tobacco industry based on green supply chain from two aspects which are internationalization and standardization of logistics management system.

#### **3.3.1 Internationalization of logistics management system**

The internationalization of logistics management system requires that, while drawing up logistics management system, the tobacco enterprises in supply chain consider not only their own condition, also requiring themselves initiatively with international standards. Logistics management innovation of tobacco industry based on green supply chain has very strict requirement for environmental protection and resources utilization in tobacco logistics process, however, there is relative minor or even no punishment for enterprise environmental pollution in China tobacco industry, this makes tobacco industry enterprise not to consider controlling pollution for saving operation cost. Because this kind of cost externalization is legal and better for promoting enterprise profits, the personal goals of supply chain members conflict with target of the whole green supply chain when they are seeking for maximum enterprise profits. The more important thing is that, the “green” target of green supply chain covers the whole life cycle of products, this target can not be achieved when the logistics activities in any stage of supply chain can not be compatible with environment. Therefore, to achieve the logistics management system innovation of tobacco industry requires inevitably that, the state and tobacco industry establish tobacco industry logistics management system, with the purpose of sustainable development, to achieve environmental protection and resources effective utilization.

#### **3.3.2 Standardization of logistics management system**

As stated above, the degree of standardization for China tobacco industry logistics management is very low, and there are a lot of differences existed between standards of different enterprises and national standards with the international standards. The standardization of logistics management system of tobacco industry based on green supply chain requires that, the logistics management standardization should be unified for the same kind of enterprises in the same supply chain, on the basis of international standardization, national logistics standards should be established according to industry actual situation, the logistics standards enacted by enterprises themselves should be the same with or higher than national standards, and keep integrated with international standards. It is particularly emphasized that, the logistics management standards of tobacco industry based on green supply chain should not only meet the requirement of industry standards, but also for the requirement of international environment management standards such as ISO 14000 series. Tobacco industry should take the lead to develop green logistics, strive for passing the verification of these international environmental management standards, to become the vanguard for internationalization and greening of China logistics management.

## **4 Conclusions**

Under the circumstances of economy globalization, “survival of the fittest” is the survival code not only in biological world, it is also suitable in the business world, to be follower of times, even the maker of standards, you have to be the best. In order to get the position in the bitter international competing for market, China tobacco industry logistics must catch the times, intending for the sustainable development, undertake a series of necessary reforms. Logistics management innovation of tobacco industry based on green supply chain is the necessary requirement of sustainable development, is the effective way to achieve the win-win situation of both economic and social benefits for all members in tobacco industry supply chain, is the inevitable choice of globalization of China tobacco logistics, is the important content of later research, too. Only while seizing the opportunities and bold of innovation, the “green” spring of

China logistics management of tobacco industry would come soon.

# A Study on Customer Acquisition Cost and Customer Retention Cost: Review and Outlook

Wu Jianxun

School of Management, Henan University of Technology, Zhengzhou, P.R.China,450001

(E-mail: my20060602@126.com)

**Abstract:** It's a general tendency for enterprises to take customers as the center, focus on their value and improve their interests. Customer Cost is the foundation of customers' interests. This paper reviews many domestic and foreign scholars' viewpoints on Customer Acquisition Cost (CAC), Customer Retention Cost (CRC), the ratio of Customer Acquisition Cost to Customer Retention Cost, elaborates the key points and difficulties of Customer Cost Analysis and reveals the difficulties in the Customer Relationship Management(CRM).

**Key words:** Customer Acquisition Cost (CAC); Customer Retention Cost(CRC); Customer Relationship Management(CRM); Customer lifetime value

## 1 Introduction

Customers are entitled to have more rights in the new economic era. They gradually become the center or initiators in the exchange between sellers and buyer. Accordingly, customer orientation plays a leading role in marketing activities. It is essential for enterprises to analyze Customer Cost in order to improve customers' value and gain more profits from them. Customer Cost Analysis is the premise of the implementation of Customer Relationship Management (CRM) and personalized marketing. This paper reviews many domestic and foreign scholars' viewpoints on Customer Acquisition Cost (CAC), Customer Retention Cost (CRC), the ratio of Customer Acquisition Cost to Customer Retention Cost, elaborates the key points and difficulties of Customer Cost Analysis and reveals the difficulties in the Customer Relationship Management(CRM)and clarifies the direction for future studies.

## 2 Customer Acquisition Cost

What cost do the enterprises need to pay to acquire the new customers? Is CAC the same for the enterprises in different industries? What is the relationship between CAC and business performances of enterprises? Scholars' researches focused on the following points:

### 2.1 The nature of customer acquisition

Kaplan and Norton(2004)pointed out that the customer relationship management (CRM) consists of four procedures, namely selecting customers, acquiring customers, retaining customers and developing relationships with customers, the implementation of which is indispensable in CRM; acquiring new customers is the most difficult and expensive procedure in CRM.

### 2.2 The component of Customer Acquisition Cost (CAC)

Kaplan and Norton(2004)made a brief study of the Component of CAC. They put forward and analyzed the target and index of measure of customer acquisition. Reichheld Frederick (1990, 2002), analyzed different forms of CAC and held that CAC includes the expenses on new customers, such as the advertising expense, the commission of promotion, and the expenses on managing salespersons. In different industries, CAC takes different forms. For instance, in credit card companies, CAC comprise direct-mail advertising cost, credit assessment cost, credit card issuing cost, and the cost on opening new accounts in the data processing system of banks which is about \$ 50-100 for each new customer. In a advertising consulting industry, CAC also involves the time and money spend by senior managers on making sales proposal and treating potential customers. In retail industry, CAC includes the discount for and the cost on setting branch stores.

F.J. Mulhern (1999) analyzed two approaches of distributing customer acquisition cost: (1) in certain industries, there are some clear and specific acquisition cost, such as the investigation of sales calls, product specifications, and discounts. (2) More typically, acquisition cost cannot be directly distributed to individual customers. For instance, manufacturers of packaged products spend large sums of money on media advertising and most of them want to attract new customers. However, there is no way to match the forms of media with these attracted customers. Therefore, the only possible approach of distribution is to calculate the average cost of all customers.

### 2.3 Customer Acquisition Cost (CAC) in different industries

Chen and Hitt(2002), F.F.Reichheld and P. Schefter(2002)held that Customer Acquisition Cost has a clear nature of variation. It has been calculated that “ranging from \$ 40 per customer of the Amazon site to more than \$ 400 of some online brokers (McVey, 2000). This may be the greatest contribution to new B to C in its start-up phase costs, on behalf of most of the initial economic losses generated by these companies. “They analyzed the typical acquisition cost of each customer in different industries: \$ 56 in consumer electronics / application industry, \$ 84 in grocery industry, and \$ 53 in garment industry.

#### **2.4 The relationship between Customer Acquisition Cost (CAC) and business performance**

What is the relationship between Customer Acquisition Cost (CAC) and Business Performance? Ang and Buttle (2006) analyzed Customer Relationship Management Performance of business direct mail in UK (See Table 1). They believed that in direct mail industry, each CAC is the ratio of the total amount of mailing cost to the number of new customers in 1998. From Table 1 we can see that the acquisition cost for each account of direct mail based on CRM is 1/3 higher than that of the traditional direct mail, while the average sales volume and profits it generate in 3 years are more than three times higher. Therefore, we can come to the conclusion that what really matters is customer’s contribution to enterprises’ initial sales and every acquired customer’s rather than extremely lower CAC.

### **3 Customer Retention Cost**

What cost do enterprises need to pay to retain old customers? What impact will it have on corporate value? Does Customer Retention Cost vary in different industries? Scholars' researches focused on the following points:

#### **3.1 The nature of customer retention**

Kaplan and Norton (2004) held that it costs lesser to retain regular customers than to acquire new customers who replace the former ones. Owing to their recognition of the product quality and service of certain brand, the loyal customers do not care its higher price. They seldom give up their preference to the chosen brand; therefore competitors need to give a big discount to draw their attention successfully.

**Table 1 Customer Relationship Management Performance of Business Direct Mail in UK**

	Dict Mail Based on CRM	Traditional Direct Mail
The number of mailing catalogue	1000	500
Mailing cost	3000 £	1500 £
The number of newly acquired customers in 1998	65	45
Changing rate(new customers)	6.5%	0.09%
The initial sales volume of each Acquired customer	180 £	120 £
Sales revenue from the total initial products	11700 £	5400 £
The acquisition cost of each account	46.15 £	33.33 £
The average sales volume of customers in1998-2001	7500 £	2200 £
Three years’ gross margin(40%)	3000 £	880 £

Source: Ang & Buttle (2006)

#### **3.2 The component of customer retention cost**

Kaplan and Norton(2004)made a brief study of the Component of Customer Retention Cost. They put forward and analyzed the target and index of measure of customer acquisition. Bauer (2003) and others analyzed the component of CRC. They put forward that Customer Retention Cost involves the cost on promotion and recruitment, on mailing catalogue or sending personalized greeting cards related to such catalogue, Restore Cost is included. There are two different types of Restore Cost: one refers to the cost occurring before the termination of the relationship in order to avoid betraying, and the other occurs after the relationship ends, spent on marketing in order to retain customers.

#### **3.3 The influence of the customer retention cost on the corporate value**

What influence will Customer Retention Cost have on corporate value? Bain & Company(1990) conducted a research in credit card industry and put forward that the profits made by a customer for the company vary as time goes by:-\$ 51 in the starting year; \$ 30 in the first year; \$ 42 the second year for; \$ 44 the third year; \$ 49 the fourth year for; \$ 55 the fifth year. This confirms that the longer the customer and company maintain relationship, the more profits it will bring to the company.

Winner (2001) demonstrated the significant of the retaining customers (compared with attracting and changing customers) on Companies’ present value by means of the cases in e-commerce (See Table

2).

From Table 2 we can see that if the three indexes related to customer retention (the amount of taxes on repeated customers, changes in repeated customers, the rate of customer loss) increase by 10% in value, then the influence of the added value 5.8%、9.5%、6.7% on e-commerce companies is higher than that of attracting and changing customers(0.7% and 3.1%,0.8%, 2.3% and 4.6%).

**Table 2 The Impact on E-commerce Companies' Present Worth with the Index Increase by10%**

	Index	Definition	Value	10% Increase	Added Value
Attracting Customers	Visitor Acquisition cost	marketing and promoting cost/visitors	\$5.68	\$5.11	0.7%
	Changes in new visitors	added numbers of new visitors1Q→2Q	62.4%	72.4%	3.1%
Change Customers	Acquisition cost for new customers	marketing and promoting cost/customers	\$250	\$225	0.8%
	Change rate of new customers	the rate of new visitor's becoming customers	4.7%	14.7%	2.3%
	Changes in taxes on new customers	added new taxes1Q→2Q	88.5%	98.5%	4.6%
Retain Customers	The amount of taxes on repeated customers	the added taxes from repeated customers 1Q→2Q	21.0%	31.0%	5.8%
	Changes in repeated customers	the rate of customers becoming repeated customers	30.2%	40.2%	9.5%
	The rate of customers loss	the first half rate of repeated customers in 1999	55.3%	65.3%	6.7%

source: Mckinsey &Co.1999

### 3.4 Customer retention cost in different industries

Is CRC in different industries the same? The study of Bain &Company (1990) shows that Customer Retention (Here stands for "Betrayal Rate") has a close relation with Customer Lifetime Value (See in Table 3). From Table 6 we can see that the longer the relationship between customers and enterprises is the lower the betrayal rate is; therefor the expected time of such relationship is longer, and Customer Lifetime Value is higher, which proves the importance of Customer Retention.

Table 3 Customer Lifetime Value (LTV)

A	B	C	D=B*C
Betrayal Rate(The rate for annual customer loss)	The expected time for relationship between customers and enterprises(year)	Annual value (value)	Lifetime (value)
20%	5	3000	15000
10%	10	3000	30000
5%	20	3000	60000
2.5%	40	3000	120000

Source: Bain &Company, 1999

## 4 The Ratio of Customer Acquisition Cost to Customer Retention Cost

In Customer Relationship Management, should enterprises focus on acquiring new customers or retaining old ones? This, to a certain extent, depends on the ratio of CAC to CRC. Studies on this aspect can be seen. The following summary is based on a general description and a comprehensive description.

### 4.1 General description

Chowhan and Saxena(2011)held that Customer Retention Cost only accounts for a small part of Customers Acquisition Cost. Zhao Qiankun and He Cencheng(2009)put forth that the cost of acquiring a new customer is two to six times higher than retaining an old customer. Peppers and Rogers(1993)thought that the cost of attracting a new customer is 4 to 6 times higher than retaining an old customer. Gronroos(1984), Rust and Zahorik(1993), Raphael and Raphael(1995), FanYunfeng(2003)believed that the cost of acquiring a new customer is four times higher than retaining an old customer. In the article "Management God", it is put forward that according to a survey, the average cost of acquiring a new customer is \$118.16 while that of making an old customer satisfied is \$19.76. Therefore, acquiring a new customer will spend more than five times of money than keeping an old customer (5.98 times). This amount of money could be used to improve the working environment,

improve your salary, or make you continue working for your company. Rosenberg and Czepiel(1983), Sasser(1990)claimed that the cost for developing a new customer is about 6 times than retaining an old customer. Coffey and Palm(2005)put forward that the cost of acquiring a new customer's cost is 5-7 times as much as you are cross selling your products to an old customer. Ahmed and Buttle(2001) presented that the researchers found that the ratio of CRC to CAC is between 1/5 and 1/10. Li Yingchun(2005)proposed that generally speaking, the cost of acquiring a new customer is about 5 to 6 times higher than retaining an old customer.

In a word, the scholars whose opinions are shown in various literature have both consensus and difference in the ratio of CAC to Customer Retention Cost. Their consensus is that the CAC is higher than the CRC, and the difference lies in the specific ratio ( which varies from 2 to 10 times).

#### **4.2 Comprehensive Description**

The Chartered Institute of Marketing specially published an article (2010) to summarize the researches on the ratio of CAC to CRC in the academic circle. It pointed out that the following material lists different numbers between CAC and CRC, of which the "cost" ranges from 3 times to 30 times.

"It is universally acknowledged that the cost of acquiring a new customer ranges from 4 to 6 times." (The article contains a calculation formula for LTV.) "Usually, it costs less to sell to an old customer and the cost of acquiring a new customer is 5 to 8 times higher than retaining an old one." "65% of a company's business comes from its old customers. And the cost of attracting a new customer is 4 times than that of making an old customer satisfied." (The data comes from Gartner). "We know that the cost of acquiring a new customer is higher (about 7 times) than marketing to an old one. This means that you should make more marketing efforts to deal with the people you know but not the strangers." It is generally acceptable that the cost of finding a new customer is two times higher than selling to an old customer. The common business wisdom tells us that the cost of acquiring a new customer is 9 times higher than retaining an old customer. "The usual average number is: selling to a new customer costs six times higher than selling to an old customer." "The cost of attracting a new customer may be 15 times higher than retaining an old customer." Statistics show that the cost of attracting a new customer is 5 to 10 times than retaining an old customer. Besides that, the cost of acquiring a new customer is over 67%. "Customer Lifetime Value includes any product that customers buy from you in the past, at present and the future. And the cost of acquiring a new customer is 20 times than making an old customer satisfied according to the calculation." The study shows that the cost of acquiring a new customer is 30 times higher than retaining an old customer, which means that you should keep a very close relationship with your customers. Therefore, you should know their exact requirements and aim at being their supplier at present and in the future and you should be irreplaceable. "The cost of acquiring a new customer is 5 to 10 times higher than retaining an old customer." "Most business activities place their marketing efforts on acquiring new customers. However, the cost of selling to a new customer is 7 to 20 times higher than to an old customer." The above mentioned online materials are dated before March, 2010.

Since the numbers above come from different scholars' research in different period with different objects of study (regions and industries), they are not comparable. This kind of phenomenon shows that it is complex to calculate customer cost and the difficult to make the comparison between different costs.

### **5 Conclusion**

In conclusion, the present problems and the focus of the future research are as follows:

Scholars have reached an agreement on the definition of customer cost, holding that it is a combination of all kinds of resources spent in the whole process when enterprises keep its relationship with its customers, which embodies the systematicness and integrity of the customer cost.

Scholars' studies of CAC focused on the nature of the acquired customers, the component of the CAC, the differences of CAC in different industries, the relationship between CAC and Business Performance and so on. The consensus is that CAC is the most expensive part of CRM. The forms of CAC in different industries vary. There exists problems in the study of the relationship between CAC and Business Performance and the present studies don't admit that the lower CAC is , the higher sales volume and profits the enterprise gains.

Scholars' study of CRC focus on the nature of the retained customers, the component of the Customer Retention Cost, the differences of CRC in different industries, the value of customers retention to the enterprises and so on. The consensus is that the CRC is much cheaper than the

Customer Acquisition. The forms of Customer Retention Cost in different industries vary. The influence of retaining customers on corporate value is more obvious than attracting and changing customers. However, the conclusion needs to be proved in different regions and industries.

Opinions vary greatly about the study of the ratio of CAC and CRC, with figures ranging from 2 times to 30 times. Meanwhile, a consensus has been made that CAC should be higher than CRC.

In the new customer-oriented economic era, the key of marketing and management of enterprises has transferred from products to customer, and customer profitability has replaced the market share to become the priority for enterprises when making decisions. Under this situation, carrying out the study of calculating and comparing of CAC and CRC is of great urgency and important theoretical value.

**Abstract:** The purpose of this thesis is providing the advanced strategic thinking and method about adjustment for domestic enterprises in the stage of the transformation of economic development within industry area in China. The method used in the study is known as Qualitative Analysis and Case Study, emphasize the unified designed strategy in the Apple company, which is to find potential needs of customers and design good user experience, set a solid foundation for its leading position in the field of IT, through the analysis of six layers : Brand Strategy, Research and Development of Products, design strategy, production and marketing, product strategy, management and leadership in Apple Company. It has important guiding role for domestic enterprises to develop design strategy based on user experience to effectively improve product development and innovation capabilities. In addition, design strategy formulation of company should combine with national conditions. So the spread of design strategy based on user experience in China cannot go without government, enterprise, market. In the future, the range of user experience will be more widely in product and service design which based on internet of things, and the innovation based on user experience will be the soul of the development of internet of things. Therefore, the studies showed that the design strategy based on user experience can provide strong intellectual support for product planning and sustainable development of enterprises.

**Key words:** Design strategy; User experience; Apple company; Qualitative analysis method; Case study method

## 1 Introduction

With the rapid development of information technology, people's demand for products has far exceeded the single "form" and "function" on the satisfaction in modern society. Products with good user experience tend to be the winner in the market competition. User experience is the overall feeling and impression when one is using a kind of product and service. This experience is accumulated in the course of formation, including psychological experience and physical feelings. <sup>[1]</sup>It emphasizes User Centered Design, treating user as the focus of the design and development activities. <sup>[2]</sup>Those that have a good user experience of products and service gain more and more popularity, and design concept, which is users experience-oriented, has become the most effective way for brand competition. First draw the attention of user experience internationally for Design corporation is IDEO that making the products become more friendly through observation users habits when they using the products. And some of the domestic internet company have been setting up Design Center of user experience to carry out research so as to promote the products development because of industrial demand characteristics and needs around in 2005.

In recent years the world is embracing design strategy, while ensuring the realization of business mission, this strategy is to figure out the relationship between design strategies and marketing environment, to make design direction and competition method, also embodied design principles of corporate culture at the same time. Design and select development and action plan to realize the target, based on company's overall strategic objectives, <sup>[3]</sup>Design is emphasized as a gene, existing in all levels of the enterprise, and plays an active role.

The principle of user experience and design strategic concept emerged in post-industrial era, when great changes were taken place in consumer awareness, where product diversity and emotional appeals weigh more. As experience economy era is coming, the concept of the design shifts from material form centered to person centered. Therefore, the target of products and services is to provide consumers with a comprehensive experience-based system. Here Apple Company sets an excellent example.

## 2 Design Strategies and Methods Based on User Experience:Apple Company

Apple is endowed with insights for customer demand, especially for finding potential customers needs. In Apple's history, strategies at different levels for innovations were witness as follow:

## **2.1 Brand strategy**

In the late 1990s, when Steve Jobs returned to Apple Company, he re-evaluated and retained the 10 products with high potential to optimize the company's product line, and highlighted the company's brand strategy "Think Different". Under this guidance, Apple introduced two revolutionary products: a transparent jelly-like texture of the iMac and the music industry Queen, the iPod.

## **2.2 Research and development of products**

In the early days that the product lines are disorder, most products of Apple are designed on the premise of technical feasibility. Latterly, Apple laid stress on taking convenience and sense of pleasure of the product use as its orientation. Teams of Apple develop products that can meet potential requirements of the market through observing consumers of the products and analyzing behavior of the consumers. The whole process of product development is designing, developing and mass producing. Taking designing as the drive of product developing and producing, it is also embodied the significance of designing link in the whole product developing process of Apple.

## **2.3 Design strategy**

Design Language of Apple can be defined as "less, but better". That is stressing briefness of product configuration and convenience of product use. It shows the resolution of Apple to bring consumers with more products that are easy to use. The most obvious example is "i" series products of Apple, especially for iPhone. It redefined mobile phone. The highly simplified and modernized appearance of iPhone (without keypad) blended multi touch technology which have consumers experienced a fire-new interactive mode through the process of calling, messaging and scanning website. The most important thing is combination of iPhone and App World (application program) changed life-style of people.

## **2.4 Production and marketing**

Through good cooperation and communication with ODM, Apple Company can devote much to the development of specific products and materials to ensure the products with a fresh and favorable user experience. Apple also follows the law of "Service First". That is their service for user starts before promotion of the product. Users can easily buy their favorable copyrighted music from iTunes while using iPod and conveniently find information that they need from the internet while using iPhone. Combination of hardware and software makes products of Apple more competitive in the market and leaves users a good experience of multi-dimension.

As point-of-sale terminal of Apple products, Apple Store has become new local landmark in many cities. Characteristics of Apple Store: first, all is for providing consumers with experience; when purchasing products in Apple Store, customers can experience the products themselves under the guidance of a staff; thus can deepen the visitor's acknowledgement and cordial feeling towards Apple. Second, friendly culture; customers can play mini game with experience equipments to relax themselves, even if they don't buy anything and join any activities.

## **2.5 Product strategy**

Product strategy of Apple stress on user-requirement-oriented. These requirements, which are established on the basis of experience and impression that has in users' mind, are expectations of users for the product and service. User requirements are distributed and dynamic. Different user groups have different requirements. Meanwhile, as user experience for products and services fatigued, user requirements will have a higher standard.

As the most vital and lasting "i" series products, except for iPod itself has quality performances and service items, product lines of iPod are also with a meticulous strategic layout. For instance, iPod Touch, which is relatively inexpensive, is regarded as an iPhone without phone functions. While besides traditional iPod music functions, it can run most of the application. Game and entertainment property of original iPod series products is largely enhanced. Thus the psychological need of low price, more entertainments of some users is satisfied.

## **2.6 Management and Leadership**

Management and leadership guarantees establishment of design strategy and its effective execution. As the company's management, one should have profound understanding and strategic thinking towards design. This had been vividly reflected by the former Apple company management which is centered on Steve Jobs.

### **2.6.1 Understanding of the design, attention to user experience**

Apple's management believes that the value of design is to provide consumers with first-class hardware and software experience, and products with aesthetic appearance. Therefore, they emphasize the strict control of details, which also inspired the best performance of Apple design team.

### **2.6.2 Powerful capacity of resource integration and implementation**

It is the strong leadership and strong execution capabilities of the management of Apple that endow it with a unique capability of resources control and integration. Once making clear the company's product design strategy, the management will put together the advanced resources of the company to provide security from the round of products' design and development, production, sales, which has laid a solid foundation for the good quality of Apple's products and their features.

### 2.6.3 Keen observation

The management of Apple can keenly capture the potential demand of customers and grasp available opportunities to come onto the market, which has provided powerful intellectual support for Apple Company to the drawing up of Apple's design strategies.

From the above analysis, we can see that Apple company's design strategy based on user experience has been effectively applied at all levels, forming a unified designed strategy in the internal of the company, which is to find potential needs of customers and design good user experience. (Figure 1) Under such a culture, Apple Company has rolled out products which are successful and of a subversive sense one by one, proving that those products with good user experience themselves are more attractive than products which merely win due to technology itself, changing the means consumers interact with technology in daily life of digitization. In addition, Apple bundles software, hardware with services to be designed, produced and sold together, creating a new business mode.

Figure 1 Apple design strategy and business model.

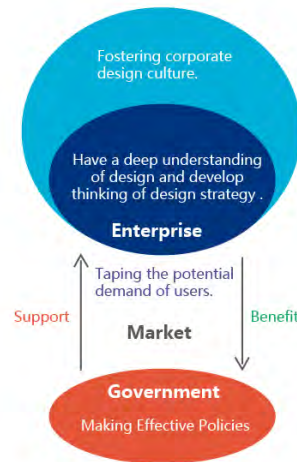

### 3 Thinking on Formulation of Design Strategy of Domestic Companies

At present, China is in an accelerating transition period of economic growth means, especially in recent years when those companies featured with OEM have been facing severe pressure to survive under the condition of a significant improvement on labor costs for domestic manufacturing and processing industry. Therefore, there are many items becoming important goals of China's economic transformation, such as accelerating the industrial upgrading of domestic enterprises and optimization of product structure, improving technology content of products, strengthening scientific management thereby stimulating domestic demand and achieving new sustainable growth model of China's economy.

As mentioned above, Apple's success proves the necessity of making design strategy based on user experience for the enterprises. However, Apple's experience should be promoted combining with China's national conditions, which will make it help domestic companies solve emerging problems in the transition period of economy in a better way.

1) The management of the company needs to have a deep understanding of design and develop thinking of design strategy. They should bear in mind that designing experience attracts customers better than designing shapes of products, with whose guidance, the management should integrate advanced resources to implement this concept in order to ensure that the products and services have good user experience.

2) Fostering corporate design culture. Based on the needs of users, the management drives the development, production and sales of the products through designs, thereby boosting improvement in technologies, improvement of brand value in order to mobilize the own power of the industrial upgrading of the company.

**Figure 2 Key factors of the spread of Design Strategy Based on User Experience in China.**

3) Through the analysis of user needs, feedback of user experience, and taping the potential demand of users, the management takes design as an effective business mode which provides important basis for the company in product optimization and drawing up of marketing strategy of the company. The management should allow users to join in rounds of design and production and guide the users to use and share innovation experience of the products so as to expand the group of consumers of the product and increase the competitiveness of the products.

4) The state should actively encourage and support enterprise to adopt user experience- based design strategy to develop high value-added products in order to build high-quality national brands and reduce the pressure and risk that enterprises face in the early period of development of products through effective policies. (Figure 2)

In China, there are pioneers who make design strategy guided by user experience, such as Internet technology company represented by Tencent QQ, e-commerce business represented by Taobao. Their products and services are attracting more and more consumers while also gradually gaining more and more right of speech in the market. Therefore, design strategy based on user experience can be summarized as follows: Starting from the user's needs and helping businesses and users to create a win-win business system with concepts of design strategy.

#### 4 Conclusion

As information technology continues to develop, people's lives will be fused with the Internet in a high degree. People enjoy more autonomy in choosing products and services. The consumers can select what they need according to their personal preferences ( feelings of experience ). Thus a good experience design is the key for products and services to win the market in information society. In the future, with the extension and expansion of Internet technology, people and objects, objects and objects can make smart dialogue, such as siri artificial intelligence voice program of iphone4s. As to products and services design based on the Internet of things, the scale that their users can experience will be wider while the innovation whose core is user experience will be the soul of development of the Internet of things. Therefore, design strategy based on user experience can be conducive to establishment and consolidation of brand systems for domestic enterprises, making their product and service have more competitive in the market to further acceleration on the industrial adjustment.

## Research on Marketing Power Synergy Mode

Zeng Ziwei, Zhang Xuan

Wuhan University of Technology Huaxia College, Wuhan, P.R.China, 430070  
(E-mail:bear209030@163.com, f06may@126.com)

**Abstract:** After analyzing principle of marketing power synergy mode, the paper identified the order parameter as a leading power in dominate the marketing power system from a disordered state to a new ordered state in self-organization. The new synergic model is sum of the contact among each unit and the external environment when the marketing power of the synergistic effecting. On this basis, the paper identified the standards of order parameter in selection and management in critical or unstable state. Finally, it put forward complementary synergy mode and competing synergy model, which also raised three synergy operation modes as parallel- cross, project team and star.

**Key words:** Marketing power; Order parameter; Behavior pattern; Operation mode

### 1 Introduction

Marketing power has been causing wide attention in business community and the theoretical circles since been proposed in 1990s. When facing competition, changing enterprise capability into competitive advantage, marketing power is an important protection mechanism relying on internal and external resources, which is one of an very important criterion as enterprise capability. So researching on enhancing the marketing power is an significant topic both of business community and theoretical sector. The current study has been made certain results in terms of concept, construction and evaluation of the marketing power. By rational resources allocation, each power can be accordance with a certain degree of interaction, cooperation and collaboration, thereby enabling the overall system function has been doubled or enlarged. But in some areas, such as the management of marketing power, especially the rational allocation of resources, studies have not been involved. The key point of the marketing power management is how to make the marketing power of cooperation internally generated  $2 + 2 > 4$  synergies, external gain a competitive advantage. The core issue of marketing power of synergy must involve collaborative model. We should analyze the principle of pattern formation of marketing power of collaboration and explore each other related to the sum of the marketing power of collaborative formed. In these areas, China is still in its infancy, this study is based on this research topic.

### 2 Analysis on Principle of Marketing Force Synergy Theory

The marketing power synergy model is the sum of all connections among the synergistic unit, collaborations between the internal unit and the external environment when the marketing power system creating synergies on the basis of a clear system goal. Not only does it reflect the marketing power of the system interactions with the outside world, but also the ways and means of system synergy.

When the research system is exchanging resources, information and energy with the outside world, the marketing power synergy means how synergies within, to achieve the desired synergy mode and achieve the synergy of internal and external competitive advantage. According to the control theory and system theory, when the first derivative subsystem (capacity unit) parameter is zero, the target subsystem is called the optimal value under the meaning of the parameters of the subsystems in this state. However, due to the non-additivity as well as different state parameters defined, constitute the entire marketing power system capacity unit target optimal state parameters does not necessarily make the entire marketing force to achieve the optimal value. For example, two new recruits assigned to the power of product units or sales force unit allow the unit to achieve the best. But the benefits obtained by marketing power system under such distribution may be far smaller than the benefit generated two, respectively, assigned to the product strength unit and the sales force unit. In addition, the marketing power synergy is associate the core business of each capacity unit, making efforts to solve the bottleneck problem in the synergistic to make the marketing power of the system to a sustainable manner to achieve optimal efficiency and effectiveness. Marketing force synergy target is essentially the optimal value of the theoretical capacity unit in the collaborative process. The contact between the units is dynamic and the model is the theoretical optimal value approximation. Therefore, it is necessary to sort out the formation process of the contacts among the marketing power synergy units and lay the foundation for further improvements or to identify collaborative mode.

Professor Haken, the founder of synergy theory, put forward an important point refer to how to

identify the collaborative mode, namely, the process of pattern recognition is the process of pattern formation. System pattern formation process is firstly the initial state of setting is part of the ordering subsystem, and then the order parameter belonging to this subsystem is winning in the competition and dominate the whole system and make it into a particular ordered state, and finally complete the macro qualitative change of the system. So we can draw a conclusion from the description of the collaborative pattern recognition by Professor Haken that marketing force synergy pattern recognition process is the process of marketing power synergy model formation. Due to internal changes in the environment, the marketing power system is in a state of change or instability. Each parameter is also mutually competitive, by a series of parameters (including fast, slow parameter amount). But ultimately only one of the parameters overwhelms the other parameters. The most powerful parameter is the order parameter, which dominate the marketing power system to achieve self-organization and bring in new time structure, spatial structure or functional structure, from a disordered state to a new ordered state, and finally lead to the marketing power system to produce integral benefit larger than the sum of each unit. Since then, we produce a new mode of marketing force synergy (The formation of the model are as follows as shown in Figure 1). The new synergic model is the sum of the contact among each unit and the external environment when the marketing power of the synergistic effecting.

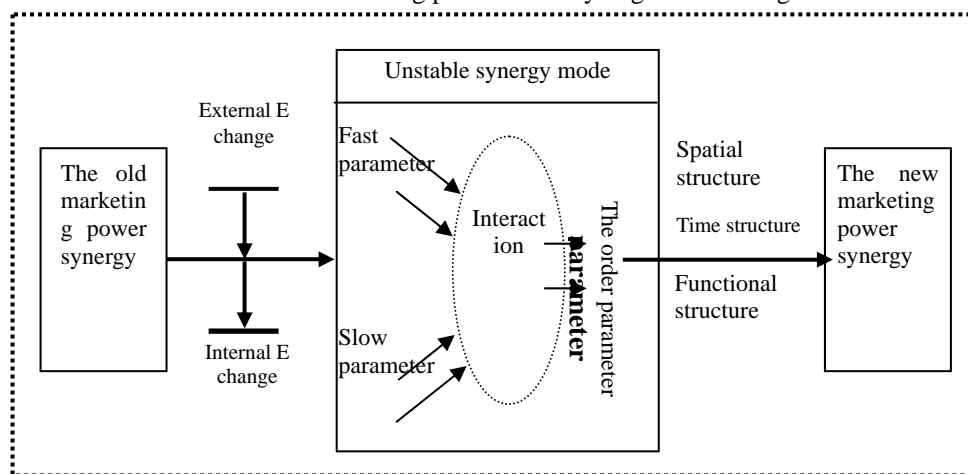

Figure 1 Formation Model of Marketing Power Synergy

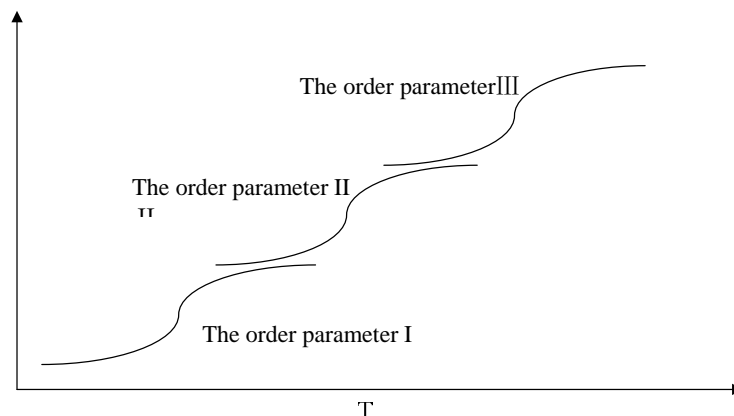

### 3 The Choice and Management of the Order Parameter

#### 3.1 The choice of the order parameter in marketing of power synergy

As an open system, marketing force system is subjected to the influence of various parameters. Some parameters have large damping and fast decay, no significant effect on the whole process of transformation, known as fast parameter. Some parameters, critically non-damping phenomenon and slowly decaying, playing a major role in the evolution process, are known as slow parameters. Although the slow parameters are only a few, it can control the whole process of system evolution and determine the structure and function of the evolution results. That is what we called the order parameter. All the subsystems within the marketing power of the system servo the system order parameter. However, what is specific order parameter that dominant the marketing force system to the order and collaborative mode? The research of this problem is still blank in China. With enterprises as the object of study, different scholars have proposed different points of view by analyzing the order parameters of the enterprise systems. These views have important guiding significance. One representative view is economist Schumpeter's innovation theory. He first proposed the innovation theory from the impact of non-balanced growth of the economic system. Schumpeterian attributed innovation to the entrepreneurial spirit, that is, the entrepreneur's ability to found and act the opportunities of innovation, taking the "entrepreneur" as the main organizers and promoters of "Innovation", the "new combination" of factors of production and economic development. It can clearly be seen entrepreneurship is the order parameter in the process of evolution. Collins and Bole Si believed (2003), the driving force of the core ideas and the pursuit of progress are determining the company's everlasting. So we can further extended the corporate evolution of the order parameter for what he called the core concept and the pursuit of progress. Fan Ming and Tang Xuejun believed that the (2004), sustainable growth of firms is the product of synergy generated by the elements of industry, technology, systems and market power, with relative

stability. Changes in the capacity of the sustainable growth drove the evolution of the various subsystems of the enterprise, and also drove the enterprise system growth capacity, and finally have direct impact on the selection and positioning of industry, corporate R&D investment and technological innovation capacity, updating and improving of management system, adjustment of organisational structure, staff training and incentives etc. Visible, they believe that the ability of the sustainable growth of enterprises is the order parameter of the corporate evolution. Liu Jianbo and Li bozhou believe that (2005), the enterprise organisational learning gene is the order parameter dominating the firms evolution. Due to the synergistic effect of enterprise systems within the subsystem, enterprise produce the learning gene of the organization, which dominating the evolution of the company. Pan Kailing and Bai Liehu believe (2006), the management of collaborative order parameter is not the only. There is a matter of choice; the choice of the order parameter depends on the specific environment. They also put forward the selection criteria of the order parameter, which has important guiding significance of our study. Pang Yong and Zhao Yanping believe that (2007), the core competitiveness of enterprises, which consist of five elements, that is, enterprise resources, technical capabilities, enterprise system, management capabilities and culture, is the slow variables of enterprise systems evolution. In order to form and ensure their competitive advantage, enterprises will continue to obtain the elements of the core competitiveness, establish and integrate the contact, and ultimately form their unique core competitiveness (order parameter). Yu Jie and Zhang Lan two scholars believe that (2010), regardless of what type of social system or in which level it is constituted, it has the leader of itself. Officials, managers and professors are the leader of their respective fields, leading political, commercial or academic areas. It can be seen that their role and status precisely reflects that they are "order parameter" of social systems. Leaders have all the characteristics and conditions that they should have as an order parameter of a social self-organizing system. Visible, they think leaders of the corporate are the order parameter of evolution.

As can be seen from the above scholars, the order parameter of the evolution of enterprise systems doesn't have a unified point of view. The author believes that the choice of the order parameter of the marketing power system should depend on the real environment. Marketing power of the system as an open system, the internal and external environment is constantly changing; the order parameter selection and cultivation should be based on different environments. When the order parameter is adapted to the needs of the environment, the system will be greatly promoted, fully mobilize external resources within the system and gain external competitive advantages. When producing a new structure and function by the pull of the order parameter, system environment will change gradually. When the order parameter is no longer adapted to the environmental requirements of the system, it is in an unstable state and the new order parameter will dominate the development of the marketing power of the system in new directions, resulting new round of growth and changes of the order parameter (Figure 2).

**Figure 2 Develop Routes of the Order Parameter**

Therefore, managers should assess the situation during the specific marketing practices, choosing the expected order parameter that dominating the evolution of system when the market in a critical state or under unstable state, hoping system developing in our favor by management. The choice of the order parameter of marketing power of collaborative should have the following characteristics:

- 1) The order parameter of the marketing power must be a macro parameter. It is the macroscopic

overall behavior generated by seven units, such as product strength unit and brand power unit, rather than a single unit reflected in the behavior.

2)The order parameter is based on resources, facing the competition, aiming to foster customer loyalty. It must be able to promote the effective integration and scientific use of the enhancement of its available resources, and the ability to dominate the system to obtain external competitive advantage in the marketing level.

3)The order parameter is the intrinsic parameter of the enterprise, transforming the corporate resources and capabilities into the marketing competitiveness and competitive advantage. Its formation is a product of the collective motion of the seven units, derived from the inner system, relying on the system of internal forces generated by one of the core parameters.

(4)The order parameter can dominate the behavior of each unit. Once formed, it would dominate the system to produce a new structure, function, and so on.

### **3.2 The management of the order parameter of marketing power synergy**

The choice of order parameter identified the direction of the system's evolutionary development. But the system, whether such as we expect, as the evolution of development, also depend on the parameter we choose, which "stand out" near the critical point of the system during the competition and really dominate the enterprise systems development. Therefore, the author believes that by managing the marketing power of the system, the system order parameter is developing towards the direction we expecting. Management of the order parameter of marketing power system should note the following.

1) When the order parameter is not adapted to new environment or the system is unstable near the critical point, we should actively create favorable conditions by reorganization of resources and process reengineering, reinforcing the parameters good to system development and negative the bad, ultimately enable the development of the marketing power of the system toward the desired direction by managers. For example, there may be some parameters, refer to efficiency, size or capacity when in a critical state, are likely to further evolve into the order parameter of the system. However, with limited resources or lack of funds, it is difficult to achieve economies of scale by additional capital resources. Then we can select efficiency as the order parameter, leading an orderly and stable development of the entire enterprise system with the existing resources.

2) Dominated by the newly selected order parameter by marketing system, we should note the controlling management, strengthen the effectiveness of management and reduce the interface problems, go to the direction by the fluctuation to the desired branch leap, improve the mechanisms, prevent the fluctuation of various unfavorable factors of internal and external to dominate the development of the marketing power of the system. And as follow-up work, we should continue to strengthen the order parameter to produce a self-organizing effect, and make the system to reach a new stable order.

## **4 Patterns of Behavior of Marketing Power**

The patterns of behavior of marketing power synergy not only reflect the purpose between the collaborative units, but can also reflect the way between the units. There are two kinds of collaborative patterns of behavior between the synergy unit.

1)Complementary synergy mode. Complementary collaborative model is a collaborative process, advantages (and disadvantages) of a collaborative unit match with disadvantage (advantage) of another collaborative unit, to make up the weakness in structure and function in order to achieve complementary advantages, and finally achieve system synergy target. For example, in a complementary collaborative mode, due to the different nature(like quality parameters) of synergistic unit, and the informative differences between actors, there are may be lead to two different forms of Complementary synergy relations, namely the symmetrical complementary synergy relationship and the non- symmetrical complementary synergy relationship. The symmetrical one is a stable marketing power synergy model, it shows that the synergy of consciousness and degree between the unit is high, while the non-symmetrical one is more unstable. The symmetrical complementary synergy relationship is the ideal form of the complementary synergy patterns. For example, the relationship between the R & D department and sales department of the product power unit. Let the sales department to know of new products when the R & D department in new product design stage, and know the attitude of its new product features. The sales department also tells the product unit of information from customers, competitors and technology. When each unit have further consensus on the new product features, we say they have symmetrical complementary synergy relationship between product unit and sales unit, or non-symmetry of complementary relationship.

2) Competing synergy model. This model means the competitive and cooperative relationship between synergistic units under the premise of ensuring the system objectives. Each synergistic unit compete with each other within the system resources, but also benefit with mutual interaction, promoting the marketing power rational flow within the system resources between units. The synergy between the units is stored in an enterprise environment between two or more synergistic unit. It is a system behavior, a system of social behavior, also an important part of an integral part of the market-oriented content. Competition is in order to allocate more resources in the marketing power system, and cooperation is in order to obtain external competitive advantage. Therefore, to some extent, such model is belonging to competitive synergy. Get information is the inevitable performance of this competitive collaboration, which is called intelligence by some scholars. Therefore, the penetration of the competitive intelligence is a decisive factor in synergistic units. The more fully penetrate intelligence within the system, the higher the degree of synergy between the marketing powers of the system unit.

## 5 The Operation Mode of Marketing Power Synergy

### 5.1 Parallel- cross synergy mode

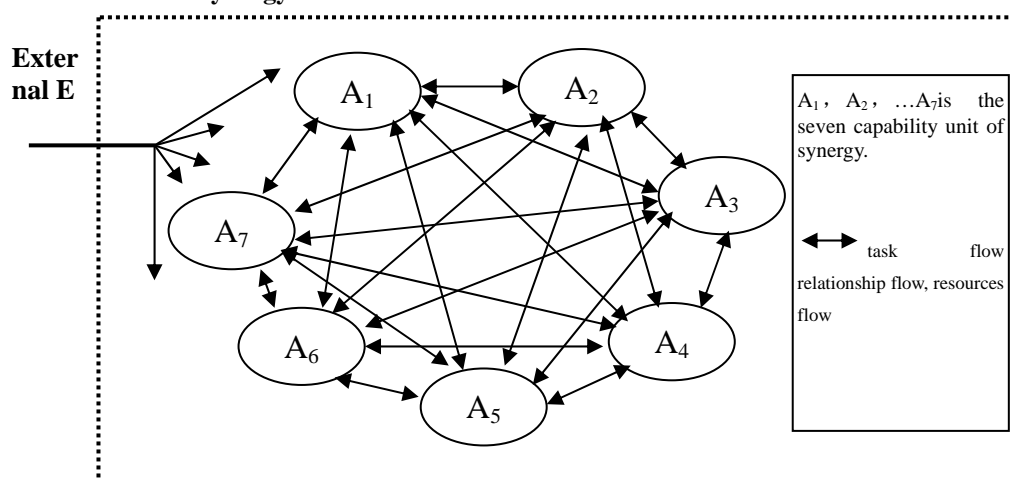

Figure 3 Parallel-Cross Synergy Mode

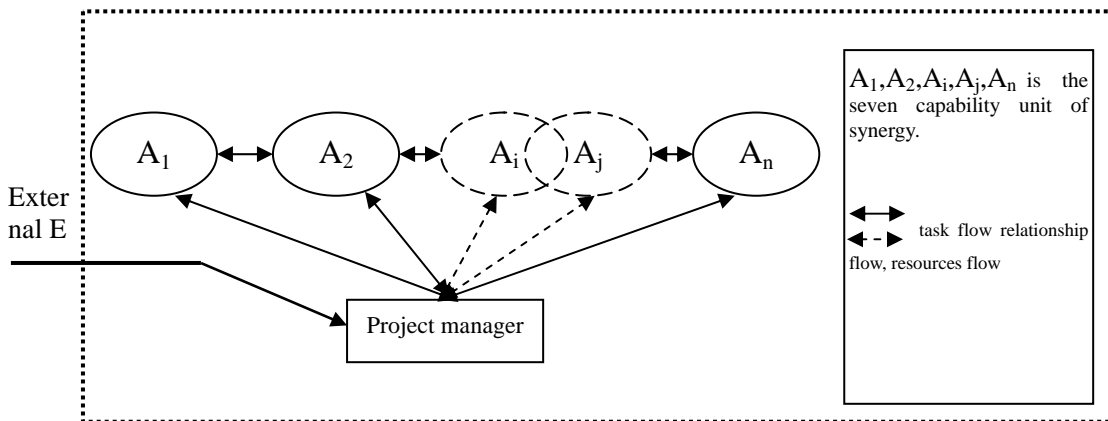

Parallel- cross synergy mode refers to a marketing power synergy unit directly connected with another synergy unit. The synergy between the units and the synergy relationship between the unit and the system environment shown in Figure 3. In this parallel- cross structure, Each capacity unit connected other units through the interface  $f_1(x, t)$ ,  $f_2(x, t)$ ,  $f_3(x, t)$ . The flow of information and material between the system unit is directly from the starting point to reach the terminal, no intermediate links, breaking the traditional system collaborative process which have different logical associations before or after. Within the system, each unit composed of more than one professional group to work together. The process within the system unit is just like a criss-cross network, to ensure eliminate some duplicate links in units synergy, greatly enhance the efficiency of the system of collaboration. For example, when the business in growth stage, the goal of the marketing power system change into the pursuit of market share maximization. The marketing power synergy unit may have four possible outcomes. First, the product units will improve product quality, expand the extension products of the service assurance, increase the product features and style, look and enter the new market segments. Second, the price power unit should mainly rely on the penetrate pricing way, attracting more price-sensitive buyers by lower prices. Third, the channel power unit should use intensive distribution, expanding distribution coverage and open up new channels of distribution. Fourth, the sales force unit should convert from improve visibility to stimulate consumer interest, preferences and desire to buy products, from the product understood to product preferences. However, these units synergy behavioral strategies are not mutually independent, but the co-ordination between each other, understanding the need of each unit. For example, if turn form popularity to product preference, it need match with the good quality of product unit, the temptation of price unit, the convenience of channel unit and so on. These are directly passed from the starting point to the end. The information transmission path is significantly shorter. The distortion of information is also greatly reduced, also greatly improving the efficiency of the unit collaboration, allowing the system to generate synergies. Another advantage of parallel- cross synergy

mode is the flow of information and substances. When close co-operation of each unit, it can generate new ideas and concepts. Some companies in Japan, especially the auto manufacturers, significantly short its product development cycle, greatly improved the efficiency of product development by this synergy, and thus becoming another competitive advantage for the Japanese automotive products and Europe and the United States company.

Stable operation of the parallel- cross synergy mode need a highly collaborative spirit of marketing power system. Not only requires the collaboration of high accuracy, but also the strong management and coordination capacity and rapid decision-making ability. Similarly, as the business becomes bigger, the number of internal interface and manage the workload was increased in geometric progression type. Therefore, the parallel- cross synergy mode is generally more suitable for the marketing power system of small and medium-sized enterprises.

**5.2 The project team synergy model**

The project team synergy model is marketing power synergy models that project manager manage the project subsystem, which composed of the main capacity modules in a project. The relationship among synergy unit, the project manager and the environment is shown in Figure 4.

**Figure 4 The Project Team Synergy Model**

One of the main features of the project team synergy model is that it involves several units of the project tasks to form a new subsystem, within each unit only one project manager interface management. This greatly reduces the efficiency losses resulting from synergy units across the boundary interface management, further strengthening the work communication and responsibility, improving the efficiency of project tasks completion. For example, the task of product innovation projects mainly related to the product force unit and the sales force unit. In new product design stage, the power unit should ensure that the sales force unit knows the views of its products. Sales force unit should inform the information from customers, competitors and technological progress to the product power unit, making some recommendations on products. By exchange views, this let the product power unit and the sales force unit reach an agreement in many ways in the beginning of the project. In the initial commercialization stage, product unit give some advice to the sales force unit to open the market in the development of marketing strategies. In the sales phase, the product unit and sales force unit serve the users of new products; maximize its value of product innovation. Another major feature of the project team synergy model is to solve the temporary problems in the marketing power system. The project team horizontal joint capacity units involved project tasks. These capacity units, as members of project tasks, solve problem together, thus greatly strengthening the response time to threats or opportunities in marketing power system, while avoiding disadvantages and turn response time to external competitive advantage.

With the global market diversification, increased demand for complex and personalized, the enterprises are facing severe challenges and important opportunities for development. Especially the opportunities for development, is an instant changing. Enterprises should seize this opportunity to become more flexible system. The project team synergy model is the product of this environment requires, which can meet the opportunities and threats of a sudden. At the same time, focusing on customer needs, and more commercialization of the demand put forward higher requirements for the constitution and operation of project team synergy model.

### 5.3 Star synergy mode

Star synergy mode refers to a collaborative body formed by various synergies between the marketing powers of synergy unit by the central synergy unit. The relationship between synergy unit, the unit and the external environment is shown in Figure 5.

Figure 5 Star Synergy Mode

In it, A7, located in the middle, is a core competency unit. In addition to the work of unit itself, the core competencies unit is also responsible for the strategic management, the development of the infrastructure of the organization and management sharing by other capacity unit, enabling each department to cooperate with each other, ensuring a unified mission and purpose of the role. Other non-core competencies unit star-shaped is arranged in star type. They are interdependent and help each other on key issues, equally of status with core competencies. For example, in the production concept, the companies believe that consumers always love low-priced products, so the management is always committed to high productivity. In this concept, the product power unit is at the core of the star patterns synergy.

One of the biggest advantages of the star synergy mode is during the collaborative process, the transfer of resources and the information between the marketing power systems is achieved by the core unit. This greatly reduces the interaction between the interface  $f_1(x, t)$ ,  $f_2(x, t)$ ,  $f_3(x, t)$  of each capacity unit. Also thanks to this proxy mechanism, when one of capacity unit is changed, only need change the corresponding part of the core competencies unit, the complexity of the marketing power system maintenance and upgrades. For example, star collaborative model is applicable to any kind of marketing power collaboration system of the high-tech enterprise, because it can be adapted to the rapid change in market and technology areas. Of course, the star synergy model also has some weaknesses. First, as a core unit of star-shaped collaborative mode, there must be equipped with some complex talent who aware of the ability of other units. If the talent selection is not appropriate, it will add to the collaborative interface between the units, reducing the efficiency of collaborative. Second, as a core unit of star-shaped collaborative mode, it must be fair and impartial, and dealing with interface issues should always be in line with the overall interests of the system, not intentionally partial to any side, otherwise it would be the interfaces between the ability of unit deteriorate.

## 6 Conclusions

Marketing force synergy is a new area of research. The synergies of marketing power are generated by the synergy unit, synergy conditions, synergy interface, and synergy mode of these four areas. Among them, the marketing power synergy model is the sum of the contact when marketing power unit creating synergy, it is the result of optimization. So, on the basis of synergetic pattern recognition theory by Professor Haken, the author study the principle of marketing power synergy mode, determine the standards of order parameter selection and management according to the characteristics of growth and change. On this basis, the author put forward two synergy modes, complementary synergy mode and competing synergy model, also raise three synergy operation modes, parallel cross synergy mode, project team synergy model and star synergy mode.

# The Influence of Culture on Work Motivation in Bolivian Managers

Fernando Nelson Villaverde Chavez

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: fn.villaverde@gmail.com)

**Abstract:** The study evaluates which were the most frequent motivational factors among 150 candidates for management positions in La Paz City (Bolivia). The results showed that the behavior of the sample is directed by the motivation for “membership”. On the other hand, international scales show significantly differing results, which indicate that managers are directed in their behavior by the “achievement” motivation. This work concludes that the differences obtained are due to cultural factors, which are scarcely investigated in psychology of work and, hence, not used in business management. This paper also concludes that the role of culture on the motivation of business managers cannot be avoided since it influences the performance of the company and the country.

**Key words:** Culture; motivation; Collective culture; Individualist culture; Managers

## 1 Introduction

The importance of organisational culture and climate has been the subject of relevant interest since the 80's until today, no longer leaving off to be a peripheral element in organizations to become a strategic element of high importance.

The development of organisational culture allows to members of the organizations certain behaviors and inhibits others. An open and humane work culture encourages participation and mature behavior from all members of the organization, if people are committed and are responsible; it is because the work culture is a strength that allows organizations headed towards excellence toward success.

The organisational climate is determined by the perception that employees have of the cultural elements, this includes the feel and the way people react against the characteristics and quality of organisational culture.

In the field of occupational psychology one of the problems facing Latin American countries is that for various reasons, most studies of organisational behavior have been conducted in the United States and Western Europe. Reasons, including greater ability to access funds for these studies, large number of researchers to exchange ideas on related topics, and expectations for professional career development has the power to investigate and or published, these are some of the reasons that cause Latin American countries intellectually nourish from these countries. This geographical imbalance in the research entails the risk that the theories developed in one part of the world can mistakenly be taken as universal, and therefore wrongly used in other countries. Bechtold D.J. and others (2002) question whether the individualistic nature of theoretical concepts frequently used in studies of organisational and consumer behavior as: motivated leaders to reach personal goals, consumer purchasing decisions taking individual employees motivated by extrinsic reinforcement and character individual may be applicable to other cultures.

Today's management theory used in Bolivian companies, shows a list of conducts considered necessary to achieve executives who lead successful organizations, these behaviors have been obtained from investigations of individual cut which seem to be unresponsive to the country's cultural characteristics. The Bolivia culture, like most of Latin America's, is of collective character; researches in these cultures show an influencing factor of motivational processes in relationships between people who share the same social identity. In these cultures, leaders have obligations to his or her subordinates, and often act in a paternalistic way that would be unacceptable in individualistic cultures (Aycan, 2000; Hui and Luk, 1997, Sinha 1994). Here, workers collectively set goals, or with other group members, which seems to motivate them to achieve goals, since they seem not want to fail at their group. Triandis et al, (1989) argue that collectivism requires the subordination of individual goals to collective goals whereas individualism promotes people's pursuit of goals that are important to them, and even change their groups to achieve them.

## 2 A Case Study

The case study helps to show that motivation and culture are related concepts, which leads to the

question: what is the motivational factor with greatest influence on the behavior of the Bolivian business leaders and in what extent culture influences it?

This research seeks to answer this question from the Bolivian reality, where cultural issues has been a little related to factors of production and human resource management, there is now an effort to study the culture, determine their impact on different aspects of social and economic life. The study is part of this line, in a quest for greater understanding of those motivating factors that govern the behavior of Bolivian managers and may differ from the behaviors valued by management theory recognized internationally.

For this purpose is considered a study in Bolivian manager applicants; their reaction and response to a series of study according to the impact of belonging a new job environment and their most nearest goals within the company and within their work group. This research was made in order to determinate the cultural influence in the leaders motivation, whether is address depending on their own social acceptance as individualist or collectivist culture people.

### 3 Methodology

The work was carried out with 150 candidates for management positions, of both sexes. All professional degree, preferably with a master, knowledge in English and executive experience at least 3 years in management positions, recruited through a notice published in newspapers in the city of La Paz (based on the International Electronic Magazine of the Latin American Union of Psychological Entities)

#### 3.1 Instruments

According to the psychosocial motivations of Fernández Seara scale, consisting of 5 factors, this study consider them next:

**Table 1 Fernández Seara Scale**

Membership	Each Factor consist of 5 components	Activation
Social recognition		Expectation
Self – esteem		Execution
Power		Incentive
Security		Satisfaction

Source: International Electronic Magazine of the Latin American Union of Psychological Entities (2002)

### 4 Results

The subjects, who were applied by survey of motivational factors, showed that the main motivating factor is the “membership.” It is characterized by the need to socialize, to be socially accepted and have security in interpersonal relationships. In these people, social contact that provides them with knowledge about the self and the world, social contact is the one that reduces uncertainty, which gives them emotional and cognitive stimulation. So, it is through their group that can create a dignified image of him or herself.

The results show that the factor “membership” is the first position into 4 components analyzed: “activation,” “expect,” “execution,” and “satisfaction”, placing the component “incentive” to the second position (see Table No 2).

**Table 2 Results of Motivational Survey**

Activation Component	Expectation Component	Execution Component	Incentive Component	Satisfaction Component
Membership	Membership	Membership	Achievement	Membership
Achievement	Achievement	Recognition	Membership	Achievement
Power	Recognition	Auto-esteem	Recognition	Recognition
Recognition	Auto-esteem	Achievement	Security	Auto-esteem
Auto-esteem	Security	Security	Auto-esteem	Security
Security	Power	Power	Power	Power

Source: Own elaboration, based on International Electronic Magazine

At the level of “activation” component, understood here as the energy needed to start a particular process, “membership” is significantly higher to the universal average  $n_s > 0.05$ . This can be found in Figure No. 1, where it is perceived that the results of our study are shifted to the right in relation to the international scale, showing that our sample is willing to drive, move and direct their energy towards seeking

Figure 1 Membership - Activation (Own elaboration)

“membership” more intensely than the average scores of the behavior reported by managers of companies from other countries.

The component “expectation” is related to the effort made by the person for what he or she considers most likely to happen. Here, the results also indicate a “membership” as the most important factor, that would mean that our executives hope to gain acceptance of their group more than they expect to get the international managers average. This can be notice in Figure No. 2 where the results of our sample are also shifted to the right,  $ns > 0.05$ .

Figure 2 Membership - Expectation (Own elaboration)

The results of the component: execution, reinforces those obtained from the other components, showing that Bolivian executives are willing to strive, to execute actions, to get moving, rather than the international average for the acceptance of their group. Here we can see like in the previous figures, the sharp rightward shift in our sample, which corroborates the results. (see Figure No. 3)

Figure 3 Membership - Execution (Own elaboration)

However it is interesting to notice that for the factors: “incentive” and “satisfaction,” the motivation to “membership” is shifted to the left in relation to the universal parameters, and it can be interpreted as the fact that our managers are seeking the "membership" they hope to achieve it, they strive for it but might be not personally satisfied.

Even if the factor “satisfaction”, the “membership” is first choice for our sample, and the second for the factor “incentive”, these are lower than the international extent, corroborating the interpretation that there is a disconnection between the satisfaction of being accepted by the group and the subject's innermost desires.

Figure 4 Membership - Incentive (Own elaboration)

To these results must be included the correlation age and “membership”, showed an inverse correlation, i.e. the higher age the lower pressure to the “membership” as motivating. The “Membership” is the main motivator for ages about 20 to 45 years, but not for managers older than 50 years, where this stopped being an important need. The subjects at this age are looking to meet other needs as the “achievement” or “self esteem”. This may be due to the age of 50, the subject looks into himself or herself, leading him or her to seek the satisfaction of other needs such as personal fulfillment.

Figure 5 Membership - Satisfaction (Own elaboration)

### 5 Conclusions

The variance analysis performed allowed us to see that the motivation for “membership” is the most important in our sample to four components. (activation, execution, expectation and satisfaction). These results lead to assume that the motivation is not just individual or about the company, is also a result of the culture the individual comes from. People from cultures with collective dominance, where it is reinforced group values (as the case of Bolivia), would be oriented to the membership, which causes to have an image of himself or herself more dependent of the group, being less sociable with the out-group than subjects in individualistic cultures, and be motivated to membership on all of intimacy, it means they seek to be accepted by their close group allowing them to obtain warm and intimate

relationships that protect them from fear of rejection. In such societies it is reinforced the values of benevolence and egalitarian commitment.

Even the fact that Bolivian managers are satisfied mostly by the factor of membership is not enough to satisfy their individual level, this could be because the subject is immersed in two different types of information on one hand the company will demand a type of motivation and the culture demands a different one as well, this would produce a dissociation in the subject. It is also interesting to notice previous studies that say: people in collectivist cultures expressed slightly higher scores on distinctiveness (it is annoying to them that others do things better and enjoy being the only ones) than subjects in individualistic cultures, this could also explain the lower results in the international parameter obtained in the incentive and satisfaction components.

The results of this study indicate the need for further studies in culture and occupational psychology. Workers in psychology must not forget that the image of man is of an ideological character, therefore is necessary to examine the existing society and ideology in a particular historical moment since the reality where men move into his social environment. Hence, be the culture, which develops the motivational provision that the employee brings to the company. Therefore, further research is needed on how culture affects the style of motivation of our managers and deepens understanding of this issue, such psychologically, socially and administratively level. We must conduct researches that allow us to create organizations that respect our idiosyncrasy and our values, to achieve individual development and create internationally competitive firms. Continue copying business models of nature individualistic cultures and applying them in subjects living in collective societies, will be achieved only discourage them and still generate a feeling of uncertainty caused by the demands of their society at odds with the demands of western administration.

# Reform and Innovation of Publishing Process Based on the Theory of Project Management

Tian Daoquan

Wuhan University of Technology Press, Wuhan, P.R.China 430070

(E-mail: tiandaoquan@126.com)

**Abstract:** In the research, work stages and management process of publishing process reform and innovation based on project management were analyzed and classified. To improve management ability and work efficiency, traditional publishing process should be re-divided and recombined, because the divisions of work stages and management process are the basic work of project management. In addition, a solid foundation will be laid to the follow-up reconstruction of organization in this way.

**Key words:** Project management; Work stage; Management process; Publishing process reform

## 1 Introduction

A project is consisted of implementation process and management process that includes the plan, implementation and control of the project. To improve work efficiency, a publishing program will be classified in several stages that are easy to be managed and all the stages can be further divided into a series of specific management process according to the characteristic of publishing industry and some conditions in the process of implement of publishing programs.

In project management theories of all kinds of stages are the key symbols to the division of the project. It is apparent that some project work that has same points will be divided into a same kind of project stage. Moreover, integrity of the outputs of the project is another important sign. Some key production can be obtained with all work of the project stages finished. The production is the export of the project stage that has been finished and it is also the import of next project stage that will be continued or the end of the project. All the work of the whole project can be regarded as an entire project life cycle of a series of project stages based the theory of project management.

## 2 Literature Review

Project management began in the 1940s and project management was applied in the national defense construction and industrial (civilian) engineering construction in the developed countries during this period. In the 1960s, many researchers did research on the theory of project management in the world. In the 1970s, project management was introduced to China from western countries and it was applied widely in national defense, construct and software engineer. And project management theory was brought in Chinese publishing industry in 1990s. Some presses like China Higher Education Press tried "the project thread". However these presses did not do undoubted project management, what they did provided new management ideas to publishing project management to cultivate talents and organization of publishing industry.

Du Linzhi (1998) raised project responsible system first time and he thought project responsible system is a efficacious method to supervise and control the publishing process.<sup>[1]</sup> Zhou Xiaoli (1999) probed project responsible system and studio system.<sup>[2]</sup> Hu Yongxu (2000) discussed the basic concepts of project management, book project manager and the cost management of book project. It was the first time to put forward the publishing project management in China. Yunfeng Chen (2001) discussed possibilities and procedures of carrying out project management to explore the ways of book project management. Wang Ping (2002) explored project management and the application in publishing process. More and more people (2003) started to do research on project management and many papers were published. Feasibility, necessity and applicability of publishing project management was discussed and analyzed. Mo Xiaodong(2004) elaborated the advantages of the concept of publishing project management and implement of publishing project management clearly. Yang Ping(2005) indicated that compound organization was fit for book publishing activities and confirmed the duties of project managers. Li Xinniu(2006) elaborated the press make full use of array of organization structure and analyzed the advantages and disadvantages of array of organization structure. Form the paper, they analyzed how to bring in project management and introduced some ways of project management in some areas by conceiving the organization structure of publishing project management. Liu Jian (2007) divided the publishing project system into three forms: subject selection project system, subject

selection and delivery project system and subject selection and sell and delivery project system. The publishing project system was a kind of organization form and aim responsible system that optimized the organization to finish a publishing project. Shen Qiao(2008) explored the duties and quality of publishing project management editor in the digital publishing environment. Yan Yuxi (2009) presented the applications of project management theory in Shenyang normal university book digital reform. Li Ruimin(2010) introduced features of book publishing project. He also expounded book publishing project management ways and implement process and summarized the cause of accomplishing the publishing project and insignificances.

The development of project management was a constant expanding process according to analyzing 92 papers discussed project management and publishing. In this process, scholars learned the project management more profoundly and more clearly. The project management theory was applied in many different areas and more companies and feasibility, necessity and restricting factors of project management were more comprehensive.

### 3 Reform and Innovation of Publishing Process<sup>[4]</sup>

A publishing project can be divided into four primary work stages. (1) Selection of the theme and decision-making of publishing project. (2) Design and plan of publishing project. (3) Implement and controlling of publishing project. (4) Accomplishment of publishing project.

The management process of publishing project can be described by Gantt chart as the shown in Figure 1.

Project process	Starting date	Days	End date
Information collection and processing	2008-01-20	300	2008-11-15
Project approval	2008-11-16	24	2008-12-10
Time and costs control	2008-12-10	10	2008-12-20
Fields of study	2008-12-21	7	2008-12-28
Allocation of resources	2009-03-02	7	2009-03-09
Time and costs control Implementation	2009-03-10	400	2010-04-14
Evaluation	2010-04-20	21	2010-05-11
Revision	2010-05-26	60	2010-07-25

Figure 1 The Gantt Chart of Publishing Project

#### 3.1 Subject selection and decision-making

##### 3.1.1 Identify opportunities and demands of the publishing program

First, the manager should know the demands of readers to carry out a project. Based on premise, members need to analyze the demands of readers further and put forward basic ideas. Then, the manager should analyze and identify whether it is a good development opportunity to the company. This is a very

challenging job since it contains analyzing the publisher internal conditions and the external environment and opportunities. After the feasibility analysis is done, the manager will make it clear that whether the project can solve the problem faced by the publisher.

#### 3.1.2 Put forward topic selection report

The second task of subject selection and work of decision-making phases is putting forward topic selection report. The specific requirements of the publications need to be pointed out in detail. These requirements include getting the ways of measuring project performance, quality, and economic benefit index and the ways of measuring the number of project output, quality, technology and economic effects of the technology and other aspects of the specific index. The specific standards and regulations of the publication should be practical and feasible and can be measured. Finally, these standards and regulations will be the basic standards to check the work performance and the publication quality.

#### 3.1.3 Study the feasibility and make decisions

In general, the project proponent, the project owner or project manager is responsible to complete the project. Meanwhile, researchers must be responsible for the authenticity, accuracy and reliability of the study. Project feasibility analysis report must get the approval of the topics demonstrate commission and the important topics must be submitted to the authorities for approval. The approval process of the report is the final decision-making process.<sup>[5]</sup> After the topics report is approved, this document will be the basis of investment decisions, design of process, financing, resource allocation and implementation plan in the future, and will be the basis of the final assessment when the project is finished.

### **3.2 Planning and designing of publishing project**<sup>[3]</sup>

#### 3.2.1 Develop publishing project integrated plan

The development of integrated plan which integrates a variety of specific plans is a schedule of overall work of the publishing project. The result of the publishing project plan is to acquire a guidance document which guides the implementation, control and harmonization throughout the whole project, for instance, to guide the implementation and control of the whole project, to coordinate between the work and the specific plans, to coordinate and facilitate the communication among the stakeholders, to define the content, scope and time of the work, to provide the standard and to provide baseline of performance measure and project control of the work.

#### 3.2.2 Develop specific plans of publishing project

The development of specific plans, the process of which is to make various plans for a variety of professional work or specific work due to different targets, is a schedule of all aspects of specific work in the publishing project. The result of the publishing specific plans is to acquire a series of guidance documents which guide the implementation, control and harmonization of every professional and specific task, for instance, to guide the implementation and the control of a professional or specific work in the publishing project, to coordinate the interest communication among all the aspects of every professional or specific work, to define the content, scope and time of every professional or specific work, to provide the standard and baseline of performance measure and project control of every professional or specific work, and so on.

#### 3.2.3 The design and provisions of publications

The design and provisions of publications are not only the physical description of publications, but also include the work of technical design, implementation scheme design, and technical specification design. These works make comprehensive requirements and regulations from the perspective of technology, quality, quantity and benefit.

#### 3.2.4 The outsourcing and contract conclusion of publishing project

The work of publishing project needs the coordination of outsourcers and suppliers. In the phrases of reviewer and print, in spite of signing contracts with authors, outsourcing is usually involved. All these jobs are within the scope of schedule, that's the reason why it falls into this phrase.

### **3.3 The session of publishing project implementation and control**

#### 3.3.1 Develop the standard of controlling publishing project

The primary task of this session is to develop the standard of controlling project in the process of which the management basis and baseline needed in the whole session of publishing project implementation and control phrase are settled. The management basis and baseline include standard of controlling quality, progress, costs, resources and labor, which are the key factors that will lead to the final success of the project.

#### 3.3.2 The work of publishing implementation

The primary work in the session of publishing project implementation and control are as follows, choosing proper freelance writer, auditing, editing, typesetting, proofreading, format designing, decoration designing, quality inspecting, printing, advertising, etc.

#### 3.3.3 Command, scheduling and coordination

In the activities that formulate production, the project manager ought to keep the whole publishing procedure in order and move on with reasonable resource allocation through the management measures, such as command, scheduling and coordination.

#### 3.3.4 Performance evaluation and reporting in the publishing project implementation

In the work of publishing project implementation, performance evaluation and reporting must be given on schedule. The performance evaluation is to compare the actual results in implementation with the project control standard. Reporting is to gather statistics, make contrast, analyze and report the actual situation of the project implementation work.

#### 3.3.5 The corrective actions in the publishing project implementation

One of the most important works in publishing project implementation and control management is to take various measures to eliminate deviation according to the performance evaluation and reporting so that the project implement to the right direction orderly. The deviation rectification includes the corrective measures aiming at personnel organization and management, resource allocation and management, improvement of process and methods, and so on.

### 3.4 Completion and delivery of publishing project

#### 3.4.1 The completion of publishing project

The major work in the session of publishing project completion includes the completion of various jobs and outsourcing contracts involved in the project. Each work is to be verified and evaluated according to the topic selection report that is the key point in the project proposal while end the cooperation contracts with various outsourcing companies by check and acceptance.

#### 3.4.2 The delivery of publishing project

According to the project management theory, the delivery of a project includes two aspects, the acceptance and delivery of both material productions and property rights. As for publishing project, the delivery is not perfect since the enterprise system and property rights are not that clear. However, this is one aspect that is to be improved in the long run for the publishing company. Acceptance and delivery of publication, the production of publishing project is executed according to the publication quality management regulations from the perspectives of both quality and quantity.

## 4 Conclusion

By the division of sessions and management procedure based on reform and innovation of project management theory, operation management of publishing can be categorized into project management, which can improve the efficiency and interest of publishing work. It's a basic work for traditional extensive management transformed into a modern refinement of management. Only the re-division and reorganization of the traditional publishing process can help conduct project management better and lay a solid foundation for the following adjustment and implementation of organisational structure.

## Justification of Ethical and Unethical Dilemmas in Human Resource

Navneel Shalendra Prasad, Asa Romeo Asa, Yuan Guohua  
 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070  
 (E-mail:navi\_7237@hotmail.com, romeoassa@gmail.com, yuanguohua@whut.edu.cn)

**Abstract:** In this paper, we have tried to explore some of the major dilemmas surrounding ethical and unethical behavior. We have used approaches, cases and myths to justify questions such as to why employees commit unethical practices, the difference between ethical and unethical behavior, whether one ethical behavior can supersede an unethical behavior and the relationship between stereotyping and unethical behavior. This paper thus draws a conclusion that moral values and norms are critical to be taught to a person from childhood and with time they become wise and by the time they reach a workplace, they are full of wisdom, which is the only way to choose between right and wrong, no matter how thin the lines

**Key words:** Unethical; Ethical; Employee; Approaches

### 1 Introduction

Many companies, all through out the world have been at the receiving end of scandals resulting from unethical practices from its very employees. Enron has been the major case that most people use as a reference. Finding the reason that leads to unethical behavior will help us in trying to avoid those situations from happening in our companies. Justifying why one commits and unethical practice, how to differentiate between ethical and unethical practices and the relationship between stereotyping and unethical behavior are the major discussions of this paper. We have used Values theory to justify most of our findings. Values represent basic convictions that “a specific mode of conduct or end-state of existence is personally or socially preferable to an opposite or converse mode of conduct or end-state of existence. They contain a judgmental element in that they carry an individual’s ideas as to what is right, good, or desirable. Values have both content and intensity attributes. The content attribute says that a mode of conduct or an end-state of existence is important.

### 2 What Motivates an Employee to commit an Unethical Behavior?

#### 2.1 Theory

Corruption as unethical in this context are broken down in two, one is with theft the other without theft <sup>[1]</sup>. One would spend ages trying to figure out why an employee commits an unethical behavior. Some employees are well-off but still follow the unethical path. When we view this from an Organisation Behavior perspective, there is one theory that explains it all. Regarded as the most well-known theory of motivation, Maslow’s Hierarchy of Needs is a theory that hypothesizes that within every human, there lays a hierarchy of five needs.

(1)Physiological – includes hunger, thirst, shelter, sex and other bodily needs.

(2)Safety – security and protection from physical and emotional harm

(3)Social – affection, belongingness, acceptance and friendship

(4)Esteem – internal factors such as status self respect, autonomy and achievement and external factors such as recognition and attention

(5)Self Actualization – drive to become what one is capable of becoming; includes growth, achieving one’s potential and self-fulfillment.

As each of these needs become satisfied, the next need becomes dominant. As represented in Figure 1, an individual moves up the steps of the hierarchy. This theory suggests that although no need is fully gratified, a substantially satisfied need no longer motivates. Thus, to motivate someone, one needs to understand what level of hierarchy the other person actually is and then focus on satisfying the need of that level or higher. Maslow divided the five needs into higher and lower orders. Physiological and safety needs were classified as Lower-order needs and social, esteem and self-actualization as Higher-order needs. The difference between the needs is that Lower-order needs are satisfied externally by things such as pay, union contracts and tenure whereas Higher-order needs are satisfied internally that is within a person. Clayton Alderfer reworked this theory and named it ERG theory meaning Existence, Relatedness and Growth. The only major difference between this to theories was that, Clayton Alderfer did not assume the presence of the hierarchy and assumed that a person could be

concentrating on all three attributes simultaneously as shown in figure 1.

**2.2 Justification**

Fierce competition has been one of the factors of employee’s committing an unethical behavior. For a manager, his/her salary is based on the performance of the business and competition prevents him from actually achieving what he expects to receive as a salary and this leads to them seeking personal incentive for providing their company services and corruption in general which is unethical. The theory basically tells us that, ‘an unsatisfied need leads to motivation to fulfill that particular need’. Therefore, an employee commits an unethical behavior because something motivates him to do so and motivation arises from an unsatisfied need. Thus, an employee commits an unethical behavior because he/she has to satisfy a need that has previously been unsatisfied. So someone needing more wealth because he/she is not satisfied with their current will be tempted to commit an unethical behavior to gain more. One would argue that everyone is not satisfied with what they have but everyone does not commit unethical behaviors. This is justified by the fact how an individual is brought up. The values and morals in his life will decide whether he/she will actually commit the behavior or not but it must be said that motivation is still eminent.

Figure 1 Abraham Maslow’s Hierarchy of Needs

**3 What is an Ethical Behavior and What Is an Unethical Behavior?**

**3.1 Theory**

Members of organizations throughout the world are finding themselves facing ethical dilemmas that are, situations in which they are required to define right and wrong conduct. What actually constitutes good ethical behavior has never been clearly defined and in recent years, the line differentiating right and wrong has become even thinner. Is it any wonder that employees are expressing decreased confidence and trust in management and that they are increasingly uncertain as to what constitutes appropriate ethical behavior in their organizations? Organizations and managers are responding to this problem in a number of ways. For instance, they are writing and distributing codes of ethics to guide employees through ethical dilemmas. They are also writing and distributing codes of ethics to shops, and other training programs to try to improve ethical behaviors. Today’s managers need to create an ethically healthy climate for his or her employees, where they can do their work productively and confront a minimal degree of ambiguity regarding what constitutes right and wrong behavior.

**3.2 Case**

Part 1: Nakama is a middle aged employee of CokePafi Comp. Ltd. He stole a \$100,000 from his company. The Managing Director of the company fired him as soon as the company found out and turned him over to the Police. Nakama pleaded guilty and was imprisoned for 10 years.

Part 2: Nakama had an only son aged 12 who was diagnosed with brain tumor. He had spent all his money in the treatment for his son. He needed a \$100,000 for the operation of the tumor after which his son would be cured if the operation was successful. He could not ask for a loan because he had no properties. The only option he had was to steal the amount from the company. He knew it was wrong but in his situation, that was to save his son, it was the right choice. He told press after his sentence that what he did was wrong but for him, in that particular circumstance, it was the right decision. His son’s

operation was successful and lived a healthy life waiting for his savior and God in disguise.

### **3.3 Justification**

“Everyone in the world are right, the only thing wrong is the time”. The above statement means that to every issue and conflict, both parties are right or correct but the reason they are having a conflict is the difference of time. Difference of time in this perspective means that the way and the circumstances in which both parties think about the particular issue is different and that is why conflicts arise.

Part 1: According to the Managing Director of CokePafi Comp. Ltd, he did the right thing to fire him and turn him over to Police. Anyone in the shoes of this Managing Director would have done the same. Thus, this was an ethical/right behavior of the Managing Director.

Part 2: According to Nakama, what he did was ethical/right because of the situation in which he was in as he had no other option to save his only son. Nearly everyone in Nakama’s situation would have done the same provided they would have gone to any limits to save their son. Both the parties in this situation are right, so what is ethical and what is unethical? The answer to this million dollar question is the following statement:, “Everyone in the world are right, the only thing wrong is the time”.

## **4 Can one Ethical Behavior Supersede an Unethical Behavior?**

### **4.1 Theory**

It is a sad truth that the employees of just about every business, in every business, will occasionally encounter team members who are taking part in unethical behaviors. Such unethical behaviors include a wide variety of different activities. Among the most common unethical business behaviors of employees are making long-distance calls on business lines, duplicating software for use at home, falsifying the number of hours worked, or much more serious and illegal practices, such as embezzling money from the business, or falsifying business records. Though there is sometimes a difference between behaviors that are unethical and activities that are actually illegal, it is up to the business itself to decide how it deals with unethical behavior - legal or not. Many employees find that discovering unethical behavior among co-workers actually tests their own values and ethical behaviors. After all, unethical behavior that is not illegal frequently falls in a grey area between right and wrong that make it difficult to decide what to do when it is encountered. Furthermore, different people have different views regarding what is ethical and what is unethical. For example, some people feel that it is alright to tell a little "white lie", or to make one long distance call on the company's nickel, as long as they can justify it in their mind. When employees discover other employees doing something that they know is wrong by the company's standards, their own sense of what is right and what is wrong instantly comes into question. That employee needs to consider how s/he feels about that particular activity, as well as informing about that activity, or turning a blind eye. Even by deciding to do something about it, the employee who has discovered the unethical behavior is presented with a number of difficult choices. Should the employee speak to the individual directly, or should the employee head directly to a company supervisor? To make this decision a bit easier, many companies have adopted several techniques that allow for the management of unethical activities. The first step is to create a company policy, in writing, that is read and signed by each employee. This erases most feelings of ambiguity when it comes to deciding what to do after witnessing an unethical behavior. The second is to give a clear outline of what is expected of the person who has discovered the unethical behavior. It should include the person who should be contacted, and how to go about doing it. With clear instructions, there will be less hesitation in reporting unethical activities, and then they can be dealt with quickly and relatively easily, before they develop into overwhelming issues. Furthermore, the repercussions of unethical behaviors should be clearly stated. This way, both the person doing the activity, and the witness to the activity will be well aware of the way that things will be dealt with, and there won't be any risk of someone not reporting unethical behavior because they're afraid that the culprit will be unfairly treated.

### **4.2 Myth of Mother and Son**

There were a mother and son who used to live in a village. The son was very arrogant, disrespectful and outlaw. He usually talked back to his Mother, was involved in fights and even stole as a result of peer pressure. One day, his mother told him that she is going to hammer a nail in the wall for every wrong that he would do and she would not remove the nail unless he does a good deed. This had no influence on the son and he continued in his usual wrong behaviors. After a year, when he looked at the wall of his house, it was filled with nails and at that moment it clicked to him of how many wrongs he had done, how many people he had hurt and how many hearts he had broken. From that very day, he decided to do all good things and to part with his old life. He started to change into a good person as

time went by and as a result of his good deeds; his mother removed the nails one by one. After more than a year, all nails were finally removed. After the nails were removed, the son told his mother that he had become a good person. So his mother told him that even though all the nails had been removed, the marks made by those nails will always remain because no matter how many good behaviors we do, our bad deeds will always be remembered.

#### **4.3 Justification**

The moral of this story is that, one unethical behavior cannot supersede an unethical behavior. Actually, no matter how many ethical things we do, our unethical behavior, even if it is just one, will always remain. Thus, concluding that one ethical behavior cannot supersede an unethical behavior.

## **5 Is there a Relationship between Stereotyping and Unethical Behavior?**

### **5.1 Theory**

Stereotyping is when we judge someone on the basis of our perception of the group to which he or she belongs. We rely on generalization everyday because they help us make decisions quickly. They are a means of simplifying a complex world. It's less difficult to deal with an unmanageable number of stimuli if we use heuristics or stereotypes. In organizations, we frequently hear comments that represent stereotypes based on gender, age, race, religion, ethnicity and even weight. Stereotypes can be so deeply ingrained and powerful that they influence life-and-death decisions. One study has shown that, controlling for a wide array of factors (such as aggravating or mitigating circumstances), the degree to which black defendants in murder trials looked stereotypically black essentially doubled their odds of receiving a death sentence if convicted. One specific manifestation of stereotypes is profiling—a form of stereotyping in which a group of individuals is singled out, typically on the basis of race or ethnicity, for intensive inquiry, scrutiny or investigation. Since 9/11, ethnic profiling has become the subject of much debate. On one side, proponents argue that profiling people of Arab descent is necessary in order to prevent terrorism. After all, a good percentage of the large-scale terrorist attacks that have taken place over the past 30 years have been perpetrated by Muslim terrorists. On the other side, critics argue profiling is demeaning, discriminatory and an ineffective way to find potential terrorists and that Muslim Americans are as law abiding as other citizens. The debate is important and implies the need to balance the rights of individuals against the greater good of society. Organizations need to sensitize employees and managers to the damage that profiling can create. Many are expanding their diversity training programs in order to particularly address ethnic stereotyping and profiling. One of the problems of stereotypes is that they are widespread and often useful generalizations, despite the fact that they may not contain a shred of truth when applied to a particular person or situation. So we constantly have to check ourselves to make sure we're not unfairly or inaccurately applying a stereotype in our evaluations and decisions. Stereotypes are an example of the warning, "The more useful it is the more danger from misuse."

### **5.2 Attribution Theory**

This theory tends to generally explain the way in which one judges another person. This theory explains the ways in which we judge people differently, depending on the meaning we attribute to a given behavior. It suggests that when we observe an individual's behavior, we attempt to determine whether it was internally or externally caused. That determination however, depends largely on three factors:

- (a) Distinctiveness (b) Consensus (c) Consistency

First, let's clarify the differences between internal and external causation and then we'll elaborate on each of the three determining factors. Internally caused behaviors are those we believe to be under the personal control of the individual. Externally caused behavior is what we imagine the situation forced the individual to do. Distinctiveness refers to whether an individual displays different behaviors in different situations. If everyone who faces a similar situation responds in the same way, we can say the behavior shows consensus. Consistency is when a person responds to the same situation in the same way over time.

### **5.3 Story**

During the Bombay riots in India between Hindus and Muslims, a Muslim mother illustrated to her son (Khan) who was hearing all the bad deeds of Hindus and was growing hatred for them, she drew a man holding a stick and giving it to him (Khan) and then she drew another man giving a lollipop to him (Khan). The mother then asked her son (Khan), which one of these two men was a Hindu and which one was a Muslim. Khan said that the man giving the lollipop to him was a good man and the man trying to

hit him with a stick was a bad man and he said that he could not say who of these two men was a Muslim and which one was an Indian. So the mother told him that this is the fact of the world, that there is no difference between people, the only difference is that there are good people and there are bad people and that there is no other difference.

#### **5.4 Justification**

There has been increasing number of situations where both you and I have a particular person by their race, color, religion or looks or even been at the end of the same treatment. As this is human nature, values actually teach us the opposite. This small story changed the life of a person and turned him into a person who can change the world. The bible says that “we were all created in the image of God and God was neither white nor black”. Parents, teachers, elders and anyone with influence should preach these words as the first step towards world peace and lay to rest any differences that prevent us from doing so. Many people must have seen this movie but only a few would have actually practiced what it taught them. Thus, there is no relationship between stereotyping and unethical behavior. If we see a Muslim person, it does not mean he or she is a suicide bomber. To think that someone who belongs to a particular group will actually do an unethical behavior is baseless. Therefore, the quicker we accept that there are only good and bad people and that there is no other difference between human beings, the quicker, a village, a town, a city, a country and our whole world can move forward bringing peace and prosperity to make our own Heaven on Earth.

#### **6 Conclusion**

As countries grow richer, their perceptions on what is ethical, changes. This paper has been written in order to convey that ethical and unethical behaviors run on very thin lines and that what is important is to instill values and norms in a person from their childhood as it is the only way one can choose between right and wrong, ethical and unethical. Accordingly, most of the justifications made in this paper are from Values theory and it is not something one can read and understand, but it is something that comes with time and being wise and it is all contained in one word, “Wisdom”

# The Cause and Prevention of Major Risks for Securities Company: Taking Hantang Securities as the Case

Liu Dingping

Board Member of China securities Co., LTD, Beijing, P.R. China, 100010

(E-mail: strongtiger1818@163.com)

**Abstract:** The hidden risk of the securities is dangerous for the securities companies. This paper will describe how the hidden risk affect the securities companies and we will analyze questions about the securities companies which come into our mind: what's their major risks, what's the reason of their irregularities leading to the huge risks, what's the action of the securities regulatory authorities, how to prevent these risks and what's revealed from the risk outbreak. With Hantang Securities as the case, this paper will give some suggests to solve the above questions.

**Key words:** Securities companies; Risk; Risk prevention; Capital problems

## 1 Introduction

Since the year of 1981 when 4.866 billion five-year state bond was issued to the enterprises and institutions, China securities industry has covered a history of over 25 years. From September 1985 when the new China's first securities company came into birth in Shenzhen the special economic zone, to the end of 2005, 116 companies had been set up. In the glooming market of recent years, the securities companies, with mistakes in choosing proper profit model as well as in risk management, failed to play the role as a medium, leading to prevailing loss in securities industry. In the subsequent remediation, some companies were cleared out of the market and meanwhile some successful ones were pushed onto the stage front.

The year of 2004 is when the hidden risks of the securities erupted in full scale. Over twenty companies with irregularities in the business operation, encounter the problem of capital china fracture, which brings great loss for the investor as well as instability in the financial market.

In developing the securities market, the irregularities of a few companies had been covered until the full scale outbreak in 2004. A group companies such as South Securities, Zhongfu Securities, Deheng Securities, Hantang Securies, etc. were stuck into business scandals due to the long-term risks.

Take Hantang Securities case for analysis.

Hantang Securities Co., Ltd (Hantang securities hereinafter), under the approval from China Securities Regulatory Commission, was established by combining Guizhou Securities and Zhanjiang Securities. In December 2001, it was listed in Shenzhen, with excellent performances in each business sector. It was ranked 32nd in 2002 up to 16th in 2003 in the annual securities company list.

## 2 Risk Outbreak of Hantang Securities

With the sequent falls of securities companies in 2004, the market sank in deep mire. Irregularities such as collateral misappropriation, state bond repurchase, etc. were risked for capitals which were used as proprietary trading leading to huge loss and broken capital chains finally. In this context, the clients of Hantang Securities demanded advanced refunds. The increasing refund demands, especially the 800 million refund in Shanghai on August 16th 2004, triggered the risk outbreak. Next day Hantang Securities was informed the capital chain fracture. At the same time, Wu Keling, the legal person of Hantang Securities, reported this crisis to Shenzhen Securities Regulatory Bureau. Subsequently, its assets were frozen after the investigation. On September 3rd 2004, it was announced that due to serious irregularities, Hantang Securities was taken over the custody to protect the legitimate rights of investors.

## 3 Major Problems and risks of Hantang Securities

### 3.1 Misappropriate client's clearing fund

Clearing fund is the deposit trusted in the securities company for securities trading by the client. It has been an open secret in China's securities market to appropriate client clearing fund by the companies, which is obviously forbidden by the related authorities and laws. Yet it is in vain without an effective supervisory mechanism. The audit result revealed that the client clearing fund appropriated by Hantang Securities amounted to the stunning 2.456 billion.

### 3.2 Trust management against regulations

Trust management refers to the trustee trusting his proprietorship or financial assets to the securities company for investment management and value growth. Nevertheless, the securities company is released from the liabilities of guaranteed investments.

In the real operation, Hantang Securities manipulated the whole trust managements against the regulations, turning them into high-yield savings essentially.

### **3.3 State bond repurchase against regulations**

State bond repurchase is to mortgage the state bond for capitals. So far, state bond repurchase is operated in exchanges and banks with different trading rules and risk management mechanism respectively. It is against the regulations by the securities companies to appropriate the client's state bond for repurchase.

State bond repurchase against regulations by Hantang Securities had pushed itself into capital crisis before the risk outbreak. It was revealed that the face value of state bond appropriated by Hantang Securities amounted to 1.338 billion.

### **3.4 Proprietary trading against the law**

It is allowed by China Securities Law to operate the self-managed securities business by securities companies. Proprietary trading gives the securities company freedom of participating in trading activities by managing the capital or securities independently. This business, taking small share in foreign securities counterparts, is high-yield yet full of risks.

It is stated in the law that any securities company in simultaneous operations of securities brokerage business and proprietary trading that fails to handle the businesses separately according to law and conduct mixed operations shall be ordered to make a rectification and confiscated of the illegal income; where there are serious circumstances, it shall be revoked of the securities businesses originally verified and determined by the securities supervision and administration institution. Too much proprietary trading results in such irregularities as clients' margins appropriation, state bond repurchase, ect. to cover losses from self- managed securities business.

Without a full consideration on financing and its own risk tolerance, Hantang Securities was finally liquidized because of its illegitimate financing for proprietary trading which results in huge loss. With only 901 million registered capital, Hantang Securities invested as much as 4.680 billion on proprietary trading, most of which was financed from irregular business operations. Once risks break out, Hantang Securities is unable to cover the capital gap leading to capital chain fracture eventually, so the serious problems appers.

## **4 The Reason for Risks**

### **4.1 Problems root in the company structure and management**

As a company with limited liability, Hantang Securities was held by twenty companies among which Hainan Runda was the first shareholder, taking up 19.97% in shares. Most of the shareholders, though, remained as nominal without real investments. Hantang Securities, controlled by Hainan Runda, was unable to build a balanced separated power structure among the shareholders, the board, and the supervisory committee.

### **4.2 Illegitimate financing and earning**

The single and illegitimate profit model results in irregular business operations that lead to business crisis.

## **5 Measures and Suggestions about Risk Prevention**

### **5.1 Precaution against appropriating client clearing fund**

It is suggested to manage client clearing fund by the independent third party.

### **5.2 Precaution against illegitimate trust management**

The securities company is suggested to finance from widening channels.

### **5.3 Precaution against illegitimate state bond repurchase**

In order to resolve risks out of state bond repurchase, the following changes on trading regulations are suggested:

#### **5.3.1 Change on trust account**

It is suggested to turn the secondary trust into trust account, and the seats coalition into account settlement, preventing the shortage in mechanism. Meanwhile, to comply with the related regulations and laws, securities companies are not allowed in state bond repurchase.

#### **5.3.2 Lower the mortgage ratio in state bond repurchase**

A lower mortgage in state bond repurchase is to increase financing investment, avoiding the risk out of mortgage shortage.

#### 5.3.3 Widen the financing channels

In long-term, it is the widened financing channels and diversified investment that resolves the problem from state bond repurchase. With a mature lending market, the qualified securities company is equally treated like the bank in borrowing and lending.

### 5.4 Precaution against risks out of proprietary trading

#### 5.4.1 Policy on self-managed investment

At the growing stage China's securities market runs at stake. With fragile risk management, the securities companies shall be cautious on self-managed investment policy.

#### 5.4.2 Management on self-managed financing

It is stated in the securities law that the self-managed business of securities companies shall use the capitals of their own or from legitimate financing. The legitimacy of the capitals reduces not only irregularity possibilities but also financial risks when self-managed business is at low ebb. The securities company shall apply strictly to the authorized approval, and follow closely the approval process.

#### 5.4.3 Control on the self-managed business process

To avoid risks, capital or shareholder account opening shall approved by the legitimate process. The shareholder account in self-managed business shall be under unified administration by another party. Restrictions shall be put on the operating personnel and operating permission, especially on the security of operating confidence. The operating permission on the capital flow-out businesses shall follow the approval process strictly. Separate the unrelated business operations.

#### 5.4.4 Control on accounting

The files and approval procedures of accounts opening, closing, and trusting shall be recorded in the accounting department. The accounts under financial accounting shall be approved by the superior management. To avoid disagreements, the documents issued by the operation office shall be stamped under its seal. Platform shall be built by the self-managed business departments to check regularly the balances with accounting departments and operation offices. With or without business operations, the statements from operating offices shall be checked. Provisions shall be withdrawn when self-managed businesses make profits.

#### 5.4.5 Policies implementation

Policies do not mean risk precautions. Without strict implementation, even perfect policies will go in vain. A lot of cases demonstrate that risks break out of various operations against policies. It is the implementation that matters.

#### 5.4.6 Focus on people to control risks

With risk consciousness, the securities companies depend on their employees to implement policies in self-managed businesses. No matter the deliberate crime, or the professional incapability, or work mistakes will lead to risks. A people oriented risk controlling lies in two points: firstly give importance to virtue examination in choosing and appointing the personnel in self-managed business. Secondly strengthen the risk awareness from the regular employee to the leaders.

## 6 Conclusion

Based on the case of Hantang Securities, this paper describes the major risks of securities companies: 1. Misappropriating client's clearing fund, 2. Trust management against regulations, 3. State bond repurchase against regulations, 4. Proprietary trading against the law. Thorough the analysis of these risks, we can find the reasons: Illegitimate company management structure and financing and earning model. So we give some suggestions to solve these problems. The hidden risks of the securities companies can't be completely eradicated, but we can take measures to reduce the risk rate through the further study on them.

Hantang Securities case is an important one on securities brokers risk disposal in our country. In this case, we can learn much experience about securities brokers risk disposal, such as the independent customer deposits save tube as the third party, the independent regulatory approval in asset management business, self-support business regulatory, independent trusteeship of the national debt, and so on. The successful experience has been rules and regulations in securities brokerage industry, and this case improved the securities brokerage industry greatly.

# Modeling and Simulation of Product Service Systems for Design and Innovation\*

Tsuyoshi Koga<sup>1</sup>, Ken Kaminishi<sup>2</sup>

<sup>1</sup>Department of Mechanical Engineering, Yamaguchi University

<sup>2</sup>Tokiwadai, Ube City, Yamaguchi Prefecture, 755-8611

(E-mail: koga@yamaguchi-u.ac.jp, kaminisi@yamaguchi-u.ac.jp)

**Abstract:** This paper addresses the process of designing new product service systems (PSS). The product service systems mean wide range of businesses which include physical products and intangible services such as software. For design and innovation, this paper proposes a modeling and simulation methodology of a system of a hardware and software. The process to promoting new PSS contains five steps. First step is to have a creative mind so that designer himself surely can start an innovation. Second step is to find good PSS idea. Third step is to select and choose the best idea. Forth step is to describe clear blueprint and to visualize the architecture of PSS. The clear blueprint helps to evaluate the technical and economical possibilities. Last step is to realize the PSS idea into this world by managing teams and projects. Based on a modeling method of hardware-software-systems based on SysML (System Modeling Language), a blueprinting methodology is proposed and confirmed by describing electric power supplying business.

**Key Words:** Product service systems (PSS); System modeling language (SysML); Creative design

## 1 Introduction

This paper discusses how to realize new product service systems (PSS). The product service systems includes wide range of businesses such as airline, automobile, hotel, travel agency, electrical energy supplying system, and so on. Launching new product service systems is one of the most important and really desired activities in this world.

New PSS creates not only new customer, new satisfaction, but also new employee, new social value, and even if new technology, new academia, and new future. How difficult the designing new PSS is well known especially for young students and young business person. On the other hand, we can recognize that in this world has some excellent PSS creator such as Steve Jobs<sup>[1]</sup>. For example, Konosuke Matsushita, who is a founder of Panasonic Corp, created more than thousands of companies which manufacture electric products and provide services<sup>[2]</sup>. What is the difference of normal PSS designer and such excellent PSS creator? This paper assumed that there should be key issues for creating new PSS business.

Some people create a lot of companies, new business, and new product-service-systems. There are many people who do not create any company even if he has excellent abilities and is excellent as an employee. What is the difference between just an employee (even if he is quite excellent) and such innovative designer of product-service-systems?

## 2 Process of Designing New Product-Service-Systems

This paper focuses on the difference between innovative promoter of new creative product-service-systems and normal people. An important assumption is that the difference never comes from how much money they have. In other word, this paper ignores the difference from parents, assets, academic record, nationality, regions, and genders, because the historical great innovator did not always have them.

This paper proposes the process of promoting new product-service-systems as figure 1.

There are two different kinds of product-service-systems. First is creative PSS such as airline service, bike rental system, internet service, mobile phone, and auto mobility services. Creative PSS provide new customer satisfaction to increase social happiness. Second is not creative PSS such as short selling attack, financial alchemy, reckless derivative (such as subprime loan), gambles in stocks, and zero-sum money game. These PSS do not create new value itself. Not creative PSS compete for the created value by creative PSS with each other.

---

\* This work was supported by Grant-in-Aid for Young Scientists (B) (23760128).

**Figure 1 Process for Realization of New Product-Service-Systems**

**Creative business**

= create new customer satisfaction and happy society  
 (Examples: airline service, bike rental system, internet service, mobile phone, and auto mobility services, etc. )

**Not creative business**

= compete for created value by creative PSS  
 (Examples: zero-sum money game, reckless derivative (such as subprime loan), gambles in stocks, selling short of hedge fund, etc.)

**2.1 Step1: Having creative mind**

First step is to have creative mind. The creative mind means that you believe that you can achieve an innovation. The first step of having creative mind is decomposed into three steps as shown in Figure 2.

**Figure 2 Step 1: Having Creative Mind**

There are two different kinds of minds. One of them is a competitive mind. The other is creative mind. The creative mind precedes everything.

- 1) Competitive mind
- 2) Creative (Collaborative) mind

Today’s school teachers teach mainly based on competitive mind. In junior school, high school, and sometime even in the university; students are forced to compete with the other students. Beating other person is often a reason of getting his personal high score.

In order to achieve high score of product-service-systems by customer, there are no personal score. Always customer evaluates the performance of the PSS providing team. Hence, creative product-service-systems require highly collaborative team. The creative idea requires collaboration, wide vision, and throughout improvement. The creative mind focuses on collaboration and creation of

new value. Hence, changing from competitive mind to creative mind is very important first process.

In order to keep creative, at first we are going to have to forget the passive mind. Most of people pretend like they are victim. Joblessness, economic slowdown, bad recession, credit crunch such as Leman’s shock, disaster of an earthquake, are sometime frequent excuse of the passive victim’s mind. First important step to be a creative is to forget the bad uncontrollable issues, and change the passive mind to an influencing mind.

Next important step to have a creative mind is to find enjoyment in a designing and creating activities. It is necessary to believe that you yourself can create some valuable product or services, and change the world.

The final goal never should be a meaningless goal or nothing but a zero-sum money game. The final goal should be a valuable goal for both of yourself and society. All effort toward meaningless goal is also meaningless. Automatic algorithm for wining zero-sum money game or technique for imitating product is one of the examples of the meaningless goal. Only worthwhile, happy-related, through-life valuable goal derives great inherent creativity in human kind.

**2.2. Step2: Finding business ideas**

After first step, the creative mind was installed. Next we have to find good ideas of product-service-systems.

Finding new PSS idea is the most creative and interesting work. Almost all business people like to do it. The number of ideas is infinite. In our society, we can find infinite number of ideas. The PSS idea can be found in every area, every field, every hierarchy, every firm, and every customer. Because all needs, troubles, and ideal gaps can be ideas. Almost all people can stand to searching good idea in 24 hour a day, every day.

For finding new PSS idea, there is no one way, but if this paper propose how to find the PSS idea, steps 2-1) to 2-3) in figure 3 might contribute.

1) reconsider an ideal as they should be (to-be )

Observing products and services in real world, and reconsider an ideal per se.

For example:

a) should automobile burn fossil oil?

b) should we always carry all of a mobile-phone, a lap-top PC, a digital-camera, and an IC recorder?

2) find gap between 'As-Is' and 'To-Be'

Next step is to find the gap by comparing between 'To-Be' world and the 'As-Is' world. From the gap, we can find many ideas.

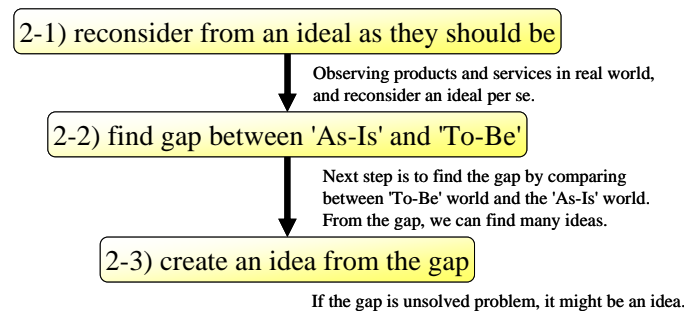

3) create an idea from the gap

If the gap is unsolved problem, it might be an idea.

For example, from 'To-Be' 1.1)-1.2):

a) light personal infomechatronics mobility with lithium battery

b) next generation smart phone

**Figure 3 Step 2: Finding Original Interesting Idea**

**2.3 Step3 Choosing one good idea**

When we finished listing the ideas, next task is to choose the best one. Question 'whether you need the realization of the idea from the heart or not' sometimes provides a good information for making a decision.

The checking must include at least following three aspects:

1) timing,

- 2) possibility, and
- 3) impact.

In order to evaluate the validity of the idea, the discussion with specialists who comes from different domain about whether we can collaborate to realize the idea can provide a good indication.

Negative feedbacks from the specialists mean that the idea cannot over the financial / technical / team issues.

**Figure 4 Choosing What Is Good and Leaving What Is Bad**

The ideas which passed the validation by the specialists are the candidates of the realization. In this step, speed of creating ideas and the number of evaluation is very important. There is one question, how much this evaluation process is going to cost? The answer is, almost zero. Rapid creation and evaluation process derives better ideas.

Figure 4 shows an example of the ratio. 100 ideas is agreed from evaluating 1000 ideas (or more than that). 10 ideas is decomposed into detailed design blueprint from choosing 100 agreed ideas. 1 business is survived from 10 design results.

#### **2.4 Step4 planning PSS and clear visualization**

After choosing excellent idea is the time when the idea is designed.

The purpose of the design is two:

- 1) possibility evaluation
- 2) front loading.

Before creating real product or service, the idea should be virtually designed as a model. The modeling process is also same with a thinking process. The modeling process contains processes of describing, thinking, adding, and again thinking the idea. In this step, speed is very important.

Also, concentrating to core concept and forgetting digressional topic is a key factor. Elimination of waste effort which has no relation with customer value is one of the purposes of the clear visualization.

The clear model helps to prevent a try-error process after real actual manufacturing. The clear model also helps to prevent an unwanted realization after real actual manufacturing.

The idea blueprint helps to evaluate the technical and economical possibilities. The integrated visualization and overview provides the total social acceptance as a system. The idea blueprint can also help to allocate required resources: capital, human, and time.

#### **2.5 Step5 realizing PSS in this world**

Next important task is to collect required resources for realizing product-service-systems. The required resources include engineering specialists, a banker, a funder in government, and a legislator. Our society always strongly desires next-generation excellent business plan. Because new PSS creates new employment, new value, new happiness, new activation of the industry, and improve GNP.

The clearly visualized business plan has strong power to move business persons. Serious energetic businessman always has strong curiosity for new interesting business idea. If the business plan had enough quality to convince the specialists, the specialists would be glad to help the realization. When the banker realizes the idea have a stable profit, they are glad to provide financing.

When the specialists realize the idea is challenging and technically interesting, they are glad to join

in the project. Hence, the convincing plan can collect required resources: specialists, finance, time, and even low.

These resources allow us to form a team. The team realizes the PSS plan into this world. The best and effective team has to be organized. There are three important factors: 1) the team has to share what are the purpose, and 2) enough time, and 3) enough reward. Without these three factors, even best excellent employee would not be able to realize the good PSS.

The best team is organized is the time when the PSS idea is realized in this world. The best team can produce, install, and operate the designed PSS. In this production stage, the 'improvement' idea is very important. It is very difficult to achieve perfect quality. The 'KAIZEN' mind in improving process can increase the perfectibility. The increasing perfectibility can be also done by providing the products and services to the customer.

**2.6 Global launch**

The last step is to provide the PSS into all over the world. Only local products and services are very hard to survive in this age. The systemizing approach is required.

**3 Modeling method of PSS**

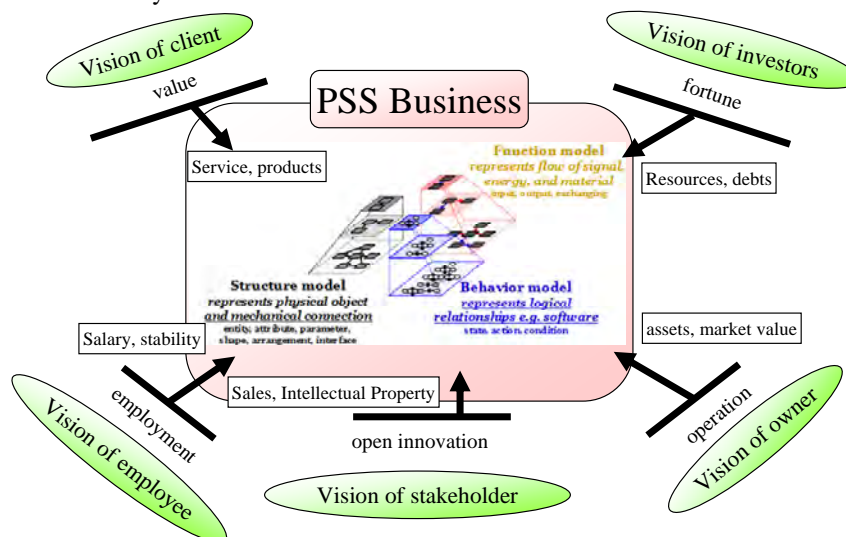

The PSS business has following five actors:

- 1) customer
- 2) employee
- 3) investor
- 4) owner, and
- 5) stakeholder.

The customer becomes happy by value provided by business. The employee becomes happy by employment provided by business. The investor is happy if the business creates fortune by business. The owner is happy when the appropriate reward comes from the business. Lastly, the stakeholder is happy when the business opportunity is brought from the business.

All actors will behave to minimize their own benefits. The benefits always conflict, because their positions are different. Hence, it is very difficult to control the business.

Figure 5 shows the modeling idea for design, blueprinting, and visualize the business based on hierarchical system modeling. This paper considers a modeling technology for mechatronics product can represent the PSS business. The PSS includes hardware systems as a product, and also includes software systems as a service. Every PSS have software and hardware.

**Figure 5 PSS Business Modeling for Design, Blueprinting, and Visualization**

Authors propose a modeling method of hardware-software systems based on SysML (System Modeling Language). Based on the modeling method of requirement [3] [4], this paper assumed that the PSS business such as hotel, traveler, and electrical energy supply business can represent the PSS business. Detailed discussion is proposed in the concurrent engineering tool [5] [6].

## 4 Design Example: Electric Power Supplying System

### 4.1 Current state and problem of electric power supply system

In 2011, redesign of the initiative electric power supply is strongly required for because of the disaster of large earthquakes in Japan and the diversification of energy resources. New national energy strategy by resources energy agency of METI represents orientation of the switch to renewable energy from non-renewable energy. Especially, renewable energy such as wind and solar has a variety of problems such as stability of supply and cost. But it tends to expand the introduction. It is required system design of the conceptual level for electric power supply such as Micro-grid.

This paper discusses an example of better system design which is intended for electric power supply system. Especially, this paper discusses system modeling method.

### 4.2 Modeling of electric power supply system

Electric power supply system is considered network which have intercross with electrical generating plant, storage equipment and consumption element through electric power transit networks. Therefore, we will define or model electrical generating plant, storage equipment and consumption element and attempt to simulation in entire network. From simulation results, we support deciding necessary capacity of equipment logically after discussing about deficiency in electrical generation capacity. In addition, we enable to estimate for cost, stability and robustness of disaster.

### 4.3 Outline of electric power supply system design approach

Figure 6 shows outline of electric power supply system design approach. The process for network design of electric power supply and demand system is process in the following. At the first, designer selects and set up element from template which is registered electrical generating plant (e.g. wind power, geothermal heat), demand element and storage element. In addition, create a correlation as electric power transit networks.

We simulated each element which is defined generating capacity and behavior and distribution of electric power between those elements in conformity with time history. So, we are able to simulate entire situation of supply and demand harboring fluctuating element. From result of this simulation, curve of supply and demand gap is led. We can calculate event such as the following from this gap. Those are enough design of electricity generated capacity, design of storage element capacity and risk of electric power shortage. From modelling functional failure as damaged network in disaster, robustness of disaster risk on the simulation base is made sure. Economical rationality which is checked in entire system is make decision from generating electricity element, storage element, set and maintenance cost of electric power cable and power loss. If we consider new set and part of improvement or elimination as business, we can estimate that it leads to benefit.

Figure 6 Concept of System Design for Electric Power Supplying System

### 4.4 Model of generating plant

Figure 7 shows depiction example of solar power plant as example of involuntariness generation plant which beyond the reasonable control of fluctuation. Solar power plant (Solar Power Plant) has production of electricity generated from installation area as attribute. Amount of solar radiation is determined by weather element (Sunny Cloudy Rainy). Day length is determined by seasonality element (Spring Summer Autumn Winter). Production of electricity is determined by amount of solar radiation and day length. Hourly amount of solar radiation is accommodated by cycle of solar irradiation. Production of electricity is determined by hourly amount of solar radiation. But, data hourly amount of solar radiation removes for sake of simplicity from model of Figure 7.

Term and percentage which can't generate electricity for periodic maintenance are shown by state transition.

Wind power and tidal power have a place as example of plant which beyond the reasonable control

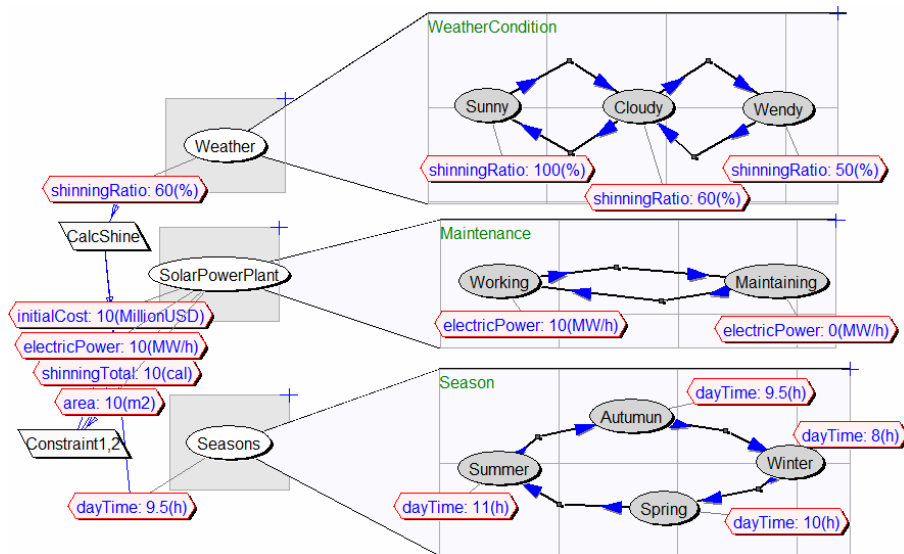

of fluctuation. Above example is shown by analogical model.

Controllable plant of fluctuation is modeled. Fluctuation element can be controlled, but is not external factor. Case in point is electric generation plant which use fire power (e.g. coal, LNG, biofuel etc).

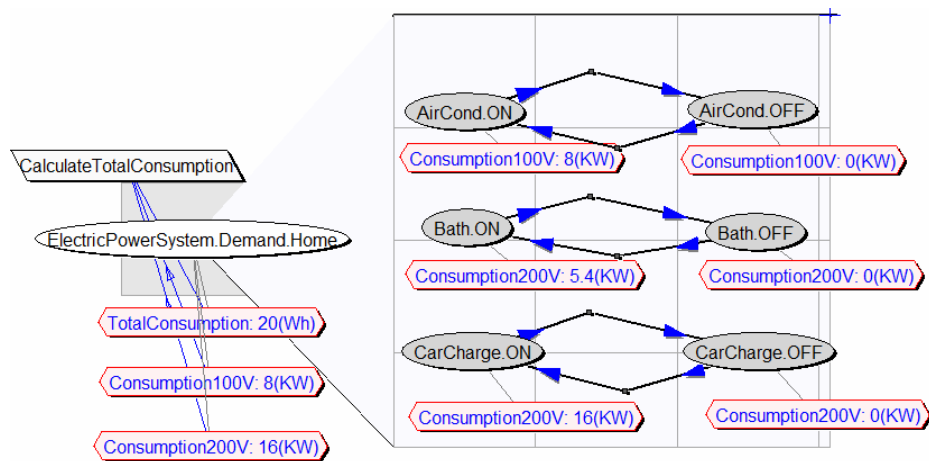

**4.5 Model of demand elements**

Figure 8 shows model description example of electrical power which be used as byword of demand elements in home. From electrification modern dwelling, most of electrical power is used by air conditioning and hot-water supply (e.g. bath). From angle of making effective use of nighttime electric power, the following is given an account. Above are laying heat in stock by nighttime water heater, using daytime hot-water, and laying electric power in stock for battery car. Entire consumed power at home is determined by the following. Above is superposition which includes consumed power at each home by probabilistic behavior.

We propose commercial installation (e.g. factory, location) and infrastructure (e.g. rail, traffic signal, street lamp) as element of demand.

**Figure 7 System Model for Uncontrollable Changing Energy Source**

**Figure 8 System Model for Consuming Element**

**4.6 Model of stock element**

Figure 9 shows model description example of secondary battery which be equipped in home as byword of stock elements. Value of model is approximate calculation of 1,000 rechargeable batteries for detached individual residence. Secondary battery is considered can cater for primary demand of discharge and charge as behavior of electrical power supply. Secondary battery start discharge when it is full charge and demand of electrical power supply exceed current supply. And secondary battery keeps discharge until definite remaining amount. If secondary battery lost remaining amount of battery charge and demand exceed supply, generating electricity make the shift to generating using controllable energy such as biofuel which is possessed stockpile.

Pumped storage generation and hydrogen storage are considered of as similar element of stock type.

**4.7 Service activities in power supply system**

The electric power supplying system consists of not only physical hardware, but also services. The service includes maintenance and operation. The proposed FBS model represents the operation/maintenance activities as service aspect. For example, the generic coal fire plant must exchange its catalyst almost once per three months. It is defined as service activities. The service activities also affect to the costing, availability, and robustness of the electric power supplying system. Hence the power supply system can be recognized as one of the PSS (Product Service Systems).

**5 Simulation Result and Discussion**

**5.1 Simulation result of generating electricity**

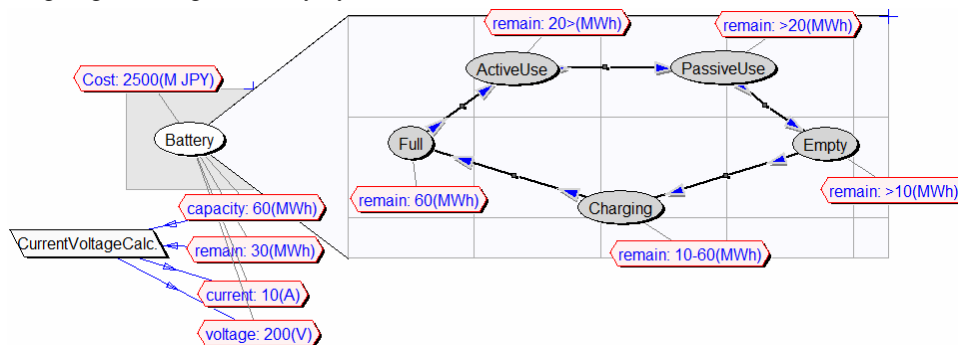

Figure 10 shows simulation result. Figure 10 shows electrical energy generated by a lot kinds of electric power plant (solar, wind, bio, geothermal heat, ocean thermal energy conversion [OTEC]) and stockpiles of secondary battery (fluctuation amount is discharge amount). Figure 10 shows information in a 24-hour period at summer days within simulation for a year. Information of all supply is all amount of electric power amount which is gotten from different energy sources.

Solar have features which generate many electric power in daytime. But solar generate low electric power in nighttime. Wind have tendency to change depending on season. Wind has behavior close to random on a day-to-day basis. OTEC and geothermal heat seem have tendency such as the following. While there are a number of efficiency changes by air temperature change, above electrical generation is keeping approximately-constant generating power.

**5.2 Comparing of supply and demand**

Curve of all demand on figure 10 shows electrical energy needs for 170,000 houses. Most of consumed power in summer day is constructed by refrigerated air conditioning. Peak of consumed power is seen 1.5 hour late than curve of insolation value. And consumed amount degrade in nighttime which debase amount of activity.

When we compare all demand and all supply, difference of both sides correspond deficiency and excess of electric power. Hatched time zone on figure 10 shows time zone of power shortages which demand is outstripping supply. Electric power network of trial design have the followings. Above are secondary battery and power-generating equipment for emergency. Secondary battery fills the role of stockpile. Power-generating equipment operates by biofuel. Electric power supply system has two-phased behavior at electricity shortage. First phase is covering shortfall by discharge of storage electric power in secondary battery. In accordance with degradation of remaining amount, second phase is switching to generating electricity by biofuel.

**Figure 9 System Model for Energy Stock**

Figure 10 Comparison Between Demand and Supply Based on Simulation Result

Secondary battery storage amount is empty among 17- 21 hour by degradation of insolation amount form process of secondary battery storage amount at figure 10. Factor is deep electricity shortage by crossover between time zone which not blows wind and time zone which electrical requirements is heavy. Figure 10 shows depending on emergency generator by biofuel in the wake of running down storage of secondary battery in 1 hour.

## 6 Conclusion

This paper proposed five steps for realizing new product-service-systems. A creative mind plays fundamental role in the early step of the creation stage. In the early design stage, finding many business ideas and choosing one good idea is important. Fast creation of different ideas and quick evaluation using advices by other specialists are key drivers of the finding and choosing processes. In order to realize the PSS idea, detailed planning and clear visualization of PSS is required. The modeling technology will help the creator to describe, evaluate, improve, and visualize the PSS business idea. A modeling methodology is proposed based on author's mechatronics modeling methodology. An analogy is found in this paper - hardware and software in mechatronics systems, and physical products and intangible services in PSS.

In the future, concrete PSS systems such as energy supplying systems, hotel service, airline service, and medical service will be designed and clearly visualized using proposed creation processes and modeling method.

# Game Analysis on Information Carrier of Risk Conduction in Venture Capital

Shen Jun, Wang Xueqin

School of Management, Wuhan University of Technology, Wuhan, P.R. China, 430070

(E-mail: Sjar@126.com)

**Abstract:** Based on the information asymmetry, there exists dual-level principal-agent risk in venture capital, which has the characteristics of dynamic conductivity. Taking information asymmetry as the theoretical basis, the paper analyzes the principal-agent problems in venture capital action, and describes the risk conduction paths of dual-level principal-agent relationship, and constructs the risk conduction controlling model of venture capital. Also, it raises the corresponding controlling measures on risk conduction in venture capital.

**Key words:** Information asymmetry; Venture capital; Principal-agent; Risk conduction

## 1 Introduction

With the game theory and principal-agent theory applied in practice of company management, scholars in different countries began to study the principal-agent problems in venture capital from various viewpoints, and got a guiding effect on the risk control in venture capital. Akerlof put forward the Lemons Model to study the adverse selection problems under information asymmetry in 1970<sup>[1]</sup>. In 1987, Spence proposed the Job Market Signal Transmission Model to solve the adverse selection problems<sup>[2]</sup>. Yuk-sheen chan<sup>[3]</sup>, Jeffrey<sup>[4]</sup> and Dirk<sup>[5]</sup> thought that venture capitalists should take installment investment in venture capital in order to reduce asymmetric information and control the investment risk. And Salman stated establishing a reasonable compensation mechanism can solve the agency problems between the investor and venture capitalist<sup>[6]</sup>.

Although research on the principal-agent problems in venture capital is later than western country in China, the scholars also got some achievements. Yao Zuowen et. analyzed that venture capital institutions can use monitoring and reputation effect to solve the moral hazard problems<sup>[7]</sup>. Nan Lixin and Ni Zhengdong proposed that the main problems of principal-agent were as followings after a lot of cases: hiding information before signing contract and hiding action after signing contract, and raised the specific solutions according to these problems: responsibility investigation, investment agreement restriction, and installment investment and so on.<sup>[8]</sup>

Scholars at home and abroad only studied the principal-agent problems in venture capital from the overall viewpoint. They do not analyze the venture capital risk from the dual-level principal-agent relationship. Actually, there are dual-level principal-agent relationships in venture capital. The one exists between the venture investor and venture capital institution. Another one exists between the venture capital institution and venture enterprise. The agent knows more information about own actions, while the principal is in opposite position. That serious asymmetric information exists between the principal and agent will lead to adverse selection and moral hazard. The risk has the characteristics of dynamic conductivity. If controlling measures are not taken, it would damage the interests of the investors of venture capital. Therefore, this paper establishes the risk conduction control model of venture capital based on the game theory from the dual-level principal-agent relationship in venture capital, and raises the corresponding risk conduction control measures.

## 2 Risk Conduction Path in Venture Capital

### 2.1 Risk conduction path from venture capital institution

If the adverse selection problem is happened, the venture investor could choose an inferior quality institution to invest, which not only has a low profit and a poor operation condition, but also lack of the experience and ability of choosing potential venture enterprise. When the moral hazard after signing contract is happened, the institution may not fulfill its own commitment although the venture investor may choose a good institution. Then it may do harm to the interests of the inventor after raising funds, due to the principal-agent risk. The information carrier of principal-agent risk will transfer to the venture investor finally. The risk conduction path may be shown on Figure 1: the venture capital institution → the venture investor 1, or venture investor 2, ..., or venture investor n.

**Figure 1 The Risk Conduction Path From the Venture Capital Institution in Venture Capital**

**2.2 Risk conduction path from venture enterprises**

After signing contract, the venture capital institution may choose the inferior quality venture enterprise in the situation of information asymmetry. The venture enterprise may not only have possibility of high-risk, but also provide a large number of false information. The venture enterprise may do some damage to the venture capital institution for its own interests. For example, it may invest some useless project which has a little on no return at all. Under the influence of multiple factors, the moral hazard risk from the venture enterprise will conduct to the venture capital institution through the asymmetric information, then conduct to the venture investor(as shown on figure 2). The risk conduction path is: the venture enterprise → the venture capital institution → the venture investor.

**Figure 2 The Risk Conduction from the Venture Enterprise in Venture Capital**

**3 Risk Conduction Control in Venture Capital Based on Information Asymmetry**

**3.1 Risk conduction control for the 1st level principal-agent relationship**

1) Before signing contract. The venture investor can choose the ideal venture capital institution according to the signal which is send by venture capital institution by making use of A. Michael Spence’s signaling model before invest (as shown on figure 3). Through carefully choosing the financing contract from venture capital institution in the market, the venture investor can get a qualified institution if the contracts are strict, perfect and meet beneficial requirements. Then comparing every venture capitalist’s professional levels and past performance and credit rating, the investor can decide the final venture investment institution.

2) After signing contract. In order to avoid the moral risk conduction effectively, the venture investor can implement a strict supervision and the incentive mechanism which is combined with the performance to the venture capital institution (as shown on figure 3). The venture investor should use the strict supervision. For example, the venture capital institution must report the important information of company such as financial condition, the feasibility of the invested project and so on. At the same time, if the venture capital institution obtains a certain performance, the venture investor can give a corresponding reward and subsequent investment according to the level of performance.

Figure 3 Risk Conduction Control Model for the 1st Level Principal-Agent

3.2 Risk conduction control for the 2nd level principal-agent relationship

1) Before signing contract. The venture capital institution should investigate about the venture enterprise and review the invested project strictly before signing contract (as shown on figure 4). First of all, the institution should know about the real financial condition to reduce the situation of information asymmetry. Secondly, it makes a sufficient investigation about the professional knowledge, skill, ability and the cooperation condition of the team of the venture firm. Also, it can do a strict review about the invested project which the venture enterprise applies, and ask the enterprise providing a detailed project application. After these measures, the institution decide weather invest the venture firm or not to avoid the adverse selection risk.

2) After signing contract. The venture capital institution should implement a strict supervision and the incentive mechanism to prevent the risk conduction. From Table 1, we can make a conclusion: if the venture enterprise chooses “endeavor”, the cost of endeavor is C. The venture capital institution can get V as earnings, and pay A as its cost. On the contrary, if the venture enterprise chooses “no endeavor”, the cost of “no endeavor” is C’. The venture capital institution can get V’ as earnings, and pay B as a lower cost.

Table 1 The Game Between the Venture Capital Institution and Enterprise

Action	Earnings	The venture capital institution	The venture enterprise
	The venture enterprise : endeavor	V - A	A - C
The venture enterprise: no endeavor	V' - B	B - C'	

In the game, the venture capital institution can control risk conduction if  $A - C > B - C'$ , and realize a win-win result. The reward given by the venture capital institution is higher than the loss that the venture enterprise does not work hard in the mechanism of supervision and incentive, the venture enterprise will work hard.

**Figure 4 Conduction Control Model for the 2nd Level Principal-Agent Risk**

In the meantime, the venture capital institution can use the market effect to constraint the reputation of the venture enterprise. The reputation model of Kreps, D, Milgrom P, Roberts J and Wilson R <sup>[10]</sup> proves that the incomplete information plays an important role on equilibrium results. The cooperation behavior will appear in the limited repeated game<sup>[11]</sup>. Therefore, the venture capital institution can make full use of implements supervision, because it can take advantage of the pressure from the market environment. After the first time investment, the venture capital institution can get an imagine about the ability and performance of the venture enterprise. And it can decide whether re-invest or not in the next time investment. In order to get more capitals and have a good reputation, the venture enterprise must work hard. The reputation influence will not only bring the effective benefit, but also prevent the moral risk conduction effectively.

#### 4 Conclusion

Based on the information asymmetry theory, research on risk conduction in venture capital is a new field in the venture capital management. It has a practical significance in the venture capital management. In the basis of domestic and foreign literature reviews, through the game analysis from the dual-level principal-agent risk in venture capital, this paper designs the risk conduction path and puts forward the relevant risk conduction control measures. It aims to help the principal reducing the unnecessary losses in venture capital contract. However, the main limitation of this paper is: to study the risk conduction control of the principal-agent relationship in the venture capital behavior only from the

principal angle. In fact, the venture capital behavior presents systematic complexity. The risk conduction paths are not only unidirectional, but also bi-directional and complex direction. It expects to process further research comprehensively and provides the better advices for the party of interest in venture capital.

# Property Right Innovation and Risk Control for China's Private Capital Accessing the Insurance Industry

Liu Yicheng

Economics and Management School of Wuhan University, Wuhan, P.R.China, 430072

(E-mail: liuyc54321@qq.com)

**Abstract:** Since the reform and opening up, China's private capital has been increasingly flocking into the insurance industry, the combination between industry and finance has been emerged. While promoting the industrial property right reform, corporate governance mechanism, and market competition structure, China's private capital also can bring about some potential risks such as corporate governance risk, related transaction risk and solvency risk while accessing the insurance industry. With the aid of modern property right theory, this article summaries the property right innovation and corporate governance improvement achieved by China's private capital entering the insurance industry, analyses the potential risks, and at the end, suggestions are provided for risk control for China's regulation department.

**Key words:** Property right theory; Property right innovation; Risk control; Private capital; Insurance industry

## 1 Introduction

Property right is a fundamental concept in the economics and finance literature. Property right provides firms with the right to own assets, to benefit from the income generated from those assets, to dispose of the assets, and to seek compensation for any damages to such assets caused by third parties. Modern property right theory holds that, the operation of economic system depends on the distinct definition of property rights. An accurately defined and stable property right contributes to the protection of freedom, but also to a room for economic activities of higher class, finally conducive to the development of modern market economy; on the other hand, a society deficient of property right or with undefined property right, while, would be comparatively low in efficiency and absolutely ineffective in resource allocation. Recent studies also show that defined property right will enhance corporate governance, corporate innovation, corporate risk control, firm growth and thereby economic growth (e.g., Adams et al., 2011; Chen Lin et al., 2012).

Since the reform and opening up, China's private capital has been increasingly flocking into the insurance industry, the combination between industry and finance has been emerged. As a mushrooming capital with defined property right definition, the private capital has set foot in the insurance industry. The move, on the one hand, can promote the industrial innovation and financial deepening by transforming the dominance of state-owned shares, perfecting internal governance mechanism and improving the industrial competition structure (YuYang, 2010); on the other hand, most importantly, the peculiarity of private capital also can bring about some potential risks such as corporate governance risk, related transaction risk and solvency risk, which are always generally neglected so far in the economics and finance literature.

With the aid of modern property right theory, this paper gives an analysis of property right innovation and risk control for China's private capital accessing the insurance industry, with detailed structure as below: Section II analyses the property right innovation for private capital accessing the insurance industry. Section III analyses the potential risks for private capital accessing the insurance industry. Section IV puts forward constructive risk control measures for private capital accessing the insurance industry and the Conclusion in Section V.

## 2 Property Right Innovation for China's Private Capital Accessing the Insurance Industry

### 2.1 Improvement in industrial property right structure

Property right structure constitutes the core of organization structure. Changes in property ownership lead to changes in the structure of shareholders, and through the behavior preference of different shareholders, affect the company's behavior and business objectives, and finally the business performance of enterprise, i.e. property right – conduct – performance. The theoretical and empirical study by modern property right theory proves that the target behavior of private enterprises is more

likely approaching to profit maximization, while that of state-owned enterprises under non-market economy system is obviously deviated from profit maximization.

In China, the insurance industry has long been under the monopolistic competition among state-owned companies, with high degree of market concentration. Taking life insurance as an example. On the one hand, insurance companies dominated by state-owned capital are predominating in quantities; and, on the other hand, in market shares, for instance in 2011(see table 1), 56% of China's gross life insurance premium were occupied by four state-owned insurance companies: China Life Insurance Co., Ltd., China Pacific Life Insurance Co., Ltd., New China Life Insurance Co., Ltd. and TaiPing Life Insurance Co., Ltd., demonstrating that China's insurance industry, in quantity or market shares, is dominated by state-owned capitals. Being an essential way to property right reform, private capital accessing the insurance industry will contribute to the property right reform in two aspects: firstly, the private capital accessing the insurance industry, either in the form of share participation or holding, leads to the mutual cooperation and interaction between the private capital and state-owned capital that forms pluralism of property rights and interests in microcosmic subjects, and facilitates the solution of "absentee owner" and "insider control"; secondly, it will lead to mutual competition and complementation between the private capital and state-owned capital that construct a pluralism of property right structure from different subjects in the meso-industry level, and reform the monopolistic competition structure by state-owned capitals in China's insurance industry.

**Table 1 Premium Of Stated-Owned Insurance Companies**

Company	2010		2011	
	Premium (RMB, billion yuan)	Proportion of China's gross life insurance premium	Premium (RMB, billion yuan)	Proportion of China's gross life insurance premium
China Life	333	31.71%	318.3	33.29%
China Pacific Life	92	8.76%	93.2	9.75%
New China Life	93.6	8.91%	94.8	9.92%
TaiPing Life	33	3.14%	31.5	3.29%

## 2.2 Improvement in corporate governance structure

Definition of property rights constitutes the basis of corporate governance, while the later is a solution mechanism adapted for the principal-agency issues occurred after the separation of ownership and management. Corporate governance's main objective is to achieve the enterprise value maximization through the settlement of absentee owner, insider control, moral hazard and other agency problems. In practice, corporate governance system is formed by the combination of the internal governance mechanism centered on the board of directors and the external governance mechanism based on product market, capital market, M&A market and managers market.

Establishment of an effective corporate governance structure has been an essential part of deepening the reform of China's state-owned insurance companies and establishing modern enterprise system. The access of private capital into insurance industry, endowed with defined ownership of property rights and stimulus, not only helps the definition of internal right, responsibility and interests of insurance company and improves the business efficiency of insurance company through internal governance; but also, no matter potentially access or accessed, will exteriorly impose a "competitive posture" toward existing insurance companies, either intensifying the market competition or through mergers and acquisitions in capital market, forcing them to improve internal governance mechanism.

## 2.3 Improvement in market competition structure

Apart from the property right arrangement and corporate governance structure in microcosmic level, factors that affect the corporate performance also depend on the market competition structure in meso-industry level. Beyond property-right theory finds, in the market with comparatively sufficient competition, average revenue has been increasingly improved after privatization of enterprise; while in the market with monopolistic competition, the revenue after privatization hasn't much significant increase. In other words, it is still not enough to improve enterprise performance only with defined property right, profit incentive will not work unless in a market with perfect competition. Also the main ideas of industrial economics believe that, the market structure and the enterprise behavior and market

performance are causally related, i.e. structure – conduct – performance. Highly monopolized and concentrated market will not only cramp the creativity of managerial personnel, but also result in distortion of economic signal, affecting the problem-finding and management improvement by property owner, which significantly affects the allocation of social resources.

Market competition pattern and industrial business performance will be improved after the access of private capital into insurance industry in the following two aspects. First, with the increase of insurance supply, to break down traditional state-owned monopolistic market competition structure, build an industrial structure with plural property right and the external competition force, thereby, facilitating the improvement of corporate governance mechanism by state-owned insurance companies as well as the improvement in industrial property right structure; Second, to lead to effective distribution and circulation of social resources (such as human resources, technical resources, etc) in the industry, thereby promoting the insurance company's or insurance industry's performance.

### **3 Potential Risks for China's Private Capital Accessing the Insurance Industry**

Owing to the peculiarity, private capital accessing the insurance industry also can be accompanied by a serial of potential risks such as corporate governance risk, related transaction risk and solvency risk while facilitating the property right reform and market competition in insurance industry, and may impose adverse impact on the economic, financial and social stability, which should be recognized and treated prudently.

#### **3.1 Corporate governance risk**

Corporate governance mainly deals with the relationship in three aspects, i.e. the relationship between the shareholders and the management, the major shareholders and minority shareholders, and the corporate and other stakeholders. Practically, corporate governance includes the governance structure, for instance the shareholder meeting, board of directors, board of supervisors and senior management, and the governance mechanism such as supervision and stimulation mechanism. Success may not be brought to a company by a sound corporate governance structure, but destruction will be definitely caused to any successful companies by the improper corporate governance structure.

##### **3.1.1 Shareholder meeting**

First, unduly decentralization and concentration of shareholding exist. Unduly decentralization leads to non-uniform value orientation, deficiency of common business idea and improper corporate governance; unduly concentration, even dominated by one shareholder, will infringe the interests of minority shareholders and cause functioning beyond the corporate governance. Second, some private capitals accessed in the insurance industry are just financial investors in the hope of acquiring fast capital premium through short-term turnover, lacking of long-term business strategy. Third, some private capitals have no continuing capital replenishment ability or the follow-up capital complement to the insurance industry is affected by the instability of its dominant business. These factors may intensify the business risk of insurance company.

##### **3.1.2 Board of directors**

First, members of board of directors, especially the chairman, is eager for quick success and instant benefits, prefers business development and capital scale to customer service and embedded value, neglects management foundation and innovative development. Second, the board of directors is generally controlled by major shareholders or core figures, especially in case of no independent directors, board of directors will be of little use if controlled by private capital in a holding position, thus decision-making risk will be intensified. Third, no evaluation as well as accountability mechanism is established for the member of board of directors, which resulting in no difference between due diligence and misconduct, and no accountability as well as punishment of dereliction.

##### **3.1.3 Board of supervisors**

At present, the major problem private capital insurance companies still face will be the absence of the board of supervisors. As the position and wage depend on the board of directors, especially on the chairman, members of board of supervisors usually lose their judgment over the decision made by board of directors, normally exerting no supervision over it.

##### **3.1.4 Senior management**

Professional manager market in China's insurance industry has achieved sound development, while senior managerial team is still labeled with "faction", the phenomena that "One managerial personnel always participate in and leave away with a team" is quite commonplace in China's insurance industry, especially in private capital invested insurance companies.

### 3.1.5 Governance mechanism

The prominent advantage of private capital lies in the property right which also put it in an inferior position, since by its unique advantage in property right, the combination of ownership and management, as well as of chairman and general manager usually occurs, and in practice, impedes the formation of scientific governance mechanism.

### 3.2 Related transaction risk

Related transaction refers to the resource or obligation shift among related parties, irrespective of whether the shift is charged or not. Two forms of relationship between related parties may occur in insurance or insurance asset management companies: the connected relationship with legal persons, and the relationship with natural persons. The former one is mainly the connected relationship among those legal persons that can directly or indirectly control, jointly control insurance company or exert significant influence on the insurance company, and the connected relationship among those legal persons directly or indirectly controlled by related natural persons. Related natural persons mainly include: individual investor that holds a certain proportion of shareholdings in an insurance company; senior management in insurance company; and those close relatives and families of major individual investors and senior management, etc. Related transaction, different from general market transaction, has its uniqueness lies in the lacking of fair market competition during transaction, and in its intricate, to some extent, transaction relationship among transaction subjects. As private capital generally accesses the insurance industry in the form of the combination between industry and finance, related transaction may emerge in the following aspects:

#### 3.2.1 Supply capital to dominant business

Generally, the combination between industry and finance is designed to reduce transaction cost. Insurance company that capable of collecting large amount of financial capital is likely to supply capital directly or indirectly for private capital when its dominant business is in need of capital support or facing financial difficulty.

#### 3.2.2 Investment along with shareholders

The other purpose of private capital accessing the insurance industry is to create the synergistic effect, i.e. private capital achieves synergistic investment or capital operation through subsidiaries under its control, for instance, trying to gain much profit with less investment in a real estate project by direct or indirect joint investment.

#### 3.2.3 Benefit transportation to shareholders/senior management

It mainly refers to the benefit transportation offered by insurance company which, under the control of shareholders or senior management, conducts related transaction with other industries (i.e. E-commerce, IT business etc) under the control of shareholders or senior management.

#### 3.2.4 Accept insurance of shareholders at low costs

It mainly refers to the fact that private capital invested insurance company, at the price lower than the market or actuarial cost, underwrites the life or property-casualty insurance of its shareholders, which indirectly achieve the benefit transportation to shareholders, damaging the interests of other policyholders.

### 3.3 Solvency risk

Solvency refers to insurance company's ability to pay debts. In accordance with the relevant regulations of China Insurance Regulatory Commission (CIRC), insurance company should possess the proper amount of capital corresponding to its risk and business scale, its solvency ratio should not be less than 100%. With the ever-growing scale of business and establishment of branches, capital supplement should be continuously required to comply with the supervisory requirement in solvency. Practically, solvency risks encountered by private capital accessing the insurance industry are mainly caused by the following factors:

#### 3.3.1 Imbalance in business structure

"Market share" strategy is normally adopted by private capitals that accessed the insurance industry, i.e. to seize up market shares by expanding business scale instantly while neglecting or rarely taking into account the business quality, expenses, and liability cycle. Then, bancassurance becomes the strategic growth point for many private capitals accessing the insurance industry, for instance, Guohua Life, because bancassurance, compared with personal agent insurance and group life insurance, can be expanded in large scale in short-term. If taking an analysis of the embedded value of bancassurance, while, less value space but heavier liability pressure is left for bancassurance due to the high agent charges and commitment for high returns. Excessive pursuit of business scale and the capital consumption type business mode have frequently led to the imbalance of business structure as well

as intensified the solvency risk of insurance company practically.

### 3.3.2 Capital market fluctuation

Insurance industry is always accompanied by risks. The product pricing and capital operation always affect insurance company's risk resistance capacity, then the solvency of insurance company because of the capital market fluctuation. In product pricing and currency policy risk, the change in interest rate may result in risk of cancellation of insurance, for instance, the prevalent vigilance against the cancellation of bancassurance. In the capital operation and investment management risk, the systemic risk or non-systemic risk in capital market such as the market risk directly affects the investment performance of insurance company as well as its solvency ability, for instance, in 2011, a year of sluggish capital market, many insurance companies were confronted with supervisory pressure of inadequate solvency. In this case, the cash flow of insurance company may be severely affected, even faced with bankruptcy risk if the ability of private capital to supplement capital is limited.

### 3.3.3 Insufficient provision for reserve

Reserves constitute the ground of solvency of insurance company. According to China's Insurance Law, insurance companies have to make appropriation of reserve for undue duty and outstanding losses. For the newly established insurance companies, owing to the large amount of budget occupied by the new contracts/policies, their burden in capital supplement will be intensified by the reserve regulation; furthermore, the actuarial assumption and reserve appropriation standard adopted in practice by different companies will directly decide if the reserve appropriation is sufficient. Owing to the pressure from business profit, capital complement or the appropriation of reserves, careless provision for reserve will directly affect the solvency ability when private capital is accessing the insurance industry.

Table 2 summarises the potential risks for China's private capital accessing the insurance industry and their affected factors.

**Table 2 Potential Risks for China's Private Capital Accessing the Insurance Industry**

Type of risks	Risk factors
Corporate governance risk	shareholder meeting
	board of directors
	board of supervisors
	senior management
	governance mechanism
Related transaction risk	supply capital to dominant business
	investment along with shareholders
	benefit transportation to shareholders/senior management
	accept insurance of shareholders at low costs
Solvency risk	imbalance in business structure
	capital market fluctuation
	insufficient provision for reserve

## 4 Risk Control for China's Private Capital Accessing the Insurance Industry

As a product emerging at the certain stage of economic system reform and the development of market economy, private capital accessing the insurance industry is accompanied by a series of risks while accelerating the capital accumulation and financial deepening. D Long Event and Min Fa Securities Event, even though not occurred in the insurance field, are similar with insurance in nature. For private capital accessing the insurance industry, the move should be encouraged by making full use of its advantage, but also be rationally guided for normal development, and thus promoting the continuous and stable development of insurance industry.

### 4.1 Supervision system

"Supervision", by its very nature, refers to the activity of government to regulate economy under market economy. Government supervision will be required to make up the market flaw when the market failure occurs owing to the externality or information asymmetry.

#### 4.1.1 Establishment of risk supervision system

Adhering to the strict regulatory theory, to achieve the quantization and systemization of risk indexes such as the solvency risk, capital operation risk, corporate governance risk, business operation

risk and related transaction risk, forming effective supervision index system.

#### 4.1.2 Establishment of networking supervision system

To unify the external ports of insurance company, which should be the acceptance standard for the opening of private capital invested insurance company, achieve the interlinking between the core business system and core financial system of insurance company and the supervision system of regulation department, thereby, implementing effective monitoring over important business activities and capital transactions of private share participated or holding insurance companies.

#### 4.1.3 Combination of filed supervision and non-field supervision

First, improve the system construction, index analysis and key point monitoring for non-filed supervision; second, regularly or non-regularly conduct filed inspection or key point inspection, even an investigation to guard against and preclude serious risks.

#### 4.1.4 Combination of administrative supervision and legal supervision

In practice, comprehensive supervision measures such as the economic means, legal means and administrative means will be carried out to intensify the regulation, as well as to improve the awareness of “Cost of breaking the law” of subjects.

#### 4.1.5 Combination of market access and withdrawal

To formulate and improve the market access and exit mechanism of insurance company, both by drawing abroad market experience and taking example by abroad legal regulations in market access and withdrawal for financial institutions. First, encourage and guide private capitals with strong strength, sound management and promising profit future to access the insurance industry; second, to regulate and deal with those companies that still have much room to be improved according to their management ability and capital quality, and guide private capital to access and withdraw insurance industry by comprehensive use of introducing the strategic investors, M&A, etc.

## 4.2 Corporate governance

### 4.2.1 Shareholder meeting

First, the source and nature of capital must correspond to the business requirement of specific industry or enterprise. Private capital, generally, can be classified into: financial capital and strategic capital. Financial capital, for insurance industry, can supplement short-term circulating capital, while for long-term, more strategic capital will be required by the development mode and profit cycle of insurance industry. In fact, regulation department, when reviewing the private capital planned to access insurance industry, is required to perform an objective assessment of its nature, for instance, issue the supervision guidance to check and confirm the sustainability of private capital after accessing the industry in light of capital strength, profitability, management level, development strategy and business ideas. Secondly, reasonable shareholder structure is a must. Studies show an inverted U-shape relationship between the concentration degree of shareholding and the governance effectiveness, therefore, a reasonable shareholding structure between major shareholders and other main shareholders will be more conducive to the corporation governance. Unduly concentration of shareholding and dominance by one shareholder affects the corporate governance; while unduly decentralization will leave the company unattended, also causing adverse influence to the governance. So, it is desired to achieve mutual complement in capital strength between private capital and state-owned capital as well as private capitals that accessing the same insurance subject.

### 4.2.2 Board of directors

First, members of board of directors assigned by the private capital should possess industrial management experience and professional knowledge, such as the knowledge in finance, laws and risk management, which should be under the supervision and guidance of regulation department. Second, strictly comply with the separation of position like the chairman and the general manager, and improve the decision making procedures of board of directors, therefore preventing major decisions that made solely by chairman but the board of directors.

### 4.2.3 Board of supervisors

On the one hand, strengthen the right of supervisor, for instance, the board of supervisors should be endowed with substantive rights such as hiring or dismissing accounting firm, the right to be informed and the interpellation and veto power; on the other hand, the supervisors with “dereliction of duties” must be held liability.

### 4.2.4 Senior management

Encourage making full use of the property right advantage of private capital, improve the construction of senior management team through the separation of ownership and management, and establish the incentive and restrictive mechanism to draw and stimulate talents in varied forms, such as

the annual salary system, performance related compensation and stock options.

#### **4.3 Internal management**

##### **4.3.1 Internal system construction**

Sound corporate governance closely rests on sound internal management system. Due to the limited experience in insurance industry, for private capital accessing the industry, in order to guide the normalization of company operation through system norms, particular attention should be paid to such system construction as the capital replenishment system, funds application system, financial management system, related transaction system, risk management system, compliance management system, anti-money laundering system, internal audit system and compensation incentive system.

##### **4.3.2 System and workflow construction**

Technical support and reasonable workflow should be important ways for risk prevention. In running insurance company, for instance, the alignment between business and financial system, between the insurance company's system and regulation department's system, and the consistency between business data and financial data, all require the IT technology, system and workflow of insurance company should be reasonably planned, both supporting internal governance and external supervision.

##### **4.3.3 Staff and operation construction**

Staff and operation risk becomes another source of modern financial risks. Staff's intentional or mistaken failures, for instance, violation of operation procedure or system requirement in settlement of transaction, may result in risk or loss. Therefore, apart from improved corporate system and workflow management, staff training, education, evaluation and work shift are also important means for preventing staff and operation risks.

##### **4.3.4 Construction of subject of liability**

Responsibility and labor division for members of senior management, such as chief executive officer, chief actuary, chief financial officer and chief risk officer, should be clear-cut, and have all members respectively held liability for their duties.

#### **4.4 Social supervision**

Supervision is a systematic engineering, which requires not only government supervision, but also the full utilization of social supervision, such as supervision by self-regulatory organizations in the insurance industry, by staff and social public, by social media and public opinion, by credit rating agencies and accounting firms, etc. Only a variety of supervision forces and measures combined can produce the social supervision mechanism and effectively prevent risks.

### **5 Conclusion**

Private capital accessing the insurance industry is the natural product of the economic system reform and the development of market economy in China. First, it plays a significant role in improving the structure of industrial property right, corporate governance mechanism, and creating perfect competition environment; while on the other hand, owing to the peculiarity of private capital, some potential risks such as corporate governance risk, related transaction risk and solvency risk, will be accompanied by when the capital accesses the industry, and may, when worse, affect the stable operation of China's financial industry. For private capital accessing the insurance industry, on the one hand, the move should be encouraged by making full use of its advantage; while on the other hand, for the health and sustainable development of the insurance industry, the progress should be rationally guided by the supervision department, and all these potential risks and their effects should be further studied in practice.

## An Assessment of Intrinsic Versus Extrinsic Motivational Factors in the Namibian Public Sector

Asa Romeo Asa, Navneel Shalendra Prasad  
School of Management, Wuhan University of Technology, Wuhan, P.R.China  
(E-mail: romeoassa@gmail.com , navi\_7237@hotmail.com)

**Abstract:** This paper is a study designed to understand how intrinsic rewards, as compared with extrinsic rewards are perceived as sources of motivation by employees of the Namibian public organizations/ ministries. This article focuses on the work motivation construct applied to the public sector particularly the government ministries. We try to identify the combination of extrinsic and intrinsic factors explaining why public employees show varying levels of work motivation. The findings of this study shows intrinsic reward factors are the main drivers of work motivation in the Namibian public sector.

**Key words:** Intrinsic Rewards;, Extrinsic Rewards; Motivation

### 1 Introduction

The aim of this study is to understand what motivates employees to work in public organizations; in particular, to consider the importance of intrinsic factors in the motivation of people to work in and remain in the public organizations sector despite being paid less than their private sector counterparts. Motivated employees are the cornerstones of all organizations, as work motivation is one crucial determinant of individual and organisational performance. This holds true in the private, the public and the non-profit sectors.

Perry and Hondeghem (2008) capture the underlying universal essence of public serviced motivation as "an individual's orientation to delivering services to people with a purpose to do good for others and society". What is consistent with all of these treatments is the notion that in the work context public service motivation means the valuing of intrinsic job rewards at a higher level than extrinsic ones. Intrinsic rewards are derived from the satisfaction an individual receives from performing a task. At times individuals engage in work tasks out of an inherent interest in the activities (enjoyment-based) and because they find the work to be meaningful owing to a commitment to self-defined goals or social norms (obligation-based) (Deci, Koestner, and Ryan 1999; Frey 1997; Osterloh, Frey, and Frost 2001). In these instances the motivation to act resides within the individual and is self-determined (Frey and Osterloh 2002). Examples of these are a sense of accomplishment and a feeling of self worth. In contrast, extrinsic rewards are those offered to an employee by someone else. Work is merely a means to an end in that it provides a salary necessary to satisfy an individual's true needs. Individuals engage in work activities to attain rewards or in response to commands. Thus, the reward emanates from a source outside the worker and the locus of causality for the behavior is external (Deci and Ryan 2000). Based on this view of human motivation, performance-related pay is ideal for motivating worker behavior. Examples of extrinsic rewards are a pay raise, promotion, job security, and status and prestige. Herzberg (2003) argues that money is a "hygiene factor", and cannot be a source of motivation. However, if the hygiene factor (in this case, pay) is perceived to be inadequate then the employee will be dissatisfied. Intrinsic rewards are personal, "internal" responses, such as satisfaction or pride in an accomplishment.

### 2 Role of Motivation in the Organization

Why do organizations need motivated employees? The answer is for the survival of the organization. In the increasingly competitive, rapidly changing world of business, the public sector has pivotal role to play in nation's economy, therefore a motivated workforce is a great asset. Motivated employees are more productive, committed and loyal to the organization. Motivation is the key among the factors for effective performance. Tosi, Rizzo and Carroll (1994) indicate that performance is the result of ability and motivation of employees.

Thus,  $Performance = f(Ability + Motivation)$

Robbins (1998) adds opportunity to the equation of performance thus:

$Performance = f(Ability + Motivation + opportunity)$

Robbins argues that even though an individual may be motivated and has the ability to perform there could be obstacles that constrain opportunity to perform. The characteristics of motivated employees are:

they always want to come to work; they want to be part of teams at work; they are interested in helping and supporting others at work; and they generally exert greater effort in their work and contribute more in the organization.

### 3 Analysis of Intrinsic versus Extrinsic Factors

The factors of Intrinsic and extrinsic that motivate employees to choose a job, and to stay in it, are complex. This study shows that public servants in Namibia are driven by a great deal of intrinsic rewards more than how much they can earn (extrinsic). Many employees place more importance on less tangible factors, such as a feeling of accomplishment, being effectively managed, and having challenging work. The study basked public servants to consider how important nine aspects of their work were to them (see Figure 1). Three factors emerged as "Highly important" to more than three out of every four public servants: A feeling of accomplishment (90%), Effective management (84%) and Challenging work (77%). Of the remaining six workplace factors (shown in Figure 1), pay and benefits was rated next, in fourth position overall. This factor was seen as "Highly important" by nearly three quarters of public servants.

Figure 1 Importance of Workplace Factors for Employee Motivation and Organisation Rating

#### 3.1 A Feeling of Accomplishment

The top priority for staff in carrying out their work was a feeling of accomplishment. Eight out of ten public servants considered this to be "Highly important". 40% of public servants rated their organisation as "Good" at providing a feeling of accomplishment. Qualitative results confirmed that some public servants did not feel that their skills and experience were recognised, and did not feel valued. Lack of positive feedback and recognition were cited as reasons for some public servants not having a feeling of accomplishment in their work.

#### 3.2 Effective Management

Effective management is the one that clearly and regularly communicates with employees. Although 84% of public servants considered effective management to be "Highly important", over a quarter of them (26%) rated their organisation as "Poor" at providing it. A proportion OF (27%) rated it as "Good". Despite the efforts that have been made to improve the quality of management within the public service, it seems many staffs still do not see management as sufficiently effective.

#### 3.3 Challenging Work

Public servants' desire for challenging work ranked as the third priority, with more than three quarters of public servants considering it "Highly important" for them to be motivated. Although there is a gap between those who think challenging work is "Highly important" and those whose expectations on this are being met, most public servants appear to be relatively satisfied with the amount of challenging work they have to do.

#### 3.4 Pay and Benefits

Public servants' pay is low compared to private sector in Namibia but they value pay and benefits as not major motivator, it can be a powerful disincentive when staffs feel dissatisfied with it. However, this factor was less important to managers than to their non-managerial colleagues as qualitative information showed some dissatisfaction with pay. This was particularly in relation to salary bands, and the difficulty in being promoted to a higher band. Some public servants were unhappy with their organisation's performance pay system.

### 3.5 Job Security

A high proportion of public servants have their expectations regarding job security reasonably well met. Finding a new position is likely to be difficult due to high job seekers in the labour industry as unemployment rate in Namibia is above 40% according to 2010 statistics.

### 3.6 Reputable Organisation

Working for a reputable organisation is rated as "Highly important" to public organisation's employees. In terms of recruitment and retention, the perception of enhanced reputation is positive for the public service as a key motivator.

### 3.7 Manageable Workload

Feeling that their work is too pressured is a common complaint from working people. Having a manageable workload is something that almost two thirds of public Employees rate of motivational importance.

### 3.8 Opportunities for Advancement

This factor was considered "Highly important" by most public servants to enhance their motivation and thus their job satisfaction that increase performance respectively. However, results of this paper generally reflected dissatisfaction with the availability of opportunities in public sector organisations. There is very little room for advancement, as the organisations are very flat, structured ones but huge.

### 3.9 Set Number of Hours per Week

Having a set number of hours that they worked each week was not a high priority for public servants - only a third rated it as "Highly important". Their level of satisfaction with this factor was reasonably high, with 56% rating their organisation as "Good" at providing a set number of hours per week. Only 10% of public servants thought their organisation was "Poor" at providing this. Number of hours per week is favourable for staffs in the public sector to achieve a good work/life balance and have fun at work. The time for family is essential for workers and therefore having that job that allows room to balance work and life keeps employees motivated and satisfied with their work.

## 4 Conclusions

The paper clearly showed intrinsic rewards dominate extrinsic factors of motivation; most public servants are motivated by intrinsic rewards such as the feeling of accomplishment in their work. They also want their jobs to be well managed and challenging. While most public servants appeared to find their jobs sufficiently challenging, a relatively high proportion were dissatisfied thus not motivated with the effectiveness of management in their organisation, signalling that more work needs to be done in this area. Pay and benefits was not among the highest work priorities for most public servants, but is found relatively more important to some staffs. Opportunities for advancement have become more important to public servants in Namibia though it's still a challenge for the government to solve this. Public sector employees want a reasonable degree of job security to be motivated and satisfied with their jobs. In terms of attracting and retaining talent, public servants' perceptions of the reputation of the organisations/ ministry where they work portray positive results for the public service.

# Research on the Moral Education Management in Universities Under the Network Environment

Jiang Xiaoyu, Qian Siyu

Planning and Development Office, Wuhan University of Technology, Wuhan, P.R.China, 430070

School of Foreign Languages, Yangtze University, Jingzhou, P.R.China, 434023

(E-mail: jxyart@gmail.com, je.uwegeeks@gmail.com)

**Abstract:** By using the empirical and functional analysis methods, this essay discussed how to effectively improve the moral education in universities under environment of network. Under the influence of network, the moral education in universities is a complex problem. Through a long time research, we changed our education concept; explored new ways and methods of education; we improved the network management mechanism. After all this research, the conclusion comes as follows: to really improve the actual effect of moral education in universities we must face challenges with the proactive attitude; Establish a sound moral education management mechanism, use the advantages of network and avoid the disadvantages of it.

**Key words:** Network environment; Colleges and universities; Moral education management; Mechanism

## 1 Introduction

In the early 90s for last century, network in China has got rapid development. According to the '29<sup>th</sup> China Internet network development statistic report' published by China Internet Network Information Center (CNNIC) in Beijing, it showed that in 2011, including the college degrees and above, their Internet usage has reached 96.1%. The network comes into every college students' daily life. Under the environment of network, how to do well in the moral education in colleges and universities becomes a new problem.

The Moral Education is not only put forward in China, but also studied by many foreign scholars. Most people agree that teacher is an important contributor to the student moral education [1]. Beyond that, the great influence of medium in forming teenagers' moral system has been proved, which means the network technology should be a positive guide [2]. The Chinese scholars, GuHaiLiang once said that 'in the 21st century, we are facing with a new task: the political education in Internet ideological. Some Chinese researchers also pointed out the importance of the network media platform; they thought that the advantages of online community could enhance the initiative of students' moral education [3]. But the lack of the research in university moral education management system is obvious. This paper focuses on the new ways and methods of moral education from, and the improvement of university network management mechanism.

## 2 Education Guide Moral

### 2.1 To set up an open moral education concept

The traditional moral education is under the situation of closed campus, which is much easier to control in one hand, but lack of enthusiasm and initiative in the other hand. Traditional didactic education highlights the many deficiencies, for example, management of relatively stiff, and relatively inflexible way, one-way dissemination of information to make educated and lack of enthusiasm and initiative. In the international generation, the traditional closed campus is no longer closed, the walls are unable to block the stream of information, and the closed moral environment has ceased to exist. Under the globalization background, our college students are in the world that unbelievable opened and related to them. Their vision has been no longer limited to the people and the things just around, their thought becomes more actively and freely. More than ever, they care about the changes and developments of international situation. Their self-awareness, competitive-awareness and enterprising consciousness are gradually increased. They not only need the global knowledge; but also need the global vision, courage and moral. As to respect other's life, they not only need to understand their own country, their national values and their moral standard; but also need to know as much as possible about other countries around the world. Therefore, the workers of university moral education have to think more than one school, one country. They must update their own ideas, widely open their mind, and increase their knowledge. Only with the high personnel qualities, we can participate in global competition.

## 2.2 To set up the “people-oriented” concept

“People-oriented” or “People-centered” means to respect one's need, pay attention to the comprehensive development of man. The development of human society and the development of education lead to this policy. In the Internet era, student is the main object for the university moral education. In order to set up the “people-oriented” concept of moral education, changing the idea of infusion into the idea of guide is very necessary. Firstly, the essence of education is to educate people. Education is a planned activities, its essence is to educate people, and the most important mission of it is to mold human nature, cast healthy personality. In short, education is to teach people how to be a good human being. Sperry, the founder of the contemporary education, pointed out: “Education is by no means just simple cultural transmission. Education should be the mind awakening. That's the truly meaning of education.” College education is the a higher stage, “a real university should be the best place to seek the truth, to grow freely; it should be the place full of the understanding of human value; it should be the place student can pursuit the meaning of life. Under this environment everyone is purified, full of solemn.”<sup>[4]</sup> Therefore, in the network environment, the moral education should focus on educational guide, teach students to find the way to have their own judgment. Fully respect to one's dignity, highly concern of one's opinion of value, to establish the "people-oriented" concept. In daily education, introduce the advanced positive social thought in modern society. In the same time, not avoiding the negative information, including some bad social phenomenon and campus style, but to guide students to analyze this phenomenon by using scientific point of view in a easy acceptable way. This is quite helpful for them to establish an excellence behavior form in their future life.

## 3 Exploring New Methods of Moral Education

Under the network environment, moral education has new characteristics and rules. To explore the new ways of working means to improve the scientific, the pertinence, and the effectiveness of moral education; to enlarge the coverage, attraction and influence of moral education in a efficient way.

Ideological and political work always needs to keep pace with the time, to keep developing with the time<sup>[5]</sup>. Using network technology to promote the teaching theory and teaching method is the main channel and the basic link in this higher education stage. The course teachers must fully understand Marx's theory. They must use the theory skillfully, and they also need to have the consciousness to proceed with the reform.

Over years, in some colleges and universities the same problems are existed for long time. Firstly, they usually pay more attention on the theory teaching, focus on the theory elaboration; and pay less attention on teaching student to solve some real problems. Secondly, “one-way teaching” still takes an important part in classroom teaching. Teachers just finish their missions in class, not communicate or have little communication with their students. Thirdly, teachers' teaching enthusiasms are much concerned, but lack of improving the students' learning initiative. More over, the traditional teaching methods still hold the main part, modern technologies and methods seems useless. The teaching methods and means are out of time. It's hard to stimulate students' learning initiative and enthusiasm in learning. In the network age, we only have two ways to go. By changing the traditional education methods, we can help students to understand the mainstream culture and ideology. Or do not change the traditional education methods, the network's negative information will find their place in our students' mind. Therefore, the ideological and political theory course teachers must study deeply, to find out the routines. Teaching activities should be “people-oriented”, pay attention to learn the Marx's theory, and help student's fully understand those theories, then teach them to use their knowledge to build their moral form.

### 3.1 To carry out the “people-oriented” concept by rousing self-conscious

In order to truly understand the Marx theory, it requires students' own experiences and sentiments. The Marx theory is a theory, which helps students to form their scientific worldview, their outlook on life and their values. It must be "in mind" and "Internalization", that's to say, it must understand by themselves. Only after that, the teaching aim and requirements of this course is reached. The teacher should clearly know what problems the students are facing with; during their growth what kind of knowledge or political theory are required. Teachers must think from every different aspect, and according to the different needs of students, choose different teaching methods. Such as seminar, lecture, class discussion, social practice, it should be changed according to the needs. And as well as multimedia teaching, network classroom or some other types of teaching, they can be combined or separated, so that students can learn, can understand, can practice and then use.

### **3.2 To carry out the “people-oriented” concept by using “internalized”**

In a certain degree, knowledge of “Internalization” is knowledge “into the mind”. The original propose of having the Marx's theory course in colleges and universities, doesn't mean to learn the theoretical knowledge of policy; but to train students to use Marx theory to analyze the problems; to have the ability of solving problems; to help and to guide the college students to establish the correct worldview, outlook on life and values. The Marx theory is different from other specialized knowledge. Their point of view and their theory is a kind of natural view, social view and world outlook. It learned in order to train students to become builders and successors of our socialist cause. That's why we must take the Marx theory into students' intrinsic ideological and political quality and ability, to make the Marx doctrine to become college students value criterion and the guide to action.

## **4 The Research of Moral Education under the Network Environment**

Under the network environment, moral education in colleges and universities must pass a series of standardizing and guiding system to develop. Therefore, we must understand the characteristics of network, and their development trend in first place, and then gradually improve the university moral education work mechanism.

### **4.1 To strengthen the management mechanism**

The network is taking more and more important place in the modern society. It's important to the science and technology improvement; it's important to information transmission and communication; it's important to the business operation. With the increasing importance of network, the Internet crime is also spreading quickly. Those crimes are widely involved, strongly concealment, greatly harmed. At present, we are strengthening the management of network, and the management system, legal system establishment is just in the initial stage. As Negroponte 'being digital' said "The Road in Heaven was also need some traffic control." [6] To strengthen Chinese college moral education through Internet, we must establish a set of network monitoring and management mechanism, in order to prevent bad information and influences.

First of all, we must establish the laws and constantly improving the legal system. The law is important to regulate network behavior. Network technology in China started relatively late, but the Chinese government works very seriously on network management legislation. In recent years, we have introduced many network security, and the laws of information management also carrying out rapidly. With the development of network technology, network crime also becomes more and more complex, the corresponding improvement of laws and regulations should be further strengthened.

Secondly, pay more attention on the monitoring the network technology is quite necessary. Although the network is a "virtual" world, but as long as the technology improved, the sufficient self control ability of technology can largely prevent network anomie behavior to occur.

Last but not least, to establish the information review system is necessary. The information ability is the important indicator of a country's ability. The information law system is the important symbol to measure the information level. To do a good job in the university moral education work under the network environment, colleges and universities network publicity department should also apply the necessary administrative means, and gradually establish information release system. For example, the forum and micro-blog are required the user's real name, "the network real-name system" is controversial, but it is still an effective kind of management pattern.

### **4.2 To strengthen the construction of moral education work team**

Under the network environment, we should strengthen the construction of network moral education work team. Training of a profound political theory of both levels: Marxism-Leninism theory training and the art of moral education work. Workers can operate the network of moral education work team by using the update technologies, and can grasp the initiative in the same time. This requires colleges and universities to build a team with counselors and teachers. They are the main body of the special combination of network moral education team. We should not only strengthen the universities network moral education workers ideological and political quality cultivation, but also greatly improve the information quality of moral educators.

### **4.3 To improve the safeguard system**

Under the environment of network, the university moral education job should be done efficiently and to make sure it falls in practice. In order to reach this aim, we must have a set of safeguard system. To begin with, to improve the leadership and the management; and to do real things to insure the work is well organized. The development of network moral education in colleges and universities is more and

more complex, we should establish a system, which leaders by University administrators, propaganda departments, student work department; and the Full-time education cadres, student counselor, ideological and political teachers are as the main multi-level of the network management system. By using QQ, BBS and other campus network platform for targeted work, Shown in Figure 1. Secondly, we should keep cooperating with the government, schools and families. Make sure the campus network environment is secured. After that, colleges and universities still can find a lot of supports in the modern society.

Figure 1 College Moral Education in the network environment management system

## 5 Conclusion

The promotion and development of network technology shows that human society is gradually changed from the industrial society to the information society. It will shape a new form of survival. College students are the most related group with network, and by using Internet they get to know the world and the society. Network influences their ideas and value orientation; influences their way of thinking and behaving. The magic of network can be seen in every important aspects of a student's life. This gives the traditional moral education a big challenge. But the advantages and disadvantages of science is always two sides in a same coin, only depends on how people use. As long as we tightly grasp the time pulse, and carry forward the positive influence of network; eliminate the negative effect of network in time; guide our young students correctly; establish a sound moral education management mechanism; make the network as a new carrier for the moral education in colleges and universities. After all, we can turn "passive" into "active", turn "bad" into "good"; we can create a new situation for the moral education in colleges and universities with the right help of network.

# Research on Inclusive Financial System in China: From the Perspective of Financial Support for Disadvantaged Fields\*

Wang Jing, Hu Guohui, Lei Yinghui

School of Economics, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: wangjing.wh@hotmail.com, whuthgh@yahoo.com.cn, catherinelei@126.com)

**Abstract:** This article studies the theory, structure and function of inclusive financial system in China through examining the financial exclusion of disadvantaged fields. It highlights the importance of building an inclusive financial system for supporting disadvantaged fields, and explores a system model with the cash flow and information flow which can integrate microfinance and the separate parts of the system into a unity. The study proposes that building an inclusive financial system should integrate the excluded, coordinate all components and follow the evolutionary laws of the system.

**Key Words:** Inclusive finance; Microfinance; Disadvantaged fields; Financial exclusion; System theory

## 1 Introduction

With the development of microcredit and microfinance, United Nations proposed the concept of inclusive financial system, aiming to propagandize “International Year of Microcredit 2005”. In 2006, Jiao Jinpu and Du Xiaoshan first introduced the inclusive financial system to China. Because it is related to the issues of financial, economic, social development closely, inclusive financial system has garnered considerable attention, and its role has also been recognized by more and more Chinese scholars and experts in related fields. Besides, the intention of inclusive financial system is substantially consistent with “Inclusive Growth” and “Harmonious Growth” which have been widely advocated in China in recent years. For China, building an inclusive financial system mainly aims to solve the practical problems that disadvantaged fields are often financially excluded.

In recent years, China has made efforts to support disadvantaged fields through the adjustments of financial institutions and the reforms of financial systems. But we have to acknowledge that there are still many difficulties to be overcome, since the financial exclusion of disadvantaged fields has been long existed, and too complex to be solved in the short term. Looking into the fundamental cause of disadvantaged fields, we can find that the imbalance and unreasonable allocation of economic resources should take responsibility. So how to make resources available for both advantaged and disadvantaged fields equally has become an important issue in China. Inclusive financial system is that committed to this issue and plays an irreplaceable role in supporting disadvantaged fields. Hence, in China, there is an urgent need to build an integrated financial support system for disadvantaged fields along with the existing efforts, which we can define as “Inclusive Financial System”.

We proceed in Section 2 with a review of related literature. In Section 3, we define the inclusive financial system and the characteristics of disadvantaged fields in China. Section 4 examines some countries’ experience and compares them with China. In Section 5, we design the structure of China’s inclusive financial system with the system theory. Section 6 puts forward some suggestions.

## 2 Literature Review

### 2.1 Researches on inclusive financial system and the related fields

Modern microcredit emerges as a market solution of poverty alleviation. Then, Stiglitz, a leading economist who utilizes the theories of information economics and imperfect competition in studying the mechanism of microcredit, comes up with the theory of microfinance. Consultative Group to Assist the Poor (CGAP, 2004) studies the eleven key principles of microfinance and argues that microfinance means building financial systems which serve the poor. Researches in China show that inclusive finance which serves for vulnerable groups, disadvantaged industries and poor areas can play an important role in promoting the development of these fields (Meng Fei, 2009). And we should take actions to introduce new categories of financial institutions, attract private and foreign capital, and integrate the microcredit into formal financial system (Huang Wensheng et al., 2009). Hu Guohui (2012) examines the special financial structure in China, and suggests that building an inclusive financial system in China doesn’t

---

\* This paper is supported by Humanities and Social Sciences Project of Ministry of Education, P.R. China: Research on Construction and Strategies of Inclusive Financial System Based on the Theory of Financial Exclusion (No. 10YJA790071).

necessarily lead to exclude the large nation-owned banks, which is different from most other countries. By and large, though there is a loud voice on building inclusive financial system, researches directly related to it are very limited. And the majority merely mention the term of inclusive financial system in policy recommendations, not discuss in-depth what the system really is and how to build it. Thus, there is still lack of independent, systematic and comprehensive researches on inclusive financial system.

However, there are relatively rich findings on microcredit, microfinance and rural finance, closely related to inclusive financial system. Especially, in China, with the asynchronous financial development in urban and rural areas, rural finance is always the first and foremost pivot. Wang Shuguang et al. (2011) mention that there is a Double Financial Dualism in China which is characterized by the oppositions between urban and rural finance, formal and informal finance, so rural financial reform is important to inclusive financial system. Zhou Mengliang et al. (2011) point out that there are two different tracks in China's rural financial reform—outside or inside the financial system, the former is carried out by the People's Bank of China (PBC), mainly about allowing private capital to microfinance, the latter is led by China Banking Regulatory Commission (CBRC) emphasizing the reform of rural finance institutions. Though those researches haven't adopted the term "inclusive financial system" directly, they do imply the idea of "inclusive", which provide us important research grounds, references and inspirations.

### **2.2 Researches on financial support for disadvantaged fields**

Vulnerable groups, such as the poor, women, children and the unemployed, are first concerned as disadvantaged fields by sociology in some countries. However, researches in China pay much attention to farmers, migrant workers and urban poverty. From a sociological viewpoint, researches demonstrate that disadvantaged fields result from the segmentation of urban and rural systems, social discrimination and the lack of education (Wan Baoying, 2009). And researches in economics note that low elasticity of demand, decreasing marginal revenue and diseconomies of scale also contribute to its severity (Zhang Feng, 2007). Financial support for disadvantaged fields is usually considered as a power that can promote economy growth. Gurley and Shaw (1967) maintain that the innovation of financial technology can support the economy growth. And McKinnon and Shaw (1973) emphasize the role of finance in promoting economic growth in developing countries. Zeng Kanglin (2005) proposes the conception of establishing special poverty-alleviation financial institutions for the vulnerable groups. Though there are relatively rich researches on financial support for disadvantaged fields, they are in different independent fields. And no discussion is carried out from the perspective of system evolution on how to integrate those marginalized or excluded fields into a mutual and harmonious financial system.

## **3 Theoretical Framework**

### **3.1 Definition of inclusive financial system**

The concept of inclusive financial system originates from the theory and practice of microcredit and microfinance but much broader than them. Modern microcredit emerged in 1970s in some countries, and then in 1990s the term of "Microfinance" gradually took the place of "Microcredit". During the following years, microfinance has developed rapidly as its participants, products and services become more diverse and abundant than ever before. People began to realize that microfinance, as an important tool for poverty alleviation, shouldn't be marginalized or excluded from the formal financial systems. So, in 2005, United Nations proposed "Building Inclusive Financial Sectors to Achieve the Millennium Development Goals", and indicates that an inclusive financial sector offers to the vast majority of the population sustainable access to a range of financial services suited to their needs.

CGAP (2004) defines inclusive financial system as an integration of microfinance into formal financial systems to ensure permanent access to financial services by significant numbers of poor people. The term "poor" refers to everyone excluded from access to financial services who might potentially be able to use financial services effectively, including not just the "extreme poor" but also wealthier, whereas still vulnerable. Du Xiaoshan (2006) points out that inclusive financial system is a system which turns microcredit into an integral part of the mainstream financial system, satisfying the basic financial needs of the majority. Jiao Jinpu (2009) believes that an inclusive financial system, constituted of financial institutions, services, instruments, laws and regulations, should be generally available for every social member and give appropriate support to vulnerable groups and undeveloped areas.

To sum up, we define inclusive financial system as a system which can include various forms of financing and provide financial services to a wide range of clients. Its clients cover all fields previously excluded by the traditional financial system, no matter they are disadvantaged or advantaged.

### **3.2 Characteristics of disadvantaged fields**

In this article, we refer to disadvantaged fields as which are in relatively low or weak positions. Although different disadvantaged fields are characterized by different features, they all cohere with the three characteristics—poverty, vulnerability and exclusion.

Poverty is the economic characteristic of disadvantaged fields. Poverty here means the scarcity of economic resources. Disadvantaged fields such as undeveloped regions, the poor and small business all reveal the poverty, which is the primary characteristic that determines the vulnerability and exclusion.

Vulnerability is the structural characteristic of disadvantaged fields. It indicates that the structure of disadvantaged fields is unstable and easy to be threatened by external shocks. For example, regional growth stops as resources exhausting and being polluted; the poor can't withstand the unpredictable shocks of disease or unemployment; small businesses face difficulties once the finance crisis happened.

Exclusion is the social characteristic of disadvantaged fields. It means that the disadvantaged fields are excluded from the formal social service systems which lead to the unfairness in sharing the social fruits. It refers to all kinds of exclusion, such as exclusion from the social security system, the healthcare system, the education system, the financial system and the legal system.

### **3.3 Role of inclusive financial system in supporting disadvantaged fields**

The disadvantaged fields have been marginalized because of the social exclusion. On one hand, disadvantaged fields are unable to obtain sufficient inputs of capital, technologies and human resources, but resulting in their outflow to the advantaged. On the other hand, gaps between the marginalized fields and others will lead the disadvantaged fields to “an isolated island” in the long-term.

Thus, inclusive financial system plays an irreplaceable role in supporting disadvantaged fields in these two ways: firstly, inclusive financial system can balance financial resources in different fields and allocate them to disadvantaged fields directly; secondly, the allocation of financial resources in disadvantaged fields can guide other economic resources to these fields and support them indirectly.

## **4 International Experience and Comparison**

### **4.1 International experience on inclusive financial system**

Based on the belief that the poor, especially women would be more credible than the rich, Grameen Bank in Bangladesh chooses the poor as their client and provides no collateral small loan. It formulates reasonable price of interest rates as a market player, initiating the group guarantee lending. In addition, it is legitimized and supported by the government. Grameen Bank not only solves the difficulties in lending to the poor but also some social problems, thus becomes a typical model of microfinance.

Regulated by Community Reinvestment Act, the community banks in America provide credits to their communities. They are regularly examined on their performance in low-and-moderate-income communities. The results will be references if the bank wants to open new businesses. However, such supervision is carried out differently according to the banks' scale. Compared with small banks, the large one will be examined strictly in its loans to disadvantaged communities.

Japan attaches great importance to support SMEs, and shapes an integrated financial supporting system, including policy finance, commercial finance and related regime support. Policy finance is implemented by government through establishing credit-guarantee institutions and insurance agencies. Commercial finance develops on the basis of policy finance and has become the main force in financial support for SMEs.

In general, international experience of microfinance can be summarized as follows: guided by the policy finance, promote the institution to be a differentiated market player, strengthen the structure of risk control system and promote the enactment of relevant laws and regulations.

### **4.2 Inclusive financial system in China and its future**

Though there has been much valuable experience already, we could not copy them without alteration, but building an inclusive financial system with Chinese characteristics for disadvantaged fields according to the special conditions and circumstances.

Firstly, with an imperfect market, we still have many restrictions in economy and finance development. Different from western countries who intend to innovate in products and services, China should reform the informal finance, promote financial market competition, broaden the access to encourage the participation of new-type financial institutions like rural bank and small loan company, and finally support disadvantaged fields in extent and depth.

Secondly, the coexistence of dual economic structure and dual financial structure is a fact we can't avoid. On one hand, it results in the multi-level of disadvantaged fields so that the different financial demands and backgrounds increase the difficulties in financial support. On the other hand, the formal

financial institutions, emphasizing on their own performance, always ignore the disadvantaged fields, while the informal financial institutions can't develop in scale without policy support and risk control. So, establishing an efficiently inclusive financial system that taking the interests of urban and rural areas both into consideration, and integrating the formal and informal financial institutions, is our future direction in disadvantaged fields supporting.

## 5 Structure and Function of Inclusive Financial System in China

### 5.1 Structure

As mentioned above, there are dualities of both economic and financial structure in China, so here we also consider the inclusive financial system in China as a dual one. The customers are divided into disadvantaged and advantaged fields, representing the duality of economy. The inclusive financial institutions consist of microfinance institutions (MFIs) and traditional finance institutions, showing the duality of finance. Disadvantaged fields, as what we have clarified previously, are served by MFIs. Advantaged fields, having relative comparative advantages to disadvantaged fields, are the target clients of traditional finance institutions. There is no absolute division between disadvantaged and advantaged fields, instead they are connected to each other, and so is the relationship between MFIs and traditional finance institutions. Here MFIs refer to savings banks, microcredit companies, micro-insurance companies etc. And traditional finance institutions are commercial banks, insurance companies, stock markets, venture capital, private equity, guarantee companies, financial leasing companies and so on.

In addition, financial information platform, financial regulatory departments, and supporting systems are also essential parts of the inclusive financial system. The financial information platform acts as an information collector. The financial regulatory departments consist of PBC, CBRC, CSRC, CIRC etc. The supporting systems include public finance departments, tax departments, etc. (Seeing Fig. 1)

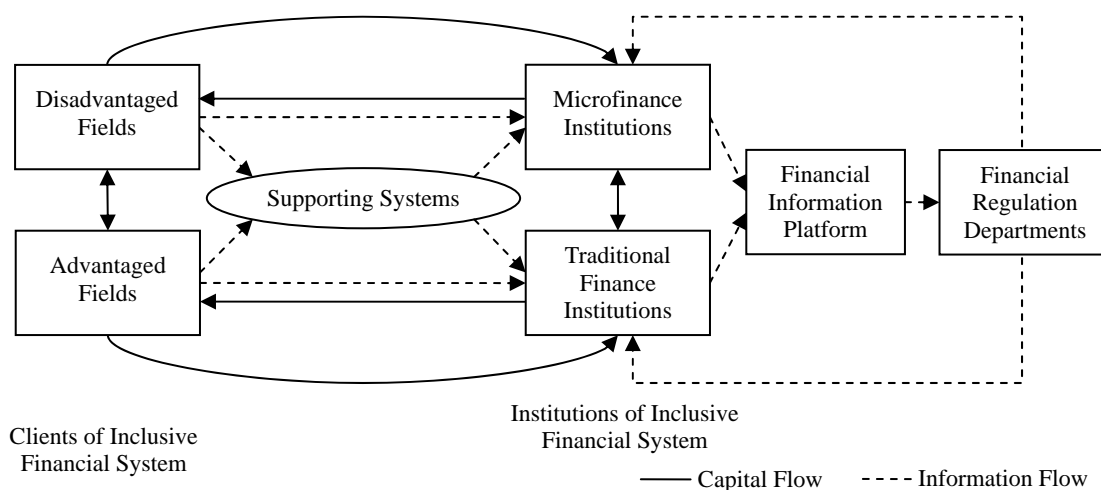

Figure 1 Inclusive Financial System in China

### 5.2 Function

Capital flows between disadvantaged fields and MFIs in the mode of taking deposits from disadvantaged fields, managing their small personal account management by the savings banks, providing small loans by the microcredit companies, supplying insurance services by the micro-insurance companies and so on. Large amount of capital flow links advantaged fields with traditional financial institutions through the indirect financing, equity investment, financial leasing etc. The inclusive financial system not only integrates the part of “disadvantaged fields and MFIs” into the system, but more importantly it interacts the flow between the parts of “the disadvantaged and MFIs” and “the advantaged and traditional” instead of flowing separately in their own part. The interactive capital flow between disadvantaged and advantaged fields takes the form of supply chain finance. And the capital flows in forms of wholesale loans between MFIs and traditional financial institutions.

Information flows in two ways. Clients provide their own information to financial institutions actively. Or the supporting systems get clients information from trade, tax declaration etc. and provide it to financial institutions indirectly which is passive but helpful to verify the authenticity of information. The function of financial information platform is to gather market information constituted of the active

and passive for financial regulation departments. The regulation departments act as the “Gatekeeper” not only for the purpose of market control, but also draw effective information through data filtering, statistics and analysis, and send it back to the market as an interaction between the government and market. Only in this way, the exchange and transmission of information can be efficient, being able to shorten the time lag of policy and strengthen the efficiency of market. The coordinated trans-information contributes to information sharing in different parts of the inclusive financial system.

## 6 Conclusions and Policy Recommendations

### 6.1 Integrating informal finance into the inclusive financial system

An inclusive financial system should include all kinds of financial services in demand, especially the diverse financial innovations and the informal finance. Recently, the prevalence of informal finance such as the “underground banks” has brought about quite a few undesirable phenomena. It shows that excluding the informal finance isn’t an effective way to achieve sustainable growth. But we should guide and regulate the informal finance in order to turn them into a powerful and sustainable force in the development of the financial system.

### 6.2 Coordinating all components through the appropriate allocation of financial resources

An inclusive financial system should coordinate all components of the system through the appropriate allocation of financial resources. Firstly, an inclusive financial system should try to seek the possibility of “Win-Win” instead of “Zero-Sum Game”. Secondly, a fair allocation between the various suppliers or the customers in the inclusive financial system can ensure the vitality of small-size financial institutions and the profits of the disadvantaged. So every component can become symbiotic in the whole inclusive financial system.

### 6.3 Adopting different patterns at different stages following the development cycle

The development of an inclusive financial system follows a life cycle, so that we should adopt different supporting patterns at different stages. At the early stage, public policies and public finance are the main support, and most institutions offer homogenous services to extend the range of financial inclusion, which can be defined as “inclusion in quantity”. At the second stage, we pay attention to the coordination and cooperation in and out of the system to achieve its self-adaptation, and provide individuality products to clients according to their different needs, known as “inclusion in quality”. In the long run, having the capacity to handle losses and gains on its own is the key to ensure the sustainable development of the system.

## Modeling University Researchers' Behaviors: Academic and Applied Researches Balances

Nguyen Huu Phuc, Yoshiyuki Matsuura, Motonobu Kubo  
Graduate School of Innovation and Technology Management, Yamaguchi University,  
Tokiwadai 2-16-1, Ube City, Yamaguchi Prefecture, 755-8611, Japan.  
(Email: phuc@yamaguchi-u.ac.jp, matu@yamaguchi-u.ac.jp, kubomo@yamaguchi-u.ac.jp)

**Abstract:** This paper suggests a theoretical framework for analyzing the behavior of academic researchers within the context of university-industry relationships and academic freedom. We assume that there are three following scenarios: 1) there is no supporting research fund for the researcher, 2) there is a supporting fund to use without any restrictions, and 3) the researcher has to seek for his own research fund through his applied research with firms in the industry. This paper, in particular, focuses on the first and second scenarios. Then it explores academic researchers' behaviors that optimize their utility functions, the satisfaction obtained by their research outputs. This paper characterizes these outputs as the results of researchers' 3C: Competence (the ability to implement the research), Commitment (the effort to do the research), and Contribution (finding meaning in the research). While most of the previous research utilized the empirical methods to study researcher's motivation to collaborate, the literature cannot develop a coherent insight of researcher's behavior without a supporting economic theory. To help fill this gap, we explore the interval factors formulating academic researcher's utility function, and examine how these factors affect individual motivation to collaborate. Our contribution is important both conceptually and practically because it provides the first theoretical framework to study the mechanism of researcher's behavior.

**Keyword:** ResearcherBehavior; Researcher's Utility; Academia-Industry

### 1 Introduction

In recent years, universities cultivated a strong capability to get involved in business and entrepreneurial activities. The assignment of university has dramatically changed: it has become more and more entrepreneurial (Siegel et al., 2007). Universities not only have to provide education and to be involved in research and knowledge production, but they also have to be involved in the commercialization endeavors of their scientific results. Accordingly, while university researchers, besides teaching, are expected to continue to think of original researches, they have come under increasing pressure to participate in the commercialization of academic research. This is the problem of balancing "academic freedom"<sup>1</sup> and "academic entrepreneurship". Understanding the individual motivational drivers for academia-industry relations is important for promoting the ultimate success or failure of this academia-industry collaboration.

Various studies have focused on what motivates academic researchers to engage in research commercialization. In contrast to researchers in the private sector, motivation of academic researchers partly stems from the concept "academic freedom". Accordingly, the intrinsic motivation of academics, unlike researchers in industry, is to value independence in choosing their research agenda rather than monetary rewards. In some cases, the decision to collaborate with industry is influenced by perceived threats to a researchers academic freedom (Tartari and Breschi, 2012). Although the main concern of academics is that industry involvement might restrict academic freedom, academics still express significant support for the collaboration with industry particularly when it is related to their research (Lee, 1996). Moreover, empirical findings in Looy et al. (2004, 2006); Wash (2009) suggest that the engagement in entrepreneurial activities coincides with increased outputs of research; activities in both do not hamper each other. Why does the collaboration have such controversial effects on the behavior of academic researchers? Literature indicated that there are some certain types of researchers suitable for the collaboration. D'Este and Perkmann (2010) found that although researchers in the UK engage with industry to further their research rather than to commercialize their knowledge, they have different

---

<sup>1</sup> "Academic freedom" has two main components: freedom to conduct research ("academic choice": the ability to choose one's own research topics or choose their own research agendas), and freedom to communicate research (whether the scientist feels constraints in disclosing, communicating and sharing this research with others, i.e. the "norms of open science") (Behrens and Gray, 2001).

motivations to collaborate depending on the channels of engagement. Lam (2010, 2011) found the similar results. Davis et al. (2009) also found that scientists oriented towards basic research, and scientists who had previously worked in industry, were concerned that university patenting would negatively affect both aspects of academic freedom. Highly productive researchers, by contrast, were less apprehensive about either effect. The less productive basic researchers are especially worried about the effects on academics ability to choose their own research agendas. Scientists who had received research council grants, and full professors, are skeptical as regard to the effects on academic choice.

This exploration of researchers' motivation has attracted a growing interest in literature. Most of these studies have been conducted through data surveys among universities and their researching staff, or direct interviews with academic researchers. Then, conclusions and insights concerning researcher's individual motivation were drawn by analyzing the collected facts. In short, the current analytical method is an empirical method. However, despite having numerous studies, still less is known about the interaction as well as the mechanism between the various internal factors of the researchers (the intrinsic satisfaction, the improvement in research ability, the research effort, finding meaning in the research, career rewards, financial rewards, etc.) and their academic stances (preferences about academic freedom and academic entrepreneurship). The current analytical method has been challenged, and it needs to be complemented by a plausible theory. As far as we are aware of, this paper is the first to offer a theoretical framework to explore academic researchers' motivation within the context of university-industry relationships and academic freedom.

### Outline

Our paper is organized as follows. Our theoretical framework is described in Section 2. Dave Ulrich's 3C concepts and academic researcher's utility function form the focus of our analysis. Section 3 presents our research results and the implications.

## 2 Theoretical Model (Economics of Researchers)

To build a model of researcher behavior, the authors have evaluated several approaches. Among them, there are two popular thinkings in economics, that is, if considering the researcher as a knowledge producer, we will adopt a kind of production function of research into the model. This scheme will characterize the researcher as the one in industry. Alternatively, assuming that the researcher is a consumer who is enjoying his scientific outputs, we will construct utility function for the researcher. However, as shown by the following Table 1, due to the fundamental differences between university and industry researchers in the motivation of conducting scientific research, we adopted the utility approach in our paper. The intrinsic motivation of academics, unlike researchers in industry, is to value independence in choosing their research agenda more highly than monetary rewards.

**Table 1 Academic Entrepreneurial Differences (Jain et al., 2009)**

	Academic	Entrepreneurial
Norms	Universalism	Uniqueness
	Communism	Private property
	Disinterestedness	Passion
	Skepticism	Optimism
Processes	Experimentation	Focus
	Long-term orientation	Short-term orientation
	Individualistic/Small group	Team management
Outputs	Papers	Products
	Peer recognition/status	Profits

### 2.1 Ulrich 3Cs

Ulrich (2009) developed a concept called "3C" (Competence, Commitment, Contribution) to manage and evaluate the performance of human resource.

Competence is "the ability to do the work". Competence means that individuals have the knowledge, skills and values required for today's and tomorrow's jobs. Commitment is "the effort to do

the work”. Committed researchers work hard; put in their time. Contribution is “finding meaning ( or intrinsic motivation<sup>1</sup>) in their work”.

According to this 3C thinking, to give the best performance of a work, the man 1) not only has to possess an ability to do it such as skills or knowledge, 2) but also gives his best effort for the work (for example, working time), and 3) he must have an intrinsic motivation to do the work or finding meaning in the work he does. If any one of these three Cs is missing, the other two will not replace it. Highly competent researchers who are not committed or are not contributing in conducting research will give low performance on research outputs.

Dave Ulrich Model 3C = Competence x Commitment x Contribution

## 2.2 Formation of Utility Function

(1)Each academic researcher owns three resources - competence ( $C_1$ ), commitment ( $C_2$ ), and contribution ( $C_3$ ) defined as Ulrich's 3C - that are able to generate two types of knowledge-based outputs: academic output ( $X$ ) and commercial research output ( $Y$ ). The concepts “academic” or “commercial” are just relatively characterized by their potentiality of commercialization. They will be affected by various external factors surrounding the researcher. They will be determined according to the particular state of the researcher. Broadly speaking, one academic output resulted from a basic research originated by a researcher may be a commercial research output for others.

In the regards to the number of outputs that the researcher is able to generate, each of the two knowledge-based outputs  $X$  and  $Y$  should be also considered as one representative output for all producible academic and commercial outputs respectively.

The assumed relations between  $C_1, C_2, C_3$  and  $X, Y$  are described as follows:

- Competence ( $C_1$ ): the ability to do the work.

We assume that the competence  $C_1$  of a researcher comprises academic competence  $C_{1X}$  and profit-making competence  $C_{1Y}$ . Academic competence  $C_{1X}$  is a kind of competence concerning the basic research ability. It is assumed to be indispensable for generating academic output  $X$ . Similarly, profit-making competence  $C_{1Y}$  is indispensable for producing commercial output  $Y$ . Practically, it is difficult to make a clear distinction between  $C_{1X}$  and  $C_{1Y}$ .

Since the competence  $C_{1Y}$  is generally cumulated through the development of  $C_{1X}$ , we also assume that the competence  $C_{1Y} = g(C_{1X(0)})$  with  $g$  as a concave function and  $C_{1X(0)}$  is the antecedent academic competence.

- Commitment ( $C_2$ ): the effort to do the work. Here, there are two efforts in the respective to the outputs:  $C_{2X}$  - the effort for academic research  $X$ , and  $C_{2Y}$  - the effort for commercial research  $Y$ .

The effort  $C_2$  can be interpreted as the time spent on the activities. The total time for working varies within the researcher's disposal working time  $\overline{C_2}$ .

$$C_{2X} + C_{2Y} = \overline{C_2} \tag{1}$$

Generally, the limitation can be extended, for instance, when some part of the work is outsourced i.e. the effort can be purchasable if the researcher can access a fund. For the researcher, a favorable joint project will occupy his minimal effort but still leaves a considerable budget for him to use in academic research (for example, buying outsource effort for his own academic research). It also offers him useful hints (for example, scientific research topic) for his academic research.

---

<sup>1</sup>Frey and Oberholzer-Gee (1997) p.746: Human behavior is influenced by both *extrinsic* and *intrinsic motivation*. The former is activated from the outside. In particular, individuals follow the generalized law of demand. Intrinsic motivations, on the other hand, relate to activities one simply undertakes because one likes to do them or because the individual derives some satisfaction from doing his or her duty.

Moreover, the competence  $C_1$ , in general, will grow over time through the endeavor  $C_2$  of the researcher. As a result, when there is no supporting research fund, with  $f(\cdot)$  as the voluntary training function, we describe the growth of the competence  $C_1$  as follows:

$$C_{1X} = C_{1X(0)} + f_X(C_{2X}) \tag{2}$$

$$C_{1Y} = g(C_{1Y(0)}) + f_Y(C_{2Y}) \tag{3}$$

- Contribution ( $C_3$ ): finding meaning (or intrinsic motivation) in the work we do.

Obviously, researchers are happy to contribute his scientific work towards the society with or even without financial reward. For example, it may be for the prestige, or is to satisfy his intellectual curiosity personally as well as the desire for doing good socially. It may be simply because he likes to do it. It is natural to demonstrate this intrinsic motivation as an increasing function  $\chi(\cdot)$  of the value<sup>1</sup> obtained from the research output  $X$  and  $Y$ .

$$C_{3Y} = \chi(X) \tag{4}$$

$$C_{3X} = \chi(Y) \tag{5}$$

It is logical to think that the intrinsic motivation  $C_3$  has a positive correlation with the respective effort  $C_2$ . As a result, when there is no supporting fund, with  $\theta(\cdot)$  as an increasing function, we can demonstrate them as follows:

$$C_{2X} = \theta(C_{3X}) \tag{6}$$

$$C_{2Y} = \theta(C_{3Y}) \tag{7}$$

The details of mathematical properties of competence  $C_1$ , commitment  $C_2$ , and contribution  $C_3$ , academic output  $X$ , commercial research output  $Y$  as well as  $C_{1X}, C_{1Y}, C_{2X}, C_{2Y}, C_{3X}, C_{3Y}$  are introduced in our full paper.

(2)The more the researcher generates  $X$  and  $Y$ , the more he feels satisfied, that is, the higher his utility<sup>2</sup>  $U$  of  $X$  and  $Y$  is.

The details of mathematical properties of the utility  $U(X, Y)$  are introduced in our full paper.

### 2.3 Mathematical Expression of the model

#### 2.3.1 Forms of academia-industry relations

There are various forms of relations between academia-industry (Table 2) as well as several types of research grants. As a result, the researcher is expected to adjust his behavior to optimize his utility depending on the combination of his collaboration forms and grant types.

**Table 2 Forms of Academia-Industry Relations (Link et al., 2007; Perkmann et al., 2011)**

Licensing	Contractual assignment of university-generated intellectual property (such as patents) to external organizations
Academic entrepreneurship	Development and commercial exploitation of

<sup>1</sup>For simplicity, we define the values of the research  $X$  and  $Y$  as  $X$  and  $Y$  respectively.

<sup>2</sup>We are aware that the economic concept of utility as generally applied today is *outcome-oriented*. As researcher's utility function is actually a function of  $C_3$  - finding the meanings of doing an activity, it also implies that the individual simply undertakes that activity because he likes to do it, or because he derives some satisfaction from doing his activity. Indeed, it is *preferences over actions* which is critically different from *preferences over outcomes* (Frey and Oberholzer-Gee, 1997; Frey et al., 2004). However, there are no problems in our paper owing to the fact that we define  $C_3$  as a function of the outcomes  $X$  and  $Y$ .

	technologies pursued by academic inventors
	through a company they (or partly) own
Collaborative research	Research jointly pursued by university and industrial partners commonly with public funding
Contract research	Application-oriented research and development activities carried out by university commissioned and funded by industry
Consulting	Application-oriented research and development activities or advice provided individually by academics commissioned and funded by industry

2.3.2 Effects of research grants

Public and industry funds have different impacts on research output: (Bozeman and Gaughan 2007) indicated that grants and contracts from industry have a significant effect on academic researchers propensity to work with industry. In turn, public grants also have an impact in increasing work with industry, but a more moderate scale. Grimpe (2012) studied six types of public and industry research grants in Germany and found that scientist productivity measured in terms of publication and patent stock is a statistically significant determinant only for obtaining foundation and industry grants while the award of an FP6 or government grant is influenced by other characteristics. Hottenrott and Thorwarth (2011) found some negative effects that a higher budget share from industry reduces publication output of professors both in terms of quantity and quality in subsequent years. However, industry fund has a positive impact on the quality of applied research if measured by patent citations.

2.3.3 Integrating industry research funds into the model

In this paper, since we are interested in the academic researcher's behavior towards the collaboration of academia-industry, public fund is temporarily excluded in the present setting.

Industry gives the researcher a research grant to obtain his commercial research output  $Y$ . Therefore, the grant amount is a function of the value of  $Y$ , that is,  $M(Y)$ . The researcher allocates the grant at will to increase his  $C_{1X}, C_{1Y}, C_{2X}, C_{2Y}$ . The allocation amount is  $M_{1X}, M_{1Y}, M_{2X}, M_{2Y}$  respectively.

The ultimate aim of an academic researcher is to optimize his utility function. He will choose his optimizing targeting levels of competence  $C_1$  and effort  $C_2$  by “purchasing” necessary amounts of them. For instance, the researcher can hire other competent researchers, or outsource the tedious task of inputting data.

The parameters  $\alpha_{1X}, \alpha_{1Y}, \beta_{2X}, \beta_{2Y}$  are the effect of one money unit on  $C_{1X}, C_{1Y}, C_{2X}, C_{2Y}$  respectively.

$$\max_{C_{1X}, C_{1Y}, C_{2X}, C_{2Y}} U(X(C_{1X}, C_{1Y}, C_{2X}, C_{3X}), Y(C_{1X}, C_{1Y}, C_{2Y}, C_{3Y})) \tag{8}$$

s.t.

$$C_{1X} = C_{1X(0)} + f_X(C_{2X}) + \alpha_{1X}M_{1X} \tag{9}$$

$$C_{1Y} = g(C_{1X(0)}) + f_Y(C_{2Y}) + \alpha_{1Y}M_{1Y} \tag{10}$$

$$C_{2X} = \theta(C_{3X}) + \beta_{2X}M_{2X} \tag{11}$$

$$C_{2Y} = \theta(C_{3Y}) + \beta_{2Y}M_{2Y} \tag{12}$$

$$C_{3X} = \chi(X) \tag{13}$$

$$C_{3Y} = \chi(Y) \tag{14}$$

$$\theta(C_{3X}) + \theta(C_{3Y}) = \overline{C}_2 \tag{15}$$

$$M(Y) = M_{1X} + M_{1Y} + M_{2X} + M_{2Y} \tag{16}$$

### 3 Analysis Results and Implications

For the simplicity, we will focus on two simple scenarios to examine our framework: 1) there is no supporting research fund for the researcher, 2) there is a supporting public grant to use without any restriction. The third scenario - the researcher has to seek for his own research fund through his applied research with firms in the industry - will be analyzed in our full paper.

#### 3.1 Case 1

There is no supporting research fund for the researcher

$$\max_{C_{1X}, C_{2X}} U(X(C_{1X}, C_{2X}, C_{3X})) \tag{17}$$

s.t.

$$C_{1X} = C_{1X(0)} + f_X(C_{2X}) \tag{18}$$

$$C_{2X} = \theta(C_{3X}) \leq \overline{C}_2 \tag{19}$$

$$C_{3X} = \chi(X) \tag{20}$$

Since  $U(\cdot)$  function,  $X(\cdot)$  function,  $\theta(\cdot)$  function and  $\chi(\cdot)$  function are increasing functions with respect to their own variables, it is easy to see that the optimizing solutions are as follows:

$$\begin{aligned} C_{2X}^* &= \overline{C}_2 \\ C_{3X}^* &= \theta^{-1}(\overline{C}_2) \\ C_{1X}^* &= C_{1X(0)} + f_X(\overline{C}_2) \end{aligned}$$

This is the simplest case. When there is no supporting fund, to optimize his utility, the researcher just conducts his work with all his effort.

#### 3.2 Case 2

There is a supporting fund to use without any restriction. The fund amount is  $\overline{M}$  (a fixed value).

$$\max_{C_{1X}, C_{2X}} U(X(C_{1X}, C_{2X}, C_{3X})) \tag{21}$$

s.t.

$$C_{1X} = C_{1X(0)} + f_X(C_{2X}) + \alpha_{1X} M_{1X} \tag{22}$$

$$C_{2X} = \theta(C_{3X}) + \beta_{2X} M_{2X} \tag{23}$$

$$C_{3X} = \chi(X) \tag{24}$$

$$\overline{M} = M_{1X} + M_{2X} \tag{25}$$

It is obvious that  $\theta(C_{3X})$  will equal to its maximum value  $\overline{C}_2$ . Like in the previous case, it implies that to optimize his utility, the necessary condition is that the researcher will carry out his work with all his effort. However, since there exists a supporting fund, how should the fund be allotted to make full use of it?

The Lagrangian equation  $L(C_{1X}, C_{2X}, \lambda)$  for this optimization problem is defined as

$$L = X(C_{1X}, C_{2X}, C_{3X}) + \lambda \left( \overline{M} - \frac{C_{1X} - (C_{1X(0)} + f_X)}{\alpha_{1X}} + \frac{C_{2X} - \overline{C}_2}{\beta_{2X}} \right) \tag{26}$$

The condition for optimization is as follows:

$$\frac{\partial X/\partial C_{2X}}{\partial X/\partial C_{1X}} = \left( \frac{\alpha_{1X}}{\beta_{2X}} - \frac{\partial f_X}{\partial C_{2X}} \right) \quad (27)$$

The left-hand side of the equation (27) is the economic rate of substitution between  $C_{1X}$  and  $C_{2X}$ .

Alternatively,

$$\frac{\alpha_{1X}}{\beta_{2X}} \frac{\partial X/\partial C_{1X}}{\partial X/\partial C_{2X}} = 1 + \frac{\partial f_X}{\partial C_{2X}} \frac{\partial X/\partial C_{1X}}{\partial X/\partial C_{2X}} \quad (28)$$

Notice that  $\alpha_{1X} \frac{\partial X}{\partial C_{1X}}$  and  $\beta_{2X} \frac{\partial X}{\partial C_{2X}}$  are the marginal research output of money spent on  $C_1$  and  $C_2$  respectively.

In most of cases, since  $\frac{\partial f_X}{\partial C_{2X}}$  is positive, it implies that at the state of optimization, comparing with the money spent on research effort, money spent on research competence gives a higher value of research output.  $f_X(C_{2X})$  is the voluntary training function that demonstrates the effect of the effort  $C_{2X}$  accounting for substantial changes (usually, the increase) in the competence  $C_{1X}$ .

Furthermore, making a comparative static analysis (introduced in our full paper) of  $M_{1X}(C_{1X}, f_X)$  and  $M_{2X}(C_{2X})$ , we found that if  $\frac{\partial f_X}{\partial C_{2X}}$  is low, researchers tend to increase money to “purchase” more research effort  $C_2$ . In contrast, more money will be allotted for “purchase” research competence  $C_1$  if  $\frac{\partial f_X}{\partial C_{2X}}$  is high.

## Measuring Employee Satisfaction in SMEs Firms

Asfaw Yilma Demisse, Wei Jianguo

School of Economics, Wuhan University of Technology, Wuhan, P.R. China, 430070

E-mail: asfity333@yahoo.com, weijg@mail.whut.edu.cn

**Abstract:** It is an obvious statement that high employee satisfaction can reduce employee turnover. Dissatisfied employees tend to perform below their capabilities. To know this in a scientific way we need to have a tool to measure employee satisfaction based on certain factors. For this reason in this paper I developed an original measuring tool based on five independent and another five dependent factors using logical mathematical concepts. Thus according to the investigation of the research Employees Satisfaction is equal to Employees Expectation minus Employees Perception and divided by summation of value of independent factors. It symbolize as  $EP - PR / \sum n (V)$ . The purpose of the research is to contribute to academic researchers as well as businesses, about how to measure the employee satisfaction in order to see what sort of human resource management skill is needed to maximize the mental satisfaction of the employees and profit as well.

**Key Words:** SMEs, Employee Satisfaction, Employee Perception, Employee Expectation

### I Introduction

It has been argued that there is a positive relationship between firm performance (usually measured by quality and efficiency) and key human resource practices (Rodwell *et al.*, 2000). More specifically, the human resource practices of incentive pay, employee training and development, recruitment and selection, compensation, industrial relations, and performance appraisals have been identified as best practices that are positively correlated to lower employee turnover, greater employee productivity and better overall firm performance (Huselid, 1995). For this effective organization is needed.

Effective organizations should have a culture that encourages the employee satisfaction (Bhatti & Qureshi, 2007). Employees are more loyal and productive when they are satisfied (Hunter & Tietyen, 1997), and these satisfied employees affect the customer satisfaction and organisational productivity (Potterfield, 1999). Employee satisfaction is defined as the combination of affective reactions to the differential perceptions of what he/she wants to receive compared with what he/she actually receives (Cranny, Smith, & Stone, 1992). This forces the managers to create and sustain the desired working environments in the organizations. One the other hand the employee satisfaction is one of the basics of organisational citizenship behavior (Ozdevecioglu, 2000). That is, the well-satisfied employees will work more willingly and this contributes to the effectiveness of their organizations.

There is no limit for the employees to reach the full satisfaction and it may vary from employee to employee. Sometimes they need to change their behaviors in order to execute their duties more effectively to gain greater job satisfaction (Miller, 2006). Employee satisfaction is perhaps the most frequently studied construct in the organisational sciences (Schneider and Brief, 1992). Employee satisfaction (often referred to as job satisfaction) has been defined as “a pleasurable or positive emotional state resulting from the appraisal of ones job or job experiences” (Locke, 1976).

The purpose of this research is to develop new measuring tool to measure Employees Satisfaction. Also it has the following significance: It is essential to facilitating development and organisational change, allows the organization to focus on needs and leverage its strengths, informs the organization on which actions will create problems for the employees, provides management with employee feedback (both positive and negative) on the internal health of the organization, measures the impact of current programs, policies and procedures and can be used to motivate employees and improve job satisfaction

### 2 Gap on Other Research Works

Traditional employee satisfaction measurement methods are mostly perception-based; that is they usually ask questions such as “all things considered, how satisfied are you with indicator x regarding your job?” without asking about “how important that indicator is to you?” The latter question can clarify the opinions or expectations of the employee toward the indicator. In such cases, unless people indicate severely low satisfaction levels, it is hard to provide specific managerial direction from the results.

Many researchers have different research on employee satisfaction. For example Nejatia., Nejatib, Shafaic (2007) in their research they try to measure employee satisfaction based on SERVQUAL method. The purpose of their study is to measure employee satisfaction and determine the existing gap

between employees' expectation and perception of their working condition. Items on the questionnaire represented various job condition aspects. Each aspect was concisely repeated in two statements: one to measure expectations and the other to measure perception about job condition, following the method used by Parasuraman et al. (1988). These aspects fell in the five dimensions of SERVQUAL model including Tangibles, Reliability, Responsiveness, Assurance, and Empathy. A five-point Likert scale ranging from very good to very bad was used to measure each of the indicators. (Very Bad = 1, Bad = 2, Fair = 3, Good = 4, Very Good = 5).

Thus, this paper uses another five independent and another five dependent factors in order to measure employee satisfaction. The independent factors are Employees Treatment, Regular Employee Recognition, Employees Empowerment, Employees Benefits and Compensation, and Effective Management. This observed in the research from employees expectation and perception perspectives.

### 3 Determinates of Employee Satisfaction and New Measuring Theory

Factors contributing to employee satisfaction include treating employees with respect, providing regular employee recognition, empowering employees, offering above industry-average benefits and compensation, providing employee perks and company activities, and positive management within a success framework of goals, measurements, and expectations.

In this research the basic idea laid on Employees Satisfaction = Employees Expectation in SMEs Firm

$$- \text{Employees Perception in SMEs Firm}$$

$$\text{I.e. } ES = EP - PR$$

$$\sum n (V) \text{ (i.e. summation of number of variables)}$$

So to reach on this logical mathematical equation we need to find the dependent and the independent factors or Variables clearly. Thus this paper suggested the following five key factors as a base line to measure employee satisfaction in any organization (See Table 1 below).

**Table 1 Independent Variables: Employees expectation**

<i>Independent Factors</i>	<i>Symbols</i>	<b>Value of Factors</b>
Employees Treatment	ET	1
Regular Employee Recognition	RER	2
Employees Empowerment,	EE	3
Employees Benefits and Compensation	EBC	4
Effective Management	EF	5
<b><math>\sum n (V)</math></b>		<b>15</b>

Thus, Employees Expectation within the Organization is equal to:

$$(EP) = (ET + RER + EE + EBC + EF)$$

When we see the dependent variables, we will find the following factors which extracted from the independent one (See Table 2 below).

**Table 2 Dependent Variables from Employees perception**

<i>Dependent Factors</i>	<b>Symbols</b>
P. Treatment	PT
P. Regular Recognition	PRR
P. Empowerment,	PE
P. Benefits and Compensation	PBC
<b>P. Effective Management</b>	<b>PEF</b>

Where P = Perception

Thus, Employees Perception within the Organization is equal to:

$$(PR) = (PT + PRR + PE PBC + PEF)$$

Therefore, Employees Satisfaction is equal to:

$$ES = \frac{(EP) - (PR)}{\sum n (V)}$$

$$ES = \frac{[ET + RER + EE + EBC + EF] - [PT + PRR + PE + PBC + PEF]}{\Sigma n(V)}$$

Where “ES” referees ‘ Employee Satisfaction’,  $\Sigma n(V)$  referees summation of the number of members of the factors: Employees Treatment(1), Regular Employee Recognition(2), Employees Empowerment(3), Employees Benefits and Compensation(4), Effective Management(5) i.e. [V1 +V2 + V3 =V4 +V5]...{1 +2 +3 + 4 +5 = 15}. Also in the above formula (EP) referees Employee Expectation within the organization and (PR) referee Employee Perception within the organization.

#### 4 Measuring Method, Examples

To apply this new measuring tools we need to have we need to follow the following measuring skills. Primary the questionnaire will distribute to the respected respondents. The questionnaire based on the independent and the dependent factors thorough three key measuring scales: Strongly Agree (has value 3), Agree (has value 2) and Disagree (has 1 value) (See the Table 3 below).

**Table 3 Examples on How to Calculate Employee Expectation (EP)**

Independent Factors	Symbols	Measuring Scales		
		Strongly Agree (3)	Agree (2)	Disagree (1)
Employees Treatment	ET	X		
Regular Employee Recognition	RER		X	
Employees Empowerment,	EE	X		
Employees Benefits and Compensation	EBC	X		
Effective Management	EF	X		

Based on the above sample data we can calculate the Employee Expectation within the organization (EP). Thus here ET = 3, RER = 2, EE = 3, EBC = 3, and EF = 3.

$$\text{Therefore, (EP) = (ET + RER + EE + EBC + EF)}$$

$$\text{I.e. EP = 3 + 2 + 3 + 3 + 3 = 14}$$

Like Employee Expectation, to calculate Employee Perception (the other dependent factors) we have to take some assumptions as well. The following table (Table 4) shows how to do that.

**Table 4 Examples on How to Calculate Employee Perception (PR)**

Dependent Factors	Symbols	Measuring Scales		
		Strongly Agree (3)	Agree (2)	Disagree (1)
P. Treatment	PT		X	
P. Regular Recognition	PRR		X	
P. Empowerment,	PE			X
P. Benefits and Compensation	PBC	X		
P. Effective Management	PEF		X	

Based on the above sample data we can calculate the Employee Perception within the organization (PR). Thus here PT = 2, PRR = 2, PE = 1, PBC = 3, and PEF = 2. Thus, the basic formula is:

$$PR = (PT + PRR + PE + PBC + PEF)$$

$$\text{I.e. PR = 2 + 2 + 1 + 3 + 2 = 10}$$

Therefore,

$$\text{Employees Satisfaction = Employees Expectation} \\ \text{Minus}$$

$$\text{Employees Perception within the Organization}$$

Having this new formula when we calculate the above sample i.e. EP = 14, PR = 10, and  $\Sigma n(V)$  = 15, we can find the following result. Below the result [0. 266] shows employees are satisfied within the sample organization.

$$\text{i.e. } ES = \frac{EP - PR}{\Sigma n(V)} = \frac{14 - 10}{15} = \frac{4}{15} = 0.266$$

#### 5 Result Description

In this research after we calculating the Employee Satisfaction based on the new formula  $(EP - PR) / \sum n (V)$  we will get result  $(-\infty, \infty)$ . This indicates that if the expectation of the Employees is equal to 15 (maximum value) and if Employees Perception (actual observation) is equal to 15 as well it means the difference will be zero. And by the formula we will divided this by 15. Then the result would be 0. In this research this result considered as Employees are satisfied in the organization. But if Expectation grater than the perception the result would be positive no. And this considered as Employees are not satisfied. On the other hand if Perception grater than Expectation, then the result would be negative no. And this Employees are highly satisfied (See Figure 1 below).

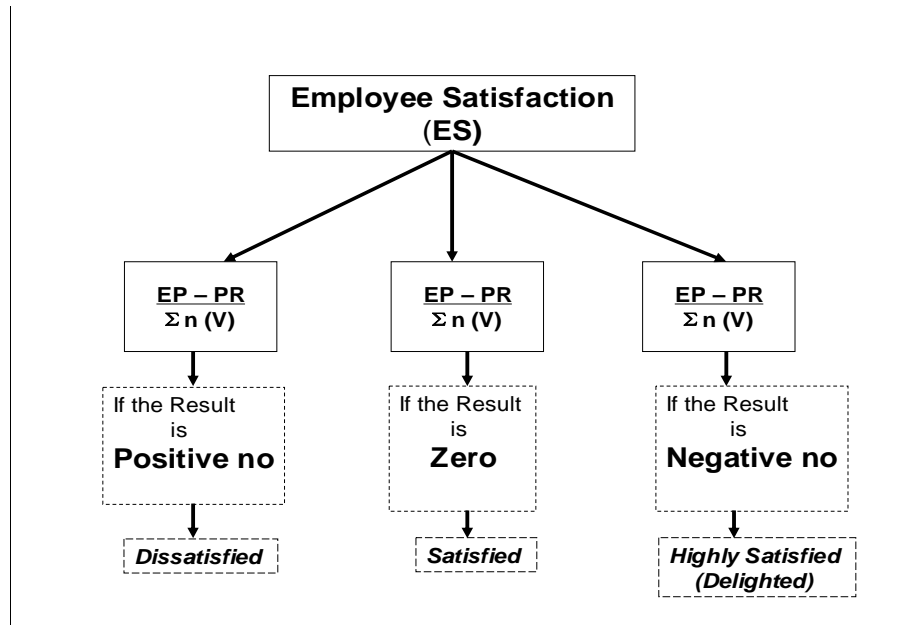

Figure 1 Result Description

## 6 Conclusion

As any effective organisational strategy designing an employee satisfaction survey with in a specific period in any SMEs firm should be considered as a basic task. This is true just because it has direct or indirect impact to see better performance and profit within the specific firm. To implement the survey and to do report on the results there must be universal measuring tool but it would not be easy to get that with in one night. Therefore different researchers keep on working on it. This research is one of the contributions for the future findings. I do believe that it will give at least a hint on the research of the area.

# Research of the Transportation Humanization Development

Li Jun

School of Politics and Administration, Wuhan University of Technology, Wuhan, P.R.China, 430063  
(E-mail:lijun1@whut.edu.cn)

**Abstract:** The extensive connection between transportation and society is decided by transportation characteristics. The author considers that modern service must based on the full respect of people's interests and feelings, and attain the humanization service. Talking about the people-oriented generally is not enough. The author puts forward that on the basis of the "people-oriented" concept cultivating and the improvement of quality of transport industry practitioners, perfecting market structure, saving time, making the information unobstructed and using modern means of managements, all of these are details, as well as the necessary choice.

**Key words:** Transportation; Humanization; Service

## 1 Introduction

The transportation industry is an important segment of social reproduction with a multiple links and process. There are many types of joint operation processes: with mobility, network, intangible property, dispersive property, and service etc. The unity of transportation, production and consumption decide the unity of business economic benefits of establishment, and social benefits, which determines the different requirements of management between transportation industry and other industries as well. With the accelerating modernization transportation industry; it has become an important problem to be solved about how to achieve the modernization of transportation management, ensure the stable transportation development and create the best economic and social benefits, and researches in these ways are relative lack.

"People-oriented" has been put in the first place of the policies that puts forward in the highway waterway traffic science and technology development strategy of China. That is to say, "In order to people" and "rely on people" is determined for traffic science and technology development goals. In the background of constructing the harmonious society and harmonious traffic, the modernization of the transportation industry can't lose the connotation of the humanization; modern management must be humanized management. The problems of guiding ideology, management ideas, and ways and means of humanization of modern transportation management still need to be studied.

## 2 Establishing Humanized Guiding Ideology

Advanced thought gestate the advanced management, Management theory and practice are certain ideological embodiment. In the modern era, transportation management guide ideology of the core and the reflection in the "people-oriented" concept, to set the humanized guiding ideology.

### 2.1 Service concept

Service is one of the important characteristics in the transportation industry. Highlight the "people-oriented", implement people-centered humanistic management, respects the human, understanding, caring person as an important part of management, customer interests as the starting point and standpoint of all work, to improve the competitiveness of enterprises is an important measure. The high speed development of transportation industry and the fierce competition of the passenger and freight market, cause the kaleidoscopic change of passenger flow and cargo flow, meanwhile, management means from the management to a service transformation. With the diversification of transport machine, the goods or passengers have more options, transport market gradually from the seller market to the buyer's market. Researching the markets, adapting to markets development, building the markets, and providing the humanized management will become important issue of transportation enterprise to build competitive edge. It will be the inherent requirement of constructing the harmonious traffic as well. Transportation enterprise should firmly establish "Customer Oriented" thought and respect customer. It shows the consideration of the client and provide the personalized service to the customers with their hearts, from every tiny place to let them feel the warmth. This kind of humanization of the guidelines and service concept benefit to the enterprise to constantly improve the service method, improve the service level, enhance the service idea, so as to better achieve management modernization.

### 2.2 Concept of talent

To realize the modernization of the transportation management, it cannot leave the talents, the human resources is the capital of enterprise development; establish the concept of talent firmly is the guarantee of realizing modernization management of a powerful. From the "people-oriented" angle, transportation enterprise in the process of modernization, it can't simply understanding for the application of advanced science or modern tools of technology, but put more energy to the improve the quality of the personnel while improving production technology level. The transportation industry more deals with clients which is the people, the first impression the customers get of the enterprise is from their service. Therefore, improving the quality of the team, and building knowledge, quality, intelligence, skill and talented team is helpful to improve enterprise image. Therefore, the enterprise must strengthen the employees on "people-oriented" consciousness and service skills, let employees serve the customer warm, patient, and with high quality, so that customers are always feeling comfortable and convenient, then becoming the satisfaction and loyal customer base of enterprise.

### 3 Establish Humanized Management Concept

In the process of constructing the modern transportation management system, it shall be according to the humanization guiding ideology, establishing human-oriented management ideas, which include the humanized market ideas, the concept of time and information idea.

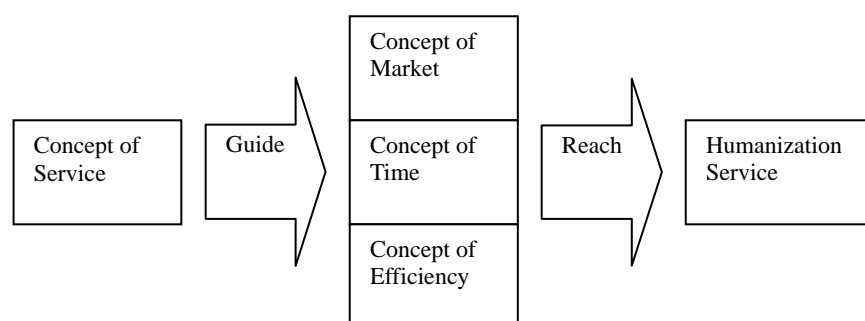

Figure 1 Idea Contributes to Humanized Service

#### 3.1 The market conception

Transport market is a special type of commodity markets; the market is one important basic condition of transportation production and business operation activities. For the transportation industry, people-oriented, customer is the highest concept, which is the humanized market idea. The transport enterprises must face the market and focus on the market, in line with the ideas of the customer service and the immediate interests that the customer cares about, adapting to the market demand from the dint structure, management structure, price, and service quality. Often listen to customers' opinions, discovering the potential requirements of customers, improving management, provide cheap, timely, convenient and safe, comfortable, civilization and humane transportation service. Win the reputation and popularity, obtaining a faster, better development of the enterprise.

#### 3.2 The concept of time

Time is a special kind of resources, with the progress of modern science and technology, the value of time is more obvious, the high and low of the efficiency is also becoming one of important factors that reflect the modern management level of transportation enterprise. On the one hand, transport enterprise must improve the hardware conditions, optimize management structure, perfect management mode and realize the standardization, so as to improve the work efficiency of the enterprise. On the other hand, transport enterprises have to improve the concept of time up to enterprise leadership, down to the ordinary employees, the management decision should be rapidly, and the service methods should be flexible. Specific humanization concept of time is reflected in two aspects, one is in the transport of goods, we should know the benefits of the owner, respect the owner and perform the contract of carriage, completed the transportation tasks quick and safely, guarantee the owner's interests; Second is in the passenger, we should know the interests of the passengers, care about passengers, complete transportation safety and timely, save the time costs of passengers, reduce the consumption of the body and mind of passengers.

#### 3.3 Information idea

Information is a kind of special resource, is the essential factor for enterprise to planning and control, and it is an important basis for effectively decision-making, the higher the quality of the

information goes the higher quality of making the decisions, and the higher the level of service will rich. Humanization information concept requires transport enterprise to establish advanced and sensitive information service system that rely on high quality staff from the organization analyze the inside and outside information flows, and collect, arrangement, screening and treatment, the transmission all kinds of information in the transport market, and make scientific decisions; Also the transportation enterprises were asked to provide accurate and fast information services which depend on effective channels to the customers , convenient for them to choose and decision making, reduce their time and economic cost in choice.

#### 4 The Humanized Management Mode

Transportation enterprise management must adapt to the nature and task of transport industry, putting the improvement of the social efficiency and the economic efficiency as a starting point, taking the market as the guidance, according to the principle of systematic, integrity, dealing with the relationship between centralization and decentralization, division of labor and cooperation. In the process of implementation of the management, the internal staff should be given more humanistic concern, to make them better customer service, better reflect the humanity of service.

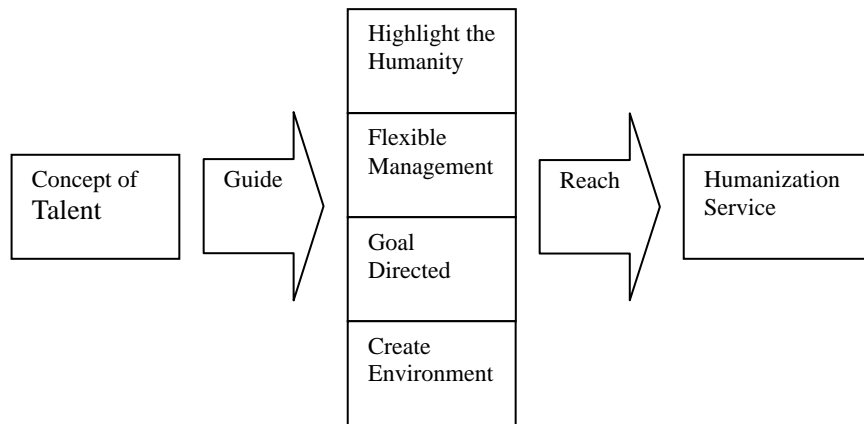

Figure 2 Fashion Contributes to Humanized Service

##### 4.1 Prominent humanity requirements

Only make principle requires and the characteristics of humanization demand agree and make humanized manifest, management can get fundamental improvement and continued to play. At the core of the problem, is from the demand point of view, to give employees respect and understanding, and create a fair competition mechanism, build, produce, development space and platform.

##### 4.2 Implement flexible management

Flexible management is to create a dynamic and flexible working environment, motivate intrinsic vitality and dynamism of employees, forming an elastic operation team spirit organization. Humanization is the existence of positive factors, but also contains inert is objective and actual; management should pay attention to stimulate the positive aspects of humanization, suppression of negative aspects. Has been formed in good earnest responsible overall environment and mechanism, to give people a greater tolerance, guide, help employee progress and promotion as the administrative centre of gravity, to give employees play the maximum space, avoid overly rigid management to the management object to cause heart injury and material damage.

##### 4.3 The right idea guidance

If there is no proper management policy to guide staff, the final result will be in vain. To reach the humanized management, must by the leader of the enterprise dedicated to a positive attitude to the leadership of the staff, so that employees can feel the meaning of work, burst of automatic driving force, and actively understand the company's overall goals and objectives, in order to achieve the goal of enterprise and diligently.

##### 4.4 Create a humane environment

The leader of the enterprise should pay attention to the big environment and the small details on the embodiment of humane spirit, in competing, these and other issues, to respect the individual will and choice; in landscape, recreational facilities, office condition should be necessary investment, to create a

suitable for people living, working, fighting environment and atmosphere, and promote the work of passion.

## 5 The Implementation of Humane Management Tools

Management means of humanity is refers in the transportation management process, through the use of modern advanced science and technology; accelerate the process of modernization of whole industry, to protect the interests of all the parties in traffic transportation, particularly a better realization of the protection of interests, it would be better to achieve the demands of humanization.

At the beginning of the 1990's, Chinese scholars began to pay attention to the development of intelligent transportation system. After 1995, Chinese intelligent transportation system start to research, test and international exchanges which has become increasingly frequent, Chinese Ministry of transportation intelligent transportation systems is included in the medium and long-term planning, transportation industry in China, ITS, VTS and other intelligent systems have great influence.

### 5.1 Intelligent transportation system (ITS)

ITS is an advanced information technology, communication technology, electronic control technology, artificial intelligence and other subjects used for transportation, thus forming a kind of timing, accurate and efficient integrated transport system. With the development of science and technology, the idea of ITS has been gradually introduced into the highway, railway, aviation and other fields, in recent years, with the development of inland river shipping. As a result of advanced traffic information system for travelers to provide a strong information support, to provide the best route and real-time navigation information for travelers, it plays a very important role of guidance, greatly facilitate the travel; advanced public transportation system using computer technology to transportation and public facilities and technical conditions and the level of service for real-time analysis traffic system plan, implementation, operation and management functions of the automation, provide passengers with real-time public transport information and transfer information. Therefore, intelligent transportation systems gradually mature for transportation enterprises to better achieve the humanized management.

### 5.2 Vessel traffic management systems (VTS)

VTS is a set of navigation technology, computer network technology, information processing technology and navigation technology as one of the traffic management system, its purpose is to enhance the safety of navigation and increase transport efficiency, the maximum guarantee the security of the person. VTS can be realized on the waters for traffic surveillance specification ship behavior, prevention of traffic accidents. Statistics show that, because of the establishment of it, the traffic accident is reduced to 1/3, 1/5, therefore, it can be greatly reduced by the accidents caused by the loss of life and property and possible environmental pollution. On the other hand, it will contribute to reduce shipping obstruction and time delays, increase transport efficiency, saving the people's travel time. Visible, the application of VTS to realize the modernization of transport management plays an important role, many of its functions and services also embodies the human side, which has great social and economic benefits.

With the ITS, VTS and other advanced technology and the continuous development of Chinese domestic transport infrastructure is perfected further, traffic industry will be able to pass these advanced technical means to improve transportation efficiency, ensure the traffic safety, improve the quality of the environment, and raise energy utilization rate. It will achieves the humanized management, and promote the harmonious development of traffic.

## 6 Conclusions

As China has entered into the twenty-first Century, humanized development is becoming the inevitable requirement of the transportation industry .The customer as a transportation service object is appear in human form at first, customer requirements are comprehensive and meticulous service, both the quality and the efficiency, also including friendly treatment. To the modern Chinese transportation industry, the very urgent task is to be in ideology establish and humanized service related concepts, including the concept of service, talent idea, market-in concept, the concept of time, the efficiency of the concept, and these ideas into the operator and the conscious acts of employees. For managers, to reflect humanized management mode and technology application is extremely important to guide and protect, it is the goal that I write this article and it is an important direction for enterprise development as well. With the society pay more attention to the people problems, research in this area will be more thinning.

## Individual Characteristics and Their Influence on Innovation: A Literature Review

Georgiana Bălău, Dries Faems, Hans van der Bij

Faculty of Economics and Business, University of Groningen, Groningen, The Netherlands, 9747 AE

(E-mail: g.balau@rug.nl, d.l.m.faems@rug.nl, j.d.van.der.bij@rug.nl)

**Abstract:** Innovation is widely acknowledged nowadays as the source for firms' competitive advantage. Whereas previous innovation research mainly focus on the group and organisational levels, only a relatively small number of studies cover individual perspectives on innovation performance. Based on a systematic literature review, we provide a comprehensive framework, identifying individual characteristics that impact innovation at individual, team and firm levels. We also distinguish between various types of innovation (i.e., technological innovation, product innovation, process innovation) and consider variables that mediate or moderate the relationship between individual characteristics and innovation performance. Gaps are highlighted and future research directions are formulated.

**Keywords:** Individual characteristics; Innovative behaviour; Process innovation; Product innovation; Technological innovation

### 1 Introduction

Organisations increasingly consider innovation also as their main source for competitive advantage (Tushman & O'Reilly, 1996). When it comes to understanding and explaining innovation performance, previous research (e.g. Crossan, Lane, & White, 1999; Damanpour, 1991; West & Anderson, 1996) has mainly focused on the organisational and group levels of analysis. Although individuals are cited as a critical component of innovation processes, a relatively small number of studies cover individual perspectives upon innovation performance (Ahuja, Lampert, & Tandon, 2008; Crossan, Lane, & White, 1999). This study aims to provide a systematic overview of existing research on the relationship between individual characteristics and innovation. Our study deviates from previous literature studies (i.e., Anderson et al., 2004), which considered the innovation implications of individual characteristics, in two important ways. First, in our study, we make an explicit distinction between different levels of innovation outcomes (i.e., individual, team and firm level of analysis). Second, we conceptualize innovation as a multi-dimensional phenomenon, examining the impact of individual characteristics on different types of innovation (i.e., technological, product and process innovation). Finally, we explicitly consider the essential role of moderators and mediators on the relationship between individual characteristics and innovation.

Taking a multi-level perspective upon innovation is important as it might contribute to a more integrated understanding of the innovation that unfolds across levels in organizations (Klein & Koslowski, 2000; Sears & Baba, 2011). Sears and Baba (2011), for instance, indicate that a multi-level perspective might recognize that an individual's aptitude for innovation is strengthened by team diversity which might be further supported, at the organisational level, by managerial professionalism and a greater absorptive capacity. Secondly, focusing on different types of innovation sheds light on the complexity of managing innovation, as different types of innovation require different focuses and different management strategies. Kimberly and Evanisko (1981) show, for instance, that individual characteristics of hospital administrators such as educational level, cosmopolitanism, tenure are positively related to administrative innovation but not to technological innovation. By highlighting the role of moderators and mediators on the relationship under investigation contributes to a more holistic outlook on innovation. This is essential as, for instance, (Zhou & George, 2001) showed that feedback valence (i.e., the extent to which the feedback is positive or negative) and supervisors' monitored behaviour influence the extent to which individuals exert (more) innovative behaviour.

This literature review seeks to advance innovation research in three fundamental ways. Firstly, our purpose is to identify the empirical relationships between individuals' characteristics and innovation performance on different levels of analysis. This purpose is meant to construct a synthesis, based on a systematic evaluation of the literature, of the available research and to provide a list of individual enablers of innovation performance. Secondly, our aim is to discover to what extent existing research has identified differential effects of individual characteristics on different types of innovation. Thirdly, we aim to provide a more comprehensive overview on the relationship between individual

characteristics and innovation by taking into consideration the role of the moderators and mediators.

The remainder of this paper is structured as follows. First, we describe the methodology that is used to conduct the systematic literature review. Second, by making an explicit distinction between individual, team and firm level of analysis, we present the results of the impact of individual characteristics on (different types of) innovation. Finally, by assessing and connecting the insights from the literature review, we analyse and discuss the findings, suggesting also interesting avenues for future research.

## 2 Methodology

For this literature review we used a systematic approach when selecting the relevant articles in order to remove the subjectivity of the data collection (Crossan, Lane, & White, 1999; Webster & Watson, 2002). Using a predefined selection algorithm and following specific procedures (Crossan, Lane, & White, 1999; Webster & Watson, 2002; Tranfield, Denyer, & Smart, 2003), this literature review was conducted in several stages which are fully described in the next lines.

The *first stage* was to identify relevant articles for inclusion in the literature review and we used ISI Web of Knowledge database as it is one of the most comprehensive databases of peer-reviewed journals (Crossan & Apaydin, 2010). Our attention revolved around those articles that addressed the aim of our literature review (i.e., how individual characteristics impact innovation), having in mind also different levels of analysis and types of innovation. Specifically, articles were selected if they addressed how individual characteristics impact *individual* innovation (i.e., innovative behaviour), *team* and *firm* innovation. We conducted keyword searches, by title, based on which a large number of articles surfaced. Essential to mention is that the keyword searches (e.g., “individual and innovation”; “motivation and innovation”; “personality and innovation”; “individual creativity and technological innovation”; “personality and product innovation” etc.) were conducted for each independent and dependent variable to increase the probability of including the most relevant articles and of conducting a complete literature review. In the light of the same reason, we applied another criterion (i.e., by subject area) and further refined the initial total number of articles by selecting specific subject areas such as business economics, psychology, behavioural sciences, sociology and operations research management science. The search procedure resulted in a total number of 276 articles.

In the *second stage*, we assessed the relevance of the articles based on title and abstract and included (a) studies that were related to innovation at all the already mentioned levels of analysis; (b) empirical studies as they bring insights to better understand the relationship under investigation (at all levels of analysis); (c) studies in which creativity was a dependent variable – this is an interesting search outcome as in the procedure for the keyword searches, creativity was not used as a keyword. On the other hand, we did not include (a) studies related to innovation adoption; (b) studies where organisational innovation was a dependent variable (when this variable was measured as product and/or process innovation, the studies were included and coded either for the product or process innovation); (c) studies that were looking at the individual characteristics in online environments.

In the *third stage*, to ensure a more accurate selection of the relevant articles we made an in-depth assessment of both the abstract and the content of the selected articles. We also reviewed the references of these articles which gave us the possibility to include some additional relevant ones. After this stage, the sample was considerably trimmed down to a total number of 40 articles for our literature review: 22 articles – Figure 1; 5 articles – Figure 2; 13 articles – Figure 3.

In the *fourth stage*, the final one, we thoroughly read the articles and created an outline that painted the content of the relevant articles in terms of (a) the data sources (i.e., title, authors, article source, publication date), (b) the independent and dependent variables and their operationalization, (c) the methodology - research design/approach, (d) the supported hypotheses and, (e) the findings of each study. Subsequently, based on this information we created conceptual frameworks (Figure 1, Figure 2 and Figure 3) to illustrate the existent relationships between individual characteristics and innovation throughout empirical research.

## 3 Impact of Individual Characteristics on Individual Innovation

Based on the reviewed literature, this section first defines the relevant concepts and provides the categorization procedure based on which individual characteristics were clustered according to relevant social-personality theories. Second, applying a concept-centric approach (Webster & Watson, 2002), we present the main findings of existing literature on the relationships between individual characteristics and innovative behaviour (Figure 1), making an explicit distinction between direct, mediating, and

moderating relationships.

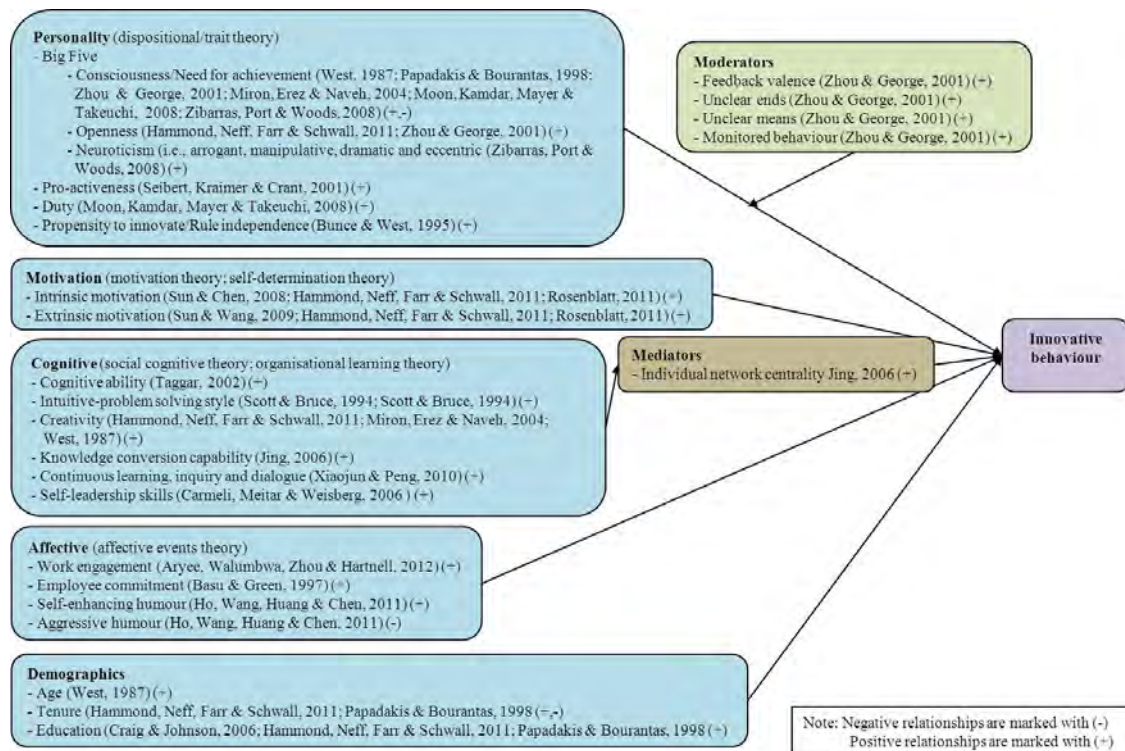

Figure 1 Individual Characteristics and Their Influence on Innovative Behaviour

### 3.1 Definition and categorization

The reviewing process of the selected articles provided us with a large number of individual characteristics, which theoretically belong to various subfields of psychology. In order to classify them, we first chose to refer to an overarching perspective offered by a single distinct area of psychology: social-personality psychology<sup>1</sup> (Tracy, Robins, & Sherman, 2009). Secondly, by making use of the social-personality theories (i.e., trait theory, motivation theory, self-determination theory, social cognitive theory, organisational learning theory and affective events theory) we classified individual characteristics into five main categories: *personality*, *motivation*, *cognitive*, *affective* and *demographics*. Within the reviewed literature, the measures of innovative behaviour pointed both to innovative and creative behaviour. Following Seibert, Kraimer, and Crant (2001: 851), we therefore define innovative behaviour<sup>2</sup> in terms of coming up with new ideas and working to implement them.

### 3.2 Findings

#### 3.2.1 Personality

Many reviewed articles (e.g., Hammond, Neff, Farr, Schwall, & Zhao, 2011; Miron, Erez, & Naveh, 2004; Moon, Kamdar, Mayer, & Takeuchi, 2008; Papadakis & Bourantas, 1998; Zhou & George, 2001) focused on *personality*-related concepts that impact innovative behaviour. According to dispositional theory, personality trait is seen as a “neurophysic structure having the capacity to render many stimuli functionally equivalent and to initiate and guide equivalent forms of adaptive and expressive behaviour” (Allport, 1961: 347).

One of the most widely accepted model of personality, the Big Five factor model, includes “Neuroticism (i.e., tendency to experience negative affects, such as fear, sadness, embarrassment, anger, guilt, and disgust), Extraversion (i.e., tendency to like people, prefer being in large groups, and desire

<sup>1</sup> This distinct area avoids the “conceptual debate” between social psychologists and personality researchers. The former ones consider cognitive psychology and not personality, as their “secondary” classification, whereas personality researchers view clinical or developmental psychology and not social psychology, as their “secondary” classification (Tracy, Robins & Sherman, 2009).

<sup>2</sup> In understanding innovative behaviour, it is essential to make also the distinction between creativity and innovation - whereas *creativity* refers to the production of novel, appropriate ideas by individuals or small groups, *innovation* is the successful implementation of creative ideas (Amabile & Fisher, 2000: 481).

excitement and stimulation; likely to be assertive, active, talkative), Openness (i.e., tendency to have an active imagination, aesthetic sensitivity, intellectual curiosity, and be attentive to feelings), Agreeableness (i.e., tendency to be altruistic, cooperative, and trusting), and Conscientiousness (i.e., tendency to be purposeful, organized, reliable, determined, and ambitious)” (Major, Turner, & Fletcher, 2006:928). Out of these five personality traits, only *openness*, *conscientiousness* and *neuroticism* were found to influence innovative behaviour. Whereas *openness* and *neuroticism* impacts positively innovative behaviour, *conscientiousness* (or need for achievement - Major, Turner, & Fletcher, 2006) have been found to have both a positive and a negative effect on our dependent variable. Individuals who score high on conscientiousness are ambitious, hardworking, competitive and keen to improve their social standing and place high value on achievement (Papadakis & Bourantas, 1998). For individuals that score low on conscientiousness, the opposite argumentation holds (Moon, Kamdar, Mayer, & Takeuchi, 2008), conscientiousness impacting innovative behaviour in a negative way.

Findings show that the relationship between *openness* and *conscientiousness* and innovative behaviour is moderated by a number of variables (e.g., Zhou & George, 2001). In this sense, feedback valence (i.e., the extent to which the feedback is positive or negative) (Zhou & George, 2001), in a work setting, influence the extent to which individuals exert (more or less) innovative behaviour. The relationships are strengthened when both unclear ends and unclear means are high (Zhou & George, 2001). Unclear ends refer to when individuals are “unable to anticipate what the end results of their efforts at work will be” whereas unclear means refer to when it is “difficult to determine how to reach work goals or objectives” (Zhou & George, 2001:514). The relationships are also strengthened when the behaviour of individuals is closely monitored by their supervisors. This is an interesting finding as this moderator strengthened the relationship under review but only when individuals receive inaccurate communication from their co-workers, when they did not receive constructive help from their co-workers and only when they work in a negative work environment (Zhou & George, 2001). Personality traits seem to be important predictors of the innovative behaviour as they have an influence over innovative strategies and outcomes (Hambrick & Mason, 1984), determining the innovation effectiveness and efficiency within organisations.

A second identified personality characteristic refers to *pro-activeness*. *Pro-activeness* (Seibert, Kraimer, & Crant, 2001) is approached not so much as a quality that can be learned but rather as a distinct and stable disposition. Considering dispositional traits as “stable tendencies in patterns of response across a wide variety of situations (Diener & Larsen, 1984:880) *pro-activeness* is defined as “a dispositional construct that identifies differences among people in the extent to which they take action to influence their environments” (Bateman & Crant, 1993:103). The concept is grounded in the interactionist approach, which incorporates a central characteristic: individuals can directly and intentionally influence their social and non-social environments (Bateman & Crant, 1993; Crant & Bateman, 2000). It has been found that individuals high on *pro-activeness* are constantly focused on finding improved ways to do things (Seibert, Kraimer, & Crant, 2001), to pursue a course of action, to effect meaningful change. This is essential to innovative behaviour as when hiring for positions that require continuous learning and an innovative attitude, organisations may wish to target those individuals whose personality traits are predictive of innovative behaviour (Major, Turner, & Fletcher, 2006).

Focusing now on the third personality characteristic identified in the reviewed literature, the sense of *duty* or *reliability* refers to offering suggestions for challenging the status quo and increasing the welfare of the organization (Moon, Kamdar, Mayer, & Takeuchi, 2008). Our findings point to a positive influence of the sense of duty on innovative behaviour, dutiful individuals demonstrating feelings of responsibility and a genuine concern toward the organization. It is apparent from this finding that by observing some of the personality traits organisations seek in potential employees, the sense of duty is one facet of personality that enhances innovative behaviour. Additionally, individuals possessing this trait possess the most potential to promote change which is both necessary for high productivity and objective performance (Moon, Kamdar, Mayer, & Takeuchi, 2008).

*Propensity to innovate*<sup>1</sup> which refers to the tendency of individuals to seek out new and improved ways of working (Bunce & West, 1995) is a fourth personality characteristic that was found to have a

<sup>1</sup> Bunce and West (1995) also mention about “rule independence” which is a 5-item scale drawn from the 12 items that produced the propensity to innovate measure. The main difference is that these items focuses on the extent to which individuals attempt to break away from existing norms and procedures relating to the way in which the job is done.

positive impact on innovative behaviour among health-service workers. Specifically, this personality characteristic determines health-care professionals to find innovative ways to respond to high pressure of work, staff shortages and interpersonal difficulties with patients (Bunce & West, 1995). Interestingly, this finding points to the efforts to increase individual innovation at work by, perhaps, focusing on altering individual's propensity to innovate and rule independence. Altering refers to the environmental contingencies such that individuals who are required to innovate develop a view of themselves as being likely to introduce new and improved ways of doing things at work. In sum, propensity to innovate was a more reliable, valid measure and a powerful predictor than the alternative, rule independence, of innovative behaviour (Bunce & West, 1995).

### 3.2.2 Motivation

A second category of studies uncovered by the reviewing process showed that *motivation* related characteristics impact positively innovative behaviour. Cognitive evaluation theory (CET) which is a sub-theory of self-determination theory (SDT) (Deci & Ryan, 1985) distinguishes between intrinsic and extrinsic motivation which are based on different reasons that give rise to an action. Whereas intrinsic motivation refers to doing something because it is inherently interesting or enjoyable, extrinsic motivation refers to doing something because it leads to a separable outcome (Deci & Ryan, 2000). Psychological construct that describe the motivational orientations individuals have when doing an activity (Amabile, 1997) intrinsic motivation has as underlying needs, the need for autonomy and competence (Deci & Ryan, 1985). Extrinsic motivation, in turn, through the processes of internalization (i.e., taking in a value) and integration (i.e., transforming the value into one's own to radiate from one's self) makes behaviours become more self-determined (Deci & Ryan, 1985). Having said that, Rui Sun and Guoquan Chen (2008) show that *intrinsic motivation* is recognized as a core characteristic for employee creativity. On the other hand, Sun & Wang (2009) explicitly note that *extrinsic motivation* refers to the motivation which employees are attracted to be innovative by the external outcomes that doing the task might yield. These findings show that internal and external "incentives" influence motivation but interestingly would be to understand to what extent incentive practices motivate explorative and/or exploitative innovation outcomes. Additionally, managers should give a proper attention to psychological processes underlying motivation so that they can designate the orientation of innovation, aspect that was not found so far in the reviewed literature.

### 3.2.3 Cognitive

Thirdly and referring to the *cognitive* category illustrated in Figure 1, there are studies (Scott & Bruce, 1994; Taggar, 2002; Carmeli, Meitar & Weisberg, 2006; Jing, 2006; Xiaojun & Peng, 2010) that brought to light the importance of the cognition on enhancing innovative behaviour. In this respect, cognitive ability, best conceptualised as a unitary construct, refers to the fact that individuals high on cognitive ability, generally perform better, they are better at information processing and they are more innovative (Taggar, 2002). While cognitive ability is measured by aptitude tests such as intelligence tests (Taggar (2002) (Wonderlic Personnel Test – a vocational and intelligence test used to measure an individual's domain-relevant skills, a component of creativity), cognitive style refers to the way individuals think, perceive and remember information. From a cognitive psychology perspective it can be said further, that *problem-solving* represents a cognitive style (Messick, 1976), alongside perceiving, thinking, etc. *Intuitive problem-solving style*, the second identified cognitive characteristic, is a mental process that points to an independent mode of thinking characterized by overlapping separate domains of thought simultaneously, a lack of attention to existing rules and disciplinary boundaries, and an emphasis on imagery and intuition (Scott & Bruce, 1994). The distinction between cognitive ability and cognitive style (Allinson & Hayes, 1996) is essential in research as it might trigger different strategies to display innovative behaviour.

Continuing with the third characteristic, *creative* individuals produce novel ideas that are useful and appropriate to a given situation (Amabile, 1983) and by doing that, they innovate, implement their ideas in research and development (Miron, Erez & Naveh, 2004). Creativity in these studies differs from innovation as the former refers to idea generation alone. These findings are interesting as relatively recently authors (e.g., Anderson, De Dreu & Nijstad, 2004) stressed the importance of manipulating creativity within experimental settings to measure its impact on innovative performance. Additionally, although creativity may be dysfunctional to performance outcomes that require conformity and attention to detail (Miron, Erez, & Naveh, 2004) it is, as these studies show, a construct with an essential impact on the innovative behaviour within the workplace.

The article of Jing (2006) is the only one that shows a mediated relationship between *knowledge conversion capability*, the next in line cognitive characteristic, and innovative behaviour. According to

organisational knowledge creation theory (Nonaka & von Krogh, 2009) knowledge conversion explains the interaction between tacit and explicit knowledge but organisational learning theory encompasses the perspective of individual who is capable of incorporating implicit and explicit elements of learning and knowledge (Jing, 2006). Individual network centrality variable (Jing, 2006) explained the relationship between knowledge conversion capability and innovative behaviour and this is not surprising since knowledge conversion explains the interaction between tacit and explicit knowledge which can be best clarified when referring to the individual position within a network (Jing, 2006). The pattern of this findings support the knowledge spiral theory of Nonaka and von Krogh (2009) which says that socialization, externalisation, combination and internationalisation exist in a dynamic interaction shedding a new light on the application of the role of knowledge in determining innovative behaviour, creative output.

Seen as essential prerequisites for innovation (Lu Xiaojun & Li Peng, 2010), *continuous learning, inquiry and dialogue* are *self-leadership skills*, the last to discuss characteristics from this third category, were discovered to be important to enhancing innovative behaviour. In this sense, individual innovative behaviour is not only influenced by organisational environment but also (re)shaped by various personality traits. The study of (Lu Xiaojun & Li Peng, 2010) is illustrative in this respect as the impact of individual learning on innovation lies on the ability of employees to stimulate new ideas. An integrated approach is of great importance in assessing the impact on innovative behaviour by taking into consideration the interaction of organisational environment factors and personality traits (e.g., self-leadership skills) on individual innovative behaviour rather than consider their influence separately.

#### 3.2.4 Affective

Fourthly and by looking at the *affective* category, it can be said that, according to affective events theory (AET), affective events are things that happen in the workplace that cause individuals to experience positive or negative affect (Weiss & Cropanzano, 1996). Maslach, Schaufeli and Leiter (2001:417) conceptualized *employee engagement*, the first affective characteristic surfaced by the reviewing process, as the positive antithesis to burnout, defining it as “a persistent positive affective state ... characterized by high levels of activation and pleasure”. The next characteristic, *commitment*, was defined as “the relative strength of an individual’s identification and involvement with the organization” (Mowday, Porter & Steers, 1982:27) which refers specifically to a mind state of an individual while working. Findings showed that both *employee engagement* and *employee commitment* have a direct positive relationship with innovative behaviour. According to the model of commitment of Meyer and Allen (1991) commitment has three different components that correspond with different psychological states: affective, continuance and normative commitment. Based on recent research it can be noted that only the first type of commitment was mostly tackled (Aryee, Walumbwa, Zhou, & Hartnell, 2012) which refers to the individual’s positive emotional attachment to the work s/he does (e.g., “At work, I feel full of energy”). The article by Aryee, Walumbwa, Zhou, and Hartnell (2012) contributes to the literature by applying aspects of self-concept-based theory (e.g., how employees come to feel about themselves) to probe the psychological mechanisms by which this contribution occurs. Additionally, employee work engagement may be a proximal psychological resource through which transformational leadership enhances innovative behaviour.

In reviewing the literature, *humour* is the last to mention characteristic from the affective category. Surprisingly, *aggressive humour*, a variable that is considered to carry optimism, belief and courage was found to be negatively related to innovative behaviour (Ho, Wang, Huang, & Chen, 2011). In contrast, *self-enhancing humour* proves itself essential for the innovative behaviour of the leaders. Having this personal trait can help them cope with a highly competitive environment. Additionally, being composed by both bad and good traits and seen, within the workplace, as a competency of leaders, humour may help organisations establish a more proactive and innovative strategy, leaders being capable to envision their future success (Ho, Wang, Huang, & Chen, 2011).

#### 3.2.5 Demographics

Finally, *age, tenure* and *education* are demographic variables that are often included in research as control variables. They offer a good index of overall experience and firm-specific skills and, consistent with previous research, they are classified under *demographics*. Based on the predictions of the upper echelons theory, innovative outcomes are partially predicted by managerial background characteristics (Hmbbrick & Mason, 1984). Age, for instance, was found to have a positive significant relationship with role innovation (i.e., the extent to which the respondents did their job differently from the people who did the job before them) (West, 1987). This direct positive relationship was not found in the case of *tenure*, or showed mixed effects in relation with innovative behaviour (e.g., Papadakis & Bourantas,

1998). This finding is consistent with previous research which states that long tenured individuals are not willing to innovate, dismissing their psychological commitment towards this type of behaviour.

Overall, findings from Figure 1 illustrate mixed results as well as either positive or negative results. Within the same Figure 1, the two additional boxes named ‘Moderators’ and ‘Mediators’ list a number of variables that influence and explain the relationship under investigation; no variables influence or explain the relationship between affective characteristics, motivation and demographics and innovative behaviour.

#### 4 Impact of Individual Characteristics on Team Innovation

Based on the same structure presented in section 3, this section starts with defining the relevant concepts that are illustrative for the relationship between individual characteristics and team innovation. Secondly, as shown in Figure 2 and as resulted from the reviewed literature, findings explain the (nature of the) relationship between individual characteristics and team innovation. Additionally, as previously mentioned, we also refer to the role of the moderators and the mediators variables for the relationship under investigation.

Figure 2 Individual Characteristics and Their Influence on Various Types of Innovation at the Team Level

##### 4.1 Definition and categorization

The classification procedure of individual characteristics follows the previous structure and based on the reviewed literature, only two main categories were identified this time: *personality and motivation*. In the case of innovation, various types<sup>1</sup> were identified at the team level of analysis. We created three categories in order to classify them: *technological innovation*<sup>2</sup>, *product innovation* and *process innovation*. The underlying explanation for creating these three categories was that previous research, when researching about how individual characteristics impact innovation, only looked at innovation from one-dimensional perspective despite the fact that innovation literature presents innovation as a multi-dimensional construct (Gopalakrishnan & Damanpour, 1997).

The first type of innovation, the *technological innovation*, provides organisations with two options: either exploiting current technologies or generating new possibilities through exploration (Benner & Tushman, 2002). Organisations want to protect their products and processes against prospective competitors and they often apply for patents for their innovations (Archibugi & Pianta, 1996). Patents are indicators of investments made in technology, and technological innovation will refer therefore to patents, as a direct outcome of the innovative process (Archibugi & Pianta, 1996).

The second type of innovation, *product innovation*, is seen as those changes in the things (e.g., products/services - a new design of car) an organization offers (Tidd & Bessant, 2009). In other words, product innovation refers to outputs and services that are introduced for the benefit of customers or clients (Gopalakrishnan & Damanpour, 1997). Previous literature showed that product innovation is closely related to the concept of technological innovation. The distinction between the two (which defines the conceptual boundaries for this literature review as well) lies in the fact that technological

<sup>1</sup> Organizational innovation was measured, in several studies, as product and/or process innovation and those studies were included and coded either for product or process innovation, respectively.

<sup>2</sup> This type of innovation is only present for firm-level innovation, within section five of this paper, but it is already mentioned here to keep a consistency in the approach.

innovation refers more to the product characteristics or intended uses whereas product innovation utilizes new or existing technologies to create commercial success. The more complex the product and/or the more radical the innovation, the greater its perceived commercial success (Gatignon, Tushman, Smith & Anderson, 2002).

The third type of innovation is *process innovation* which involves a set of ideas that are incorporated in the product itself; process innovation makes reference to those changes in the ways products are created and delivered (Tidd & Bessant, 2009). An example would be the change in the manufacturing methods and equipment (e.g., rear suspensions, gas tanks, roof, body side panels etc.) used to produce a car (Tidd & Bessant, 2009). Previous research approached a complementarity perspective when speaking about product and process innovation (Garcia & Calantone, 2002). However, throughout this paper a process innovation only assists to produce products or services (outputs) from inputs.

Based on the reviewed literature, for the relationship between individual characteristics and team innovation, only product and process innovation categories surfaced and, in the light of these two types of innovation, findings are presented in the next section.

## 4.2 Findings

### 4.2.1 Personality

To start with, studies (Aronson, Reilly, & Lynn, 2008; Duanxu Wang, Huijuan Xue, & Jie Xu, 2009; Eisenbeiss, van Knippenberg, & Boerner, 2008; Eisenbeiss & Boerner, 2010) showed that *personality* characteristics such as openness, emotional stability, consciousness, extraversion etc. of the leaders were found to matter for both product innovation and process innovation. In order for the leaders to respond to the uncertain demands of the innovation, at the team level, they need to be equipped with well-defined personalities to be able to cope with and lead effectively the entire process of innovation. One of the most controversial of the Big Five traits, openness was not related to many applied criteria before and, based on the study by Aronson, Reilly and Lynn (2008), leader's openness was found, this time, to be significantly related to new product development (NPD) success, especially when the innovation is radical (Aronson, Reilly, & Lynn, 2008).

The reviewed literature also highlighted the role that *leadership* plays for the R&D team innovation. Integrating two contradictory positions, Eisenbeiss and Boerner (2010) found a U-shaped relationship between transformational leadership and R&D team innovation. They showed that R&D team innovation was high both under high and low levels of transformational leadership. In contrast, R&D team innovation was low under moderate levels of transformational leadership. These findings matter for understanding the relationship between individual characteristics and product innovation. Moreover, when leaders hold moderate levels of transformational leadership they might need professional training to be able to enhance team innovation success (Eisenbeiss & Boerner, 2010). Other authors (Duanxu Wang, Huijuan Xue, & Jie Xu, 2009) found a negative relationship between transformational leadership and product innovation, a relationship also mediated by knowledge sharing and team communication. In contrast, Eisenbeiss and Boerner (2008) found that transformational leadership was positively related to product innovation at the team level. As their results showed, transformational leadership may be instrumental in team innovation but is not sufficient to stimulate team innovation. The relationship was mediated by the support for innovation variable which referred to the cooperation among team members and their mutual assistance in the development and application of novel ideas (Eisenbeiss & Boerner, 2008). These findings point to the need of an integrative perspective by addressing calls for research identifying relevant mediating variables and moderators that influence the relationship between various individual characteristics and team innovation. This might also contribute to the advancement of the team innovation literature.

### 4.2.2 Motivation

*Motivation* represents the second characteristic that was found to have a direct impact on both product and process innovation. In line with the essence of the motivation theory, *leader-empowering behaviour* refers to a relational and a motivational dimension. This means that leaders can empower employees to believe and increase their self-efficacy and sense of power (Burpitt & Bigoness, 1997) in order to enhance team-level innovation in professional project teams. This individual characteristic determined team-level innovation which was more complex than initially conceived. Team-level innovation had a market-orientation (i.e., acquisition of new skills to improve the team's ability) and a problem-solving orientation (i.e., new application of familiar technique to develop new solutions). These findings prove themselves important as they demonstrated that managers can employ specific behaviours to stimulate innovation among project teams (Burpitt & Bigoness, 1997).

Overall, the findings from Figure 2 showed mixed effects and they direct attention towards the fact that there is scarce or no information on possible cognitive, affective and demographic characteristics that might impact team level product and process innovation. Moreover, based on the reviewed literature, it can be seen that technological innovation was not predicted by any individual characteristics. Additionally, the need for research on possible mediating and moderating variables is deemed to be necessary to understand *how* individual characteristics impact various types of innovation, at the team level of analysis.

### 5 Impact of Individual Characteristics on Firm Innovation

Following the same structure as in previous sections, this section makes an in-depth assessment of the reviewed literature on the relationship between individual characteristics and firm-level innovation. As illustrated in Figure 3, the role of moderators and mediators is again highlighted.

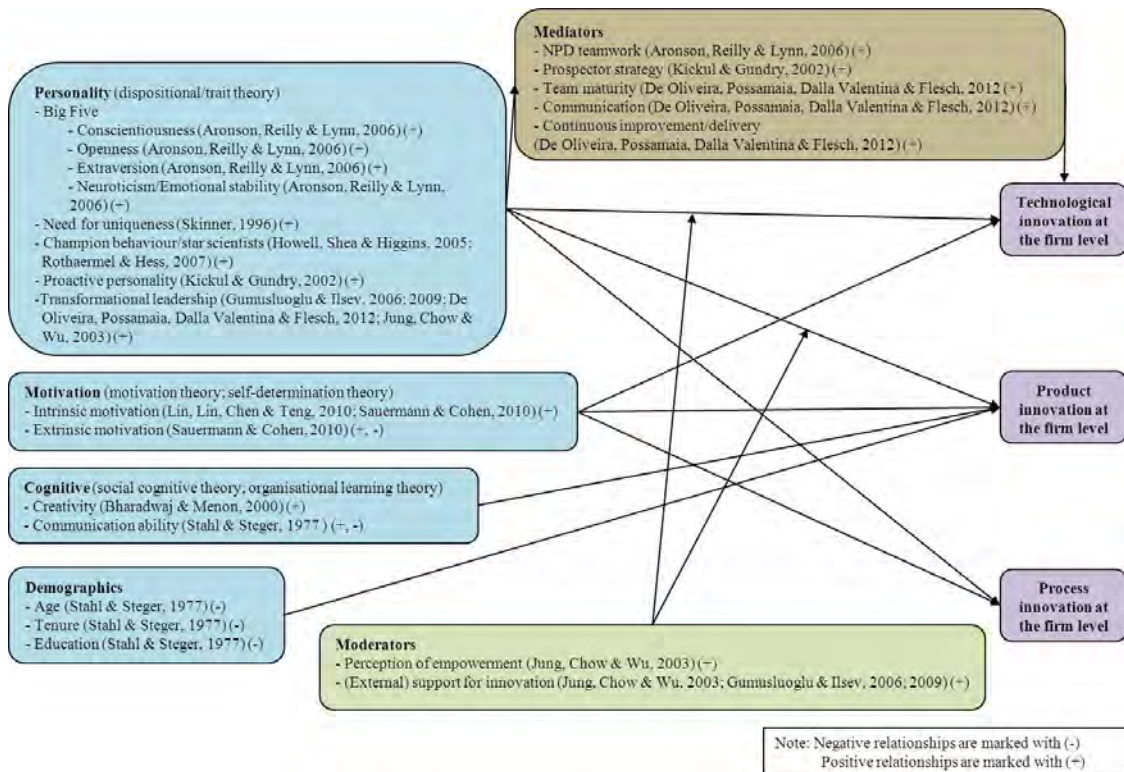

Figure 3 Individual Characteristics and Their Influence on Various Types of Innovation at the Firm Level

#### 5.1 Definition and categorization

The same framework for classifying individual characteristics and the previously mentioned categorization of innovation (i.e., technological, product and process innovation) are used. Almost similar with the individual characteristics impacting individual innovation (section 3), individual characteristics impacting firm innovation seem to cover four main categories discovered in the existent and reviewed literature: *personality*, *motivation*, *cognitive* and *demographics*. As far as the innovation at the firm level is concerned, the existent literature revolves especially around product innovation. In the next section findings are presented.

#### 5.2 Findings

##### 5.2.1 Personality

To begin with, a consistent number of studies (Aronson, Reilly, & Lynn, 2006; de Oliveira, Possamai, Dalla Valentina, & Flesch, 2012; L. T. Gumusluoglu & Ilsev, 2007; L. Gumusluoglu & Ilsev, 2009a; L. Gumusluoglu & Ilsev, 2009b; Howell, Shea, & Higgins, 2005; Jung, Chow, & Wu, 2003; Kickul & Gundry, 2002; Rothaermel & Hess, 2007; Skinner, 1996) focused on *personality* related characteristics. All these studies found that personality positively influences all three types of innovation (i.e., technological, product and process innovation) this time identified at the firm level. For instance, from

the *Big Five* traits only consciousness, openness, extraversion and neuroticism/emotional stability were used by Aronson, Reilly and Lynn (2006) to examine the effect of leader personality on new product development (NPD) project performance, under differing conditions of uncertainty. Essentially, it has been found that under uncertain settings, the process of the new product development is iterative and experiential and NPD leaders, high on openness, should be more successful on such error and trial tasks (Aronson, Reilly, & Lynn, 2006). Conversely, under more certain conditions, characteristic of incremental innovation, extensive planning is appropriate, making the conscientiousness of the leader to be a desirable trait. The model advanced by Aronson, Reilly and Lynn (2006), for instance, posits *teamwork* as a mediating variable between leader personality and NPD performance. Their conclusion was that leader openness had a significant influence on NPD project performance as well as a significant indirect influence through teamwork under high uncertainty but not under low uncertainty conditions.

It is interesting to note that other studies (Howell, Shea, & Higgins, 2005; Rothaermel & Hess, 2007) highlighted that *champions*, individuals who informally emerge to actively and enthusiastically promote innovations through the crucial organisational stages (Howell, Shea, & Higgins, 2005: 642), are necessary to overcome the social and political pressures imposed by an organization and convert them to its advantage. Nowadays, the idea that *everyone* can enhance innovation is a fact and this perspective is a departure from how things used to be in the past; requires champions to lead others to free their valuable perspectives that might lead innovation in many dimensions.

*Pro-activeness* (Kickul & Gundry, 2002), this personality stable disposition previously found to impact individual innovation (section 3.2), was found to influence, this time, product innovation at the firm level. This finding is in line with the essence of the theory of entrepreneurial alertness which describes entrepreneurs' ability to "see", to discover and exploit opportunities that others miss. From this perspective pro-active personality (Bateman & Crant, 1993) is linked to a strategic orientation which in turn determines the development of new and improved products. With regard to the mediators, the model proposed by Kickul and Gundry (2002) incorporates *prospecter strategy* as a mediating variable between proactive personality of the entrepreneurs and product innovation at the firm level. This explains the critical link between the business owners' proactive personalities and the ways they engage in innovative processes to develop innovative firm level systems.

Also from the personality viewpoint, the last identified individual characteristic is *transformational leadership* which was found to influence product innovation. According to the transformational leadership theory leaders are considered to have specific skills and abilities that determine the others to achieve innovative and creative results. This type of characteristic brings a significant contribution to the literature because only a handful of empirical studies (de Oliveira, Possamai, Dalla Valentina, & Flesch, 2012; L. T. Gumusluoglu & Ilsev, 2007; L. Gumusluoglu & Ilsev, 2009a; L. Gumusluoglu & Ilsev, 2009b; Howell, Shea, & Higgins, 2005; Jung, Chow, & Wu, 2003) have looked at the effect of transformational leadership on innovation at the firm level. *Communication* and *continuous improvement* and *delivery* represent other mediating variables that link transformational leadership and product innovation at the firm level of analysis. These variables have a significant role as the results showed large managerial implications, because they help in understanding an increase in performance levels in innovation projects (de Oliveira, Possamai, Dalla Valentina, & Flesch, 2012). With regard to the moderators, it can be mentioned that under the conditions of *empowering employees* they are more likely to promote creative endeavours and transformational leadership positively impacts product innovation (Jung, Chow, & Wu, 2003). The same effect was found when there was *support for innovation*. Because the behaviour of organisational members occur in a far more complex situations, examining this issue at a cross-level of analysis might yield interesting results as other additional variables might also be present.

### 5.2.2 Motivation

Focusing on the second category, *motivation*, both *extrinsic* and *intrinsic motivations* were found to have an effect on all three types of innovation: technological, product and process innovation. A number of studies (Liang-Hung Lin, Wei-Hsin Lin, Ching-Yueh Chen, & Ya-Feng Teng, 2010; Sauermann & Cohen, 2010) focused on the role of money, intellectual challenge and independence as having a positive impact on firm level innovation. However, studies also highlighted negative effects of motivation on innovation reflecting perhaps that respondents with a strong desire for responsibility are less interested in working at the bench and prefer broader organisational responsibilities, dampening their own inventive productivity (Sauermann & Cohen, 2010). Examining empirically to what extent pecuniary and non-pecuniary motives are related to innovative performance, a noted finding was that the desire for responsibility was negatively associated with patent applications (Sauermann & Cohen, 2010). These findings are in line with the essence of the motivation crowding theory (Frey & Jegen, 2001) and

self-determination theory (Deci & Ryan, 1985) which state that extrinsic and intrinsic motivation describe psychological needs and processes that once fulfilled, they can determine desirable outcomes and be significant drivers of innovation.

### 5.2.3 Cognitive

In addition to the personality and motivation characteristics, *cognitive* related characteristics were also covered by the existent and reviewed literature. These individual characteristics only related to product innovation and not to technological or process innovation. Studies (Bharadwaj & Menon, 2000; Stahl & Steger, 1977) showed that *creativity*, a property of the thought process that can be acquired and improved through instruction and practice (Bharadwaj & Menon, 2000), led to significantly superior innovation performance in the case of product innovation. Within the new product development literature, the role of creativity in making innovation happen in organisations was unexplored and the empirical study by Bharadwaj and Menon (2000) for instance, provided evidence that individual creativity mechanisms lead to innovation. Creativity is thus seen not necessarily just as an innate phenomenon, but can also be inculcated, encouraged and trained (Bharadwaj & Menon, 2000) to enhance innovation at the firm-level. *Communication ability*, seen as being developed with other professionals within one's own group or with professionals outside one's own group, within laboratory, on technical matters, was found to have positive influence on product innovation (Stahl & Steger, 1977). However, the same respondents - civilian and military scientists/engineers in 105 work groups in three Air Force laboratories – developing communications with the group leaders on technical matters determined a negative impact on product innovation. These findings appear to lend credence to the idea that stimulation due to contact with peers is critical in R&D work.

### 5.2.4 Demographics

Finally, the last category of individual characteristics impacting the firm-level innovation is clustered under *demographics*. For this particular category the study by Stahl and Steger (1977) showed a negative relationship between *age*, *tenure* and *education* and product innovation. These results are not surprising as findings in psychology which address, for instance, the aging issue state that aging causes certain abilities such as learning and memory to decrease. Furthermore, Ahuja, Lampert and Tandon (2008: 62) listed as an argument that older managers are less able to invest in innovation being less willing to take risks. Additionally, tenure was found to have a negative effect on innovation and these findings come in contradiction with those arguments that sustain that tenured managers impact positively innovation efforts. The underlying explanation is that they are more capable of “getting things done” and are able to use the pool of resources in a more valuable manner. Important to note is that there is no literature addressing whether and how demographics are related to technological or process innovation.

Overall, studies from Figure 3 provided mixed results showing that personality, motivation and cognitive related characteristics impact all three types of innovation at the firm level. However, the number of moderators and mediators is considered to be small, these types of variables being only identified for the relationship between personality traits and product innovation.

## 6 Conclusion and Discussion

In this section the most important findings of the current literature review are discussed. As already anticipated in the beginning and throughout the paper, the main focus in this part is on highlighting important gaps in the literature on innovation. By connecting and assessing the insights and evidence brought in by the reviewing process, we take a critical stance towards the existent literature and support a comprehensive overview of the impact of individual characteristics on (1) innovative behaviour, (2) innovation at the team level and (3) innovation at the firm level of analysis. Additionally, this section is constructed around three main criteria that help us build up the main discussion points: (1) the *amount* of the studies – it helps us to assess to what extent there has been a lot or not (that) much research done in the field; (2) the *content* of the studies – it helps us identify the specificity of the research and whether there has been a scant attention given to particular aspects compared with other aspects on innovation; (3) the *similarity* and the *difference* between the studies – it helps us assess to what extent there is either consistency or, on the contrary, dispersed interest in research on innovation.

By looking at the *amount* of the studies, firstly, it can be noted that studies addressing the impact of individual characteristics and innovation at the team level of analysis are limited, in number, compared with the other two streams of literature (i.e., at the individual and firm level of analysis). Secondly, innovative behaviour is predicted by five categories (i.e., personality, motivation, cognitive, affective and demographics) of individual characteristics while team innovation is predicted by only two (i.e.,

personality and motivation) and firm innovation by four categories (i.e., personality, motivation, cognitive and demographics). Thirdly, both moderators and mediators were found to influence only the relationships between the individual characteristics and (1) innovative behaviour and (2) firm innovation. For the relationship between individual characteristics and team innovation, only a list of few mediator-variables was found, and no moderator-variables. Finally, individual characteristics predict only product and process innovation at the team level while at the firm level, individual characteristics impact a third type of innovation, technological innovation.

In terms of *content*, firstly, it can be noted that **personality**-related characteristics such as the Big Five traits were found to have mixed results on innovative behaviour and only positive effects on product innovation at the team and firm level of analysis. More research should address this path of research by, for instance, integrating these three streams of literature and comparing and testing these specific characteristics in one single study. Secondly, as far as the **motivation** category is concerned, studies revealed, as an exception, mixed results for the relationship between individual characteristics and innovation at the firm level of analysis. However, within all three streams of literature, the overall findings support consistent positive results and a direct relationship for the relationship under investigation. Thirdly, importantly to note is that **cognitive** related characteristics such as cognitive ability, knowledge conversion capability, communication ability and intuitive problem-solving style were not found to impact product innovation or process innovation at the team level. Additionally, cognitive related characteristics impact positively innovative behaviour while their impact on product innovation at the firm level provides mixed effects. In line with these ideas, the team level of analysis should be explored more by research and empirically assess the impact of cognitive individual characteristics on innovation. Fourthly, a unique finding is represented by the **affective**-related characteristics (e.g., work engagement, self-enhancing humour) that were found to have an impact on innovative behaviour. Especially for this category, research should address different types of innovation at the team and also at the firm level of analysis; it might also advance the field by taking into considerations emotions and affective behaviour to generate innovative output. Additionally, age, tenure and education – **demographics** – known for being used as control variables, within studies, offer divergent results. The added value of the age, tenure and education in determining innovative outcomes might prove useful especially if researched to impact innovation at the team level of analysis. One can easily observe that these characteristics lack in Figure 2. Finally, it is essential for research to focus, when it comes about the moderators and mediators variables, on the role of managers that should “create a mind-set for innovation, make innovation meaningful for the entire firm and make innovation part of strategic conversation” (Ahuja, Lampert, & Tandon, 2008: 57). Feedback valence, support for innovation, perception of empowerment can be conditions used by researchers to test the impact of individual characteristics on innovation at the team/project level of analysis and not only at the individual and firm level. Furthermore, this argument is in line with the work of Cummings and Oldham (1997) who found that organizations which provided a supportive environment and context for creativity tend to reap greater benefits from individual employees.

Assessing the *similarities* and *differences* between studies, one can observe that there is a similarity with regard to the level of analysis when it comes about the personality- and motivation-related characteristics. Both are important for innovative behaviour and also for the innovation at the team and firm level. As far as the cognitive- and demographic-related characteristics are concerned, these are important for innovation at the individual and firm level of analysis while affective-related characteristics only at the individual level of analysis. *Proactive personality and creativity*, for instance, have a positive impact on innovative behaviour and on the product innovation at the firm level. In terms of differences, what comes out as striking from the reviewing process is the scant research attention that this topic received at the team level, compared with the research conducted at the individual and firm level. There is no surprise that more research has been conducted at the individual level compared with the other two levels as the focus of this topic is on the impact of *individual* characteristics on innovation. A further expectation would be that the ‘next in line’ level of analysis (i.e., the team level) would pay also a considerable amount of attention on this topic. However, it seems that more research has been conducted at the firm level of analysis than at the team level of analysis. Thus, it is timely to close this gap and advance research in the direction of complementing this middle level of analysis, which links the other two levels located at different ends of the spectrum of analysis.

Although all the three streams of literature took into account the role of moderators and mediators, their use is limited and, essential to note is especially their scarce presence at the team level of analysis.

Future research can bring a significant contribution by shedding light on the variables that influence and explain the relationship between individual characteristics and innovation at different levels of analysis. Another important avenue for future research is addressing not only various types of innovation but also degrees of innovation (i.e., radical and incremental) (Archibugi & Pianta, 1996; Benner, 2002; Gopalakrishnan & Damanpour, 1997). In this sense, research can identify which specific individual characteristics impact radical or incremental innovation and with what effects. Additionally, because previous research did not distinguish between more radical and incremental ways of innovation, future research could also address these issues especially at the project level of analysis where nowadays there are more iterative ways of coming up with new products and services.

In a conclusive manner, the aim of this systematic literature review was to provide insights through a theoretical synthesis into the fields of innovation, new product development and psychology. Serving both academic and practitioner communities, this reviewing process is also meant to increase methodological rigour (Tranfield et al., 2003) and develop a reliable knowledge base for a future pragmatic research on innovation.

# Innovation of Credit System of Loan Students at Chinese Universities

Fang Li

Department of Ideology and Politics, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail:fangli@whut.edu.cn)

**Abstract:** There are many factors to influence the loan students to pay for the debts. These factors will influence the will of students to pay for the loans and the risk of government-subsidized student loan. This article has analyzed government-subsidized student loan under imperfect and perfect credit system, and has put forward that to analyze the behavior of paying for the loans is important which can help we explain the risk of the loans. Through this analysis, the innovation of credit system becomes the important factor to the students who choose to pay for the loans or not, and to innovation the credit system, students, colleges and the banks all can benefit.

**Key words:** The innovation; Credit system; Game theory; Government-subsidized student loan; Management risk

## 1 Introduction

At present, There are many factors to influence the loan students to pay for the debts. These factors influence the will of students to pay for the loans and the development of government-subsidized student loan. To improve government-subsidized student loan, to help the poor students finish their studies, to drop the harmful risk of banks must overcome the unfavorable factors which influence government-subsidized student loan. We should improve the credit system and strengthen the system innovation to resolve these questions. Now more and more scholars come to realize that the innovation mechanism and credit system can make the government-subsidized student loan more scientific and reasonable. However, larger viewpoints often arises from different kinds of credit system how to innovate. These viewpoints<sup>[1][2]</sup> have stressed to design government financial aid programs. They think it is necessary to consider the loan default, family income and student demographic characteristics.

For many years, worldwide scholars have developed a lot of models. At present, the traditional methods mainly include the maximum-likelihood technique probit, an alternative to traditional price response theory etc. Knapp and Seaks (1992), drawing methodological guidance from earlier work by Greene (1989), studied nearly 2000 traditional 2- and 4-year college students who had attended one of 26 Pennsylvania institutions, had borrowed federally guaranteed Stafford loans, and had graduated (or dropped below half-time enrollment)during the academic year 1984–1985. The authors found each borrower characteristics to have a statistically significant association with a lower probability of default. St.John also thinks we should treats student responses to different forms of aid as uniform (1995).

In China, the students loan has carried out in 2004. Because of short history, how to control the loan risk, how to improve the loan system, and how to improve the credit system become impetuously in China.(Wang Hengli, 2005; Ding Hua, 2005)<sup>[3]</sup>

## 2 Analysis of Imperfect Credit System for Students Loans

### 2.1 Relationship between the banks and the loan students

When the credit system is imperfect, the management risk of the banks will increase without the perfect information which the loan students can pay for the debt or not. So in order to realize the maximum profit, the banks must adopt measures to reduce the unfavorable risk. According to the tradition ideas, the banks may carry out the choice behavior to provide the loans to students in terms of the probability distribution of the default students. But the banks have difficulty to carry out this activity. Because government-subsidized student loan just has carried out only 8 years, it is difficulty to obtain the probability distribution of the default students. So in order to reduce the risk, the banks must look for another risk undertaker\_that is the college. The relationship between the banks and the loan students becomes the relationship between the banks and colleges and the relationship between the colleges and the students who got the government-subsidized loan.

### 2.2 Relationship between the banks and the colleges

In terms of the theory of agreement agency, in order to reduce the the moral risk, the clients should design reasonable contract. The contract of the banks design builds on the colleges duty which is to press the students to pay for the debts on time. If the colleges do not finish this duty, the banks will

reduce or cancel the education loan. For the colleges, if they increase the press on the students, the cost will add, and if they do not carry out this duty, the colleges development will frustrate. So the banks make the colleges get into the morass.

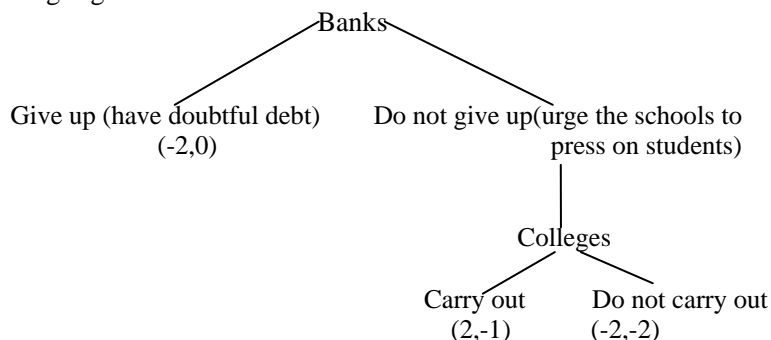

Figure 1 The Banks and Colleges Game Playing

The brackets is the profit of banks and colleges. Under this contract, the colleges is the acceptance of the biggest risk. No matter the colleges carry out the duty or not, they ain't the biggest beneficiaries. Furthermore regardless of income, the colleges still run into morass. On the one hand, the colleges superior will exert pressure to the colleges to increase the loans. This is a good things that can assure the poor students to finish their studies. But the education directors interpose the colleges overmuch, the development of colleges has been influenced. On the other hand, if the colleges interpose the loans overmuch, the function of routine education will be trailed off. So the colleges should adjust their role in time to safeguard the loan system.

**2.3 Relationship between the loan students and the colleges**

Basis of the contract of colleges and banks, the colleges will select the scheme to press the students to pay for the loans. If the students pay for the loans on time, the colleges and the students all have got benefit. But the students do not do that or default, the colleges can increase the cost to press the students to pay for loans, or they can force to withhold the graduation certificate to press them. Of course, the colleges adopt the first scheme, their income can reduce. If the colleges adopt the second scheme, the loan students can be unsatisfied very much.

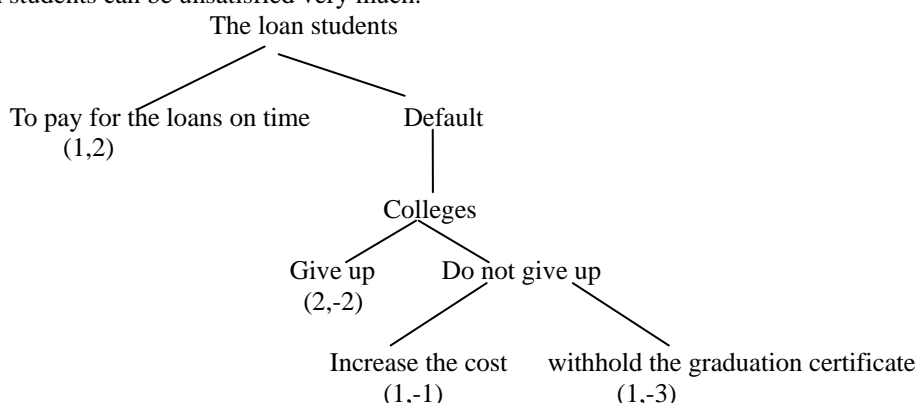

Figure 2 The Loan Students and Colleges Game Playing

**3 Analysis of the Banks' Movement System under Imperfect Credit System**

The banks cannot get the loan students' full information under the imperfect credit system. On the one hand, the banks have difficulty to forecast the future loans. On the other hand, they have difficulty to restrict the students. So the banks may face many problems which are differ from other formal loans when they carry out the business that provide the loans for the poor students.

**3.1 Difficult to exert the interest rate role of converse choice**

The interest rate has converse choice' role. The people who would like to fork out higher loans often are inclined to the higher risk. But for the government-subsidized student loan, the interest rate just can influence the students' choice between the saving and consumption. The interest rate is not the premise to apply the loans. So it is difficult to depend on the interest rate to evaluate the students default risk.

**3.2 Difficult to exert the loan amount to judge default**

When the loan amount is bigger, the default probability is bigger. But the loan amount that the country supports the students to study is finite. If the students cannot get more loan, the banks have difficulty to become aware of the students whether they are ready to default or not.

**3.3 Difficult to exert the signal indication**

It is difficult for the loan students to find a way to communicate with the banks which make the banks believe they can pay for the loan on time. The government-subsidized student loan has aimed at the poor student. If the information of these students is incomplete, the banks have no way to differentiate the loan students risk. So the government-subsidized student loan can't carry out effectively under the imperfect credit system and lacking of the signal indication.

**4 The Dealing Model of loan Students under the Perfect Credit System**

The relationship between banks and loan students becomes obscure under the imperfect credit system. So only to establish and perfect the credit system, the relationship will become clearly with the information publicity.

The loan students will consider to pay the loans on the saving, or to distribute the loans on the saving and consumption in order to realize the maximum utility. (Geoffrey A.Jehle )<sup>[4]</sup>If they pay the loans all on the saving, they get the income:

$$R = B(1 + r) \tag{1}$$

If the students distribute the loans on the saving and consumption, we can get :

$$U = \int_{t=0}^{\infty} e^{-\rho t} u(C(t)P(t)) dt \tag{2}$$

$$u(c(t)) = \frac{c(t)^{1-\theta}}{1-\theta} \tag{3}$$

$C(t)$  is the consumption of the students who have loans at  $t$  time;  $u(\cdot)$  is the instantaneous utility function;  $\rho$  is the discount rate;  $\theta$  is the risk abhorrence relatively coefficient;  $P(t)$  is the number of obtaining the loans at  $t$  time. At the same time assuming the loan students are homogeneous.

The budget restriction of the loan students:

$$\int_{t=0}^M e^{-R(t)} C(t)P(t)dt \leq w_1 + \int_{t=0}^M e^{-R(t)} B(t)P(t)dt \tag{4}$$

$w_1$  is the income summation of loan students;  $B(t)$  is the surplus after the students put all the wealth on the consumption, that is  $B(t) = Y(t) - C(t)$ ;  $R(t) = \int_{\tau=0}^t r(\tau)d\tau$ ; At the same time assuming that students can get loans every year.

According to(2)and(4):

$$\Gamma = \int_{t=0}^{\infty} e^{-\rho t} u(C(t)P(t))dt + \lambda[w_1 + \int_{t=0}^M e^{-R(t)} B(t)P(t)dt - \int_{t=0}^M e^{-R(t)} C(t)P(t)dt] \tag{5}$$

Derivative  $C(t)$ , then ordering  $C(t)' = 0$  can get:

$$e^{-\rho t} c(t)^{-\theta} = \lambda e^{-R(t)} \tag{6}$$

The loan student wanting to realize the maximum utility must consider the future discount rate and interest rate under budget restriction. Furthermore, they must think of the opportunity cost. If they are ready to default, they get income 2, but they may lose to obtain other loans possibility. If they pay for the loan on time, they get income 1, but they obtain the chance to increase fame investment.

The analysis is based on the assuming that all the students are homogeneous. In the realism, every student consider the risk and opportunity cost with different visual angle, the difference of their behavior also is big. But the credit system is perfect, the students rational choice will be consistent.

**5 The Credit System Innovation**

### **5.1 To increase the students signal indication**

When the different borrowers who have different risk inclination get together, it is difficult for banks to differentiate them. If the banks choose the higher balanced level, the lower risk borrowers will be drove out of the loan market. If the banks choose the lower balanced level, their income will be suffered. So the lower borrowers must adopt some measures to promote the banks to believe their risk degree, the balance may be realized between banks and borrowers.

It is premise of signal indication to find out the information about the government-subsidized student loan. At present, many students learn the information about the government-subsidized student loan very little. They just have been notified to prepare series datums. If the necessary information is imperfect, the students may lose the judgment about cost and income. They don't know what measures they should adopt to protect their maximum rights and interests.

It is key of signal indication to judge the risk inclination rationally for students. Different students have different risk preference. Students should judge their risk degree accurately and they should learn to judge the opportunity cost. The consider between future return and present cost can influence the risk choice for students.

The important gist for banks to offer loans is the signal indication game playing of students. On the one hand, the lower risk borrowers depend on the more rigorous condition of loans, more rigorous items, and lower return to show their risk preference through signal indication. On the other hand, the banks can learn the default probability about students through the signal indication game playing. So the banks can look for the lower risk borrowers from these different default probability.

### **5.2 To establish perfect credit system about the loan students**

The foundation for the government-subsidized student loan is that the colleges should establish perfect credit system. So the credit datums about loan students should include three factors.

The first factor is the moral endowment about loan students. The moral endowment about students is the kernel of credit system. Because the moral restriction is higher than the economy restriction for most students, the colleges must hold the moral endowment fully about these students including personal quality, moral attitude, honesty and keeping faith, etc. According to the basic moral endowment, the colleges can establish the students personal credit system.

The second factor is the family income. The family income amount is the most important factor for poor students to apply the loans, and the important factor to pay for loan on time. After graduating from schools, the students may pay more income on the family to help family develop, and the fund for repaying loans may not be in place because of the more consumption on the family. So the colleges not only must know the family income of having loans students, but also consider all the factors to deal with loans rationally.

The third factor is the school work and the work ability of students. The school work and the work ability influence the employment, work income and the choice of repaying loan. So to grasp these information is the key for establishing credit system about loan students.

### **5.3 To establish the credit information bank**

The banks must have full information in order to safeguard the information symmetrical. So to constitute the information bank can resolve the restriction of loan students well. For the default students, the banks should put the badness credit record into the personal information bank, and deprive them to obtain the loan again. From the point of view, the banks can reduce the management risk, and the poor students can finish their studies between the cost and income trade-off.

## **6 Conclusion**

When students get loan, they often hesitate between the cost and income. The colleges and the banks will increase the cost and management risk because of imperfect information about the loan students. So to innovate the credit system, students, colleges and the banks all can benefit. At the same time, the students, colleges and banks should adopt measures to promote this innovation.

(E-mail: nchattopadhyay@gmail.com, shahmrinalini@gmail.com)

**Abstract** :Restaurant business in India has witnessed exponential growth. Objective of this paper is to examine possible relationship between innovativeness, effectiveness and efficiency of a restaurant. For this study, data were collected from 175 restaurants. To conclude, this paper identifies important relationships between operational effectiveness, business performance and innovations in service delivery.

**Keywords**: Operating effectiveness; Business performance; Service innovation; India; Restaurants

## 1 Introduction

Restaurant business is one of the oldest and most evolved business, as observed all over the world. In the current Indian context of increased globalization, changing taste of younger generation and better affordability due to rapid economic growth, restaurant services have seen substantial growth in the recent years and there is tremendous scope for improvement in service design and operations. Recent research has suggested that innovativeness contributes to business performance (Deshpande et al., 1993; Hult et al., 2004; Hurley, 1995; Tajeddini et al., 2006). Innovation plays a major role in formation and execution of business strategy, due to its impact on profitability and differentiation. In addition, a large number of prior studies concerning innovativeness have been conducted in different firms focusing on products and processes (Tajeddini, 2010).

However, even though the services sector has become a tremendously large part of the modern economy (Lee et al., 1996; Oldenboom and Abratt, 2000), empirical research related to services seems to be quite insufficient in empirical economics and innovation research (Hollenstein, 2000). More precisely, we have little knowledge regarding the effect of innovativeness upon the companies that provide services to the consumer, such as restaurants, hotels and leisure (Tajeddini, 2010).

In an economic system as in India, where growth is in double digits year after year, not much work has been done to co-relate operating effectiveness and innovation in the service industry.

On one hand, there are many well-established multi-national restaurant chains with great marketing, personnel, financial, and other resources. On the other hand, changes in customer tastes and dietary habits as well as national, regional and local economic conditions and demographic trends have made the restaurant industry intensely competitive. Therefore, the present study's emphasis is on providing restaurant managers with more understandable guidelines on innovativeness, efficiency and business performance.

The paper begins with examining plausibility of innovativeness, efficiency and offers a collection of associated hypotheses. In the methodology section, the study sample of restaurants is discussed and the construct measures are evaluated. Next, the relationships among these constructs are assessed and discussed to reach conclusions.

## 2 Background

### 2.1 Innovativeness

Innovativeness is conceived as one of the avenues to gain a competitive advantage (Clemons and Row, 1991; Deshpande et al., 1993; Edwards et al., 2002; Hult et al., 2003; Hurley and Hult, 1998; Martins and Terblanche, 2003; Nieto and Quevedo, 2005; Olson et al., 2005; Salaman and Storey, 2002; Sandvik and Sandvik, 2003; Tajeddini et al., 2006; Tajeddini and Trueman, 2008).

In general, innovativeness has been defined as an organisational culture that encourages the introduction of new processes, products, and ideas (Hult et al., 2003, 2004; Hurley and Hult, 1998), and the creation of new products, services, and technologies (Antoncic and Hisrich, 2001).

From a service perspective, some marketing and management authors have defined innovativeness as the degree of newness relative to the outside world and the firm itself (Kleinschmidt and Cooper, 1991; Olson et al., 1995; Olsen and Sallis, 2006). Similar to product innovativeness, simply introducing a new

service is necessary but not sufficient as an indication of innovation; that is, an innovative product or service must also be unique in its market (Holbrook and Hughes, 1998). However, some scholars (Atuahene-Gima, 1996; Oldenboom and Abratt, 2000) argue that the lack of planning and informality have forced service organizations to rely heavily on competitive imitation and/or customer canvassing to foster new ideas.

Despite the growing interest in service and innovation, no strong consensus has formed about the innovation process for service firms. Perhaps it is because service innovation was perceived as a contradiction in term (Dolfsma, 2004). Part of the perception may be associated with the lack of applicability of the methods measuring innovation for products to the heterogeneous group of sectors such as service industries (Dolfsma, 2004; Kleinknecht, 2000). Moreover, while a large number of innovation strategy scholars have developed theoretical models and embedded concepts to understand processes of product innovation, the possibility of applying them in the context of service industries is in question (Dolfsma, 2004; Sundbo, 1997; Tajeddini, 2009, 2010). On the other hand, a constantly changing environment, highly demanding customers and intensive global competition characterize today's service climate.

Hence we witness customers' needs and perceptions of service firms are constantly changing.

In this regard, Chang et al. (1999) conclude that it is crucial to regularly appraise one's competitive status and make appropriate decisions on required modifications to offerings and marketing campaigns. Therefore, it is not surprising that innovative companies continuously investigate various means of improving the quality of their offerings and enhancing sustainable superior value for their customers. To achieve this objective, organizations must search for new ideas, adopting open search strategies that involve the use of a wide range of external actors and sources to help them achieve and sustain innovation (Laursen and Salter, 2004).

## **2.2 Innovativeness and Effectiveness**

The current environment is characterized by time-based competition, wherein increasingly impatient customers favor providers that offer speedy delivery of a quality product or service (Hult et al., 2004). Alignment to the market, through capturing the voice of the customer via quality function deployment (Jaraiedi and Ritz, 1994; Madu and Kuei, 1995), improving market information processing (Ottum and Moore, 1997), increasing market and learning orientation (Tajeddini, 2009), and modernizing technology are recognized as influential factors for explaining quality improvement.

Porter (1980) observed that operational effectiveness are any organization's skill sets or "core competencies" which must fit and work together to implement the strategy. Ren et al. (2006) argue that taking the risk of investing in innovation may be a means of ensuring longer term strategic flexibility, thereby securing operational effectiveness. Furthermore, it is accepted that innovative organizations need to be ahead of what customers want and enjoy a greater operational efficiency due to the quality offered and better satisfaction. In return, customers will perceive the firm's service offerings as being of premium quality (Chang et al., 1999).

This perception improves the effectiveness of a firm's operation and leads to customer satisfaction.

This leads to the first hypothesis:

*H1. There is a positive relationship between innovativeness and Operational Effectiveness.*

## **2.3 Operational Effectiveness and Business Performance**

Chang et al. (1999) argue that operational effectiveness yields higher quality and customer loyalty and leads the organizations lowering costs and retaining competitive advantage in price. Similarly, by creating the strategy/operational effectiveness dichotomy, Porter (1980) argues that a firm can improve performance if it learns how to reduce defects in products or develop better products faster.

Hence the following hypotheses are posited:

*H2. There is a positive association between OE and business performance measured by: (a) service quality; (b) customer satisfaction; (c) overall customer service level.*

The overall conceptual model indicates that innovativeness leads to greater effectiveness.

# **3 Methodology**

## **3.1 Data collection and procedure**

A questionnaire was designed to ask businesses for their perceptions on a range of organisational variables including the nature of innovativeness, Operational Effectiveness, and business performance. The questionnaire was pretested in order to ensure that the survey content and measurement scales were clear, valid and appropriate.

Based on the pre-testing results, it was determined that restaurant managers and owners were the most qualified to provide the required data because they were primarily responsible for the overall operation. Based on responses from the pre-test, the survey instrument necessitated no significant changes. Interviews with selected general managers helped ensure the content validity of the measures. In this study participants consisted of 175 restaurant owners/managers from four major destinations located in National Capital Region of India (New Delhi, Noida, Gurgaon and Ghaziabad). In order to collect the data, the procedure of Kara et al. (2005) was followed.

**Figure 1 The Conceptual Model**

Therefore, all of the participants were recruited randomly on the basis of convenience, and all participated voluntarily.

Data were collected through personal interviews after contacting each organization and seeking permission to collect data. In face-to-face interviews all of the respondents were guaranteed anonymity for themselves and their companies and were promised an offer of a report of the results as an incentive to participate in the study. The survey process consisted of two or more visits to the businesses. In almost all cases the first visit consisted of leaving the survey with the owner/manager for them to complete. In the second, follow-up visit, questions were answered and the completed survey was collected (Kara et al., 2005). Data were normally collected during business operations; however, sometimes it was necessary to collect the completed surveys while the business was closed or at a convenient time that met the business owner's schedule. Finally, a few open-ended questions were added to give "color" to our data and lead the respondents to think analytically and critically.

### 3.2 Measures

All measures were drawn from previous research and aligned with the conceptual aspects of each construct. Innovativeness was quantified using the five-item scale frequently used by Hurley and Hult (1998), because it incorporates management opinion about receptivity to new ideas and innovation (e.g. Management actively seeks innovative ideas). To measure OE, the scale of SERVQUAL scale (Parasuraman et al., 1988; Zeithaml et al., 1990), using a five-point Likert scale, was adopted due to its ability to assess a general class of services. Its concept and operation are based on a gap theory and its 22-item scale was built along five components:

- 1) Tangibility;
- 2) Responsiveness;
- 3) Reliability;
- 4) Accuracy; and
- 5) empathy.

Business performance uses three perceptual measures derived from Kara et al. (2005), namely profit goal achievement, sales goal achievement and return on investment (ROI) achievement (e.g. for the last three years profit goals have been achieved). Table I provides some information about the respondents' demographic characteristics as well as their organisational characteristics.

### 3.3 Analysis and results

The reliability analysis of the measures utilized for the multi-dimensional constructs was conducted by utilizing Cronbach's coefficient alpha (Churchill, 1979). The overall coefficient alpha score for each construct suggests a high level of reliability since in each case the value is greater than the suggested cut-off level of 0.7 (Nunnally, 1978). The innovativeness and SERVQUAL scales were first scrutinized for reliability. The Cronbach's alphas are 0.81 and 0.78 and Guttman's split-half reliability coefficients 0.81 and 0.76 for the innovativeness and SERVQUAL scales, respectively.

Assessment of the content validity of the innovativeness and SERVQUAL scales was based on a qualitative exercise. The two main characteristics were: the extent to which scale items depicted the

construct's domain, and the thoroughness with which the construct to be scaled and its domain were articulated (Parasuraman et al., 1988). The procedures observed by the authors whose constructs were utilized in this study are congruous with the recommendations of Churchill (1979) for developing psychometric marketing scales.

Furthermore, for this research, face and content validity checks were performed on the SERVQUAL and innovativeness measures to confirm that the dimensions would be understood by the sample and reflect the theme that the items were designed to capture. These checks were performed with the restaurants' owners and managers as well as with academics with expertise in small service business management. Correlations between innovativeness and service quality components are provided in Table 1.

**Table 1 Correlation Matrix with  $p < 0.01$**

	SERVQUAL	Tangibility	Responsiveness	Reliability	Accuracy	Empathy
Innovativeness	0.64	0.44	0.32	0.47	0.52	0.41

### 3.4 Test of hypotheses

H1 proposed a positive relationship between innovativeness and effectiveness. The result of a regression analysis reveals that effectiveness has a significant effect on all three of the measures: service quality; customer satisfaction and overall customer service level ( $p, 0.05$ ; Table 2). An overall measure was computed using factor analysis based on the three individual measures. A subsequent regression analysis shows that innovativeness has a significant association with the overall effectiveness measure ( $p, 0.05$ ). Therefore, it can be concluded that there is a positive relationship between innovativeness and operational effectiveness. In other words, an innovative restaurant is able to yield greater effectiveness.

**Table 2 Innovativeness and Effectiveness**

Dependent Variables	Independent: Innovativeness	
	Standardised b	p-Value
Overall Service Quality	0.36	<0.05
Customer Satisfaction	0.36	<0.05
Customer Service Level	0.23	<0.05
Overall Effectiveness	0.33	<0.05
Sample size	175	<0.05

According to H2, operating effectiveness has significant effect on business performance. It positively affects profit goal achievement and ROI achievement (two of the three performance measures) (Table 3).

The results generally suggest that effectiveness positively influence business performance.

**Table 3 Business Performance and Operating Effectiveness**

<b>Table</b>	<b>3:</b>
<b>Table</b>	<b>3:</b>
<b>Table</b>	<b>3:</b>
<b>Table</b>	<b>3:</b>

## 4 Analysis of Results

The research data supports both the hypotheses. First, innovativeness has a positive effect on Operating Effectiveness. Specifically, innovativeness shows a strong association with service quality as measured by the SERVQUAL scale.

Effectiveness, in the long run, positively affects profit goal achievement ( $p$ -value, 0.01) and ROI achievement ( $p$ -value 0.05) as two indicators of the business performance.

## 5 Conclusion and Implications of Business

The objective of this research is to examine the extent to which innovativeness has an effect on restaurants' performances. The findings present a fresh insight by exploring the effect of innovativeness on operating effectiveness (e.g. service quality) and how this driver affects the performance of restaurants.

The research results offer several important managerial implications. First, the present study evidently shows a positive effect of innovativeness on effectiveness, suggesting that there are some advantages to embracing innovativeness. For example, innovativeness results in productivity and quality gains, and may also contribute to profit goal achievement. At the same time, it may also yield a more cost-efficient operation by achieving higher productivity and generating more sales from each employee (Chattopadhyay et al.,2011). Since many service firms investigate how “quality consistency” and “innovation” could have contributed to a sustainable competitive advantage in business, the findings of this study reveal that restaurants seem to have evolved towards a more competitive position and are likely to enhance their business performance. This is consistent with findings of Hult et al. (2004, p. 436), who state that “innovativeness is likely to be useful for allowing the firm to pre-empt competitors with new or improved products, diversify product lines, and generally expand the firm’s scope of activities”. As a result, innovativeness is critical for businesses and is regarded as a factor which might contribute to achieving sustainable competitive advantage.

This study highlights the importance of managerial emphasis on the creation of an internal business environment contributing to innovative activities, superior service quality and greater productivity. Specifically, superior productivity and advanced service quality were found to have a significant and positive impact upon restaurant business performance in the long term.

The findings of this study can help the relevant stakeholders of modern day restaurants to promote innovation among employees and other possible stakeholders. This study can reveal to the restaurant owners the impact of innovativeness on the operational performance of restaurants and also to put in necessary initiatives to close the gap between the service quality perceptions and expectations.

# Application of the “737355” Differentiation Mode to the Talents Training Programs in Higher Vocational Education

Xu Jiuqing, Wang Jiangren

The president of Chongqing I.T. college, Chongqing, P.R. China, 404000

(E-mail: xxxcqec@sina.com)

**Abstract:** The “737355” differentiation mode to talents training is an important component of the differential developmental strategy for vocational colleges. If vocational colleges want to win in the increasingly fierce competition, they must make dramatic reforms in such aspects as training programs, curricular system, teaching content and teaching methods, and create a differential training mode that will suit the needs of higher vocational education and differ from the undergraduate education mode so that they can yield twice the result with half the effort.

**Key Words:** Higher vocational education; Training mode; Differentiation; Exploration

## 1 Introduction

Unlike undergraduate education which stresses academic disciplines and aims at training academic researchers, higher vocational education, in accordance with occupational classification, intends to train high-level practice-oriented talents who will work at the forefront of production, construction, management, and service, to meet the actual needs of certain occupational positions (groups). Therefore, the most important criteria for measuring the success of a vocational college are the popularity of its graduates with the society and employers, and the employment rate as well. These criteria are also the starting line and the destination on which higher vocational colleges should focus their attention in the talent training mode reform. Currently, higher education is flourishing and the competition is becoming increasingly severe in China. Under the circumstances, higher vocational schools must differentiate themselves from undergraduate colleges and make a radical reform in the talent training mode to establish a differentiated training mode suitable for higher vocational education and then win out of the game.

## 2 The Nature and Features of the Higher Vocational Education Training Mode Differentiation

### 2.1 The nature of the higher vocational education training mode differentiation

A talent training mode is generally regarded as the structural style and the operation mode of a training process adopted to achieve the talents training objectives, and it mainly consists of curriculum system, teaching mode, teaching design, educational methods, etc.

The differentiation strategy first appeared and prevailed in the business world, then was widely introduced to such institutional and social organizations as schools, hospitals, and research institutions, and now has become a management strategy responsive to the needs of our times. Michael Porter, a famous professor at Harvard University, defined the differentiation strategy as a unique strategy that can differentiate an agency's product or service so that it is perceived industry-wide as being unique.

In accordance with the meaning of the talent training mode and the definition of the differentiation strategy, the author proposes that the higher vocational education training mode differentiation is the structural style and the operation mode of the training process which is different from that of undergraduate education and which aims at training high-level practice-oriented talents who will work at the forefront of production, construction, management, and service. It is a non-academic and competence-based higher vocational education mode consisting of curriculum system, teaching mode, teaching design, and educational methods.

### 2.2 The features of the higher vocational education training mode differentiation

The intrinsic feature of higher vocational education is to train high-level practice-oriented talents who will work at the forefront of production, construction, management, and service. Occupational pertinence or employability is its essential attribute. In accordance with the characteristics of higher vocational education and the nature of the higher vocational education training mode differentiation, the author argues that the main features of the higher vocational education training mode differentiation are reflected in the following aspects:

First, its basic task is to train high-level practice-oriented talents.

The major educational function of vocational colleges is to train high-level practice-oriented talents, and they have both the attribute of higher education and that of vocational education. Thus the higher vocational education training mode must be subordinated to the objective of higher vocational education training, which is to train those who can not only master the basic knowledge and qualities offered by higher education, but also possess the occupational skills and professional qualities necessary for future occupations. Employment-oriented training therefore is the intrinsic feature of the higher vocational education training mode.

Second, it develops training programs by focusing on cultivating the ability to put technology into practice.

Higher vocational education aims at training high-level practice-oriented talents who are different from the interdisciplinary ones and who will work at the forefront of production, construction, management, and service. Therefore, vocational colleges should adapt themselves to the needs of the society, and design training programs by focusing on cultivating the ability to put technology into practice, so that their graduates can master moderate theoretical knowledge, remarkable abilities to apply technology, a wide range of knowledge, and high occupational qualities.

Third, it builds the practice-oriented system of curriculum and teaching content.

Higher vocational education set the training of practice-oriented talents as the primary objective. Quite unlike undergraduate education which stresses academic disciplines and aims at training academic talents, higher vocational education requires students to master moderate theoretical knowledge but great practical skills. Thus, higher vocational education does not require students to learn knowledge as comprehensively and systematically as undergraduate education does. Instead of stressing the breadth of fundamental theories and professional knowledge, it attaches great emphasis on professional skills and requires students to have an excellent mastery of practical skills. Therefore, the most significant feature of the higher vocational education training mode is to build the system of curriculum and teaching content in accordance with the requirement of future occupations which is to master moderate professional knowledge and excellent practical skills.

Fourth, practice teaching takes up a large proportion in the training program.

Teaching-oriented and research-oriented universities put emphasis on cultivating students' innovative thinking ability and the ability to put knowledge and technology into practice, and focus on training students in applying their theoretical knowledge to technological innovation and the development of new technology. Although vocational colleges also put their focus on students' ability to apply technology, this kind of ability refers to the skill or technique to use mature technologies that have already formed technical specifications, rather than the capacity for technological innovation and new technology development. Therefore, vocational colleges should pay more attention to training students' practical skills than undergraduate colleges, and the proportion of practice teaching in the teaching program in vocational colleges should also be larger than that in undergraduate colleges.

Fifth, it adopts a combination of production and teaching as a basic approach to talents training.

The combination of production and teaching in talent training is in line with the essential requirement of higher vocational education. First, the combination of production and teaching is conducive to the achievement of higher vocational training objectives; second, the combination is conducive to the specialty setting of higher vocational education; third, it is conducive to improving the quality of higher vocational teaching; fourth, it is conducive to the training of double-qualified teachers at vocational colleges; fifth, it is beneficial to graduate employment by improving the employment rate. Vocational colleges must adopt the combination of production and teaching as the basic approach to running and developing the schools, and promote a new talent training mode that is motivated by the collaboration between schools and companies, between teachers, students and workers, and by the combination of classroom teaching and the production site, of theory and practice.

### **3 The Assumptions of the Differentiation in Higher Vocational Education Training Mode**

Vocational colleges should orient themselves towards employment, identify the point of market entry with scientific and rational positioning, and focus on training high-skilled practice-oriented talents with innovative capacities and entrepreneurial spirit. They should also establish the concept of quality and innovative education centering on the trinity of knowledge teaching, capacity training, and quality improving, and commit themselves to the formation of a distinctive talent training mode.

#### **3.1 Differentiation in talent training program**

The innovation and differentiation of higher vocational education training mode should start with the differentiation in talent training programs. Vocational colleges should consider students foremost, take competence training as the foundation, and focus on bridging the gap between the theory and practice and the gap between curricular and extracurricular activities, and discard the traditional three-stage mode employed in undergraduate education. They should also strive to comprehensively improve students' professional qualities, mastery of knowledge, and formation of basic capacities, and to train high-level practice-oriented talents who will work at the forefront of production, construction, management and service.

### **3.2 Differentiation in curriculum system and teaching content**

The objective of higher vocational training should be to train students to master moderate basic professional knowledge and excellent professional skills, and to build the competence-oriented curriculum system and teaching content. Therefore, traditional teaching concept which emphasizes an comprehensive and systematic way of mastering vertical knowledge should be discarded. The curriculum system and teaching content should shift focus from academic subjects to the needs of employment. In addition, vocational qualification training and course teaching should be integrated so that students can obtain two or more certificates at school, which will better prepare them for future occupations.

### **3.3 Differentiation in the way of training**

Vocational colleges should adhere to the methods of "order training" and "occupation-targeted training", namely, training talents in accordance with orders and training them in vocational skills required by occupations. Schools and companies should decide the training programs as soon as students enroll in the schools. Schools should work in strict accordance with orders, and the companies should comply with the two-way selection mechanism and give preference to those qualified graduates for employment.

### **3.4 Differentiation in training method**

Chinese higher vocational education should learn from the dual education system practiced in Germany to create a unique dual education system, the core of which is to closely combine theoretical knowledge taught at school with practical skills trained at companies, and to strengthen students' vocational qualities and skills. Moreover, the proportion of the hours of theoretical teaching to those of practical skills training should be no less than 1:1. Thus, vocational schools should rely on companies and make full use of modern equipment and latest technology to enhance students' vocational skills.

### **3.5 Differentiation in training focus**

Teaching-oriented and research-oriented universities should commit themselves to fully improving the overall qualities of students, including scientific, cultural, moral qualities and the spirit of innovation. Although vocational colleges should also educate students for all-round development, it is unnecessary and impossible for them to compare with undergraduate colleges. Their focus is to train students in vocational qualities, including dedication, hard-working, discipline, and innovativeness, which are necessary for performing their duties in work. So, to cultivate "professional employees" is the crucial part for higher vocational education.

## **4 To apply 737355 Training Mode and Adopts a Combination of Production and Teaching Are Effective Ways to Achieve Differentiation in the Higher Vocational Education Training Mode**

Chongqing Information Technology College, on the basis of a comparative analysis of the domestic and foreign reforms in higher education, together with its long-term practices in school reform, has created a 737355 Training Mode which is considered an effective way to achieve differentiation in the higher vocational training mode.

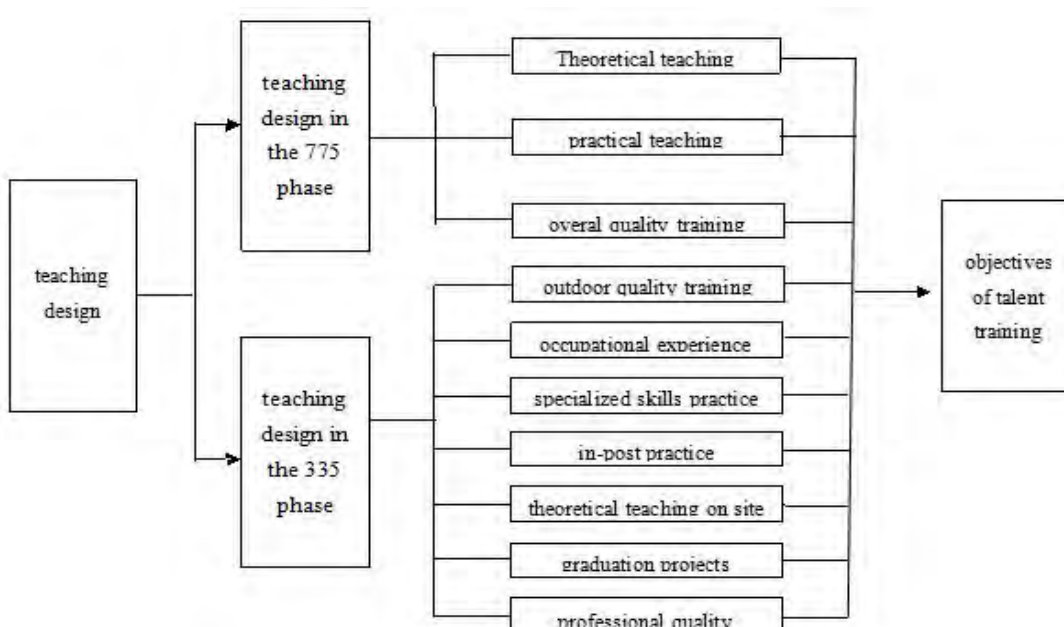

### **4.1 The nature of 737355 training mode**

Under 737355 mode which combines production and teaching, students not only receive lessons at schools but also go to companies for production practices in accordance with the training programs jointly developed by schools and companies. This new training mode is motivated by the collaboration between schools and companies, between teachers, students and workers, and by the combination of classrooms and production sites, of theory and practice. To be specific, in the first academic year, vocational students spend 7 months learning elementary courses at school, 1 month at outdoor education bases for outdoor survival qualities training, and then serve a 2-month experience apprenticeship in companies; in the second academic year, they spend 7 months learning specialized core courses at

school and 3 months practicing basic vocational skills in companies; in the third academic year, they spend 5 months learning comprehensive courses at school and 5 months practicing overall vocational skills in companies. In this year, students should also determine the titles of their graduation projects and complete the projects under the joint supervision of their teachers at school and their tutors in companies.

**Table 1 The Teaching Schedule of 737355 Mode**

teaching phase	teaching place	academic year	duration (month)	teaching or practice content
775	schools	first	7	elementary courses
		second	7	specialized core courses
		third	5	comprehensive courses
335	outdoor education bases	first	1	foster quality development
	companies	first	2	experience real work
		second	3	practice basic vocational skills
		third	5	practice overall vocational skills

**Figure 1 The Teaching Design on the Basis of School-Company Collaboration**

**4.2 The features of 737355 training mode**

First, a change from sole educational subject to multiple educational subjects

Schools used to be the subject in talent training. With the implementation of the 737355 Training Mode which is in line with the characteristics of higher vocational education, schools and companies have become the two main roles in educating students. They jointly formulate teaching plans and are jointly responsible for teaching students.

Second, a change from sole educational environment to multiple educational environments

Companies are the best places for developing students' practical abilities and overall qualities. With the implementation of 737355 Training Mode, students can not only acquire knowledge and get trained at school, but also experience actual production, management, and service in companies. Under the multiple educational environments both at school and in society, students can comprehensively improve practical skills and overall qualities, including dedication, quality awareness, service minds, cooperative sense, team spirit, etc. Student will gradually develop strong professional qualities in terms of humanistic spirit, physical and mental health by working at the forefront of companies.

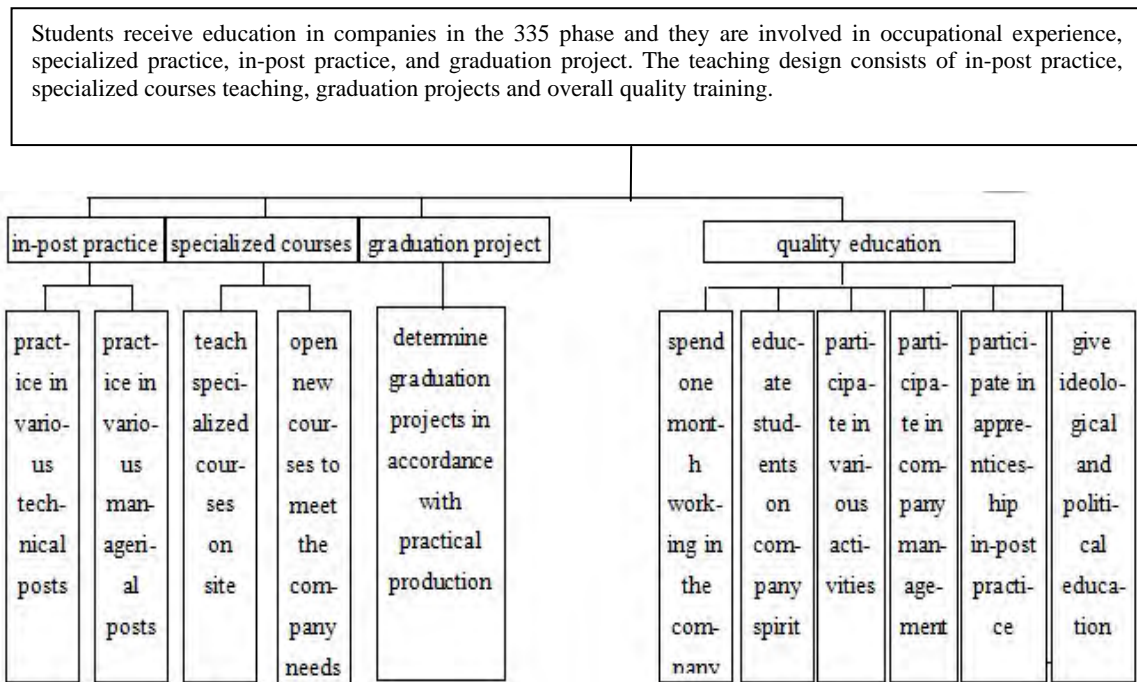

Figure 2 The Teaching Design in the 335 Phase

Third, a change in training method toward dual education

By the traditional training method centering on theoretical knowledge teaching in classrooms, theory and practice have been separated, and students tend to have a poor grasp of practical abilities. 737355 Training Mode closely combines theoretical knowledge teaching in classrooms and practical skills training in companies. It will create a dual education system suitable for higher vocational education, under which students can master good comprehensive qualities, adequate theoretical knowledge, strong professional skills, and feel at ease with the work after being recruited.

#### 4.3 The Effects of 737355 Training Mode

In order to fluently carry out the 737355 Training Mode, the college made a lot of reforms in the organization frame. We took the advantage of flexibility of a private college to adjust, expand, and optimize the function of the Board of Directions to adapt the original structure into a new system where the four parties, the government, the industry, the school and the corporations will cooperate with each other. Under this situation, the college designedly sent the students to the cooperating corporations to do their internship in the aspects of occupation, professionalization, and post practice. The college has further carried on the mode of order training, alternation of teaching and working. Also, according to the current situation of I.T., creative and modern service industries and their trends, the college has carried on the teaching-learning-practice integrated mode to let students combine knowledge and practice together and experience and learn from the real working environment.

With educational reforms of more than two years, Chongqing Information Technology College has won initial success by adopting this training mode. The significant effects of 737355 Training Mode can be reflected in the following aspects. First, it deepens the reform of school-running system. 737355 Training Mode closely links society, schools and companies, and school-running systems thus can change in accordance with social and corporate production modes and better serve the economic development. Second, it helps to enhance the professional qualities of students. According to 37355 Training Mode, students spend a month developing the quality for surviving in the wild, a process that can strengthen their professional qualities, and train them in team spirit, cooperative sense, resistance to frustration, and self-challenge. Sending students to the forefront of production enables them to withstand the test of a role change, and strengthens their will and spirit. They can learn from the industrial workers some professional qualities that cannot be learned at school such as dedication, teamwork, quality awareness, service minds and cooperative skills. Third, it helps to enhance students' practical abilities.

During the 335 phase of 737355 Training Mode, students are required to go to the forefront of production. The integration of theoretical teaching and practical education can not only effectively overcome the problem that students grow weary of learning theoretical knowledge, but stimulate students' enthusiasm for learning by arousing their interest in new technologies. It can also comprehensively improve students' ability to solve practical problems emerging during production, and provide a more targeted approach to academic study so that students can put their theoretical knowledge into practice, thereby increasing the number of students employed in occupations that suit their training.

## 5 Conclusions

To sum up, in an increasingly competitive situation where higher education flourishes, higher vocational education must adhere to the strategy of differentiated development, which is to implement differentiation in such aspects as school running, positioning, talent training mode, and management, in order to gain an advantage in achieving sustainable development. An effective way to achieve the strategy for differentiated development of higher vocational education is to choose the training mode most suitable for the objectives of training vocational students through conducting research into talent training mode differentiation.

## Efficient Solutions for Business Operations Through Raising Questions — Q10 as a Structured Way of Thinking about Business

Lu Xu

VP of Beijing GuoShun technology Co., LTD, Beijing, P.R. China.100000

(E-mail: Luxu@unisguard.com)

**Abstract:** The Lenovo Q10 management tool is a structured way of thinking about business. When confronting problems, the staffs involved are no longer blindly reliant on experience, but rather first identify the most important problem, and then find its root cause so that they can develop and implement the best solution plan. This paper proposes the problems existing in business operations management, examines the innovations and functions of Q10 management tool and discusses its application. The paper concludes that Q10 can enhance the ability of managerial thinking, improves the efficiency of organisational operations and achieve organisational synergy.

**Key Words:** Business Operations Management; Q10; Function; Application

### 1 Introduction

During the course of corporate development, with the expansion of business organizations and the diversification of its staff, an enterprise's business is becoming increasingly complex and the execution of its strategies becomes increasingly difficult as well. These contradictions will manifest themselves in the smoothness of business operations as well as the efficiency of solving operational problems. Many enterprises have met problems with business operations. When a concerted effort is needed, inefficient coordination always occurs among the business management departments at various levels in an enterprise. Moreover, rapid decision-making at meetings often brings about poor solutions, and repeated occurrence of the same problem always drags the enterprise's business operations into a vicious circle, resulting in a devastating impact on the enterprise.

### 2 Problems Existing in Business Operations Management

The cause of the above-mentioned situation lies in a lack of a common understanding of business within the enterprise. Staff members tend to be self-centered in understanding problems and expressing ideas, leading to endless arguments over certain problems and ultimately making it difficult to reach any conclusion. Being too dependent on experience, they may hastily propose a solution, then draw a conclusion, and finally make a wrong decision.

There are a number of management theories and methods regarding how to solve the problems in this respect, such as Kaplan's Balanced Scorecard method which emphasizes the decisive role of balance in management and the Six Sigma methodology which highlights the importance of data analysis and continuous improvement. However, the problem is that it is difficult for the vast majority of employees to quickly grasp the essence of these sophisticated theories and methodologies, and quickly master the skills to solve specific business management issues.

During the course of managing business operations, many Chinese enterprises which are in the phase of rapid expansion have encountered such problems as how to achieve a unified business language so that communication can be simple and effective and a consensus can be quickly reached and how to quickly tease key issues out of vast amounts of information and thus form an action plan.

Lenovo Group Limited has also encountered such problems in its path toward internationalization. The birth of the Lenovo Q10 management tool provides great impetus for solving the above problems.

The Lenovo Q10 management tool is defined as a structured way of thinking about business which is a question-driven management tool centering on 10 questions (see figure 1). These 10 questions are in a strictly logical order, composing a logical closed loop. Under the guidance of this management tool, users, through five steps (see figure 2), can unify the logical starting point, think over the questions with a rigorous logic, quickly reach a consensus and execute the best solution. The Q10 management tool can not only help its users deal with business issues, but can also improve its users' managerial thinking ability by enhancing the five key thinking skills which are systems thinking, logical thinking, creative thinking, action thinking, and learning thinking respectively.

Figure 1 The Lenovo Q10

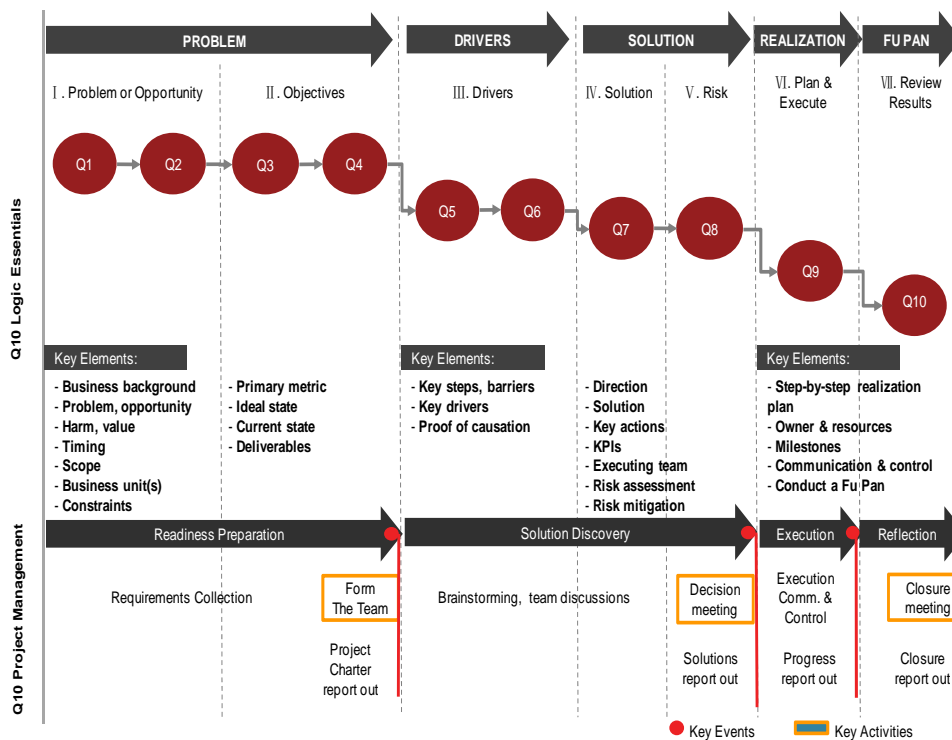

Figure 2 The Framework of the Lenovo Q10 Management Method

The Q10 management tool focuses on two fields, the first of which is about how to identify the fundamental problem influencing the business and how to enhance the effectiveness of solving the business problem, that is, “do the right things”. The other field is about how to develop effective solutions and resolutely execute the solutions to improve the problem-solving efficiency, that is, “do the things right”. Lenovo has been attaching special importance to the use of Q10 to improve the effectiveness at work.

### 3 The Innovations and Functions of Q10

Unlike other management tools, Q10 has the following innovations. First, it enhances the ability of managerial thinking rather than mere managerial skills. Its innovation is to train people's thinking ability, and to equip people with a scientific way of thinking instead of some specific management tools

confined in certain circumstances. This kind of managerial thinking, if internalized by an individual, will become a good tool of thinking and acting by changing his mode of thinking, and benefit both his work and life.

Second, Q10 can cultivate similar logic thinking abilities to avoid the conflicts generated by cultural differences. In the area of business management, holding similar modes of thinking by the two sides is an effective way to avoid cultural conflicts. This rule is applicable to people from different geographical areas both within in a country and around the world. For an enterprise that is expanding globally, this rule gives it the opportunity to reduce the impact of cultural differences on its teams that come from different countries and regions, and to facilitate the communication and integration between international teams within the enterprise.

Third, the popularity of Q10 within an organization is very important in improving the efficiency of organisational operations and in achieving organisational synergy. The use of a common language to discuss business issues at meetings can prevent arguments. Moreover, owing to the consensus on the problems and the causes, the efficiency of decision-making is dramatically improved, and a closer collaborative relationship between executors is also established. This is a characteristic that many other management tools lack.

With its growing popularity, Q10 has played a very active role in enhancing one's managerial capacity because it can

1) bring managers back to organisational rationality

When a manager makes a mistake in decision-making, people tend to believe that the manager is ill-considered, opinionated, subjective, domineering, etc. It is the irrational decision made by the manager that makes people believe so. Under the guidance of Q10, however, the manager and his teammates will think and act more rationally, and the manager is expected to shift his attitude toward decision-making from overriding all objections to pooling the wisdom of the masses. Q10 thus is the guarantee of right decisions.

2) promote organisational harmony

The basis for harmonious operations is to promote the business in strict accordance with the logical closed loop of Q10. Each participant can exert his or her strengths on a certain logical node, and enhance his or her sense of honor and identification with the organization.

3) present implicit information

When a manager uses Q10 to help his subordinates comb through amounts of information, through raising the 10 questions, he can instruct his team to consider such questions as how things are going, what kind of questions they should answer, and who the stakeholders are. Those questions are clearly presented in the logical order of Q10, which makes all kinds of information, especially the information valuable for promoting the business, presented piece by piece.

4) promote the implementation of corporate culture

Culture influences individuals in a way which goes like values - way of thinking - behavior - results. Many enterprises only concern themselves with the agreed values, but neglect the fact that changes in the way of thinking go prior to the changes in behavior. Q10 provides an effective tool for managers to change their ways of thinking. For example, as to the question of how to think clearly, Q10 provides a unified way of thinking that can go beyond mere cultural slogans and effectively promote the implementation of corporate culture.

#### **4 The Practice and Application of Q10**

Guided by these 10 questions, Q10 can shorten the duration of any meeting, encourage good teamwork, and make plans reasonable. When confronting problems, the staff involved are no longer blindly reliant on experience, but rather first identify the most important problem, and then find its root cause so that they can develop and implement the best solution plan. The following case is a typical example of Q10's application in Lenovo's business practices.

There was an occasion when some Lenovo channel sales managers reported to the general manager that the inadequate number of sales promotion materials had affected sales performance. The general manager asked the sales promotion department to solve this problem as soon as possible. The sales promotion manager drafted a plan to issue an additional 50% off sales promotion materials, and submitted the plan to the business director who doubted the high costs of the plan. He believed that an additional 50% off sales promotion materials would bring an 50% increase in the budget for issuing promotional materials, and there was no supporting data regarding how many materials were needed in

actual sales promotion and how many more materials were needed. Under this circumstance, the business director invited a Q10 promotional team who could help tease out a solution to join the project.

Following the logic of Q10, the project team started by answering Q1 which is "What is the business problem or opportunity?", and gradually carried out their discussion of the problem itself. After an in-depth discussion about the background of the problem, the business leader's demands and the problem's impact on business, the project team determined that Q1 was about how to enhance the management of sales promotion materials to meet the business needs.

When answering Q2 which is "What is the scope of the problem or opportunity?", participants defined the scope of their problem by drawing a flow chart (see figure 3), and found that the real users of sales promotion materials were the Lenovo dealers who were responsible for store sales. After discussion, they set dealer satisfaction with the number of sales promotion materials as the main measurable indicator, and used the ratio of the amount of sales to sales promotion expenses as an auxiliary indicator. After identifying the measurable indicators, the project team, through research and statistical analysis, then determined Q4 which is about the status quo and the objective of the indicators, that is, the main objective of the project was to raise dealers' degree of satisfaction with the number of sales promotion materials by 20% from 3.2 to 3.8.

Figure 3 The Sales Promotion Materials Distribution Process

With dealer satisfaction becoming the focal point, the project team began to answer Q5 which is "What are the critical barriers?", and Q6 which is "What are the critical drivers for each barrier?", in order to find the root factor affecting the achievement of the objective.

Through analysis of Q5, the project team found that the unreasonable distribution of sales promotion materials had resulted in two types of low-degree satisfaction with material distribution. On the one hand, the inadequate number of promotional materials had resulted in low-degree satisfaction with the number of materials. On the other hand, even though the promotional materials had been adequately distributed, the dealers remained unsatisfied. One reason was that the promotional materials of various kinds were distributed far too frequently. Moreover, the huge number of dealers, as well as the negligent supervision of regional managers over distributors, led to the situation where a number of promotional materials had not been distributed timely, and some had even been left in warehouses by the distributors. The other reason was that the designing of sales promotion materials needed to be improved. The poor applicability of the designed materials prevented the distributors from distributing the promotional materials. For example, some dealers' stores were too small to use the uniform-sized promotional banners issued by the headquarters.

Based on the above findings, the project team eventually worked out Q7 of "What is the best solution?". The solution aimed at improving the designing of the promotional materials, enhancing the supervision over the distribution process and maximizing the efficiency of distribution. The solution also focused on the use of means of information technology to develop a new webpage for informing all regions, distributors and dealers of the latest materials. What matters most is that dealers, after receiving the materials, needed to confirm the types and quantities of received materials via the webpage, in order to give their feedback on the applicability of the promotional materials.

To ensure the desired effect of the solution, the project team assessed the risks of the solution by answering Q8 which is "What are the risks associated with selected solution?". The team used the risk matrix to rank the three key risks, and designed a risk avoidance strategy. In the wake of the risk assessment process, the project team developed a detailed implementation plan which included the development of the information system, the adjustment of the distribution ratio, the improvement of the management mechanism and so on, by answering Q9 which is about implementing the plan and about monitoring the key points of the implementation process.

Six months after the beginning of the project, the project team answered Q10 of "What are the final achievements?". According to the survey results, the degree of satisfaction with the number of promotional materials had surpassed 3.8 and reached 4.05, a level achieved with no increase in promotional expenses. Q10 had saved an ineffective input worth several million. More important, it had effectively improved the sales performance by determining the root of the problem.

## 5 Conclusion

As an effective management tool, Q10 plays an important role in solves the problems existing business operations management. It is a good tool to change the usual mode of thinking. However, the goal of changing the usual thinking mode of business managers and employees cannot be achieved overnight, which means that Q10 can only bring a gradually-advanced change to enterprises. The core of the problem is to persuade the staff, especially the managers at all levels to accept, apply, and spontaneously popularize this management tool among their team members.

**Abstract:** The paper based on the national psychological problems which under the China's current social management, applying positive attitude of national horizon to probe the social management innovation. The positive national mentality is important in social management, it's the social psychological foundation of producing social management effectiveness, it can prevent and reduce the social risk, promote social harmony and stability, and it's also the aim of the social management. Finally the paper put forward some new ways of social management innovation, like construction of advanced culture, national mentality monitoring, the construction of persuasion system, the creation and perfection of social management, the construction of social management team and the cultivating and shaping the positive national mentality and so on.

**Key words:** Positive national mentality; Innovation of Social Management; System theory

## 1 Introduction

In the high speed development of economy society, in the modern countries "growing pains", the national psychology and social management innovation become the important subject and mission of contemporary Chinese academic research.

Since the reform and opening up, because of the high-speed development, the sharp and profound changes from the economic structure to the way of life have an all-round, high density of strong impact to national psychology and national mentality. Chinese national should digest and bear the social adapting pressure and experience the psychological transformation in 30 years as the westerner in 100 or even longer time. Such great contrast bring the public's pressure of psychology unbalance times of superposition. It needs the whole society to finish the psychological deconstruction and mentality reconstruction which is extremely hard together, china is experiencing the "growing pains". It's the period that all kinds of deep social contradictions highlight, it's also the period that social management become more difficult day after day, and become more difficult to coordinate the relationship of interests. The way and pattern of single social management which under the unit system society can not adapt to the contradiction and risk of the multiple society, social management innovation to be strengthened.

At present, there are only a few researches about national mentality combination with social management innovation, just in several pieces of sporadic articles. Ai Yiwei put forward the public psychological is the important ideas to strengthen the social management innovation; Liu Mingwei present the social management innovation ability should start from "heart", its value is fostering good social mentality; and Ma Xianxin proposed the social management should be paid close attention to the construction of mentality, and try to reflect fairness and justice and to construct the rational spirit.

The paper plan to theory discuss which is based on the national psychological problems which under the china's current social management, applying positive attitude of national horizon to probe the social management innovation, so to find another way to optimize the social management effect.

## 2 National Mentality and Positive National Mentality

For the national psychology, scholars pay attention and explore from different angles. About the concept definition, the famous sociologist Shao Daosheng put forward "national mentality is a 'combination' of regard, emotion and behavior of a country's social members in certain social development period, it's "the sum" of psychological reflections of social existence by the national<sup>[1]</sup>. As the reflection of social existence, the national mentality is both direct connected with economic social development and influenced by social history and culture.

The positive is index of positive psychology. So "Positive national mentality" can be concluded a concept about the positive character and positive mentality of the nationals. It's a collection of the nationals' emotion tendency, behavior tendency and understanding tendency which are positive, and follow history current in an age. The former chairman of American Psychological Association,

psychology professor of University of Pennsylvania and one of positive psychology movement advocates Seligman mentioned in Structuring human advantage: be psychology forgotten mission in 1998, there are three missions of psychology: to study the negative psychology to treat the human spirit or psychological disorders; to enable human to live more abundant, enrich and meaningful; to identify and cultivate the talented person<sup>[2]</sup>. Meanwhile, Seligman pointed that: when a country of a nation was puzzled by starvation and war, the primary mission of social science and psychology is treatment; but when the society is peaceful, it become to make a better live for the people<sup>[3]</sup>. Thus, psychology divided into two aspects: pathology psychology and positive psychology. Positive psychology is a discard to pathology psychology, it is “a science dedicated to research the human’s positive qualities, like development potential and virtue and so on”, it is also the science need to develop in the period of peace.

The concept, Positive national mentality, is an extended based on this context. One of its theoretical foundations is positive psychology. The research of positive national mentality include the theory studying, evaluation and way of guiding, it’s a system which involve in anthropology, cultural studies, sociology and psychology.

### **3 “Growing Pains” and the National Psychological Problems in Current Chinese Social Management**

According to historical experience and social psychology, when a national economic develop into Per Capita GDP 3000 dollars, it will be the golden period of economic swift development, and it’s also the period that all kinds of deep social contradictions highlight. The nation faces with “growing pains”.

Since reform and opening, China’s economy developed successful, but lace of emphasis on national psychology and ideology. It formed “richer in material life, and more urgent in spiritual exploring.” The national mentality tends to bad. The book, Modern Spirit Trap: the Evolution of National State of Mind wrote by Shao Daosheng, analyzed and summarized six morbid social psychologies in China: “addicted to desire for material wealth”, “unreason group restless”, “indifferent humanity”, “vulgarizing”, “irresponsible” and “false exaggerating style”. Due to national psychology problem, now in China the social contradiction are prominent, group incidents, public security, and individual suicides happened more frequently. Those influence the individual healthy growth and development, the complement and happiness of family, the social stability and social basis of the party. The reason that leads to bad national mentality and emotion is complicated and varied. The deep reasons to result the unbalance or morbid of national mentality mainly are income gap, unfair distribution, legal limitations and moral weakening, etc.

## **4 The Value of Positive National Mentality for Social Management**

### **4.1 National mentality is the psychological basic of producing Social management effectiveness**

The deepest lever of social management start from mentality, good individual mentality is an important sign of perfect personality and health of a person, positive national mentality is an important condition and psychological foundation of orderly operation and harmony of a society. Only grasp the social management objects wholly, the manager can define the management goal, strengthen the management defectiveness. Social management effectiveness can be displayed by the achievement of social public policy goal and social management expected effect. National mentality can be displayed by the national’s value orientation, emotion attitude, thinking mode and behavior mode. It can influence the national’s behavior orientation and Decision behavior. Different national mentalities could affect the national and let them to form different recognized and behavior mode about specific problem .It could let the actual social management express different effects. Positive national mentality can lead the people make rational decision, then drive the social management go forward follow expected goal and get expected effect. While negative national mentality will make negative effect to the social management. It may bring the reduction and failure of social management function.

### **4.2 Positive national mentality To prevent and reduce the social risk, promote the social harmony and stability**

National mentality is the weatherglass of social stability. Positive national mentality helps to maintain social stability. After 30 years, the economic of China developed speedily; the economic social structure had been changed deeply, a lot of social contradictions will inevitably appear mostly. Chinese society enters into a high-risk period. If use improperly, it may fall into “the trap of Latin- American”, then influence Chinese social harmony and stability. The prevention and mitigation should be taken to

deal with the crises lead by risk society. “The twelfth five-year plan” made it clear that “cultivate strenuous enterprising, rational peaceful, open inclusive society”. The country attach high importance to social mentality, it’s the important embodiment of people foremost and scientific development, it’s also the important action to prevent and reduce social risks, and promote social harmony and stability.

#### **4.3 Positive national mentality is the aim of social management**

The fundamental task and goal is to coordinate the social relationships, standardize behaviors, conciliate conflicts, promote justice, maintaining stability, etc. To build a positive national mentality is correspond to the aim of social management. Positive national mentality is the important psychological foundation to promote the progresses of individual, society and the nation; it’s the important part of national cultural soft power; it’s also the objective to achieve by social management. If there have positive national mentality, lots of social management problem will be solved.

### **5 From the Perspective of Positive Attitude Horizon Social Management Innovation Path**

#### **5.1 Strengthen advanced thought culture construction, innovate social management concept**

The running of a society can not only rely on system, but also depend on constraint of the mind. To restraint the mind need idea, culture and morality. After all, the reason that bad social mentality and emotion exist is lack of support by scientific belief and value guidance by advanced thoughts and culture. Thought and culture system come from social psychology. It also leads the social psychology and social management. Social management should pay attention to make and advocate the leading values and the inheritance and cultivation of excellent culture. Social management should lead people to use right position, viewpoint and method to observe the society, to use tolerant attitude to see and handle problems, to use culture inspiration and immersion to construct reason spirit and put spiritual home. Then people can “ like their food,clothes, residence and entertainment”.

Now, it must develop the socialist culture more prospective, construct Chinese nation’s common spiritual home and bring socialism core value system into play its function of leading, encouraging and adjusting to strength and to innovate social management. According to the social development and public need, contain the service in management, incarnate the service in management, and realize the management in service. Meanwhile, to pay attention to strengthen the self-discipline of social manager, unify the self-worth and social value to keep up the social consensus and social trust. China’s social management must take order of idea “people foremost”, stick to combine “hard management” and “soft management”, the “moral rule ”and “legal rule”, set the idea “service first and take the service in management ”up and achieve the humanization,socialization, refinement, informatization and systematization of social management.

#### **5.2 To create and perfect the social management institution, to promote the scientific level of social management endlessly**

Now institution construction is key point of strengthening and creating social management. It has overall importance , basic , decisive function about social management. It can achieve scientific level of social management and then provide to maximize public benefit and make good rule of society. China’s institution construction appear sold out and vacuum on condition of quick development of economic and society .Now our social management institution is distemperedness ,lack of standardization and not scientific and it makes many uneven problems. Those problems have become prominent problems in China’s social management .So we should put to create and perfect the social management institution as first things. Now we should stick to combine providing social stability direction and providing social justice in making up new social management .We should construct a effective dynamic regulation and mechanism to resolve all kinds of contradiction and problems ,as while as to pay attention to institution arrangement justice. We need to construct righteous legal system open social system distributed system.

#### **5.3 To strengthen system construction of psychological monitoring and channelize, to create new channels of social management endlessly**

National mentality is the psychological foundation of social management effectiveness. “Know the mind, is goo and save the lost”, only master the trends and evolution of national mentality completely, know the psychological demands and way of acceptance, the government can innovate social supervisor mode with time, enhance the management.

So, there should build a national mentality evaluation index system, strengthen the monitoring, evaluation and warning, improve the national psychology counseling and adjusting, promote the communication way of national emotion expression unimpeded. Now ,Chinese positive mental health

seminar has finished the manufacture of measuring table of positive mental of qualities Students in middle and primary schools, university students and adults(see table 1)。The table use the Likert scale to mark and construct computer measuring system. It has good reliability and validity and is the important tool of measuring, evaluating and researching the positive national mentality<sup>[4]</sup>.Based on this, to innovate the social supervisor mode and way need to encourage public participate, people oriented, to speed up the institutions of the classification reform, guide and stress the enterprise to bear more social responsibility, and develop the social organization and community building. We need to strengthen the informatization construction, be good at use the most advanced idea, the newest technology, the freshest utterance, the popular tact to win the widest support of the nation, finally to get significant results.

**Table 1 The 3 Measuring Tables of Chinese Positive Qualities**

Six dimensions	15 qualities of Students in middle and primary schools	20 qualities of university students	20 qualities of adults
Wisdom(cognition)	Creation; in pursuit of knowledge; thought and insight	Creation; Curiosity; Love study; thought and insight	Creation and Curiosity; Love study; thought and insight
Courage(emotion)	Sincerity; dedication	Sincerity; to persist bravely; passion	Sincerity and fixure; Bravery and passion
Kindheartedness(interpersonal)	Love; Friendly.	Feel the love; Love and kind; wisdom of relationship	Friendly; wisdom of relationship
Justice(citizen essence)	Leadership; cooperation	Leadership; Team work; fair	Leadership; cooperation
Temperance(self-control)	tolerance modest cautious	tolerance modest prudence self-control	Tolerance and modest prudence self-control
to surpass(spirit )	To touch the string humorous Belief and hope	To touch the string humorous Belief and hope	To touch the string humorous spirit belief Optimistic hope

#### **5.4 To strengthen construction of social management team and to improve the relations between the cadres and the masses and public credibility**

Social manager will face public directly in management cross ,so their behavior and working effect will affect public and their bad working style and behavior way will produce and expand the bad national mode and mentality. Those bad national mode and mentality severely affect the relations between the cadres and the masses and public credibility of government, and deeply affect the effective of social management finally. Now some officers' nonfeasance, malconduct and even many illegal action like power-see-rent and power-money deal lead to many bad social general mood and social mentality ,such as enemy officers , enemy rich and universal weak tendency mentality. So if we want to complete the social management job, we must strengthen construction of social management team firstly. The important thing is to do the self-discipline construction and profession training, to raise their political consciousness and working ability ,modify the working style and to provide the social consensus and Social trust . Specially ,we should work the official morality education and continue the anti-corruption uncompromisingly.

#### **5.5 Cultivating and shaping a positive national mentality, making the essential target of social management come true in peaceful period**

“Positive” comes from Latin “positum”, means “practical” and “potential”, it’s an “object” inevitable power which construct on the basic of the understanding of social adjust and human well-being. A society just put “positive” as the fundamental value, this society could be a effect, adjust and humanistic. When the society is in the peace period which is stable and flourishing, the social culture will pay particular attention to the positive of individual and group, such as creative, good moral character and high quality living conditions and so on . China is in the period of peace and renewed, cultivate and shape the positive national mentality conform to “positive”, it also conform to the essential aim of social management in peace. The final aim is lead all the social members to live the happy life.

Nowadays , social manager should lead the nationals to put up good spirit appearance, to construct

positive national quality. So they need to cook true “Chicken Soup for the Soul”. They should create a justice social environment for strenuous mind, a democracy and legal system social environment for reasonable and gentle mind and a harmony without sameness social environment for open and forgivable mind.

## 6 Conclusion

The paper discusses the theory of social management innovation from the angle of positive national mentality in another way. It raises some new ideas like to manage the social from construction of advanced culture, national mentality monitoring, the construction of persuasion system, to create and perfect the social management institution, the construction of social management team and the cultivating and shaping the positive national mentality and so on, and it's not enough. The writer think there should be deeper research and discuss in portray of basic concept and theory, the combination of Chinese traditional culture, the construction of national psychological basic database which is extensive and broadly representative, and the communication and cooperation with other objects. I think we need to unfold deep research and discuss in clearing out the basic theory, clearing up the traditional culture resource, constructing the basic database of national psychological problem and the communication and cooperation with other courses.

# The Establishing of University's Full-Four-Process Entrepreneurial Education Model\*

Li Dongmei

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail:bluesky2578@163.com)

**Abstract:** Establishing entrepreneurial education is a new-born requirement in university, for the development of the society raises the standard for the revolution of the whole education system, besides it is also the international trend throughout the world. This paper, firstly, introduces the thorough circumstances of the development of entrepreneurial education in advanced country as well as in China, and analysis the problems in it. Secondly, the paper summarizes and specifically analysis the main model of entrepreneurial education in Chinese universities, combined with the market surveys and the experiments of entrepreneurial education in Wuhan University of Technology of China, brings out the Full-Four-Process entrepreneurial education model, made up with the wake-up of entrepreneurial conscious, entrepreneurial ability establishment, experiment and training and track service. This model is more full-rounded and systematic than the traditional one, which will be beneficial to the establishment of entrepreneurial talents.

**Key words:** Market survey; Full-Four-Process; Entrepreneurial education model; Curriculum system

## 1 Introduction

In 1947, Harvard Business School started the first curriculum of entrepreneurial Management of New Enterprises which was generally acknowledged the earliest college entrepreneurial education<sup>[1]</sup>. The governments have introduced the supporting policies to provide the financial support for innovational entrepreneurial education and some developed countries have formed a relatively mature enterprise and enterprise support system. At the same time, they held large-scale innovational enterprise competition and project to encourage college student to establish innovational enterprise. Entrepreneurial education has permeated every level of the national education in many countries. In college, they emphasized the innovational enterprise practices of formed a systematic educational model. According to statistics, there have been more than 1600 colleges started 2200 curriculums of entrepreneurship in America and 86% enterpriser in the most outstanding public companies and high-tech enterprises have accepted entrepreneurial education<sup>[2]</sup>. Some developed countries like UK and France and some developing countries like India and Thailand, all of them have started curriculum of entrepreneurial.

In the practice of entrepreneurial education, China started it in the early 90s. The first action of Chinese college students entrepreneurial education was the "Enterprise Plan Competition" held by Tsinghua University in 1998. Though years' of hard work, China has gained a stage achievement in entrepreneurial education both in theoretical and practical. However, it still exist many problems, such as they pay a lot attention on organizing "Enterprise Plan Competition", joining "Enterprise Designing Competition" and setting enterprise centre, imperfect designing of curriculum of entrepreneurship, deficiency of entrepreneurial education teachers and professional institutes and officers etc. This thesis is about establishing the whole new entrepreneurial education model—the Full-Four-Process entrepreneurial education model catering to the problems that exist in Chinese university's entrepreneurial education.

## 2 University's Entrepreneurial Education

Entrepreneurial education is the kind of education process based on the innovative education and creation education, during which the entrepreneurship, entrepreneurial qualities, skills and characteristics are the most emphasized contents for the development of entrepreneurial type versatile talents of students. Through the cultivation of entrepreneurship consciousness, basic knowledge, and first-hand practice, it can allow students equipped with the knowledge, skills and characteristics required for the future vocational activity, in a more entrepreneurial way. And at the same time, it can teach students to have the consciousness and spirit of pioneering work and the mentality of entrepreneurs, for

---

\* This paper is supported by the 2010 teaching and research project of Wuhan University of Technology.

the main purpose of this education is not only direct students to start their own businesses but ,more importantly, to foster the positive entrepreneurial attitude and spirit. Entrepreneurial education is the further step of Innovation education, it makes Innovation education more.

In America, entrepreneurial education model divides different curriculums in order to instruct students for differentiated needs on the basis of the recipients' age, philology and knowledge spectrum. What is more, it has been equipped with comprehensive curriculums and stable professional faculty. The entrepreneurial education in Singapore's university adopts diploma education model. While in Australia, entrepreneurial education adopts divided-layer model in curriculum structure. And in China, we mainly have four types, but all four types have one weakness, lack of systematicness as well as relevance, together with uncomplicated curriculum system.

### **3 Entrepreneurial Education Model in Chinese Universities**

#### **3.1 Traditional talents cultivation of entrepreneurial education oriented in the cultivation of the conscious of entrepreneurship**

In China, the general environment of entrepreneurial education in universities is that most of them are following the traditional entrepreneurial education path which oriented in the cultivation of the conscious of the entrepreneurship. Which mainly depends on the wide spread activities, such as enterprise plan competition, entrepreneurial seminar, minor curriculums, or simulation of entrepreneurial, etc to initiate entrepreneurial education, which focus on the light-up of students' entrepreneurial conscious and teach them the basic knowledge.

#### **3.2 Talents cultivation model of entrepreneurial education oriented in the cultivation of the skills of entrepreneurship**

The second model is the new cultivation model of entrepreneurial education which oriented in the development of skills of entrepreneurship, universities which apply this kind of model usually have its own entrepreneurial center or entrepreneurial science-technology park, which cater to the cultivation of the actual entrepreneurial skills of the students, such as Bei Hang University, applies business operation, establishes university entrepreneurial park, allows students to learn how to start their own business through training and experience. At the same time, they also establish institutes which specially support them with fund and consultancy service.

#### **3.3 Capable person cultivation model characterized with the improve of teaching ability**

The third model is the new cultivation model in entrepreneurial education characterized with the improve of the teaching ability. Such as: in Renming University, they give equal attention to the revolution of both the first classroom as well as the second classroom either, and strength the general ability of students. In the first classroom, they enlarge the percentage of the minor curriculums, and add entrepreneurial education series courses, form experimental groups which depend on the major knowledge, and organized by social groups. What is more, in Heilongjiang University, with the core emphasize in the improve of teaching ability, they initiate students' entrepreneurial education, explore "major plus entrepreneurship" combination model and the "major plus industry plus entrepreneurship" embedded new model; establish the entrepreneurial education system—faced with the general environment, based on major, divided cultivation and emphasize experiments. However, this kind of model is more inclined to focus on the theoretical level.

#### **3.4 Capable person cultivation model characterized by area**

The fourth model is characterized by area, which utilize the specific area advantages as well as economy development and resources advantages to initiate the entrepreneurial education. Just like Wenzhou University, who efficiently utilize its area advantages, as Wenzhou is famous for its small businesses and start-up companies, to initiate its students' entrepreneurial education, which is really flagged with its area characteristics, focusing on the development of specialized entrepreneurial workshop to initiate entrepreneurial education. And this kind of model is more deal with the experimental level.

### **4 An Introduction of the Full-Four-Process Entrepreneurial Education Model**

In recent years, the Wuhan University of Technology are on the road to initiate our university students entrepreneurial education, and have made our own contribution to its theory research, and in 2008, successfully applied the innovative person cultivation(entrepreneurial education) experimental zone of education bureau, and clarified our instructive value of entrepreneurial education and the experimental zone of the university: led by science development value, stick to the principle of focusing

on the cultivation of person, respect of individual differences, encourage variety, emphasize in divided instruction, focusing on cultivating the innovative spirit and entrepreneurial conscious of university students, moreover, develop students' entrepreneurial capacity and ability, take the advantage of the industry basis, and establish through entrepreneurial education service system gradually, besides be beneficial to students' full-rounded development, and continually to improve the quality of the cultivation of students. At the same time, within the entrepreneurial service system, there are contents, service type, establishment of operation security system, and the cooperation with all the other aspects in the society.

On the basis of the survey on the entrepreneurial education abroad and at home conducted by Wuhan University of Technology, combined with the instructive idea of entrepreneurial education, we bring out the idea of establishment of thoroughly new Full-Four-Process model of entrepreneurial education in universities, which specifically present in figure 1.

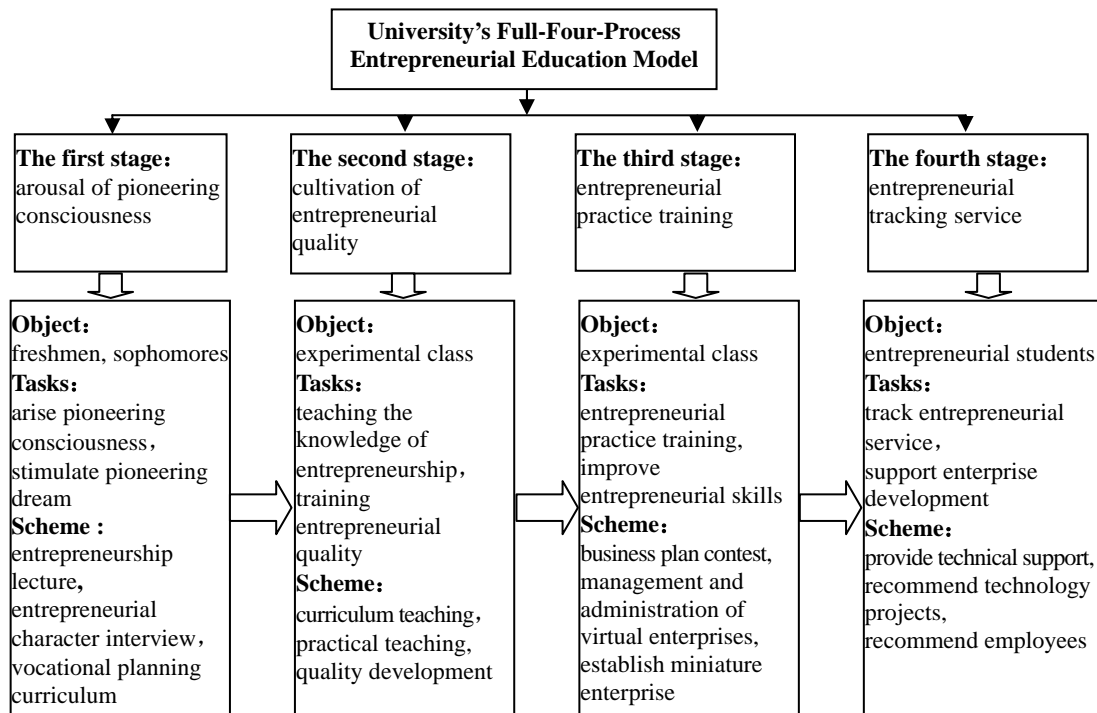

Figure 1 University's Full-Four-Process Entrepreneurial Education Model

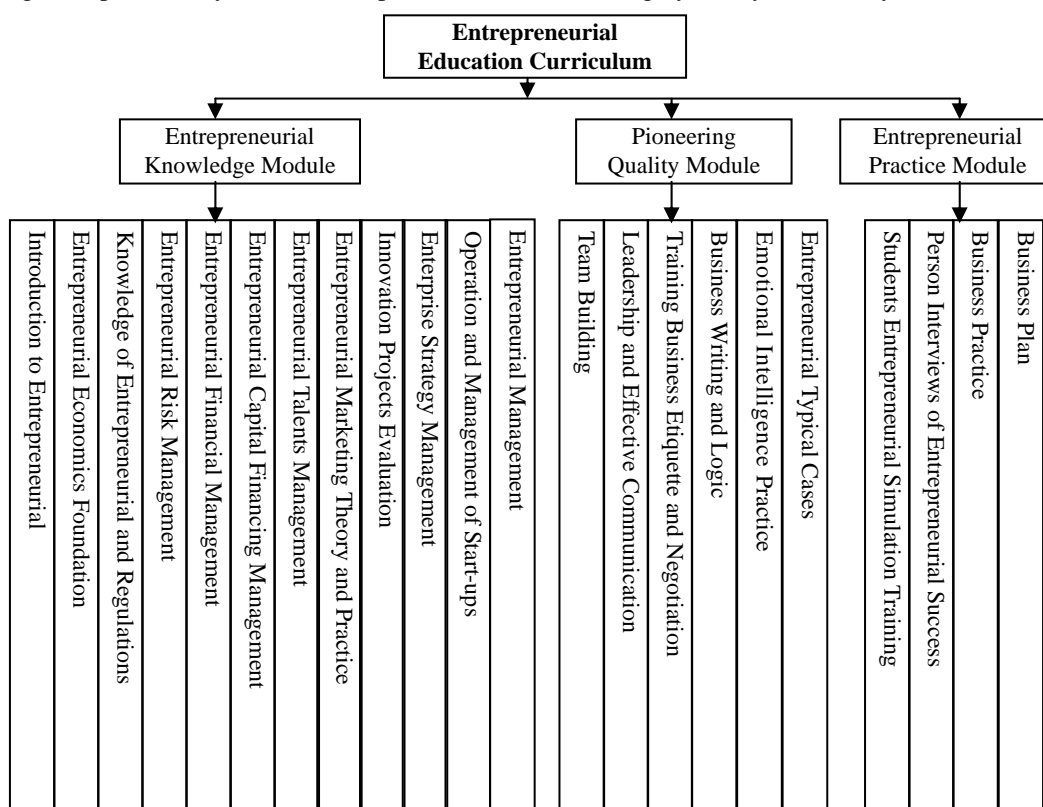

#### 4.1 Process one: the wake up of the conscious of entrepreneurship

This process mainly targets freshman and sophomore, in this process, through courses, seminars, competitions etc, to cultivate a kind of entrepreneurial atmosphere, which aims at lit up students' entrepreneurial passion. Specifically, curriculums can also be related to the education of vocational development, through these vocational courses, students can know themselves, tell the circumstances, and have the right vocational position for them, and at the same time be realized about themselves' advantages and disadvantages. What is more, by opening "university students KAB entrepreneurship basic" courses, we can wake up the conscious of entrepreneurship of students from all aspects. In this process, we also should invite some experts, scholars, entrepreneurs to give some speeches to the students regularly, tell them the importance of entrepreneurial education, by analyzing what kind of person this society needs, what is their harsh employment environment right now, the environment of start their own companies, and introduce the experience of company's management development and their company starting experience, which all aiming at arouse the importance of entrepreneurship conscious within students' hearts. Only by the nutriment of students' ideas, can the students' concepts be changed, and then cultivate the campus entrepreneurial culture. Moreover, through all these activities, like successful elite interviews, start-up company plan competitions, vocational evaluation, etc, to lit up students' entrepreneurial passion, and pick some students who equipped with entrepreneurship conscious and promise to send them to experiment class of entrepreneurial education to receive systematic learning and training. In this process, the recipients are massive and usually relate to low

grade students.

**4.2 Process two: the cultivation process of entrepreneurial quality**

In the operation of entrepreneurial education experimental class, all students should receive entrepreneurial education theories and improvement of entrepreneurial quality which equipped students with the basic entrepreneurial theories, knowledge and good qualities as well as potential to start. All the students will receive full-rounded, systematically and specially targeted courses catering to that we have designed a whole new entrepreneurial education curriculum system, made up with knowledge, quality and practice, specific contents are present in figure 2. After finishes all the required courses, students can own minor management degree, then, I will explain the above three patterns: firstly, knowledge pattern, mainly includes the basic knowledge, such as management science, economics, law; secondly, quality pattern, mainly relates to the cultivation of entrepreneurship related qualities, including interpersonal communication, cooperation management, organization development, business etiquette, etc. thirdly, practice pattern mainly focus on the application of what the students have learnt, containing imitate entrepreneurship process, entrepreneurial practice and training, etc. All three patterns take effects all together, periodically and cultivate potential students thoroughly and systematically.

**Figure 2 Entrepreneurial Education Curriculum System**

Although all these patterns are performed as curriculums, but they are dramatically different from traditional one, while put attention on the knowledge acquirement, it more focus on the improvement of students' comprehensive abilities and qualities, and the most essential thing is the nimble usage of knowledge. And in the teaching process of knowledge, we generally apply case research, group discussion, simulation business, etc. teaching methods, based on the combination of theory and actual facts, views and cases, utility and operation as well as China's environment and specific entrepreneurship programs, drop void theoretical explanation, in the contrast, through analysis and discussion of vivid variety of cases between teachers and students as well as participation play, the new method can help the students to acquire comprehend and apply the entrepreneurship knowledge quickly.

What is more, in the teaching process of entrepreneurial quality pattern, we divide quality into different teaching minor patterns with different contents, and each pattern has its own settled learning hours, which enables students train Periodically until they actually able to apply practice teaching method, lead students to the real entrepreneurial training, or may even make a real start-up business

attempts with students.

Within the quality cultivation process, knowledge pattern and quality pattern account for most part of curriculum system, the teaching of entrepreneurial knowledge and the formation of the entrepreneurial quality are the most important entrepreneurship consciousness, and the quality cultivation process applies to elite education model.

#### **4.3 Process three: practice training process**

Through opening entrepreneurial practice classes, organize series of entrepreneurial practice activities and lead college students to participate in the enterprises' practice based on major advantages. Through entrepreneurial simulation platform to initiate entrepreneurial practice and simulate enterprises' management operation. Through entrepreneurial practices and first-hand experience led by experts' instructions, it will immensely improve students' entrepreneurial ability from all aspects and by all means.

The practice and training process is the implementation process of the whole curriculum system in figure 2, which also targeted the students from entrepreneurial experimental class.

#### **4.4 Process four: followed entrepreneurial service process**

During the process of pioneering work after students' graduation, university will keep on providing support to them with followed service, such as technology, training, management, elite employee recommendation, etc, in order to raise the success ratio of students' pioneering work.

Besides, other services are also include drawing successful student entrepreneurs back to university to help for nurturing the pioneering work of college students cooperation, and the fourth process is an important part for the sustainable development of entrepreneurial education in college and is also a essential part for university to draw investment and cultivate related teachers.

## **5 Conclusions**

Based on wide survey and the pioneering work education exercises of Wuhan University of Technology, this paper brings out the Full-Four-Process pioneering work education new model, compared with the traditional one, this new model is characterized with comprehensiveness and systematicness, and it not only beneficial to the development of students' comprehensive quality and employment competitiveness, however, in reality, cultivate numbers of innovative elite who has actual pioneering capacity.

University's pioneering work education is really essential to our country's innovation project and future economy. But in order to achieve great results, pioneering work education in university should put attention on the following these aspects, apart from the breakthroughs on the model of pioneering work: 1) Put attention on the recruitment and cultivation of the pioneering work education faculty. 2) Cultivate great entrepreneurial atmosphere in campus. 3) Establish entrepreneurial education practice base widely. Universities should emphasize on the entrepreneurial practice activities, for the cultivation of entrepreneurial quality and capability depend on practice.

## “Five-dimensional Model” of Marketing Management

Liu Junlin

Beijing Kedinglong Technology Development Co., Ltd. Beijing, P.R.China, 100191  
(E-mail: ljl@kdl.com.cn)

**Abstract:** Management is an important factor for the improving of an enterprise. Along with the development of science and technology, the market competition is increasingly fierce, the management mode also need constantly development. The marketing management innovation is a new goal for marketing improvement. According to the experience of Beijing Kedinglong Co., Ltd for many years, the thesis analyzes the basic situation of the marketing management in modern time and proposed a “five-dimensional model” of marketing management, in other words, the five core elements of marketing management: strategies, patterns, implementation, team and performance, which are mutually reinforcing and influencing. Through the description of this mode and its important practical influence, we can get the conclusion that the “five-dimensional model” is a successful mode for marketing management development.

**Key Words:** Management innovation; Marketing management; Five-dimensional model

### 1 Introduction

China's accession to the WTO provides more opportunities to the domestic enterprise. At the same time, we are also faced with more challenges. How to improve the core competitiveness and promote the improvement of the economic benefit in one company and social benefit becomes a problem need to be solved quickly. As an important part of enterprise development, marketing management is important for improving core competitiveness of one enterprise. So the marketing management model innovation is the first job of enterprise improvement.

To develop rapidly, an enterprise should not only depend on its technical capabilities and production capacity, but also depend on its marketing capabilities which are more importantly. Marketing is a kind of science and art which is about the enterprise how to discover, create and deliver value to meet the needs of certain target markets, and meanwhile, obtain the profits. Marketing management is used to identify the unmet needs, define and measure the size and potential profit of the target marketing, and find the most suitable subdivided market for the enterprise and the suitable market supplies for the subdivided market.

In fact, the reason why the world-renowned Panasonic can get a surprising development is that it established its own position in the process of circulation. There is a saying in Japan, “technological Hitachi, and traded Panasonic”. In the early 1950s, after reorganizing the production systems, Mr. Matsushita immediately established a distinctive distribution network and the method of “installment-based payment” so that the Panasonic had a broad prospect. It is the real meaning of marketing management: a kind of ability to control the market and affect the customers to penetrate toward the circulation field, close to the process of consumption and consumer site.

#### 1.1 Marketing environment changes since reformation and opening up

Since reformation and opening up, our social and economic develop rapidly, we contact and trade with other countries more often. In the process of economic globalization, the competition of marketing is more and more fierce. The competition between different companies is turned from domestic competition into international competition. Industry enterprises marketing in our country are faced with more challenges. Computer network has been more and more common, knowledge technology become an important factor of marketing management improvement. There is knowledge technology everywhere. Economic development promotes the improvement of living standard in our country. The consumption management and consumer demand also change greatly. The consumption ability gradually increases, consumers begin to pay more attention to product quality and personalized consumption becomes mainstream consumption. So there are more chances for the marketing development in our country.

#### 1.2 The meaning of marketing management innovation

The marketing management of one enterprise is different with the internal management of one enterprise. The marketing management is under the market environment, which will change at any time. The development and survival of the enterprise need marketing management innovation. Under the fierce market competition environment, marketing management innovation will remind enterprise

managers to manage the company according to the market situation. The marketing management of one enterprise is not same all the time, it needs enterprise managers learn about market changes at any time and put forward different strategies to make all parts solidify and cooperate well. So the marketing management innovation can make different parts cooperate to improve the profit of the enterprise according to the scientific management strategies and make full use of resource. To develop quickly and sustainably, the administrator of the enterprise need to have the marketing management innovation conception and enough professional knowledge to communicate with their employees well and view the development of the enterprise as the most important work which need to be paid much attention to. What's more, the development of the enterprise is directly connected with the sales marketing, that's to say, the enterprise will be faced with great difficulties and get into hot water once the sales marketing situation is awful. Production marketing is closed related to the sales marketing conception and marketing management. So the marketing management innovation will promote effective distribution of the resources and manufacture products which can meet the need of customers to improve the core competitiveness and make the enterprise develop quickly.

### 1.3 The marketing management control

The table 1 shows the basic aspects of marketing management control. We can see clearly that the main job of different departments in marketing management process.

**Table 1 Marketing Management Control**

Control aspects	Principal	Objectives
Annual plan control	The senior management department	Check whether the project goals realized
Profitability control	Marketing executives	Check where to make money
Efficiency control	Function management department or senior management department	Evaluate and improve efficiency of expenditure
Strategies control	Top management or Marketing auditors	Check whether the company is seeking out the best opportunities in the aspects of market, productions or channels

## 2 The Management of Marketing Strategy

Market competition is one of the basic characteristics of the market economy. The right strategies of market competition are the key for the enterprise to achieve its marketing objectives successfully. If the enterprises want to remain invincible in the fierce market, they must establish the concept of competition, make correct market competition strategy, and strive to gain initiative of competition. Besides, strategic management includes the following contents.

### 2.1 Objective analysis

In the company's early development stage, the market has great products and business development potential and space, so the company should spend a lot of resources, time and effort to develop new products or new business, new markets in order to maintain large enough, the necessary growth or growth speed of the company.

In the middle development stage of the company, the market demand growth accelerated competition, which requires the company improve operation efficiency and strengthen the profit model (or business model, mode of operation) based on value chain of the competition. That's to say, the enterprise must make the purification of the embellish and economic value maximize in order to expand the scale of operation and increase operational projects, which will provide auxiliary pad to the sustainable development of the company. Now, the Beijing Kedinglong Co., Ltd is in the middle development stage, so the most important job for the company is to make profit maximized, in other words, the object at this time is to make the production profit more than other similar companies based on the marketing environment in modern time. According to the statistics, the average profit rate of the Kedinglong company is about 10%, which is more than other similar companies. So the profit rate is tallied with the objective in the middle improvement stage.

In the later development stage, the market is saturated and competition is deteriorated, which requires the company to control cost well, maintain market share and make cash capital backflow maximized to make sure the stability of the company's cash turnover rate and reduce the marketing capital requirement and cost. The table 2 shows the objective in the next 30 years. These indicators are

interdependent and there are expansion mechanism and restrictive mechanism in these indicators.

**Table 2 Objective in the Next 30 Years**

Control items	The first decade	The second decade	The third decade
Sales revenue growth rate( $\cong$ )	35%	25%	18%
New sustainable business sales average rate( $\cong$ )	25%		
Personal capital profit growth average rate( $\cong$ )	10%		
Personal cost reduction average rate( $\cong$ )	2%		

## 2.2 Competitor analysis

In the process of conducting marketing activities, it is not enough for the enterprise just realize their customer. The enterprise should also realize its competitors because only by knowing the others and yourself can the enterprise gain a competitive advantage and win in the business battle.

## 2.3 Target market analysis

After find and select the attractive market opportunities, marketing managers should make further market segmentation and choose target market. Segmenting market, choosing target market and market positioning constitute the whole process of target market and are the core content of the target market.

To find the best target market, the managers should establish the Information collection mechanism and market information channel and contact with the well-known IT enterprises to discover new business opportunities. For an example, an USB portable power supply called Energy Link was paid much attention on the SONY Open House Product launch at Las Vegas in 2007. this charger is turned into power supply, which can be carried easily. According to the introduce of SONY company, this production can support most USB of MP3 player, mobile phones and all kinds of other USB devices, and it will be sale about 35 dollars in this summer. If much effective market information like this can be collected and implemented, the company will find target market easily.

## 2.4 Products analysis

The enterprise's marketing activities should meet the needs of the market, and it can only be achieved by providing a kind of product or service to meet the needs of the market. Therefore, product is an important factor in the marketing mix of the enterprise. The strategic management of the product can directly influence and determine the management of other marketing mix factors, which is vital for the success of the enterprise's marketing management, including: product classification, optimization and adjustment of the product mix, product extension and positioning of the product's competitive power.

## 2.5 Marketing method analysis

The product, produced by the enterprise, only can be supplied to the consumers or users at the appropriate time, place and the right price by a certain marketing method, which can overcome the differences and contradictions between producers and consumers, meet the needs of market and achieve the marketing objectives of the enterprise. It is the key of the successful marketing and the important part of marketing strategy to choose what kind of suitable marketing method for the product.

## 2.6 Marketing plan analysis

Making marketing plan is to conceived vision for the company firstly, and then action, until the plan implementation, so as to ensure the stability and rapid growth of the marketing company. The core of the marketing plan is sales income and sales plan. The sales department of Kedinglong company grasp the sales situation in different place, and make different plan according to the special sales situation and evaluation of the sales growth rate to make full use of the resource of the company and obtain the biggest profit.

## 3 The Management of Marketing Pattern

After determining the enterprise's marketing strategy, a very critical issue is to find a suitable marketing pattern which has both core elements and auxiliary elements. The core elements constitute the foundation of marketing pattern, which cannot be changed easily, while the auxiliary elements are serving the core elements, which can be adjusted according to the situation.

From macro perspective, the marketing pattern is mainly divided into three categories: first, the proxy pattern; second, the direct pattern; third, the mixed pattern that includes both the proxy pattern and the direct pattern. The direct pattern can be divided into store direct and network direct because of the development of the Internet.

The management aiming at the marketing pattern is generally a firm maintenance of the established

core elements in a certain period of time, and the flexible adjustment of the auxiliary elements to promote the achievement of marketing objective. For example, if we take the proxy marketing pattern, it is the core elements - “agent, a corporate enterprises which has no investor relations with the product enterprise sells products instead of the product enterprise”, which can not be changed; “the price of the product, the promotion strategy and the payment, and so on” are the auxiliary and can be adjusted according to the market conditions.

The management of marketing pattern is the maintenance to the core elements and the advancing adjustment to the auxiliary elements.

#### **4 The Management of Marketing Implementation**

After having strategic planning of marketing and clear marketing patterns, the next question is the implementation of the marketing planning. It should be tested by the implementation whether a plan is good or bad, and in all of the marketing steps, implementation is the core step. However, the management of marketing implementation is a process of dynamic adjustment, not a static process.

The process of marketing implementation is to make the plan come true via marketing action according to the strategy, plan and programs formulated before so that ensure the stability and rapid growth of the enterprise’s marketing and promote the development of the enterprise. Specifically, the management of marketing implementation should deal well with the following stages:

The first stage is the management of the initial implementation. Initial management is mainly to test the marketing plan’s rationality and feasibility to the program, to find the questions of the program which does not coincide to the actual situation, and to propose amendments to the marketing method and plan.

The second stage is the management of the medium-term implementation. The medium-term management is the key period of the management of marketing implementation. The implementation of a marketing program will be divided into three situations in the medium term: having not completed the plan, normal completion of the plan and exceeded the plan. Among them, both having not completed the plan and exceed the plan have the problem to analysis the reason of the implementation management and adjust the plan and the program.

The third stage is the subsequent management of the implementation. The subsequent management of the implementation is usually the period to complete the marketing plan and to make new plan for the future when the working focus is summarizing the questions and experience of the previous year.

#### **5 The Management of Marketing Team**

All of the enterprise should be completed by people, and marketing is no exception. Therefore, the establishment and management of a marketing team is an important work. The aim of establishing marketing team is to bring high performance to the enterprise. The marketing team is a group of people who are mutual complement by their skills, responsible for each other and working together to improve the enterprise’s marketing profits and achieve the enterprise’s marketing effectiveness. The blue-chip marketing team has a clear understanding to the enterprise’s marketing goal and firmly believes that this goal contains significant meaning and value. Besides, the importance of this goal also motivates the team members to sublimate personal goal to group goal. In a blue-chip marketing team, the members are willing to make a commitment to the team’s goal, and clearly know what kind of job that the team wants them to do, as well as how to work together to finish the marketing task. The establishment of an excellent marketing team should also do the following work:

First, train the marketing personnel. The training to the marketing personnel is to learn the attitude, knowledge, abilities and skills that are closely related with the requirement of marketing work with plan and organization, aimed at making the marketing personnel’s enthusiasm, ability and industry way have some enhancement and improvement which are benefit for the marketing effectiveness. People being trained should not only include the new recruits, but also the experienced marketing personnel and the most successful marketers. Through training, marketing personnel can deeply understand and get along with the enterprise, have a comprehensive understanding to the enterprise’s products, understand the characteristics of customers and competitors, realize the whole marketing process and their responsibilities, adapt to the changing market, overcome the human weakness like loneliness, and cultivate the marketing personnel’s creativity. The training can use the method of giving lessons, studying the case, role simulating, guidance and wing controlling, etc. so that a high performance marketing team can be founded.

Second, make customer relationship management(CRM) towards the customers visited by the marketing personnel.

If an enterprise wants to found a high performance marketing team, it should make effective management to the visited customers, which can ensure the marketing personnel getting better marketing profits from the customers. The management to the visited customers should be done as following words: enhancing the source of the customers' combat effectiveness of mathematical distribution, classifying the customers, standardizing the visited customers, surveying the visited customer's conditions, improving the quality of the visited customers and identify the key person and countermeasures.

## 6 The Management of Marketing Performance

Performance management has been a core work of the HR department, which is a very complex and detailed work. Performance appraisal is reorganization with actual performance to how the staff completes the working objectives and systematic summary to the staff's personal advantages and disadvantages, which provides basis to the decision of the personnel department, like promotion, exchange, rewards, and so on. Besides, performance appraisal is the requirement of giving the staff feedback and confirming the staff's training and career development, and meanwhile, it can help diagnose the organization's problem. In the process of marketing management, performance is still an important step. How can an enterprise do well with the management of the marketing performance?

First, implement well the target responsibility of marketing leaders.

The management of the marketing performance should directly deliver the operational responsibility of the enterprise's survival and development to the marketing leaders, and directly translate the strategic and performance requirement which is relevant with the enterprise's survival into KPI of the marketing leaders. Force the marketing leaders to face the pressure of market competition by relying on the "target responsibility system". Improve continuously the marketing leaders' willingness and ability to take responsibilities by relying on "independent pressure of market competition and the freedom space of their position for innovation. Import the law of marketing competition, determine the "generally acknowledged truth", establish the "rational rules" and relevant mechanism of assessment restraint, compensation incentives and the mechanism of promotion and eliminated, and improve the marketing leaders' willingness and ability to take the responsibility by relying on the "target responsibility system".

Second, do well with the performance evaluation management of the marketing channel.

From a macro point of view, marketing channel performance includes benefit, fairness and efficiency. Benefit is the channel's capabilities to deliver the service needed by the end user's, and meanwhile, it should be as effective and fair as possible when deliver a service. That is to say, in a country, every member has the same opportunity to use and approach to the marketing channel existed in this country. Efficiency refers to the effectiveness of the cost when the social material is used to complete the important products.

Investigating the marketing channel performance from the microscopic point of view, including the view of the manufacturer, the factors that should be examined include the channel's marketing performance, the channel's contribution to the profit, the ability of the middleman, the middleman's obedient degrees, the middleman's ability to adapt, the middleman's contribution to growth, and the customer's satisfaction.

Third, do well with the performance evaluation management of the marketing personnel.

To make effective management of the marketing personnel, the enterprise's marketing managers must establish scientific evaluation and assessment mechanism for the working performance of the marketing personnel, and regard the mechanism as a basis of allotting reward.

At first, the marketing personnel's basic understanding to the assessment work should get a deep understanding from the marketing managers. Therefore, the marketing managers' critical task is how to make the staff realize and accept the function, meaning and process of marketing effectiveness evaluation, fully understand the close relationship between the enterprise and the staff themselves, and make the staff establish an active concept of performance evaluation. What is more, the marketing managers' critical task also contains the preparation of basic data, including the performance data, service attitude data, and capacity evaluation data of the executives and ordinary employees, as well as the preparation for the question before the evaluation of the marketing personnel, including: whether the marketing personnel's quantity and quality can be guaranteed to reach the enterprise's goal, how the

marketing personnel's coordination and communication skills, whether the salary is incentive enough, whether the demission rate is high, and the improvement measures, and so on.

In the aspect of specific personnel performance assessment, the enterprise should establish the assessment process, and then make statistics for personal performance from the statistics of the marketing personnel's sales receivables performance, the marketing personnel's individual sales profit and loss, and the marketing performance according to month and year, and other statistics; at last, make fair and prompt encourage according to the performance.

## 7 Conclusion

Marketing management is one of the most important management of the enterprise. With the expansion of the market, competition is also increasingly fierce, so a good management system will become the important method in market competition. Along with the development of science and technology, management mode also need to be constantly improved, so only with the management innovation of enterprise can improve the market competitiveness of the enterprise. There are many different theoretical discourses about marketing management. The author proposed a "five-dimensional model" of marketing management, which is including of marketing strategy management, marketing pattern management, marketing implementation management, marketing team management and marketing performance management, based on his enterprise practice of many years, hoping it can make contribution to the management of some enterprises, and also expecting to get criticism and comment for correction from more friends.

## Challenges for Strategic Management of Innovation in a High-Tech Firm: The Case of CPqD

Rodrigo Lima Verde Leal  
Fundação CPqD  
(E-mail:rodleal@cpqd.com.br)

**Abstract** This paper seeks to identify challenges for strategic management of innovation in high-tech firms, considering the case of a firm from a developing country, embedded in a highly internationalised sector and going through major organisational changes. It provides an assessment of its competitive and technological strategies, how it chooses between acquiring or generating knowledge and how it manages innovation throughout the organisational structure, complemented by a critical analysis of the market it focus. The discussion shows that the firm is under a critical learning process of developing the capabilities needed to be competitive. Its main challenge comes from how it develops new roles and capabilities for managing innovation at the same time it has to integrate those different roles, which are still spread throughout organisational structures and routines. This paper reinforces the view that managing innovation requires a strategic approach by top-management, in which an innovation strategy must be created for defining the way the firm will compete with its portfolio and secure the factors that are needed to create the core competencies and capabilities to develop a sustainable competitive advantage.

**Key words:** Innovation management; ICT; Developing countries

### 1 Introduction

Innovation management interacts with competitive strategy of any given firm and can be considered a key process for growth, despite all the uncertainty and tensions that inherently exist between market-driven incremental innovation and the exploration of market-creating radical change. In a firm, such process comprises (i) the prospection of market and technological opportunities, (ii) the selection of opportunities according to its alignment with business strategies, (iii) the decision-making involving in-house development or sourcing the capabilities needed to explore those opportunities and (iv) the implementation of innovations, from concept to commercialisation of new products or implementation of new processes (Quadros, 2005). But this generic process is influenced by the national and sectorial contexts and the firm's trajectory in terms of learning and innovation, limiting the range of possibilities of the innovation process itself.

This paper seeks to identify the challenges for strategic management of innovation in high-tech firms, considering the case of a former state-owned R&D institute, not only pertaining to a peripheral economy and embedded in a highly internationalised sector, but also going through major organisational changes since its privatisation in the late 1990s. CPqD was the R&D branch of former Brazilian telecommunications holding Telebrás and today is a non-profit private organisation focused in innovations driven by information and communication technologies (ICT), in order to contribute to the Brazilian competitiveness. But CPqD is also competing in a sector dominated by multinational companies and global value chains, at the same it has been promoting organisational changes to move from a public-owned R&D institute to a high-tech market player condition.

The research found that the main challenge faced by CPqD comes from the learning process it has to carry out, in which the development of new roles and capabilities for managing innovation have to be developed in concomitance with the integration of those different roles, all of which are still spread throughout organisational structures and routines.

An assessment of CPqD's competitive and technological strategies, along with a research on how it chooses between acquiring or generating knowledge and how it manages innovation throughout the organisational structure, complemented by a critical analysis of the market the firm has been focusing since its privatisation, showed that CPqD is under a critical learning process of developing the capabilities needed to be competitive.

This paper reinforces the view that managing innovation requires a strategic approach by top-management, in which an innovation strategy must be created for defining the way the firm will compete with its portfolio and secure the factors that are needed to create the core competencies and capabilities to develop a sustainable competitive advantage.

The methodology used in the research includes a bibliographic review on innovation management

literature, in order to collect a set of key issues which were then sought after in the sectorial, national and firm-level contexts under which the subject of analysis operates. Sectorial and national contexts were identified by means of a corresponding bibliographic review, while firm-level context uses information gathered in public reports from CPqD and internal surveys conducted by the author throughout the last 18 months.

In order to identify the challenges faced by this high-tech firm, the paper is divided in the following sections. The next section provides a brief literature review in order to identify key issues to be analysed in the case study. Section 3 details the main transformations that happened in the context under which the research subject is embedded, along with a historical perspective that highlights those same key issues. Section 4 discusses the challenges faced by the research subject and Section 5 concludes the paper.

## 2 Innovation Management as a Key Process for Growth

A first aspect of innovation management is prospecting market and technological opportunities. This has much to do with the relationship between *competitive strategy* and innovation strategy, since the first defines the range of possibilities that should be perceived as opportunities by the latter. Competitive strategies can be divided in two broad approaches in the literature: positioning strategies and resource-based strategies. The first considers competitive strategy as the search for a favourable competitive position in a given industry, in terms of a profitability and sustainability against forces that determine the competition arena (Porter, 1986). The forces determining profitability are: threat of new competition, threat of substitute products or services, bargaining power of customers, bargaining power of suppliers and intensity of competitive rivalry. But it is the sustainable competitive advantage of the firm that determines its relative position in a given industry, leading to three generic strategies: cost, differentiation and focus.

The other approach is the resource-based view of the firm (Penrose, 1959; Prahalad and Hamel, 1997; Barney, 2002; Teece, Pisano and Shuen, 1997; Wernerfelt, 1997) and can be considered highly complementary to the first, since it explores further the sources of competitive advantage. This approach looks at strategy in terms of how to compete successfully, focusing on the “idiosyncratic, costly to copy resources controlled by a firm – resources whose exploitation may give a firm a competitive advantage” (Barney, 2002). These resources could be assets, capabilities, competencies, organisational processes, information, knowledge and so on, the collection of which enables the firm to develop and implement the right strategies to compete effectively.

The second aspect of innovation management is the selection of opportunities according to its alignment with business strategies, which highlights the link between *technological strategy* and competitive strategy. Integrating technology and strategy must first consider the perspectives of the latter. Strategy can be driven by positive or normative views and by product-market or resource-based views (Burgelman, Maidique and Wheelwright, 2001). Positive view reflects top-management beliefs about the basis of the firm’s success in terms of core competencies, product market areas, core values, people and the associations between these elements, while the normative view is concerned with what the firm’s strategy should be. Product-market view of the strategy is concerned with how the firm will compete with its portfolio, while the resource-based view is concerned with how the firm secures the factors that are needed to create the core competencies and capabilities to develop a sustainable competitive advantage. A normative view that encompasses product-market and resource-based views is pretty much in line with the earlier discussion on the relationship between competitive strategy and innovation strategy, since it is driven by what a firm *actually* does and not by what top-management *believes* it does.

The alignment between competitive and technological strategies leads to many of the aspects included in the management of the overall innovation strategy, such as competitive intelligence and technological prospection (Tidd, Bessant and Pavitt, 2001; Miles, Keenan and Kaivo-Oja, 2002; Phall, Farrukh and Probert, 2001; Millet and Honton, 1991; Sandia National Laboratories, 1997), innovation projects portfolio management (Cooper, Edgett and Kleinschmidt, 2001; Cooper and Edgett, 2001; Wheelwright and Clark, 2001; Jolly, 2003), stage-gates and innovation funnel (Ganguly, 1999; Cooper, Edgett and Kleinschmidt, 2002; Clark and Wheelwright, 1993) and knowledge management (Davenport and Prusak, 1998; Garvin, 2000). It also has much to do with the next aspect of innovation management: *the decision-making involving in-house development of or sourcing the capabilities needed to explore those opportunities*. External links between the firms and 3<sup>rd</sup> party organisations should be considered in

the innovation strategy, since it may include alliances for technological cooperation (Tidd, Bessant and Pavitt, 2001; UNCTAD, 2002; Vonortas and Safioleas, 1997; Doz and Hamel, 1997), such as cooperation and co-development with suppliers (Tidd, Bessant and Pavitt, 2001; Bozdogan et al., 1998; Sobrero and Roberts, 2002; Jürgens, 2000).

Finally, the *implementation of innovations*, from concept to commercialisation of new products or implementation of new processes, must encompass all the aspects presented above, in the sense that the introduction of any change – technical or not – must be managed, in order to ensure its acceptance and effective use. Successful innovation management involves taking a strategic approach to innovation and the problems of managing it, developing and using implementation mechanisms and structures – and the supporting organisational context – and building and maintaining external linkages (Tidd, Bessant and Pavitt, 2001).

All the aspects of innovation management presented in this section are influenced by the national and sectorial contexts and the organisation's trajectory in terms of learning and innovation. These two sets of influential factors are the focus of the following section.

### 3 National and Sectorial Contexts and the Organisation's Trajectory

#### 3.1 The telecommunications sectorial context

Until the mid-1980s, innovation processes in the telecommunications sector were vertically - or quasi-vertically - integrated by large monopolistic telecommunications service providers. Telecommunications equipment manufacturers and software suppliers in each industrialised country enjoyed the privileges given by their corresponding monopolistic service providers (and in some countries they were the same company), such as AT&T, France Telecom and NTT, specially due to the old technological and learning regimes in which those suppliers were inserted: the old telecoms industry was marked by closed innovation system, high entry barriers and few innovators (Fransman, 2002a). Moreover, the "engine of innovation" (*ibid*) was located in the research centres of those network operators, such as AT&T's Bell Labs, France Telecom's CNET and NTT's Electrical Engineering Laboratories, in which R&D was conducted to develop new telecommunications equipment and software.

Developing countries, in general, found themselves dependent on foreign suppliers from the triad - USA, Europe and Japan. Nevertheless, in Brazil, technological cooperation activities were being developed by local players, with government policies stimulating indigenous creation of value with growing share of local production *vis-a-vis* equipment imports, along with the development of indigenous technology in cooperation with research institutes, like CPqD and local universities (Szapiro and Cassiolato, 2003). Telebrás was the state-owned monopolistic telecommunications holding and CPqD was at the centre of the system of innovation in the sector, as it was responsible for developing technologies suited to Brazilian characteristics and cheaper than the ones provided by foreign firms. As an example of such role, CPqD developed for Telebrás a new technology for digital telephony switches to compete with multinationals, called Tropicó, a feat that allowed the final cost per terminal to fall from around US\$ 1000 to US\$ 200–300 levels (Loural *et al.*, 2006).

After the mid-1980s, the global scenario changed due to commercial and regulatory liberalisation processes happening in USA, Europe and Japan, which in turn intensified the internationalisation of innovation processes, the end of monopolies and the entrance of new actors in the sector (Fransman 2002a and 2002b; Henten, Falch and Tadayoni, 2004). According to Fransman, the 1990's faced the dawn of a new industry, which he called "Infocommunications", associated to new technological and learning regimes. The old industry was marked not only by closed innovation system, high entry barriers and few innovators, but also by a fragmented knowledge base, medium-powered incentives and slow, sequential incentives. Conversely, the new Infocommunications industry presents: open innovation system; low entry barriers; many innovators; common knowledge base; high-powered incentives; and rapid, concurrent innovation (Fransman, 2002b). Moreover, it was no longer dominated only by the traditional telecommunications equipment manufacturers, but also began to be heavily influenced by companies from the IT sector, such as Cisco Systems and IBM. More recently, firms from Asia have also developed important competitive positions in the global market, with global players such as Samsung, Huawei and ZTE.

This worldwide change had its impacts in the Brazilian telecommunications sector too. The same two processes that happened throughout the world can be considered the major drivers in the institutional evolution and the regulation model of the Brazilian sector in the 1990s: (i) commercial

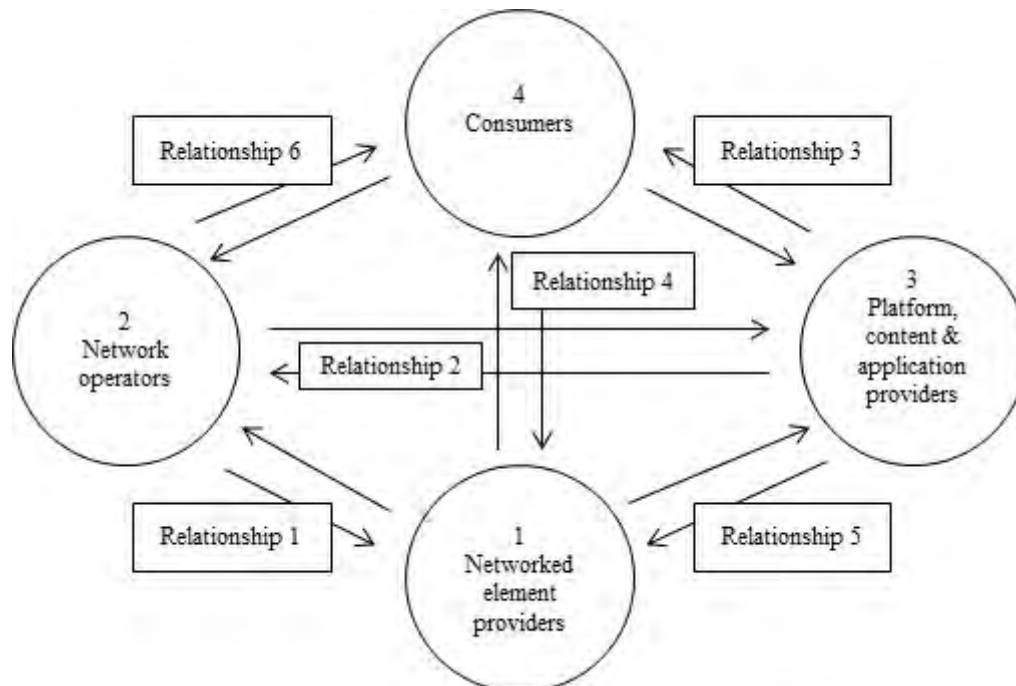

liberalisation and (ii) institutional and regulatory changes. On one hand, liberalisation, along with constant economic crisis in Brazil and an apparent lack of industrial policy, led to a technological downgrade process in the local telecommunications sector, marked by a constant pursuit for cost reductions through organisational changes inside the firms and, consequently, a reduction of local R&D spending (Szapiro and Cassiolato, 2003). On the other hand, institutional and regulatory changes in the late 1990's restructured the national system of innovation, with the privatization of Telebrás and deregulation of the telecommunications sector. This led to an even greater dominance by multinational manufacturers, which imported the great majority of production inputs. Since imports raised, exports were limited to only a few products assembled locally and R&D activities in these firms were located in their home countries, the Brazilian sector as a whole became even more dependent on foreign technology, with only a few indigenous mid-sized technology firms remaining, focused in parts and components with low technological specialization or concentrated in niche markets (Oliva *apud* Szapiro and Cassiolato, 2003). Loural *et al.* (2006) consider that the technological development model was successful as long as the protectionist economic policy persisted, but "when economic and political circumstances could not anymore sustain an import substitution approach, in the 1990-decade, the model fell apart" (*ibid*).

Economical and regulatory liberalisation and competitive pressures have also stimulated the internationalisation of R&D activities in the telecommunications sector, which in turn could open technological opportunities for Brazilian players to become part of global innovation networks, especially in software development (Leal and Loural, 2008). These factors were supported by recent changes at the knowledge base, originated by the technological convergence of telecommunications and IT and the role of global standards, enabling the division of work by means of interoperable modules, thus creating conditions for the development of different organisational models for R&D units in locations throughout the world (*ibid*). Despite those opportunities, recent research shows that, in general, this scenario has not changed. With few exceptions, indigenous firms have not been able to keep up with the pace of the technological frontier created in more advanced economies, remaining distant from key roles in the global networks that define the technological evolution of the ICT industry (Loural *et al.*, 2011).

Another element important in this discussion is the growing concentration of telecommunications service providers market since the privatisation of Telebrás in the late 1990s. What once was a sector with dozens of potential customers to be addressed by any firm in Brazil, is gradually becoming an oligopolistic sector due to mergers and acquisitions among telecommunications service providers. At the present, the Brazilian telecommunications sector is dominated by four economic groups, which correspond to 90% of the total subscribers and 86,5% in terms of revenue (Teleco, 2012) and all four have foreign capital firms in their executive management.

One last and very important element to be brought up derives from the vision of this new ICT industry as a layered ecosystem, which refers to "a number of organisms that interact within an environment" (Fransman, 2007). In the first layer are the network element providers referred throughout this section, which produce computers, software, phones, switches, transmission systems and specialised software systems. The second layer refers to the telecommunications service providers, also referred earlier, which create and operate networks and are the customers of the players in the first layer. The third and fourth layers are related to content and applications providers and the final consumers, respectively. This Schumpeterian approach proposes that the emergence of innovations is largely related to six symbiotic relationships between the players of each of the four layers (Figure 1) with consequences that may or may not be beneficial for the parties concerned (*ibid*). This is relevant for this discussion, because these relationships, some of which did not exist two decades ago, can be seen as sources of opportunities for players in the first layer. These players can diversify in terms of creating new products and services to be marketed to players in the third layer and/or they can explore themselves new products and services and be part of that third layer. Of course, this brings up many new challenges since players in layer 1 have to evolve from the old telecommunications model, in which they were only driven by the traditional telecommunications symbiotic relationship 1.

**Figure 1 Symbiotic Relationships Between the Four Groups Of Players in the New ICT Ecosystem (Fransman, 2007)**

In sum, the telecommunications sector, now part of a greater ICT ecosystem, has changed from a condition of a closed innovation system, with high entry barriers, few innovators, fragmented knowledge base and slow, sequential incentives, to one of an open innovation system, with low entry barriers, many innovators, common knowledge base and rapid, concurrent innovation. In Brazil, commercial liberalisation and institutional and regulatory changes created a context in which indigenous networked element providers had to face an even stronger competition from foreign firms, not only due to telecommunications equipment manufacturers and companies coming from the convergence with IT, but also due to a trend in market concentration in terms of potential customers. Nevertheless, with rapid innovation cycles and growing internationalisation of innovation networks, along with the evolution of the ICT ecosystem creating new roles and relationships, indigenous firms have to deal with new opportunities and challenges. In terms of Porter's competitive forces, local firms developing a competitive strategy are facing strong threat of new competition, bargaining power of customers and high intensity of competitive rivalry.

### 3.2 Historical overview

In 1972, the Brazilian government created Telebrás, the monopolistic telecommunications holding, and in 1976 created CPqD, its R&D branch located in a region close to some of the country's largest universities and industrial base. The industrial policy at that time was based in the "import substitution" principle, in which technologies and products were developed in order to strengthen the country's commercial balance. The dual purpose of CPqD's creation was (i) to conduct activities that would lead to telecommunications products and (ii) to absorb technologies in order to avoid or substitute imports. This model, which derived from the industrial policy explained in the previous section, was in place until the late 1980's and throughout that time period CPqD, with the support of universities, led technological development and transferred technologies to 3<sup>rd</sup> party manufacturing firms. Aligned with that, Telebrás would then orient its telecommunications service provider subsidiaries to purchase the corresponding products from those manufacturing firms. In the early 1990s, this model was broken by the change in the overall federal industrial policy, henceforth becoming driven by competitive integration to the international markets, gradually exposing local industries to international competition. Since then, CPqD, and the local firms that explored the technologies developed by it, had to compete face to face with global players such as Siemens, Alcatel and Ericsson: Telebrás's subsidiaries no longer were forced to purchase products based on technologies developed by CPqD.

By then, CPqD had already developed in-house capabilities and external linkages around many relevant ICT technological areas that could be considered in pace with the state-of-the-art. This was used

by top-management as the rationale in changing the firm's product development portfolio to one that would be in condition to compete with the international players in Brazil. At that time, telecommunications network operations support systems, as well as business support systems, were starting to become the focus of telecommunications service providers. Thus, CPqD opted to lessen the importance of network gear development in its portfolio and strengthened its software development program driven by that market demand. CPqD also began to offer a specialised technological services portfolio to local telecommunications service providers, driven by its ICT expertise learned throughout its history.

Another big change in CPqD's trajectory occurred in 1998, when the Brazilian government privatised its telecommunications firms. Telebrás was divided in 13 parts, being CPqD one of these. On one hand, CPqD became an autonomous private firm, no longer tied to the typical "bureaucracies" of state-owned organisations, but on the other hand it had to start facing the challenge of any given private firm: being self-sustainable. In other words, using the ICT ecosystem model, CPqD changed its position in the layered model, moving from layer 2 - network operator - to layer 1, becoming a supplier of software and services to layer 2 (symbiotic relationship 1) and product technologies to network element suppliers (intra-layer relationship).

Driven by the challenge of being a self-sustainable and autonomous private firm, CPqD's top-management decided to diversify its activities and began exploring other markets besides telecommunications using the capabilities it had in ICT, something not possible before when it was a state-owned firm. Today, CPqD conducts technical and commercial activities not only in telecommunications, but also in the following markets: energy, financial services, government & public sector, corporate and manufacturing companies. CPqD also diversified in terms of the geographic location of marketing & sales activities, creating firms overseas to explore markets outside Brazil. It also began creating high-tech firms to explore the technologies developed by means of its in-house technological activities.

### 3.3 Competitive strategy

CPqD uses a *positioning strategy* based on three pillars: technological intelligence for the market, leadership in ICT development and partnership with the Brazilian state. The first pillar is based on (i) state-of-the-art works conducted with exemption and independence, (ii) technological development driven by market needs and trends and (iii) the creation of a multiplying effect in the ICT value chain. The second is based on (i) transferring technologies to manufacturing firms, on (ii) supplying software systems and on the (iii) creation of high-tech firms. Finally, the third pillar is based on becoming a partner of the state, developing advanced technologies under public R&D programs that contribute to digital inclusion.

This positioning strategy seeks sustainable competitive advantage by means of a *focused differentiation strategy*. CPqD's original strategy after its privatization in the late 1990s relied on differentiation in terms of technological competencies inherited from decades of experience developing technologies for the telecommunications sector and in terms of professional links with both the academia and key decision makers in recently privatized telecommunications service providers. Initially focused only in telecommunications, CPqD broadened the efforts of its original strategy including the other five segments listed earlier as potential markets to conduct business, but it can still be considered a focused differentiation strategy, since all activities rely on the firm's ICT market-related capabilities.

### 3.4 Technological strategy

The alignment between technological strategy and competitive strategy can be seen through the selection of opportunities stated on CPqD's chosen *activities* and *outputs*.

On the first place, CPqD conducts *activities* divided in three groups: "R&D program", "sales force" and the "creation of firms".

Its "R&D program" is divided in terms of the source of funds used to run its projects. A first one is based on resources coming from the telecommunications sectorial fund – FUNTTEL – which funds the firm's largest R&D projects and complies with the Telecommunications General Law, in terms of maintaining CPqD's competencies in telecommunications even after privatisation, focusing public interest innovations and technological transitions. These projects, which must be related only to the telecommunications sector, are approved by a specific council including representatives from many public and private organisations. This is strongly related to the third pillar of CPqD's positioning strategy: to become a partner of the Brazilian state. The second one comes from R&D funds managed by many government organisms, such as São Paulo Research Foundation (FAPESP) and Financiadora de Estudos e Projetos (FINEP). CPqD applies proactively or reactively to projects related to research

programs sponsored by those organisms. The third one originates from customer-led development projects, under which CPqD's customers have access to the technologies and other assets developed. Most of them are driven by the electric energy companies and by IT manufacturing companies, all of which are obliged to invest in R&D projects under corresponding federal regulations. The fourth and last one corresponds to in-house projects funded by CPqD's financial resources. Since the firm is a non-profit organization, it may reinvest its surplus to create its own R&D projects.

The second and third groups of activities – “sales force” and “creation of firms” – have the main goal to explore commercially its products and technologies in the market. The former is driven by its own marketing and sales staff and focuses the telecommunications, energy, financial services, government & public sector, corporate and manufacturing companies vertical markets. The latter implies the creation of new firms, which become responsible for all the operations needed to explore the technologies developed under CPqD's “R&D program”. Its purpose is to leverage the generation of innovations from R&D investment and at the present time, CPqD has created over ten high-tech firms, located in Brazil, USA and Angola.

On the second place, CPqD has *outputs* which can be divided in three large groups: software systems, technological services and product technologies. Software systems and technological services composes CPqD's portfolio used by its “sales force”. Software systems are mainly operations support systems and business support systems. Technological services are highly specialized consultancies, customer-led developments and laboratorial services, many of which are provided only by CPqD in Brazil, and are based on CPqD's expertise in ICT and laboratorial infrastructure, developed and created throughout its R&D-related historical trajectory. The third group is related to technologies that result in serial products and since CPqD is not devoted to serial production, they are transferred to 3<sup>rd</sup> party manufacturing companies, which in turn become responsible for commercial exploration under licencing contracts or similar agreements. CPqD's *outputs* can be pictured in terms of year-over-year growth in the market reached by the firm's technologies in the last decade and, despite the fact that every year shows positive growth, there is a tendency that this growth is decelerating (Figure 2).

Figure 2 YoY Growth in the Market Reached by Cpqd'S Technologies

### 3.5 Decision-making involving in-house development of or sourcing capabilities

CPqD has two approaches to the involvement of 3<sup>rd</sup> party organisations in its technological strategy. The first is driven by the directives set by top-management for its “R&D program”-related activities, under which CPqD has to foster a partnership environment to integrate specific competences from every agent involved in the program: government, universities, research institutes, costumers and the overall private segment. The decision-making process is left to the mid-management staff responsible for each R&D project and is driven by its own idiosyncrasies.

The second approach is also driven by top-management directives, but in this case they are related to the “sales force”-related activities. In this case, CPqD has to promote strategic partnerships to fulfil customer needs aligned with those market segments defined in the firm's positioning strategy. Thus, the

decision-making process is driven by the marketing & sales mid-management staff of each vertical market and is not only focused in building strategic partnerships, but also in creating new sales channels by means of a network of sales representatives. Strategic partnerships are divided in “technological partners” and “application partners”. The first are based on using basic technological assets from 3<sup>rd</sup> party companies, which are embedded into CPqD’s proprietary products. The second refers to the conjoint development and marketing of new solutions that use technological and marketing assets from both firms.

### 3.6 The implementation of innovations

CPqD has two approaches to innovation management. One is related to control, which is performed by a specific corporate department that answers directly to the organisation’s top-management. This department uses inputs from the firm’s strategic plan, from its own market and technological forecasting activities and from R&D projects proposals coming from all technical areas. Using these inputs, this department provide corporate directives, R&D budget allocation and R&D project control. It is also responsible for measuring R&D outputs in terms of the number of patents, publications and new products.

The other approach is in each of CPqD’s technical departments, which have their own mid-management staff providing and receiving inputs to and from the corporate innovation management department. These innovation managers are responsible for technological monitoring activities and for proposing R&D projects, which should focus new offerings aligned to market needs.

Technical departments also have corresponding “product marketing management” staffs, which is a very recent effort, with only a few years. Even more recent - less than a year - was the definition of the scope of work for this role by the HR department, along with the dissemination of “best practices” by means of an unofficial training driven by CPqD’s “sales force” (meaning it was not driven by the HR department). In theory, this technical area inside each technical department should develop marketing plans in line with product life-cycle management, but a survey conducted throughout all technical areas have identified a few points of attention.

One first point of attention is that, in practice, product life-cycle management routines are not fully institutionalised in CPqD. Product marketing and management staff are mainly driven by daily pre-sales activities, more specifically bids & proposals, with poor congruence with what those roles demand. Such roles should be based on specific routines for “product management” and “product marketing management”, all under a broader framework for product life-cycle management. The first refers to market analysis, business cases and profit and loss investigation, customer and market research, writing marketing requirements documents and working with engineering to finalize functional specifications, competitive analysis for use internally at the company, analysis of technology trends, running alpha/beta programs and capturing early customer feedback, making feature, schedule and cost trade-offs as the product nears completion (Lawley, 2003). The second includes writing product launch plans and product messaging, developing sales tools (white papers, presentations, collateral, competitive analysis for external use with customers), working with PR to manage launch tours and product review programs, setting product pricing, working with beta sites to generate customer success stories, running product launches and working with sales, channel marketing, corporate marketing, marketing communications, technical support, finance, operations and other departments to ensure the product is effectively introduced to the market and continues to be successful (*ibid*). Being driven by the short timeframe and the rush of bids & proposals activities, product life-cycle management is consequently not considered a priority by technical departments. This creates weaknesses in the product marketing outputs developed by technical areas, which should then be used by the remaining “sales force” personnel. Consequently, the latter become more dependent on the technical area staff for conducting pre-sales and sales activities, thus creating a vicious cycle in which the priority of product life-cycle management remains at the bottom. It also creates weaknesses in the product itself, due to the absence of institutionalised product planning and control routines in the technical areas. The evolution of existing products becomes driven mainly by opportunistic market opportunities and not by careful market research and analysis, business cases and profit and loss investigation and so on.

The second point of attention is a rather strong incongruous match between the two groups of routines described above and the capabilities found on the personnel working in the technical areas. The survey identified that the people responsible for “product marketing” lack the set of skills needed for that, considering themselves much more congruent with “product management”, but even this is almost non-existent. As Lawley (2003) pointed out, product managers work close to engineers, while product marketing managers deal with product messaging, sales force training and working with press, each

demanding very different skills. Moreover, although project management capabilities are well developed throughout CPqD's technical departments, many of which have managers certified by international institutes, they are, in general, used solely for R&D project management and not for product life-cycle management.

Finally, there is also a gap in measuring innovation outputs in terms of the level of success of new products in the market, such as sales from new products or selling to new customers, due to the lack of systematic and accurate statistics. On one hand, information systems used to automate sales force activities and enterprise resource planning are not in match with CPqD's portfolio of products and services. Thus, portfolio management is fundamentally at risk, since there is no accurate data showing which elements of the portfolio are more profitable or generate more revenue or are more innovative. In short, it is difficult to verify how close or distant the portfolio is to the firm's overall strategy. On the other hand, there is no definition of what to measure whatsoever. The mere definition of what constitutes an innovation is a difficult task. It could consider "attributes and performance characteristics of the product as a whole" and "changes in components of the product which improve its efficiency, including the nature of the services which it delivers" (OECD, 2012).

#### 4 Discussion

From the elements provided in previous sections, it is possible to picture a brief summary of CPqD's competitive strategy. The firm relies in its two sources of competitive advantage - technological competencies in developing ICT for decades and professional links with academia and key decision makers in recently privatized telecommunications service providers - in order to apply a focused differentiation strategy in the following industries: telecommunications, energy, financial services, government & public sector, corporate and manufacturing companies.

The telecommunications sector is at CPqD's origins and was the basis for the development of its competitive advantage. Nevertheless, as shown earlier, this sector has undertaken a plethora of structural changes, both in the global and local perspectives. Since the privatisation of Telebrás and the birth of CPqD as an autonomous market player in the late 1990s, the sector became marked by an open innovation system, with rapid innovation cycles and new players constantly being born and competing locally and globally for markets becoming more concentrated as network operator merge with one another.

Looking at the telecommunications sector as a market for CPqD's outputs, its source of competitive advantage to keep the differentiation strategy is under threat. The most obvious threat is the fact that professional links with key decision makers in network operators are finite. As time goes by, key personnel in network operators that were there after their privatisation are being replaced and new links have to be constantly created in symbiotic relationship 1, a process that suffers from fierce competition by global and local players and by the bargaining power of an oligopolistic market. At the same time, network operators, in their turn, have to create, manage and foster the new symbiotic relationships in the new ICT ecosystem. Afraid of losing control of their customers in symbiotic relationship 6, network operators are either strengthening their symbiotic relationship 2 with content and applications providers in order to be closer to market signals from consumers they share or are themselves diversifying into layer 3 and creating their own symbiotic relationship 3 with their consumers. The point here is that all these symbiotic relationships are multidimensional: purchase-sale (financial flow), input-output (material flow), information flow and input flow into the innovation process (Fransman, 2007). The behaviours associated to the last two dimensions in the symbiotic relationship between CPqD and network operators pose the biggest threat to maintaining CPqD's source of competitive advantage. The fourth dimension collects elements from the other three in order to innovate (*ibid*). For example, CPqD (in layer 1), which is involved in a symbiotic relationship 1 with network operators (in layer 2), uses its revenues (purchase-sales), along with inputs from partners (input-output) and the information it has gathered (information flow) in order to generate innovations, such as new software applications for telecommunications network operation. Continuing with the example, in the new ICT ecosystem, network operators (in layer 2), facing competition from other network operators, are compelled to provide new value added services to consumers (in layer 4), such as location-based software applications, which can be done either in partnership with content and applications providers (in layer 3) or by becoming content and applications providers themselves (moving into layer 3). All this involves purchase-sale and input-output dimensions, and also, more importantly, information flows and input flows into the network operator's innovation process, which in turn, may or may not be fully transferred

to players in layer 1, such as CPqD. This poses threats to CPqD's source of sustainable advantage, since not only new professional links have to be constantly created, but new technological competencies in developing ICT must be also constantly monitored and created in order to be in sync with the network operator's innovation process. In short, all the new symbiotic relationships sought by network operators are impacting the information flow and input flow into the innovation process. CPqD success in the telecommunications market will be determined, in part, by its ability to create the competences needed to monitor and respond to market and technological signals provided by the whole ICT ecosystem.

Moving to the other vertical markets (energy, financial services, government & public sector, corporate and manufacturing companies), the challenges are potentially even greater. One of the sources of CPqD's sustainable advantage - professional links with decision-makers in network operators - is irrelevant in those markets. Moreover, the professional links with the academia developed in its past history as the R&D branch of Telebrás are not necessarily the same ones that are needed to generate technological innovations for those markets. Thus, CPqD relies heavily on its technological competence in ICT as the main source of sustainable competitive advantage. The electric energy and manufacturing companies are probably the ones in which CPqD developed a relatively strong competence in R&D, mostly driven by customer-led development projects under its "R&D program"-related activities. The same cannot be told in terms of building a portfolio of products and services to be explored by its "sales force"-related activities. In the other vertical markets, CPqD still has a small portfolio too and its technological competences are still restricted to specific niche opportunities, such as fraud management (financial) and public management (government) software systems. Looking again at the ICT ecosystem layered model, the challenge for CPqD is to develop or strengthen (i) symbiotic relationship 4 with layer 4 (consumers), (ii) relationship 5 with layer 3 (content and applications providers) and (iii) possibly relationship 5, by becoming a player in layer 3. This is a great challenge, considering the dimensions of information flow and input flow into the innovation process, along with the fact that it has been only 14 years since CPqD's privatisation and diversification into other markets besides telecommunications.

All the challenges identified here can be tackled using a strategic approach to innovation and the problems of managing it, developing and using implementation mechanisms and structures and building and maintaining external linkages (Tidd, Bessant and Pavitt, 2001). This is in line with linking technological strategy, competitive strategy and the overall innovation strategy under a normative view that encompasses product-market and resource-based views. The main question in this approach is related to what the firm's strategy should be in order to define how the firm will compete with its portfolio and secure the factors that are needed to create the core competencies and capabilities to develop a sustainable competitive advantage.

Success in innovation depends not only on technical resources, but on the capabilities in the organisation to manage them (*ibid*). Under this approach, successful innovation management depends on the learning process that each specific firm has to go through in order to build, improve, recognise, understand and facilitate the emergence of effective routines, which need to be integrated into a set of abilities that together make up the organisation's capabilities to manage innovation (Table 1).

**Table 1 Core Abilities in Managing Innovation (Tidd, Bessant and Pavitt, 2001)**

Basic ability	Contributing routines
Recognising	Searching the environment for technical and economic clues to trigger the process of change.
Aligning	Ensuring a good fit between the overall business strategy and the proposed change.
Acquiring	Recognising the limitations of the company's own technology base and being able to connect to external sources of knowledge, information, equipment etc. Transferring technology from various outside sources and connecting it to the relevant internal points in the organisation.
Generating	Having the ability to create some aspects of technology in-house.
Choosing	Exploring and selecting the most suitable response to environmental triggers which fit the strategy and the internal resource base / external technology network.

Executing	Managing development projects for new products or processes from initial idea through to final launch. Monitoring and controlling such projects.
Implementing	Managing the introduction of change – technical and otherwise – in the organisation to ensure acceptance and effective use of innovation.
Learning	Having the ability to evaluate and reflect upon the innovation process and identify lesson for improvement in the management routines.
Developing the organisation	Embedding effective routines in place – in structures, processes, underlying behaviours etc.

CPqD is under a learning process of developing the capabilities needed to be competitive in a very turbulent sectorial environment. The many roles relevant for managing innovation are spread on different organisational structures and routines. So the main challenge is to integrate these different roles and keep developing the capabilities in the organisation.

On the first place, routines for *recognising* technical and economic signals to initiate a process of change and *aligning* them to the overall business strategy are still poorly institutionalised and are hardly integrated with one another.

On the second place, CPqD needs to integrate the two different approaches used in the decision-making involving *acquiring* or *generating* assets needed in the innovation process, developing effective routines for such, which in turn should be used to *explore and select* the most appropriate response to the technical and economic signals. “R&D program”-driven and “sales force”-driven routines for decision making on the subject are already in place and each have many corresponding success cases, but they should be approached using integrated and effective routines. Strategic partnerships are a plausible option for reducing risk and uncertainty and accessing complementary assets (UNCTAD, 2002), especially on a sector marked by an open innovation regime such as ICT, but they also depend on building effective routines for dealing with transaction costs associated to those partnerships. These routines also have to consider the difference in power between partners, such as CPqD and multinational firms, but there is a good chance to build a successful collaboration agreement between asymmetric partners (Blomqvist and Hylaheiko, 2000).

On the third place, routines for effective *execution* of R&D projects are in place in CPqD, but the firm should develop additional capabilities in order to apply them to product management, in terms of managing development projects, from initial idea through final launch, and monitoring and controlling such projects.

On the fourth place, there are gaps in measuring innovation outputs. CPqD can fill those gaps by defining innovation outputs and embedding them into information systems aligned to the portfolio of products and services used by “sales force”-related activities and to the product development projects carried out by the “R&D program”-related activities.

On the fifth place, CPqD is still institutionalising product life-cycle management routines. The main challenges here are (i) maintain product marketing and management staff at a “safe” distance from daily pre-sales activities and (ii) develop the right skills in product marketing and management staff. Perhaps this issue can be considered the greatest organisational innovation the firm in developing in its recent history, since it means the creation of a market-oriented organisation at the same time it has to foster its technology-driven competencies developed throughout its R&D institute heritage.

## 5 Conclusion

The purpose of this research paper was to identify a set of challenges that a developing country high-tech firm has to face in order to develop capabilities needed for strategic management of innovation under the influence of sectorial turbulence and constrained by its own firm-level learning regime. CPqD was a state-owned Brazilian telecommunications R&D institute privatised in the late 1990s and since then has been facing the challenge of being self-sustainable by means of exploring and leveraging its ICT capabilities, at the same time it competes with multinational companies and tries to position itself in global value chains.

On one perspective, the telecommunications sector has suffered many structural changes, becoming part of a greater ICT ecosystem, with low entry barriers, many innovators, common knowledge base and

rapid, concurrent innovation. In Brazil, indigenous firms had to face growing competition from foreign firms in a market highly concentrated in terms of potential customers. Nevertheless, the evolution of the ICT ecosystem offers new technological opportunities and challenges for those indigenous firms.

On another perspective, CPqD's trajectory began in 1970s as a state-owned R&D institute with the purpose of fostering the "import substitution" industrial policy at the time. By the 1990s it had placed itself in the centre of the national system of innovation, but commercial liberalisation and institutional and regulatory changes conducted by the federal government, driven by competitive integration to the international markets, gradually exposed local industries to international competition. This led to changes in CPqD's product development portfolio, giving more attention to specialised software systems for telecommunications network operators and specialised technological services. In 1998, CPqD was privatised and, since then, diversified its activities and began exploring other markets besides telecommunications using the capabilities it had in ICT, created overseas operations and new high-tech firms to explore the technologies developed by means of its in-house technological activities.

An assessment of CPqD's competitive and technological strategies, along with a research on how it chooses between acquiring or generating knowledge and how it manages innovation throughout the organisational structure, complemented by a critical analysis of the market the firm has been focusing since its privatisation, showed that CPqD is under a critical learning process of developing the capabilities needed to be competitive. The main challenge faced by the organisation is how to integrate different roles relevant for managing innovation, which are still spread throughout organisational structures and routines, at the same time it has to keep developing them in the organisation. The author also provides a set of recommendations on how to tackle those main issues identified in the research.

One can conclude that a strategic approach to the management of innovation fits well in this case study, since most of the opportunities for improvement identified in the discussion have to do with the problems of managing, developing and using implementation mechanisms and structures, specially supporting organisational context, and building and maintaining external linkages. This is very much in line with what Tidd, Bessant and Pavitt (2001) and Burgelman, Maidique and Wheelwright (2001) have explored. In short, the main question for top-management is what should be the firm's strategy for defining the way it will compete with its portfolio and securing the factors that are needed to create the core competencies and capabilities to develop a sustainable competitive advantage.

Further research can be conducted to use this approach in other high-tech firms in developing countries and competing in highly internationalised sectors. This could be used to identify possible similarities in the challenges faced by these firms in terms of learning processes they have to manage in order to build, improve, recognise, understand and facilitate the emergence of effective routines. Policy-makers could then use these conclusions to develop frameworks for facilitating the creation of organisation's capabilities to manage innovation.

# Analysis and Effectiveness of a Real Organization's Strategic Human Resource Management

Li Fang

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

(E-mail: lifang526@126.com)

**Abstract:** This paper focuses on analysis a real organisation's strategic human resource management. VACRO organisation was established in 1872. The strategic human resource management issues raised in this case is human resource outsourcing. Human resource outsourcing is one of the most significant forces affect human resource management via gaining more competitive advantages. In order to develop organization performance, strategic human resource management must be evaluated in terms of how they contribute to the achievement of the organization's strategic business objective, such as: being measurable, including deadline dates for accomplishment, identifying and involving the hr customers to ensure the necessary collaboration, nominating the individuals or parties responsible for implementation.

**Key words:** Human resource management; Competitive advantages; Collaboration; Implementation

## 1 Introduction

This paper has show the human resource management study of VACRO organisation, which was established in 1872 after the 1871 royal commission into the penal establishments and goals, as the discharged prisoners' aid society of Victoria. This report also illustrates the strategic human resource issue that is human resource outsourcing. After analysis how strategic human resource links to company mission the how the competitive advantage of human resource outsourcing can be achieved, there are also some recommendations that how an effective strategy contribute to the achievement of the organization's strategic business objective.

As the discharged prisoners' aid society of Victoria, VACRO was established in 1872 after the 1871 royal commission into the penal establishments and goals. It was urged by the royal commission to give assistance to discharged prisoners. VACRO is a non-government, non-denominational organization [1].

In 1872, the early work of the discharged prisoners' aid society (PAS) focus on providing material aid to prisoners. For example, they prepared almost 700 large paper bags with a pound of wonderful foods and some tobacco to prisoners at Christmas. Meanwhile, they also offer toys, health food and gifts to families via generous donations from the community. At the following year, a ladies branch committee was establishment in order to respond the needs of female. As part of the Victorian department of justice better pathways strategy, the service of women including transitional support, mentoring and assistance with childcare and transport for women completing community based orders. In 1913, PAS considered that it was necessary to work with 'prisoners' wives and support family members' needs with early insight to maintain their relationship. Their early intervention and prevention work with families and children reduce the damage done by crime to future generation. Nowadays, VACRO has reflected many changes during its history. A typical assistance might involve pick up someone on their release from prison, a help of homelessness and management of prisoner banking via electronic funds transfer. VACRO now using a through care approach to help prisoners such as working with them, their families and communities at the time of arrest, through court, in the prison system and the period when they transition safely back into community life <sup>[1]</sup>.

## 2 SHRM issues: Human Resource Outsourcing

According to the information received from Varco's external HR consultant Mr. O'Grady who only works at VACRO one day per week, VACRO is a very small organization that only employs around 100 people. There are no internal HR staffs in its organization structure. Other staff without HR background has undertaken the HR work. He said:" I am doing some work for VACRO at the moment one day per week and once HR policies and procedures are in place, I expect the CEO will best decide how HRM activities will be managed within existing staff resources. HRM matters are the overall responsibility of the CEO who sits on the Board".

Every company and its CEO are under the unremitting pressures to improve performance. Based on Varco's HR consultant Mr. O'Grady' understand, VACRO is a very small organization, it might be not

necessarily to have a special human resource department. The HR work has undertaken by other staff without HR background. In order to improve their performance, VACRO needs an experienced “outsourcer” design and support HR activities. The manager will happy to deliver the complexities of HR activities by using outsourcer. They delight in belief: “now it’s their problem.” Their widely experienced specialists will take responsibility for the intimidating, endless vexations associated with human resource management.

David Baker believes that “SHRM has been one of the major developments of this rethinking process. There have been a number of reasons for this. In many organizations, staff costs represent a major proportion of the budget; the cost-effective deployment of personnel must be a key priority in any competitive situation” [2].

Human resource outsourcing is one of the most significant forces affect human resource management. It is normally considered as the permanent contracting out of activities that were performed in-house previously. Business strategy and operational influence generate the trend toward outsourcing.

From strategic perspective, some human resource departments are able shift their focus and resource toward a strategic role through the use of outsourcing. The use of outsourcing human resource is like introduce external market force into the organization, it will result some advantages in reduce bureaucracy and to encourage more responsive and cost-sensitive culture. Besides outsourcing also can be used for political purpose like control head count in human resource [2].

From operational perspective, using outsource is good at create more efficiency or better service in performance of functions. Outsourcing has been seen as a method for cutting cost. The number of human resource specialists in human resource department always been cut while the company during downsizings. In addition, when a specialized expertise is not available in-house, outsourcing can be used to solve the problem.

Human resource management (HRM) refers to the formal structure of an organisation responsible for all levels of the management of human resources. HRM is focused on implements the activities needed to support organisational decisions. In contrast, Strategic human resource management (SHRM) is identified as the process of human resource management that is driven by planning, foresight and analytical decision-making. SHRM is proactive and is focused on vision and developing strategies to achieve a desired state in the future [3]. The position of the HRM is showed in figure 1.

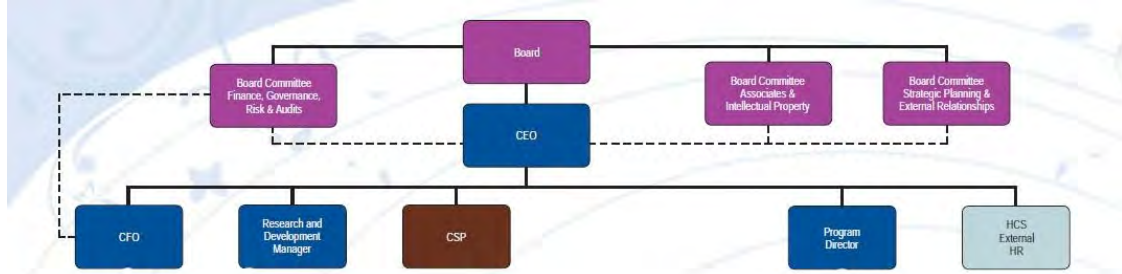

Figure 1 The graph of the organization structure of VACRO

### 3 SHRM Links to the Mission and Vision

The mission of VACRO is to offer support and information for individuals who have been charged with a criminal offence, offenders, prisoners and their families; as well as a leadership, education, training and research on the Justice System for the Community (VACRO annual report, 2009). Therefore, strategic human resource management in VACRO is about to improve their strategic plan for effectively helping criminal through with the right person.

SHRM is important to an organisation’s survival and sustainability because it will lead to improved organisational performance. Effective SHRM have an influence on the organisation when it required changing its overall strategy. It is not just simply follow the organisation’s strategy.

Strategy formulation as an important component in the conceptual framework provides direction to the organization. By an investment perspective, required effective organisational strategies shape and guide the organization to achieve its mission and vision. Human resource management has become a key to obtaining and providing competitive advantage, the rush to competitiveness, and an awareness of the demands of the technologically advanced environment in the future. A successful human resource

management are now considered as a source of competitive advantages. Those advantages can be gained through human resource strategies such as highly developed employee skills, distinctive organisational cultures, management processes, and systems.

Therefore VACRO has committed their service that “the end is essentially the same but the means constantly change”<sup>[3]</sup>.

#### **4 Corporate or Business Strategy of the Real Organization**

VACRO's annual report 2009 shows that VACRO has undergone a period of considerable growth in the areas that they had highlighted after the inception of their strategic plan in 2006, which is VACRO has offered support, information and leadership to assist discharged prisoners across the criminal justice system. The grant funding that VACRO received from ANZ trustees has given VACRO the space to grow and develop. At the next five coming years, their planning will focus on the needs of an expanded client base, the criminal justice system and the wider community.

In this financial year, in order to provide significant capabilities beyond the delivery of their core service and program, they have restructured the organisation and built a research and development function within the VACRO structure, which gives them an ongoing resource and strengthens in the future. These make VACRO as a 'learning organisation'. The VACRO team continually inspired the Council. Meanwhile, staff, volunteers and students worked with passion to the different requirements of Council, colleagues and Council.

The following paragraph will explain how the business managers link the business strategies into the SHRM policies and practices.

Strategic human resource management objectives and plans can be linked to strategic organisational objectives in Cost containment, Customer service, Social responsibility, and Integrity. Cost containment involves the organization reduce headcount, improve expense control, improve productivity, reduce absenteeism and lower labour turnover by focusing on cost reduction. Customer service related human resource development in recruitment and selection, employee training, development, reward and motivation via focusing on achieving improved customer service. Social responsibility and integrity are attempted to improve the organisation's reputation for ethical behaviour and honouring of agreements<sup>[4]</sup>.

#### **5 Organization Structure Showing Where the SHRM Is Linked**

However, organization Structure didn't show where the SHRM is through the information from Varco's annual report and Varco's external HR consultant Mr. O'Grady. CEO and board members should address most important issues in strategic planning. In one company, the CEO is most making critical choice about the company's business portfolio and future strategic direction. In terms of corporate strategy for CEO, there are four different types of activities: strategic thinking, strategic decision-making, strategic planning and strategic execution<sup>[5]</sup>.

#### **6 Recommendations**

It is important that the company can overcome SHRM issues during its future development. One of SHRM issues that Varco faces is human resource department outsourcing. The options to overcome the issues with action plan and discussed as follow. All strategic human resource management objective and activity must be evaluated in terms of how they contribute to the achievement of the organization's strategic business objective, this means that they must: Be measurable, Include deadline dates for accomplishment, Identify and involve the hr customers to ensure the necessary collaboration, Nominate the individuals or parties responsible for implementation.

#### **7 Conclusion**

During this VACRO case study and theory related, we can learn about the difference between strategic human resource management and human resource management, and how the strategic human resource management links to company's mission and vision especially when there is not human resource department in-house. Human resource outsourcing has obtained several competitive advantages in strategy and operational perspective. Further more, in order to develop organization performance, strategic human resource management must be evaluated in terms of how they contribute to the achievement of the organization's strategic business objective.

# The Varying Roles and Styles of the Change agent

Li Xiangcai

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070  
(E-mail: lifang526@126.com)

**Abstract:** This paper discusses about the varying roles and styles of the change agent or facilitator. The paper starts with the definition of a change agent whose roles and responsibilities are also discussed. Next, some key factors about the change process are analyzed: How many steps are involved in change process? How can the companies achieve it? What are the primary and supporting activities and styles adopted by change agent? Furthermore, we provide an example to discuss the organisational case. How and why the change agent is important for the organisational change is further analyzed.

**Key words:** Change agent; Roles; Responsibility; Organisational case

## 1 Introduction

As we can see, the world has been changed rapidly such as the change in globalization, information technology and managerial innovation. The Market and environment are changed by globalization as well as the change of the function the organization operated. Information technology is change patterns of work like how work is performed and how knowledge is used. Managerial innovation merges the change of globalization and information technology, act the influence on organization. Organizations must adapt to these complex and uncertain technological, economic, political and cultural changes. Change agent is important for helping organizations change themselves and responses these changes effectively.<sup>[1][2][3]</sup>

According to Manoj Bhardwaj, “Change agent is a person who leads a change project or business-wide initiative by Defining, Researching, and Planning, Building business support and recruiting volunteers to be part of a Change team”<sup>[4]</sup>. This report will generally express the change agent with its style, responsibilities and function in reality.

## 2 Type of Change Agent

A change agent is usually as a practitioner in organization. At least three type of people relevant organization development practitioner: consultants, content-oriented OD practitioners and organisational staff. Consultants who provide professional services to organization clients exist in internal and external environment. For example, human resource department examine that organization needs someone are capable of turning strategy into reality and demonstrate the value they can contribute to the company. Content-oriented OD practitioners refer to people who specialize in fields related to OD like reward systems, organization design, total quality management, information technology or business strategy. They are working with OD professionals on large-scale project to obtain the experience and competence. Organisational staff refers to the managers and administrators who are able to introduce change and innovation into organization.

## 3 Responsibilities of Change Agent

Change agent focus on the conceptions of planned change which means how change can be implemented in organizations and what action must take place in order to initiate and carry out successful organisational change. A change agent plays a supportive role like guide, educators, facilitators and cheerleaders but not in position to design or lead the project in organization. They create an effective relationship with individuals and groups to help them gain necessary competence to solve their own problems. Typically, internal consultants have their own technical expertise, such as IT enterprises.

## 4 Functions of Change Agent

Usually, change agent plans change process step by step. The steps start with the problem identification. The problems are normally found by an executive who has power and influence in organization. He or she plans the change to solve an existing problem. One of Critical success factors is that there are supports of leaders which have power & authority but not agent.

Next step is facilitating a group meeting, gathering and analyzing appropriate information. Change agent will help them to determine the strengths and weakness of the organization. The OD practitioner

and the client members integrate the ideas into change design and decide what further actions should be taken. At same time, change agent make effort on the program and Encourage client members to lead the change program not themselves.

Meanwhile, the monitor role of change agent regularly measures progress towards the change goals. Change agent will promote buy-in more important change than moving quickly by educating and training client member necessarily. Make the case for change again and again until obtain leadership interest. This is another important success factors for change program.

In addition, a change agent needs to be as a coach sponsor because change cannot be moved without sponsor. The most effective implementation relies on when best understand and support each other. Beside a change agent is able to know how to design and execute an intervention, remove barriers and know how the change is progressing in order to guide implementation. As a change agent, he or she needs to overcome many hurdles to Gaining credibility with Employee such as: Change agent role foreign to Staff; difficult to understand value; typically, agent not a worker; subject to mistrust; Facilitation and encouragement can be perceived as patronizing. OD practitioners will face these dilemmas when they try to joint into organization performance. They have to create the values of trust, collaboration and openness with employee for improving organisational effectiveness and productivity. [5][6][7]

### 5 Valuable Characteristics & Behaviors

As a supporter, Change agent need to make effort to integrate with the client member and also make valuable characteristic or behaviors in performance such as:

- Balance process with results;
- Respect for Managerial as well as subordinate staff;
- Demonstrate active listening;
- Avoid taking personal credit;
- Keep commitments; follow through when asked for help.

Being effective as change agent largely depends on ability to form relationships. Assertiveness: being self-confident without arrogance; having strong belief in what you are doing. Non-threatening: being low-key & supportive; showing that your intention is to help. Trustworthy: showing that you can be trusted from the top to the front line. [8][9]

### 6 Levels of Change Leadership Skills/Styles

A change agent adopts varying styles and skills of leadership to adapt himself to various situations and steps in the change process to bring about an effective change. He or she does the following in the process of facilitating the change:

**Figure 1 The Change Agent Styles Can Be Explained Clear Through The Below Given Change Agent Style Matrix.[10]**

- Accepts the requirement for change communicates and examines the need for organization development which means small change initiatives with clear direction.
- Defines and starts, identifies the key point in changing program which means change projects at local level.
- Transformation of central vision into change initiatives & organization-wide communication.

- Generates change with a high degree of transformation.
- Ability to revolutionize organization.

## 7 Theory in Practice

- The firm: treasure unlimited;
- An exporting firm;
- Problem perceived: return of stock send due to delay;
- Reason perceived: irresponsibility of dispatch staff;
- Reason for inviting change agent: increase morale of dispatch Staff
- Problem identified: technical issues; mainly machine failure and communication error.

For example, in reality the problem that was perceived turned out not to be the real problem. The real problem was hidden underneath and that is mostly the case with many of the organization. The identification of the real problem not just by the change agent but its acceptance by the employees and the management is the greatest challenge faced by the change agent especially when the problem underlying reveals some of most sensitive issues in the organization. In such cases, the action oriented activity group to participate in identifying the real problem can be one of the best approaches to tackle the issue. The change agent may use intriguing questions to bring light into the real issue but make sure the answer comes from their part.

## 8 Conclusions

To sum up, Change Agent is a person who tactically performs the multi roles through marginality. They may be people who are relevant organization development practitioner like consultants, content-oriented OD practitioners or organisational staff. They develop, collect and share tools to help Group Dynamics among the Management, Managers, Employees and Change Agent define and achieve their goals. Change agent need to facilitate vertical installation of effective communication system between manager and employees as analyzer or pathfinder. Based on the research of environment and social change, change agent assist in provide appropriate mixture of styles and roles to makes the change effective and sustaining in the organization.

# On Flexibility Management's Application in Modern Hotel Management

Cui wei

School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430074

(E-mail: davidcui010@yahoo.com.cn)

**Abstract:** The Chinese hospitality industry has developed into a new stage, in which management innovation is required to create a competitive edge. This article proceeds with flexibility management theories, incorporates characteristics of hotel management, proposes the notion of hotel flexibility and constructs a flexible management system plus a set of evaluation indicators on this basis. In addition, SFA (Stochastic frontier approach) was employed to conduct empirical research on management efficiency of selected hotels in Beijing. The research findings have proven that hotels with high ratings in the flexible management system have functioned in a more efficient way than their counterparts.

**Key words:** Flexibility management; hotel flexibility; dynamic humanistic dimensions; SFA

## 1 Introduction

### 1.1 Development of chinese hotels and emerging challenges

The Chinese hospitality has undergone the burgeoning (prior to the 1980s), inception (1980-1982), rapid growth (1983-1993), setback (1994-1998) as well as the recovery and rise (after 1999). By now, this industry has roughly gained maturity, with starred hotel, ordinary hotel and budget hotel roughly classified as the three basic categories. The first category that is relatively well developed has acted as the pillar and specimen of this industry.

Chinese hospitality industry at this developmental stage is mainly confronted with the following challenges: firstly, the intensified competition; secondly, ever-increasing hotel cost; thirdly, clients' ever growing requirements for customized service. All these challenges have ushered in a stage of connotative development, in which hotels are expected to obtain competitiveness through management innovations. The concept of flexible management of hotel is proposed in this context.

### 1.2 Brief introduction of flexible management research

Western scholars are primarily focused on the construction of FMS (flexible manufacture system) in research on flexibility and flexible management. Their secondary focus includes strategic management and operation management. Strategic managerialist Ansoff (1988) was one of representatives for early research on flexibility theories<sup>[1]</sup>. He brings up two modes of flexibility, inner flexibility and outer flexibility. Volberda (1996) emphasizes that flexibility is a product of inner and outer pressure of a certain organization, as well as dynamic management competence on the strategic, structural and operational levels<sup>[2]</sup>. Gerwin (1993) explores the operation and management issues of flexibility construction system<sup>[3]</sup>. Research on flexibility and flexible management in service arena was initiated in the middle and later 1990s. Fitzsimmons (2001) believes that the success of a service organization is based on how much flexibility has been incorporated in the service<sup>[4]</sup>. Harvey (1997) studies the flexibility-related technical problems in service-oriented enterprises and creates a model concerning management flexibility<sup>[5]</sup>. All these researches are enlightening for the forthcoming researches on flexible management of hotels. Domestic scholars such as Zheng Qixu (1998) and An Yingmin (2008) have also brought up their own ideas concerning flexibility and flexible management. Their opinions are highly representative of the domestic research in this field. Both scholars stress that flexible management is human-oriented, involving encouraging the employees to take their initiatives to counterbalance the drawbacks of inflexible management<sup>[6][7]</sup>... In the domain of service management, Chen Rongping (2006) makes a breakthrough by constructing a framework pertinent to the notion and theory of flexible notion, and conducts a theoretical analysis of service flexibility and its management in a relatively systematic way<sup>[8]</sup>. Chen's framework and analysis provide significant references for the definition of hotel flexibility in this thesis.

This thesis explores the notion and connotation of hotel flexibility and its management on basis of flexibility theories, and further constructs a hotel flexible management system and an evaluation index system. Besides, this thesis also involves an empirical analysis of flexibility management of certain hotels in Beijing by use of this index system and a further exploration of the relationship between flexible management and management efficiency of hotels.

## 2 Hotel Flexibility Management System

### 2.1 Definition of hotel flexibility and its management

This thesis defines the hotel flexibility based on a review of thoughts by domestic and foreign scholars. The hotel flexibility should be interpreted as a capability through which the hotel could make efficient response to changes in exterior environments by replying on the staff initiatives. Hotel flexible management refers to a process in which the hotel draws upon common values, inner culture and enterprise spirits of its organization to optimize the inner resources, innovatively improve flexibility of all the levels and enhance the enterprise's capability and flexibility to respond to changes.

Hotel flexible management is built on a combination of human-oriented management and dynamic management. The former notion is determined by the hotel's identification as a service institution: accordingly, the expertise and experience of the employees are not easy to replace; meanwhile, added values created by the employees during the serving process are the major component of the creation of client-oriented values. The key to enhance service quality lies in whether the hotel can take non-compulsory measures to trigger a sense of recognition and initiatives on part of its employees so that organisational will can be translated into voluntary behavior. Dynamics refers to the management which is aimed at encouragement, maintenance and improvement of the enterprise's flexibility, sensitivity, responsive speed and adaptability so that the hotel can obtain competitive edge in face of changes in outer environments.

In essence, it can be concluded that the connotations of hotel flexible management includes the following aspects:

(1)The objective of hotel flexible management is to improve its dynamic management capability to obtain competitive edge;

(2)The basis for hotel flexible management is to enhance the flexibility of its employees;

(3)The core of hotel flexible management is the creation of client-oriented values;

(4)The methods to realize hotel flexible management is re-creation.

### 2.2 Classification of hotel flexibility and index evaluation model

Hotel flexibility can be further classified into that of employees, of the whole organization, of the service system and that of information which functions on all the aforementioned levels.

#### 1)Flexibility of Human Resources

It is the inner origin and an integral component of hotel flexibility. The "human resources" factor, in the context of a hotel, can be further categorized into three parts, including the manager, core employees and periphery employees. The three parts construct a man-oriented flexibility system of a hotel through mutual influence in the process of information transfer.

#### 2)Flexibility of Organization

It is concerned with a capability which is founded on basis of man-oriented flexibility and relates to timely response to changes in the outer environment. It mainly takes the form of flexibility and adaptability of the organization. Organisational flexibility mainly manifests itself in the changes in organisational structures. The transformation from traditional inflexible hierarchy to an organisational structure featuring one level and networking captures the developmental trends of organisational structure of modern enterprise. The organisational flexibility concerns both the flexibility in the organisational structure but also the existence of non-formal organization. Efficient non-formal organization can release angry caused by existing or potential fractions and conflicts. Meanwhile, intensive exchanges between employees in such organizations help to exert creativity appease anxiety and reduce confrontations.

#### 3)Flexibility of Hotel Service System

Such flexibility is mainly reflected in the flexibility in service design, service products and service process. The core is the capability of fast response founded on the client-oriented values. Flexibility in service design concerns the competence through which the hotel can adjust and modify service provided based on its strategic position according to changes in operational environment. Flexibility in service products concerns the ability through which the hotel can develop new products or adjust existing products in order to meet the clients' requirements. Flexibility in service process refers to the capability to make efficient adjustments of service transfer system to satisfy changed requirements.

#### 4)Flexibility of Information

This refers to a competence relying on which the hotel can disseminate, store and manage information on all levels in an efficient and timely way, and make adjustments to its own information system.

Based on the hotel flexible management index system, the first-class indexes include the flexibility of human-resources, of the organization, of the service system and of the information. The second-level indexes encompass the flexibility of duties and responsibilities, quantity, time, and salary; the flexibility of organisational structure, of authority decentralization, and of non-formal organization; the flexibility of service design, service products, service process; flexibility of information formation, and of information transfer. In this thesis, an HFI index (hotel flexibility index) was constructed on basis of questionnaire and consultancy from the experts.

### 3 Empirical Research of Flexibility Management Efficiency

#### 3.1 SFA<sup>[9]</sup>

In the SFA formula, the cost of an economic institution is determined by output (y), factor price (w), cost efficiency (u) and random error (v), just as follows:

$$C = C(y, w, u, v) = C(y, w) \exp(u + v) \tag{1}$$

The error factor (u + v) consists of two parts. u, reflecting the inefficiency of operation and management, is uni-directional. It is no smaller than zero in the SFA functional model of cost, and no bigger than zero in the SFA functional model of production. Its distribution functional model mainly takes the half-normal form or trans-log form. v is bi-functional, signifying the white noise in random shocks and statistics. It is commonly distributed in a bi-directional and normal way, with an average of zero and variance of D. CE (cost efficiency) can be calculated by the ratio between minimal cost and actual cost.

$$CE = C^{min}/C = C(y, w) \exp(v) / C(y, w) \exp(u + v) \tag{2}$$

Based on formula (1), and the research methods of Ching-Fu Chen<sup>[10]</sup>, a SFA Cobb-Douglas functional model of cost in the broad sense is stated as follows:

$$\ln TC_i = \beta_0 + \beta_1 \ln w_{i1} + \beta_2 \ln w_{i2} + \beta_3 \ln r_i + \beta_4 \ln TR_i + \beta_5 \ln OR_i + \beta_6 \ln VFR_i + (u_i + v_i) \tag{3}$$

In this formula, r<sub>i</sub> represents the capital price of the hotel's fixed assets, w<sub>i1</sub> is the average salary of the employees, and w<sub>i2</sub> is the consolidated price of raw materials. TR<sub>i</sub> is the total annual income of various hotels. Effective variables include occupancy rate (OR<sub>i</sub>) and unit area value of Food and Beverage Department. The total cost TC<sub>i</sub> is a variable. Assume that cost frontier and input price observes linear homogeneity. The SFA functional model of cost in the empirical research can be set as a half-normal form. Likelihood comparison measurement can be used to assess the significance of coefficient estimate. The ratio for standard deviation between u and v, the ratio between u and σ<sub>v</sub><sup>2</sup> are both important indexes to measure the relative inefficiency, and deviation between management inefficiency and white noise, which can be calculated with λ = σ<sub>u</sub>/σ<sub>v</sub> and γ = σ<sub>u</sub><sup>2</sup>/σ<sub>v</sub><sup>2</sup> respectively. Generally speaking, λ ≥ 1, 0 ≤ γ ≤ 1. The larger λ, the closer γ is to 1. Management inefficiency occupies a larger quota.

#### 3.2 Empirical research data

##### 1) Samples

In this article, fifteen starred hotels were sampled as subjects of studies. Their cross-sectional data in 2009 was used to construct the SFA functional model to evaluate their operation and management efficiency.

##### 2) Estimation of SFA Functional Model of Cost

Based on the maximum likelihood to estimate Formula (3), one can come up with the estimation index as shown in Table 1.

**Table 1 Cobb-Douglas SFA Index Estimations of Certain Hotels in Beijing**

Variables	Index Estimations	T-Statistic	Corresponding Statistics	
Constant Term	- 3.2913	- 3.2431	σ <sub>v</sub> <sup>2</sup>	0.0030
lnwl	0.4245	6.3128	σ <sub>u</sub> <sup>2</sup>	0.0784
lnwo	0.2976	3.0126	γ = σ <sub>u</sub> <sup>2</sup> /σ <sub>v</sub> <sup>2</sup>	0.9628
lnr	0.3687	4.9331	σ <sup>2</sup> = σ <sub>u</sub> <sup>2</sup> + σ <sub>v</sub> <sup>2</sup>	0.0815
LnTR	0.8985	12.3298	λ = σ <sub>u</sub> /σ <sub>v</sub>	5.0876
OR	0.2372	2.7892		
LnVFR	-0.5787	-7.5721	Sample Size	15

##### 3) Estimation of Hotel Management Efficiency

By calculating index estimations and indexes for various variables of sampled hotels, one can estimate  $u$  of every sampled hotel. Based on Formula (2), one can estimate their CE (Table 2).

**Table 2 Estimates of CE in Some Beijing Hotels**

Hotel Numbers	CE	Hotel Numbers	CE	Hotel Numbers	CE
1	0.92	6	0.75	11	0.65
2	0.96	7	0.86	12	0.77
3	0.87	8	0.84	13	0.76
4	0.89	9	0.73	14	0.75
5	0.78	10	0.8	15	0.82
Max: 0.96   Min: 0.65   Average: 0.81   Standard Deviation: 0.065					

#### 4)Comparative Analysis

By conducting a comparative analysis of CE estimates of sampled hotels and their flexibility management index, it can be identified that flexible management and CE observe a positive correlation relationship, which means that flexible management can enhance the management efficiency of a given hotel.

## 4 Conclusion

Empirical research findings have proven that overall management efficiency of sampled hotels in Beijing needs improving, and that flexible management has a positive correlation relationship with management efficiency. Enhancing the construction of flexible management system in a given hotel can improve its management efficiency in an effective way. Following researches can adopt the following perspectives: firstly, empirical analysis of how various factors concerning hotel flexible management influences management efficiency, which is aimed at further clarifying key factors for construction of hotel flexibility; secondly, quantitative analysis of cost for hotel flexible management.

## Evaluation of the Impact of R&D Tax Incentives on the Propensity to Innovate

José María Labeaga Azcona, Ester Martínez-Ros  
Universidad Nacional de Educación a Distancia, Madrid, Spain  
Carlos III University, Getafe, Spain  
(E-mail: martinez@merit.unu.edu)

**Abstract:** This paper analyzes the effects of R&D tax incentives on the propensity to innovate of Spanish firms. We wonder whether transmission of inputs into outputs in the innovation function depends on public policy incentives. These policies can affect firms' decisions both at the extensive and intensive margins and transmission could go to sales, employment or productivity. We match data from the Survey on Business Strategies and tax records from the corporate tax and we conduct several exercises trying to identify causal effects. The results show that public policies have some impact on the use of private funds and on the promotion of innovation in big firms but they do not either affect the propensity to innovate or modify the behavior of small firms. As a result, we propose to make a deep revision in the design of the system of fiscal incentives in order to allow small and medium firms benefiting more from it. Since the firm structure of the Spanish economy is dominated by small and medium firms any progress on R&D effectiveness will depend on the behavior of those companies.

**Key words:** innovation, tax incentives, impact, evaluation

### 1 Introduction

Why Spain does not really progress as much as other EU countries in R&D issues? After the effort during the last decade of national, regional and local governments to create incentives and grants to foster private innovation activities, we still present a gap with other OCDE countries. According to OCDE data, Spain is located in 2010 at the position 29<sup>th</sup> out of 34 countries as regards innovation effort with a volume of internal R&D relative to GDP of 1,38 percent far away from OCDE average of around 2,40 or UE27 average of 1,90. Although we have to consider that most OECD countries depart from higher initial values, the evolution of this figure for Spain during the period 2003-2010 show a 39 percent increase while it is 6 percent for the OECD as a whole.

The Lisbon Strategy created the fundamentals of growth and employment based on knowledge. However, a huge unemployment rate and a low level of innovation activity are still two characteristics of the Spanish economy. In one side public policies have failed to stimulate innovation activities and on the other side, private investments have not developed sufficiently to create added value for job creation through this channel.

The generation of new ideas is supported by the production of information and knowledge that enhances in itself as a public good, since the information is non rival and non excludable. Usually, two reasons justify government intervention in enhancing private innovation activities. First, the difficulties that firms face to finance their R&D projects; second, the problems with appropriability of R&D returns. When they perceive that for some reasons the costs are higher than the benefits stemmed from that investment the incentives to invest are reduced.

If whatever of those factors are relevant to the private firm' investments, we should observe in an ex-post assessment that firms recipient of fiscal incentives innovate more, on average. There exists a wide empirical research in Spain<sup>1</sup> and in other countries<sup>2</sup> concluding that fiscal incentives have positive effects on innovation at the extensive and intensive margins. There are also differences in these conclusions, however, because frequently the results are very sensitive to data, methods and empirical specifications. We propose a more accurate evaluation of such programs and policies using complementary data sources. It is important at this moment where the main objective of governments' actions is fiscal consolidation of public deficits to provide accurate evaluation of the impact of public policies. That assessment should not set up to leave away those programs, but to take into consideration the limitations of the actual design, possible deviations from initial objectives, errors in the allocation of

<sup>1</sup> In Busom, Corchuelo and Martínez Ros (2010) show an evaluation of effects of different public policies on the private R&D investment. In the same volume, we can find other studies which also evaluate the impact of the direct funds of firm R&D.

<sup>2</sup> Berubé and Mohnen (2009), Czarnitzki et al (2011) or Lokshin and Mohnen (2011).

grants, etc. We have to bear in mind that the final goal of those policies is improvements of Spanish economic competitiveness, creation of jobs and at the end of the day increases in social welfare of the country.

Our paper focuses on the study of the effect of R&D tax incentives on the propensity to innovate through changes in the inputs of the innovation production function (R&D expenditure or employment in R&D). Moreover, we postulate that if we observe those changes they should translate to modifications in firm performance as an indirect effect of fiscal policies. We propose to relate them to firms' productivity in order to analyze the capacity of a public program to transfer its benefits into production, sales or employment. Our study is divided in two well defined and different parts. The first one describes the Spanish situation and compares it with the situation in OCDE countries. In the second part we do an econometric and a simulation exercises using a novelty sample of registers providing information about the corporate tax with the aim of using real data for testing our hypotheses and proposing, when necessary, alternative schemes for public programs.

We plan to use two different data bases to carry out this analysis. The "Encuesta Sobre Estrategias Empresariales" (hereafter ESEE), is a survey of around 2000 manufacturing companies in the period 1990-2008. It is an anonymized panel, which no possibility to identify firms. This survey is representative for large firms because it is a census but for a small firms is a sample with some problems of representativeness.

The second data base is a sample of registers of the corporate tax in 2008 provided by the Spanish Instituto de Estudios Fiscales. Those registers allow us to evaluate alternative tax credit policies as well as check their sustainability for the public budget. In this information we know the initial situation in terms of fiscal cost and the tax deduction policy that firms use, so we are able to suggest changes in the schemes of tax policy because we can follow the firm according to sector and volume of sales. Results of such exercises provide us the possibility to assess the effect of changes in the R&D tax incentive policy on the propensity to innovate of Spanish manufacturing firms.

## 2 Prior Literature

In the public programs and policies supporting R&D activities there are several alternatives from the promotion of basic research for the knowledge production to those oriented to reinforce launching new products to the markets. In all cases, those instruments try to overcome market failures derived from private initiative that do not confer effort to those activities without enough returns in the short or medium term or when there exist problems of imitation that threat the appropriability of the returns of innovation.<sup>1</sup>

Fiscal incentives are one of the most used instruments by many governments to lower the user cost of R&D and thereby stimulate business investment in research and development. Market failures due to R&D externalities and asymmetric information between lenders and borrowers for financing R&D projects are often cited to justify the existence of such government programs, which often involve substantial tax burdens (OECD, 2007). The effectiveness of R&D fiscal incentive programs, however, continues to be the object of intense debate among economists (Lokshin and Mohnen, 2010). Those instruments are articulated through the fiscal law (Corporate Tax) with the object of reducing the cost of investment and increasing private profitability, trying to achieve a balance between social and private production of R&D. However, an important issue as European Commission recognizes (2003) is the vast of designs inside countries which implies a key point to compare their effectiveness.

Following the international index of Warda (2006) we can affirm, a priori, that the Spanish fiscal system is one of the most generous. Corchuelo (2006), Heijs *et al.* (2006), and Marra (2007, 2008) concur that Spanish tax incentives reduce the cost of capital in R&D. In a recent paper, Busom *et al.* (2011) analyze a combination of public policies and find a positive effect of such policies but they conclude that firms face important limitations to their use due to several obstacles as financial restrictions or limits in appropriability. So, an interesting research question could be how a redesign could make them more attractive for firms and affect their decisions to use them more efficiently and invest more in R&D activities.

In 2003 a report from IDETRA and CEIM set up to Ministry of Economy and Finance the

---

<sup>1</sup> It is difficult to imagine the private initiative dedicating funds from the first stage to the study of DNA 25 years ago since profitable discovers have not provided benefits to the society until now. We need from public policies to promote research and development at basic and applied level, sometimes even in the presence of high levels of uncertainty in the returns.

existence of difficulties to apply R&D deductions by the firms in terms of interpretations and required conditions. Because the number of firms making use of such incentives is not very high, we should try to investigate about the reasons behind this behaviour, given the theoretical simplicity of the scheme. Corchuelo and Martínez-Ros (2008, 2010) show the participation of firms in the tax credit system and conclude that despite knowing the advantages of the program, they frequently prefer do not make use of such tool. The percentages of use are around 20% for SME and 40% for large firms. Behind different arguments about non participation in these R&D tax incentives, Corchuelo and Martínez-Ros (2008, 2010) conclude that is it crucial for non-participating the volume of information firms should provide to the Tax Agency that could increase the probability of further inspections. However, to our knowledge, the most important barrier to the entry into these programs is the complexity of the rules and the tax scheme for the actual Spanish business network with a 60% of SME, with a majority of family business or micro firms.

In 2009, the Ministry of Science and Technology order a new report about the comparison of different systems of R&D Incentives in OCDE countries. From this report, we can extract that Spanish firms intensive in R&D can accumulate tax credits but they never can fully apply, like small innovative firms, technological start-ups or large firms with huge amounts of R&D investments. So, our aim is evaluating how aspects related to the design of the instrument can affect firms' decisions and how changes in the design of public programs and policies can improve access to and use of them. A second important key point of this report relies on the cooperation between the private-public sectors. For example, the tax credit allows the deduction of internal employment dedicated to R&D but not the external one, then if a firm has collaboration with a Research Center hiring part of the personnel the firm could not reduce it from the cost of R&D.

### **3 Data sources**

In this section we describe the two different data sources that we use to carry out our analysis.

#### **ESEE 2001-2008**

We use data provided by the SEPI Foundation on behalf of the Spanish Ministry of Industry, Tourism and Trade. This survey contains data from 1990 on manufacturing firms with more than 10 employees, which are questioned about their strategies in the short and long run, including their R&D decisions. Since 2001, this survey has included some questions about the knowledge and use of tax incentives for R&D that allow us to distinguish between firms that merely are aware of these incentives and firms that actually use them. Because of some problems with answers in 2001, our research refers to the year 2002, although we measure some variables for the period 1998 to 2002. Our final sample includes 1708 observations at the firm level.

#### **Registers from the Corporate Tax – 2008**

These database has been provided to us by the Spanish Institute for Fiscal Studies and it consist in a random sample of administrative records for firms with a business volume below the threshold of 8.000.000 € in 2007. This sample represents 85% of the total population in terms of activity whereas in size it is representative of the 93.5% of SME related to the ESEE survey. It contains 302.031 companies but only 697 report expenditure on R&D with 33.7% belonging to the manufacturing sector.

## **4 Empirical Exercise**

### **4.1. Research questions**

In this section we set up some empirical questions with the spirit to evaluate whether the objectives of fiscal policies are well fitted according to their initial design. The concession of public funds to R&D entails the well known crowding out effect where private investment could be substituted or replaced in part by the incentives since they minimize the costs. Recently, there exist a vast literature paying attention to this phenomena (for tax credits: Bloom, Griffith and Van Reenen (2002); Lokshin and Mohnen (2011); Czarnitzki, Hanel and Rosa (2011); Duguet (2012); for direct grants or subsidized loans: Gelabert, Fosfuri and Tribó (2009); Czarnitzki, Ebersberger and Fier (2007); Cappelen, Raknerud and Rybalka (2011)), but with mixed results about the effectiveness of the fiscal policies on innovation activities. Hence, our research questions explore about the relationship between public and private R&D funding, not in cause-effect terms but in terms of comparison among the provision and use of different funds by the companies.

We are worried about these issues in the empirical exercise and so we wonder about complementarity in the use of public – private funds, presence of external spillover effects and changes

in behaviour induced by public policies. In this sense, we like to answer the following three questions:

- RQ1: Does public funding complement or substitute R&D private funding?
- RQ2: Does public funding -tax credit- create incentives or conditions to compete among firms?
- RQ3: Does public funding –tax credit- modify the behavior of firms to start with innovations?

#### 4.2. Methodology

In the literature there are two main approaches to the evaluation of the effectiveness of R&D tax incentives. The first approach is based on the estimation of a demand for an R&D equation that depends on a user cost of R&D that is itself a function of R&D tax credit parameters (Bernstein 1986; Hall 1993; Bloom et al. 2002; Mairesse and Mulkey 2004 or Baghana and Mohnen 2009). This named structural method allows adjusting and distinguishing short run from and long-run effects and then one can make assumptions about the evolution of the tax policy with simulation purposes. The main econometric problem is the endogeneity of the R&D tax credit variable such that instrumental variable estimations are needed to provide consistent results. The second approach estimates the treatment effect by using factuals or counterfactuals, comparing treated and control firms before and after the introduction of a policy change. Within this methodology, there is a variety of procedures as matching methods (Czarnitzki et al. 2004; Duguet 2008), instrumental variable estimators (Cappelen et al. 2008 or Corchuelo and Martínez-Ros 2008), difference-in-difference procedures (Cornet and Vroomen 2005) or regression discontinuity designs (Haegeland and Moen 2007). In all cases, the aim is to compare the average R&D effort of firms that receive R&D tax credits with the average R&D of firms that do not but that are otherwise similar. The use of different methods depend on the conditional independence assumptions, i.e., comparing firms having the same likelihood of receiving R&D tax credits or are near (just above or just below a threshold of eligibility of receiving).

We will use the second approach and in order to have a first feeling about the answer to the proposed questions, we first present different descriptive statistics. They only provide correlations among the variables and thus they inform us about trends but we are looking at causal effects. It has been common in this literature to attribute causality to the effects obtained for variables measuring public policies in the context of discrete choice models. We are aware that those variables are far from being strictly exogenous because accessing or applying for a public policy could be non-randomly. Either the distribution of funding results generates non-random samples or the decisions to apply are endogenous. In addition to test and correct for sample selection, we give a further step through instrumental variable techniques. All results point out towards the existence of impact of the policies only for big firms. Since our corporate tax database contains information of all regions and some region in Spain are subject to different corporate taxation (region 1, say), we use the counterfactual that firms in all regions behave the same way concerning tax incentives and we use the figures for firms in region 1 to simulate results for firms in region 2 (those with different tax scheme). This experiment allows confirming econometric results. Finally, we use simulation techniques to check whether alternative policies of tax credits (like that in region 1) are sustainable for the public budget at this moment of crisis.

### 5 Results

In this section we try to answer the three questions exposed earlier using the different methods explained. As a first step, we have calculated the evolution of total and internal expenditure in R&D by employee splitting the sample by size and by technological sectors and comparing companies with public aids and without them. We report this information in Table 1.

In Panel A, we clearly observe that for SME public funds do not represent a complement to private investment while for large firms are tax credits more than direct funds what really incentive their effort to invest on R&D. This result has to be taken carefully since it is only a description and it does not inform us about a causal effect. However, we consider that it constitute a good starting point, since joint with results in Panel B, we can infer the same implications. Moreover, a graphical description in Figure 1 helps confirming this phenomenon.

**Table 1 Changes in the evolution of R&D effort**

R&D Expenditure per Employee				
PANEL A	PYMES		GRANDES	
	Total	Internal	Total	Internal

With TC in 2008 & 2007	87.6	38.1	27.6	19.8
Without TC in 2008 & 2007	5.8	3.70	34.5	67.7
With DF in 2008 & 2007	41.2	59.6	13.5	24.6
Without DF in 2008 in 2007	25.1	5.70	43.5	48.3
With TC & DF 2008 in 2007	20.8	24.9	6.2	1.10
Without TC & DF in 2008 & 2007	-1.84	-13.0	37.7	50.6
<b>PANEL B</b>	<b>High Tech Industries</b>		<b>Med-Tech Industries</b>	
	Total	Internal	Total	Internal
With TC in 2008 & 2007	30.7	56.9	30.4	38.5
Without TC in 2008 & 2007	28.6	29.1	32.3	28.7
With DF in 2008 & 2007	25.3	54.8	28.2	35.7
Without DF in 2008 in 2007	30.4	30.3	28.7	39.0
With TC & DF 2008 in 2007	28.5	62.4	30.3	38.7
Without TC & DF in 2008 & 2007	30.2	30.6	33.4	32.1

Nota: TC means Tax Credits, DF means Direct Fund.

Figure 1 Total Average R&D Expenditure

In this picture we observe that successful innovating firms with tax credits in 2008 reduce their total R&D expenditure whereas similar innovating firms without tax credits increase their expenditures. For non-innovating firms, the public program of tax credits does not contribute to change the behavior of companies. This is the first point to think that perhaps this program really needs a complete redesign since it does not report significant changes besides the continuous efforts by the Central Government to push firms to invest more in R&D.

In Table 2 we report the last descriptive analysis corresponding to measures of innovation outputs. We check whether firms introduce product or process innovations comparing the observed probability in the treated group (with public support) and in the control group (without public support). As we see, large firms need less help from public programs than small – medium firms, in general. However, we observe that the funding is important for large firms in the Medium Tech industries. It constitutes a surprising result that the higher propensity to innovate corresponds to firms belonging to High Tech industries which do not receive public support.

**Table 2 Propensity to innovate by size and sector**

	SMEs		LARGE FIRMS	
	2007	2008	2007	2008
With funding <sub>t-1</sub>	83.3	62.5	64.0	79.3
Without funding <sub>t-1</sub>	33.8	28.3	54.3	55.7
	High Tech Industries		Medium Tech Industries	
	2007	2008	2007	2008
With funding <sub>t-1</sub>	14.3	66.6	88.9	81.8
Without funding <sub>t-1</sub>	54.9	53.8	51.5	50.0

In the next analysis using discrete choice methods we try to shed more light to the yet uncover questions. This analysis is carried out using the ESEE but since we plan to check these results using a simulation exercise with data from the Corporation Tax, we restrict our estimating sample to those firms with the same business volume (form small firms less than 8 millions Euros) to be consistent in the comparisons as well as to be able to use parameter estimates in subsequent simulations.

We estimate equations where the dependent variable is a dummy reporting the introduction of product or process innovation by firms and where our explanatory variable of interest (TC) is a dummy equals to 1 if firm uses tax credits and 0 otherwise. These equations include other controls as size, sectors dummies, dummy for exporters, capital intensity, etc. The equations are separately estimated for SME and large firms. We report marginal effects in Table 3.

For SMEs, fiscal incentives in the form of tax credits do not contribute to increase the probability to innovate, while for large firms this probability increase 8.6 per cent. To confer validity to these results we address some robustness checks: for habitual users of tax credits, for entrants and exiters of those policy and we confirm previous results. We also take into account possible endogeneity due to sample selection and estimate the specification by instrumental variables, and also using a Heckman's type sample selection model (Heckman, 1979), obtaining again the same results. The results are also similar in the context of cross-section and when we use the data in its panel form assuming that the heterogeneous effects are random.<sup>1</sup>

Our last analysis constitutes an experiment but could be an indication of which direction a policy maker should re-address the design of fiscal policies. We can identify in our data firms belonging to the different Spanish regions in a way such that the tax credit scheme is different for firms in the Basque Country and the rest of firms.<sup>2</sup> We name the common fiscal regime as the Spanish model while we name the fiscal regime of the Basque Country as the French model because it is the same applied in France. While the Spanish model sets limits to the tax credit (up to a maximum of 50% of the amount to deduce), the French model reimburse all investment made on R&D.

The idea is to assess whether exist differences in the propensity to innovate when we change the scheme of deductions. So, we randomly assign to firms of the rest of Spain the index of use of tax credits that firms in the Basque Country have using as indicators the industry to which the firm belongs to and its size (volume of activity). This random assignment applies up to the point in which the samples for both regions have the same propensity to ask for tax credits.<sup>3</sup> Then, we re-estimate the model using

<sup>1</sup> All these sets of estimates are available upon request.

<sup>2</sup> This is so because there are two different fiscal regimes in Spain, one corresponding to the Basque Country and Navarra regions (known as *régimen foral*) and another corresponding to the rest of regions (known as *régimen común*).

<sup>3</sup> The propensity to apply for tax credits is 25% higher in firms operating in the Basque Country.

this new generated variable. The results we get in this experiment are for SME for TC is 0.020 (standard error 0.03) and for large 0.094 (standard error 0.02). They compare to those presented in Table 3 and we again can conclude that the new scheme does not modify behavior of firms.

There is another alternative scheme known as the Canadian model where the reimbursement is for all investment made on R&D which is more costly than the Spanish and French ones. Although we cannot make an exercise like the previous one because we do not have any firm applying the Canadian model within our database, we simulate as a last exercise the costs of the three models for the public budget. Whether they are sustainable or not could affect policy decisions of changing the design of the current policy. The costs of the three schemes are presented in Table 4. We have to take into account that this data base represents 85% of firms which the volume of annual revenues is lower 8 millions of Euros and only 4.20% get tax credits. Using the simulation figures, we can conclude that for SME any of the alternative fiscal incentive policies would be sustainable. Whether or not they are going to produce impact on the propensity to innovate of Spanish firms is still a question which requires additional evidence.

**Table 4 Costs of the current and alternative policies**

	Nº of firms	Canadian model	French model	Spanish model
TOTAL	697	98.740.444,59	22.227.410,32	14.134.293,09
From 1 to 10	35	4.344.620,9	65.289,64	34.158,23
From 11 to 25	286	27.557.217,98	7.465.969,68	3.997.604,31
From 26 to 50	205	29.126.435,8	8.271.217,62	5.743.924,69
From 51 to 100	125	26.721.698,55	2.880.446,5	2.169.716,67
From 101 to 250	36	7.326.678,3	2.914.992,89	1.883.578,07
More than 250	10	3.663.793,06	629.493,99	305.311,12

## 6 Conclusion

The effort of governments to stimulate the generation of knowledge and ideas in the Spanish economy in the last decades does not seem to produce the expected fruits at the light of macroeconomic R&D figures. Indeed, we do not improve our position in the UE or OECD and the incentives did not produce the benefits to the system in order to alleviate the low private level of investment on innovation activities. Hence, it is obvious for a policy maker to assess about the effectiveness of that policy. Our results are not conclusive but show a certain pattern of deficiencies of our fiscal system as regards in this case its scheme of tax credits. With all the caution, we observe from the empirical analysis that for large firms the tax credits stimulate the propensity to innovate in product or in process increasing figures in a marginal magnitude of 8%. This is not the case however for SMEs and we feel that a new design of this public program is necessary to stimulate this activity in the size segment where most of the Spanish operate. Another important need that we feel as necessary for stimulating R&D activities is the public – private collaboration.

**Abstract:** Based on the literature review, this paper takes Visico Alliance as an example to analyze the status-quo, organizational structure, mode of operation, capital investment, fund management system, the internal communication and cooperation situation in China industry technology strategic alliances. Moreover, the paper attempts to explore the intrinsic and important factors influencing the development of industry technology strategic alliances, and puts forward the countermeasures and suggestions to promote the healthy and sustainable development for China industry technology innovation alliance.

**Key words:** Industrial technology innovation strategic alliance (ITISA); Organizational structure; Mode of operation; Capital investment; R&D needs

## 1 Introduction

The development of Chinese industry innovation alliance was officially opened in December 2008, when the “Guidance regarding the promotion of building industrial technology innovation and strategic alliances” was jointly issued by the six ministries of China (the Ministry of Finance, the Ministry of Education, Ministry of Science and Technology, the State Council, the SASAC, the All-China Federation of Trade Unions, the National Development Bank). Based on the industrial innovation alliance, a group of industries, which relate to China’s key strategic, have achieved a major breakthrough in cutting-edge technology. For instance, steel recycling processes alliance in the first batch has successfully developed more than 200 innovative technologies and captured a number of core technical problems in the industry. A new generation of coal (energy) Chemical Alliance develops fluidized bed methanol-to-propylene industrial technology by itself, breaking the monopoly of foreign countries. Moreover, the industrial innovation alliance established by enterprises, universities and research institutions plays an irreplaceable role in economic development. Industrial innovation alliance can reduce the R&D investment risk of participants, access to new technologies or new products, improve core competitiveness, and promote the level of industrial technology in China by the close cooperation. Therefore, based on such a positive role of industrial technology in China, the development of industrial innovation alliance is much needed.

However, the fact shows that the development process of industrial innovation alliance based on the technical exchange oriented and technological innovation oriented is very slow.

Industrial innovation alliance to promote technical exchanges and technological innovation-oriented development process is very slow. Alliance project leading enterprises lack the desire to seek joint ventures, and most companies do not have the basic capabilities to make enterprise cooperation. Meanwhile, scholars have also discovered industrial alliance problem. Ying and Hu (2011)<sup>[1]</sup> point out three issues on industrial technology strategic alliance, i.e. lack of government guidance, lack of continuous innovation, and low investment in research and development. Porter et al. (1987)<sup>[2]</sup> find that the failure rate of industrial technology strategic alliance can up to 40% to 70%, which mostly dues to the development of the instability of the industrial technology innovation strategic alliance (represented by ITISA). Bruhn (1995) proposes that the instability of industrial technology innovation alliance mainly from alliance interior, which can lead to collapse finally. Sarkar & Cullen (1995)<sup>[4]</sup> and

---

\* This paper is supported by Wuhan Technology Planning Project (201271031387)

Aulak (1996) <sup>[5]</sup> emphasize the importance of member selection on building industrial technology innovation alliance, and consider four critical impact on partner selection, i.e. trust, dependence of mutual benefit, set up costs, and termination costs. Su (2011) <sup>[6]</sup> proposes that mechanism innovation is essence of industrial technology innovation alliance. Arvanitis and Vonortas (2000) <sup>[7]</sup> point out that knowledge transfer and sharing are the core issue of research trends of industrial technology innovation alliance.

The paper takes Visico Alliance as an example, and analyzes six impact factors of ITISA, i.e. development status, organizational structure, mode of operation, capital investment, fund management system, situation of communication and cooperation. Moreover, the paper summers up the intrinsic theoretical reasons of technology strategic alliance, and discuss the countermeasures to promote the healthy development of the industry innovation alliance, which contributes to develop recommendations for the next step in the country's independent innovation policy rationalization proposals.

## 2 Visico Alliance Development

### 2.1 Alliance Description

Industrial technology innovation strategic alliance is a technological innovation cooperation organization in the formation of joint development, complementary advantages, benefit sharing, and risk sharing, which involves enterprises, universities, research institutions, or other organizations. ITISA is based on enterprise development needs and common interests of all parties, to serve for the protection of a legally binding contract.

Visico Alliance was founded in October 2008, which is China's first commitment to universal access to broadband networks, promotes three networks convergence, and promotes technological innovation chain of the broadband industry to build national alliance. In January 2010, the fiber access (FTTx) industry alliance was approved by the Ministry of Science and Technology, which become one of the country's first batch 36 pilot alliances. In terms of industrial development, the products sale of the alliance optical access system and fiber optic cable is a top priority in the world.

### 2.2 Alliance Objective

The alliance objectives of the Visico Alliance are implementing the national information strategy, promoting three networks convergence, developing broadband, enhancing industrial technology innovation capability and global competitiveness of China light intervention.

(1) Cooperation in technological innovation, enhancing core competitiveness of fiber access (including systems, optical fiber cable, optoelectronic devices, etc.), and achieving new breakthroughs in independent intellectual property rights of key technologies;

(2) Cooperation reference innovation, building a fiber intervention network which has international advanced level and competitiveness, and can meet Chinese characteristics and application requirements;

(3) Based on the original innovation and technical standards, striving to sustainable access to the new technology in the field of international standards for the right to speak.

### 2.3 Alliance Development and Industry Development

The total annual income of the main business of alliance member companies reaches more than 1.5 trillion RMB in 2010 and 1.3 trillion RMB in 2011, which occupies more than 90% of the information and communication business revenue. The domestic market share of the alliance in China fiber access systems equipment occupies more than 90%; the domestic market share in access to fiber optic cable occupies more than 50%, the international market share occupies 12%, and production scale ranks second in the world. The domestic market share of optoelectronic devices domestic market share occupies 40%. The low-end access optoelectronic devices do a fair amount of exporting to Europe and the United States Japan and South Korea, accounting for 40% of the annual shipments; construction and operation of fiber access networks accounted for more than 95%. Based on the demand for industrial development, the alliance members achieve a joint application to the national science and technology projects, and division of work in the process of commitments, complementing each other, and finally get what they want to achieve the effect of  $1 + 1 > 2$ .

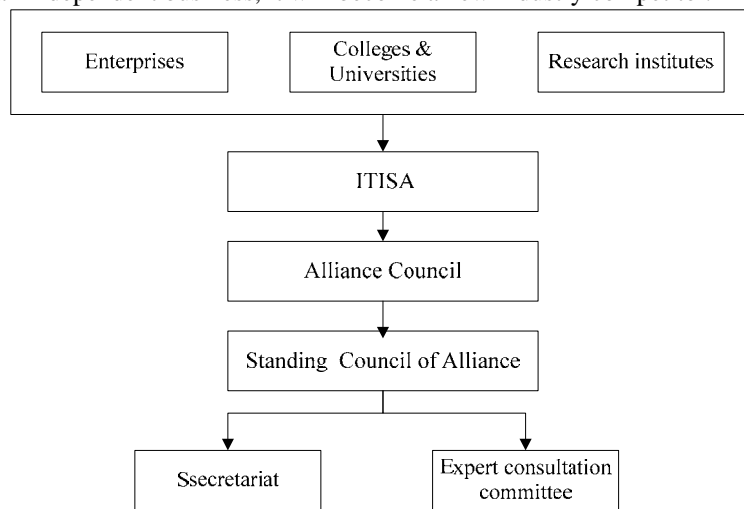

**2.4 Alliance Structure**

Currently, Visico Alliance is mainly constituted by the alliance members of the Council of the League, Alliance General Council, the Secretariat of the League, the expert Advisory Committee. The alliance members are extensive, involving businesses, universities, and research institutes, the initial formation of the "CEEUSRO" integration mechanisms.

**2.5 Alliance Mode**

The ITISA starts late in China. Though many scholars have made theoretical study on ITISA, the issue on relationship between organizational model and development needs cannot be well resolved. Currently, the main mode of the alliance is non-legal entity-type mode, which refers to no independent legal personality and no joint entity R&D institutions. The small part of the alliance adopts equity-based legal entity type mode. Some other members build alliance by forming industry technological society groups, such as TD-SCDMA alliance.

According to the 2011 summary report of each alliance, some alliances have obtained legal personality or have a mind to obtain. Once the alliance has an independent legal personality, in other words becomes an independent business, it will become a new industry competitor.

**Figure 1 Internal Organization of Visico ITISA**

The competitive situation cannot be avoided in the industry chain. The alliance internal members have tends to form a negative sum game effect. Specific value provided by the each member is difficult to measure. In the primary stage, alliance members usually cannot provide large amount of set-up funds, which may leads to large corporate equity monopoly; in the development stage, the nature and original intention of alliances may changes when they face the uncontrollable situations of equipment depreciation, insufficient R&D capability, lack of production capacity etc.

Therefore, ITISA alliance should not obtain legal personality. The alliances which have been made in the legal personality, should independent operator as a third-party service enterprise under government’s guidance and management,

**2.6 Operation Management**

The operating mechanism of Visico industrial technology strategic alliance has a complete process system, which takes advantage of expert resources, full supports research projects, and promotes technology standardization process. Based on the careful division of work and definite steps, the effectiveness of project review achieves maximized protection. Separation of the administrative work and intellectual property management avoid cross-cutting brought legal risk and moral hazard. The operating mechanism can be promoted to high-tech or metal manufacturing industries. The operating mechanism which appropriately reduces the technical standardization requirements can also be used in processing and manufacturing industry of agricultural products, and chemical products manufacturing industry. However, the project review system should be strengthened to reduce or eliminate “speculation

behavior” due to the large number of relevant alliance members.

**2.7 Internal Communication**

Based on co-ordination arrangement and differentiated technological innovation (such as GPON, EPON, WDMPON etc.), alliance members gradually influence and even lead the formulation of relevant international standards in their industries, such as ITU, IEEE, and FSN etc. under coordinately promotion of secretariat.

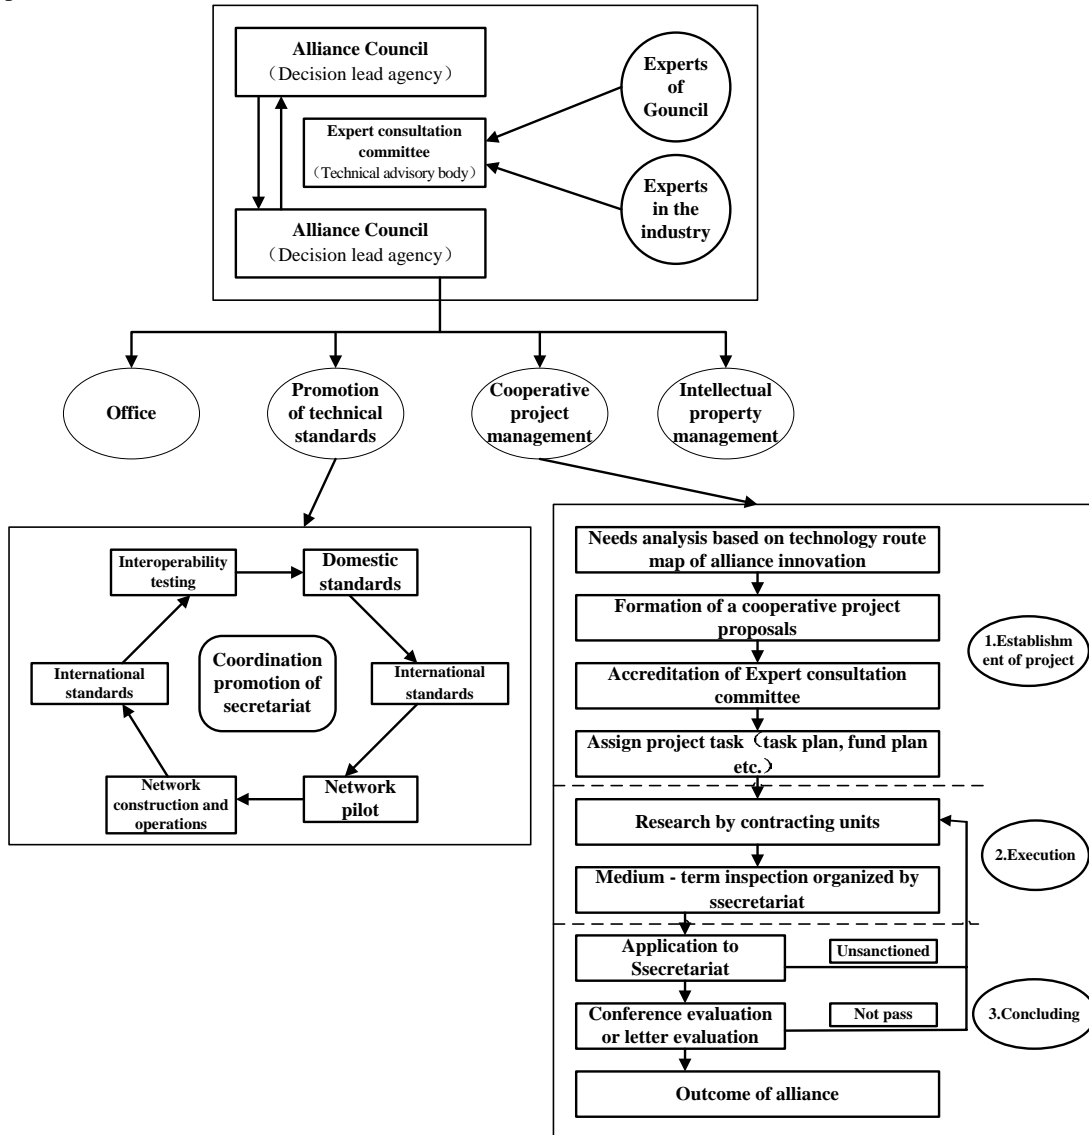

Figure 2 Operating Mechanism of Fiber Access Industry ITISA

**3 Existing Problems in Visico Alliance**

According to the research results and literature survey, the obstacles in the process of implementation of the national scientific and technological projects in Visico Alliance come from three main reasons, weak technological base, financial constraints and the slow development of the industry alliance.

**3.1 Weak foundation of technology**

The technical R & D system of Visico alliance is shown in Figure 3. Alliance members participate in the operation of the Union's decision-making; develop the strategic direction of technological innovation and long-term development plan according to their own innovation and industry needs.

Alliance members send related staff to participate in the work of innovation alliance, which can maintain a smooth communication with R&D department, and share experience in scientific research and practical results. The project's commitment has priority use rights to scientific research of industrial innovation alliance, and has part of its participation in share according to its intellectual property rights. On the outcome of proliferation issues, alliance does not open the patent usage right to non-alliance members in order to protect the interests of the alliance members.

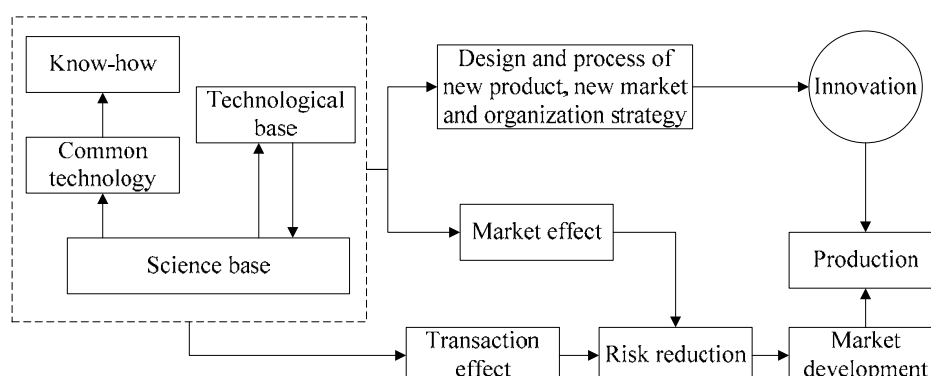

Figure 3 Industrial Technology R&D System of Visico Alliance

The problems of the Visico Alliance in low-cost, flexible application, system maintenance, are the common and critical issues to the development of large-scale fiber access, and also the issue FTTH should solve.

The main impact factors of the above issues are as follows: ①lack of critical technical capacity; ②weak conditions of equipment to R&D platform; ③drawback of research capacity and innovation capability of manufacturing process; ④industrial level is insufficient, barriers to foreign intellectual property. To breakthrough and solve those “bottlenecks” need a lot of money. However, enterprises cannot afford by themselves and national special funds are not enough, which lead to difficult development.

Alliance member FHT proposes that researchers of enterprises should participate in expert workshop of national technology research project, discuss the research issues with related experts, which can contribute to constructive projects that have more accordance with national industrial development needs, strong potential for development and taking into account the enterprise's interests.

### 3.2 Funds and its management

The main source of Visico Alliance R&D funding comes from tow aspects in the implementation of the national scientific and technological support projects: government support and the self-provided funds. The government support can only be used for the operations of particular projects, not as alliance management costs. The self-provided funds come from main investors of alliance. The expense ratio of government support to self-provided funds is 1:4 in support project, which shows the limit of government support funds. Currently, the national government provides total 37.43 million RMB in support projects, comparing 1.1 billion RMB from self-provided funds.

Alliance members show big pressure to funds operation according to the research results. If the national government cannot provide funds support to basic research projects, enterprises have to share part of funds to basic research projects, which severely restrict the development of core competitiveness of enterprises and even industrial development. For instance, as one of the members of the alliance council, FHT provides partial funding free of charge every year, in order to maintain the construction and development of the alliance.

### 3.3 Alliance and SMEs

Based on the demand for new technology development, Visico Alliance has begun to explore how to strengthen the communication and cooperation of the internal members. The countermeasures are holding regular technical exchange workshops, enterprise joint research, enterprise complementary advantages, and strategic cooperation as well. However, the countermeasures have high limitation limitations to promote communication and cooperation of alliance members. Most of the small and

medium enterprises cannot participate in high-tech research projects under the monopoly of leading enterprises, which leads to poor situation of industrial basic research in China.

Currently, a number of leading enterprises have communication with foreign large enterprises and worldwide well-known colleges and universities. For instance, BTI and FHT entered into a development and support agreement. However, small and medium enterprises do not have enough strength to such cooperation. Therefore, the result leads to “the strong stronger and the weak weaker” situation, which is detrimental to the development of the whole industry.

Moreover, the communication between alliance members and non-alliance members is seldom. Alliances have no intention to expand their scale and do not want to absorb new members. The reasons are as follows.

(1) Competition in the industry chain node. The industry chain is relatively dense in fiber industry. Once a new member is introduced, the balance within the industry chain will be broken and the competition situation will become much more complicated which goes against with alliance stability and development.

(2) Enterprise capability. The early establishment of alliance is supported by the national Ministry. Enterprise capability and scale should be considered in screening the first batch of alliance members. The enterprises, universities and academic institute with strong strength will join the alliances in the subsequent development process. Each alliance member occupies its position in the industry chain now. Therefore, the possibility of admitting new members is almost lost.

(3) The prospect of the industry. Taiwan enterprises and joint ventures form a plastic optical fiber alliance. They hope to join the fiber access ITISA in the process of alliance development but are declined by the alliance council finally. The main reason is that fiber access represents the mainstream of the worldwide fiber optic industry development trends, but plastic optical fiber is a niche industry, the potential is small for development.

#### **4 Suggestions for a Better Development of Visico Alliance**

(1) Building national fiber research center. National fiber research center should be established with the help of the National Science and Technology Ministry, focusing on the basis technology and common technology. Small and medium-sized enterprises should be paid attention to provide hardware environment of R&D. Researchers of enterprise can be invited to expert discussion workshop, which committed to high-tech R & D, clear the direction of industrial development, industrial development continued, to provide scientific advice on major issues, research, decision-making, the formation of long-term management mechanism, for the industry development provides a good environment for the development, improve the competitiveness of the industry.

(2) Fund input and support. Implement national supportive policy, enhance support strength, shorten R&D cycle, promote key project. Membership fee should be transfer into alliance in order to maintain normal operations of alliance. New alliance members should be absorbed appropriately in order to expand alliance influence and ensure implementation capacity.

(3) Enhance management system. Supervision and punishment should be strengthened aiming at nonfeasance or speculation behaviors of alliance members and project undertaking enterprises. The enterprises and research groups in key projects should be supported. Several policies, such as organization leadership, guidance of industry chain, overall plans and coordination, and supervision, should be paid important attention. Adequate and systematic service should be improved to develop alliance establishment.

(4) Encourage communication and cooperation. Communication between alliance members and non-alliance members should be encouraged in the fields of technology development trend and basis technology research. Foreign potential members can be absorbed into alliances in order to reach international technology level. Foreign talents and good research mechanism can also be introduced in order to improve their own development.

## Study on Independent Directors of Listed Companies in China

Li Xuehua<sup>1,2</sup>

1 School of Management, Wuhan University of Technology, Wuhan, P.R.China, 430070

2 Beijing Yongbang Law Firm, Beijing, P.R.China, 100081

(E-mail: lixuehua@cietac.org)

**Abstract:** Independent directors should be independent. They should neither occupy any position(s) other than seats on board in listed company, nor have any relationship(s) with either the listed company or its majority shareholder(s) that may adversely affect them making independent judgment and decisions. Since China employed the independent director system in listed companies in 2001, independent directors have contributed to the protection of minority shareholders' interests and the improvement of corporation government in listed companies. However, there is still a considerable gap between the reality and the goal that the independent director system is established to achieve. Through investigation and statistical analysis, this paper has found out the main problem of the independent director system in China's listed companies, which is the election mechanism of independent directors. The author pointed out that the engagement or dismissal of an independent director is controlled by majority shareholder(s) and chairman of the board or CEO who represents the majority shareholder(s)' interests. For solving the foregoing problem, this paper proposes a detailed, practical solution for the election mechanism of independent directors in listed companies, which based on excluding or restricting controlling shareholder(s) or majority shareholder(s) to nominate independent directors in order that the independent director(s) could maintain independence.

**Key words:** Corporate governance; Election mechanisms; Independent directors; Statistical Analysis

### 1 Introduction of the Independent Director System in Listed Companies in China

#### 1.1 Overview of listed companies in China and their problems

Since listed companies initially appeared on Chinese economic stage in 1991, they have made a tremendous growth in the past more than 20 years. The number of listed companies has expanded from the initial 14 to 2,432 since 1991 until to June 11, 2012. However, due to historical factors, most of listed companies in China rooted in the disposition and reorganization of the state-owned entities, and therefore they generally have the state-owned shares overwhelming characteristic, which made listed companies gain rapid expansion and meantime caused a few of outstanding problems related to the historical and institutional factors. The main problems, among others, are as below:

1) Major shareholders deprived the interests of minority shareholders. Due to asymmetric information and imbalanced shares, the major shareholders deprived interests of minority shareholders at will, and it is difficult for minority shareholders to get their interests reflected or protected.

2) "Internal control" is serious. The phenomena of "internal control" fleeing the company, major shareholders damaging the interests of minority shareholders in listed companies are very serious. The insiders are also known as the inside directors, referring to director and senior management. Senior management, referring to the company's general manager, deputy general manager, financial person in charge of listed company, board secretary and other persons stipulated by the articles of association, namely staff appointed by the Board. The results for internal control is senior management arrogate all powers, the Board of Directors remain useless, and the power structure of the company is serious imbalance.

3) Frequent related-party transactions. The related party of the listed company is usually its controlling shareholder. Due to the dominance status of the controlling shareholder, it can easily abuse the controlling power for the sake of self-interest to have illegal related-party transactions with the listed company, and therefore make some trading arrangements are not conducive to the interests of both minority shareholders and the creditors.

As a result of the above highlighted problems, crimes and delisting cases happened one after another in listed companies, which frequently raised an alarm to investors, regulators, and even listed companies themselves.

#### 1.2 Overview of independent directors in listed companies in China

In response to the problems of listed companies mentioned above, government regulators have applied a series of solutions. The most important solution is the implementation of the independent

director system in listed companies.

On August 16, 2001, the China Securities Regulatory Commission (“CSRC”) released the Guiding Opinions on the Establishment of Systems of Independent Directors by Listed Companies (hereafter referred to as the Guiding Opinions), which required that listed companies should establish Independent Director Systems. The Guiding Opinions set forth provisions on qualifications, selection, responsibilities, functions and powers, allowances, and etc. of independent directors. Meanwhile, the Guiding Opinions set time limits for fully establishing independent director systems by all listed companies in China.

On January 7, 2002, CSRC and the State Economic and Trade Commission jointly released the Code of Corporate Governance for Listed Companies in China (hereafter referred to as the Code). The Code has been the most comprehensive standards of corporate governance in China's securities market since the market opened. The Code also set out detailed provisions for establishing independent director systems by listed companies.

On January 1, 2006, the amended Company Law of the People's Republic of China (hereafter referred to as the 2006 Company Law) became effective, which had been amended and adopted at the 18<sup>th</sup> session of the Standing Committee of the 10<sup>th</sup> National People's Congress of the People's Republic of China on October 27, 2005. Article 123 of the 2006 Company Law provides that: A listed company shall have independent directors, and the concrete measures shall be formulated by the State Council. Although the provision is simple, it indicated that the system of independent director was recognized by law for the first time, and since then, the establishment of independent director systems in listed companies has been a statutory requirement in China.

According to the author's statistics, as of the end of 2011, the A shares of 2,314 listed companies have a total of 7,595 independent director positions, the total number of independent directors is up to 5,593 people. Per independent director is serving in 1.36 companies. From the sources of independent directors, university scholars are most popular and nearly 40% of independent directors are university professors and experts. Some experts pointed out that those scholars in universities have become the largest source of independent directors. That is because, on the one hand, they have relatively high quality, and are quite well-known; and on the other hand, scholars in universities are lack of corporate experience which will not offer too much opinion about specific management issues to companies. The second largest source of independent directors is financial and legal profession: 17% of the independent directors come from accounting firms and law firms, and they all enjoy high professional ability and reputation. In addition, active or retired government officials as well as the person in charge of the industry association have also become an important component of the independent directors. More than 15% of the independent directors once worked in government, and nearly 12% of the independent directors with the background of the relevant industry associations.

## **2 Problems Existing in the Election Mechanism of the Independent Director System of Listed Companies in China**

### **2.1 Comments on the status of the elective mechanism of the independent directors of listed companies in China**

As to elective mechanism of independent directors, the current provisions are found only in the Guiding Opinions by CSRC. Article IV of the Guiding Opinions stipulates that a listed company's board of directors, supervisory board and shareholders who individually or together hold not less than 1% of the shares in the listed company may nominate candidates for Independent Director. Such directors will be decided through election by the shareholders' general meeting.

As the existence of the aforementioned dominance and internal control in corporate governance of listed companies, this elective mechanism will undoubtedly give the vote right of the independent directors to the major shareholder and the internals who actually control the board of directors. For their own sake of interests and for no obstacle when violating interests of the minority shareholders, of course, the major shareholder and the internals will choose those people to serve as independent directors who can represent the will of the major shareholder and the internals. Therefore, the elective mechanism provided by the above provision cannot guarantee the independence of the independent directors, but only led the independent directors to become the spokesmen for the interests of major shareholders.

According to the author statistics about the independent directors of 300 listed companies in 2011, the independence of independent directors is not strong, and the main reason to it is the elective mechanism of independent directors. In those listed companies by statistics, nearly 90% of independent directors are nominated by major shareholders or the board of directors, and in which 65% of independent directors are nominated by major shareholders, 24% are nominated by the board of directors, and only a very limited quantity of independent directors are nominated by minority shareholders. Status of elective mechanism of independent directors led to the independent advice from the independent directors is actually dependence.

## 2.2 Problems existing in the current elective mechanism of the independent director system

The original intention of establishing independent director systems in listed companies in China is to protect the legitimate rights and interests of minority shareholders and to improve the corporate governance structure as well. However, under the current elective mechanism of independent directors, the independent director system is fallen well short of its goals. On one hand, independent directors were commonly controlled by majority shareholders and it was very hard to fulfill their duties, and on the other hand, some independent directors did not take serious about their jobs and thus were willing to do nothing. As results, there are some so-called “celebrity directors”, “vase directors”, “favor directors”, and “consultant directors”. A scholar has criticized such phenomenon in an article published in People's Daily on May 5, 2012, and pointed out that the independent director positions have become benefits for the privileged.

By counting and analyzing public Administrative Punishment Decisions issued by CSRC during the period from April 2004 to October 2009, CSRC gave 114 independent directors warning punishment, and at the meantime 36 of the 114 independent directors were also imposed a fine of RMB 30,000 or 50,000 yuan. From January 2007 to June 2009, the Shenzhen Stock Exchange has given disciplinary punishment to 89 independent directors who serve in the 29 listed companies. Among them, 69 were circularized a criticism and 20 were imposed a public censure. From July 2008 to June 2009, the Shanghai Stock Exchange has reviewed 78 cases of violations by independent directors. These further show that the current elective mechanism of independent directors make independent directors attach to the controlling shareholders or the actual controllers of listed companies, and therefore violations of laws and regulations by independent directors are very prominent.

## 3 Causes of Problems Existing in the Election Mechanism of the Independent Director System of Listed Companies in China

The author believes that the reasons for the operation problems of the independent director system include not only the working ability of independent directors, working expenses, and other aspects of reasons, but also the deeper inherent defects of the existing independent directors elected mechanism, and the long-term legal absence of independent director system.

First of all, there is a serious flaw in the current elective mechanism of independent directors.

Shares are highly concentrated in listed companies in China. Furthermore, there are quite severe “insider control” problems in those companies too. Under these circumstances, most of candidates of independent directors, in practice, were nominated by the controlling shareholders or insiders in accordance with Article 4 of the Guiding Opinions issued by CSRC, and in other words, the controlling shareholders or insiders decided who could take on the positions of independent directors in listed companies. This phenomenon is completely contrary to the duties of independent directors. This is the main reason why independent directors often badly behaved in listed companies. As mentioned earlier, independent directors are supposed to play big roles in listed companies in China. They should not only supervise the fairness of related-party transactions carried on by listed companies, but also oversee whether the insiders and senior managers of listed companies act in accordance with the companies’ interests in performing their duties. To independent directors with such a heavy burden of responsibilities, it is incredible that they are nominated and appointed by persons supervised by them. It is obvious that, under such elective mechanism, independent directors in listed companies are impossible to keep a true and complete independence.

Next, there are no regulations on the independent director system for a long time. Although the 2006 Company Law that took effect on January 1, 2006 provides that all listed companies must have independent directors, raising the level of the independent director system, that provision is very simple, and has authorized the State Council to formulate the specific measures, such as independent directors producing mechanism, functions and duties, rights and responsibilities, incentive mechanism, litigation system, etc. So far, the 2006 Company Law has come into effect for more than six years, but the State Council has not drawn up any specific rules on any aspect of the independent director system under authorization. It has been showed that the long-time absence of regulations on the independent director system in China caused the election of independent directors without institutional support.

## **4 Proposals on the Improvement of the Current Elective Mechanism of Independent Directors**

### **4.1 The theoretical basis of proposals**

For the election mechanism of independent directors, the core of maintaining vital and effective working is the Independence. The independence is essential to independent director mechanism and to ensure the independence is the foundation of its effective working. The election phase is, of course, the first step in keeping the independence. So, only by maintaining independence can independent directors step forward for the minority shareholders and fight for their interests. Considering that the ownership structure is highly centralized in our public companies, we should make sure that the election of independent directors is independent of controlling shareholders and majority shareholders. And that is the author’s aim and purpose for offering advices.

### **4.2 Detailed proposals on the election mechanism of independent directors**

In author’s opinion, the design of election mechanism is not only to maintain its independence, but also can not violate the 2006 Company Law. So, the suggested measures are as follows:

#### **4.2.1 The proportion of independent directors on the board of directors**

The number of independent directors, which has a direct bearing on the degree of dominance on shareholder’s proposal right by majority shareholders, is the basic measure to make sure the effectiveness of the independent director system. Therefore, substantially raising the proportion of independent directors on the board has realistic importance. Based on studies by OECD in 1999, the proportion of independent directors on the board was 62% in the U.S., 34% in UK, and 29% in France. In addition, according to the report published by Kom-Ferry in May, 2000, the average number of directors on the board among the Fortune 1000 was 11, and 9 of 11 are independent directors, accounting for 81.2% of the total number of directors on the board, the remaining 2 directors are insiders, accounting for 18.2%. This kind of phenomenon does not appear by accident, it is an inevitable choice for listed companies as the development of economy and the constant progress of capital markets.

The author thinks that at least half the board members of a listed company in China should be independent. In this way, independent directors can not only increase the difficulty of inside control in a listed company, but also easily develop a group size effect in order to dominate the decision-making processes of the board. This will promote the formation of a just and independent board in a listed company, and fundamentally solve the problem of insiders control in listed companies in China.

#### **4.2.2 The number of candidates for independent directors**

The author suggests that the total number of candidates for independent directors should be twice greater than the number of independent directors to be elected. Thus, the best fits could be selected, and all vacancies of independent director positions on the board could be filled as well.

#### 4.2.3 Qualifications of independent directors

Candidates for independent directors should be chosen from persons who meet the qualifications required by the job. The author proposes that the government regulators should lead to establish the independent director's qualification certification mechanism and the pool of qualified candidates for independent directors, and then candidates for independent directors in any listed company can only come from the pool. Since the author focuses on proposing about the current elective mechanism of independent directors, he will not deeply discuss the issue of qualifications of independent directors in this paper.

#### 4.2.4 The nomination of candidates for independent directors

To nominate candidates for independent directors is the first step in the election process of independent directors. This step gives the most important impact on the independence of independent directors. As one of the important goals of the establishment of the independent director system in China is to protect the rights and interests of minority shareholders, the legal design of nominating candidates for independent directors should be in favor of achieving such a goal.

As was discussed before, there exist majority or controlling shareholders and "insider control" defects in listed companies in China, such defects enable majority shareholders to dominate not only in general meeting of shareholders, but also in the board of directors and the board of supervisors. Under the current elective mechanism of independent directors, majority shareholders and their agents are able to make sure their nominees to be finally elected as independent directors through a series of procedures. This shows that the majority shareholders in a listed company in fact gain the power to select and appoint independent directors due to the current election mechanism, but such power is supposed to be held by the company. As a result, the current election mechanism of independent directors contributes nothing to keeping independent directors independence.

In conclusion, if independent directors in China want to keep their independence, they must have no relationships with the controlling or majority shareholders in listed companies. There are no current law and regulations of restricting the majority shareholders to nominate independent directors in listed companies. The author believes that the nomination of independent directors by the controlling or majority shareholders and insiders is contrary to the original intention of implementing the independent director system in listed companies, so the controlling or majority shareholders should not be allowed to nominate independent directors. More specifically, if a shareholder's voting powers as a whole are enough to appoint a non-independent director, the shareholder should be restrict to nominate independent directors. Put it in another way, candidates for independent directors in a listed company should be nominated by shareholders who are unable to nominate even one non-independent director in the same company. These shareholders can solely or jointly nominate candidates for independent directors, but each shareholder or each group of shareholders is only allowed to nominate one candidate. All these nominees will be ranked in order of the amount of voting shares held by the shareholder or the group of shareholders who has nominated him or her, and then official candidates will be chosen from the top to the bottom in the ranking and the number of them will be twice the number of independent directors to be elected.

#### 4.2.5 The application of cumulative voting system and combining with the election of non-independent directors

The author proposes that the election of independent directors should be mandatorily applicable cumulative voting system, and it should consolidate election with general directors in the same general meetings of shareholders in listed companies. A candidate for Independent Director should win a seat on the board if he or she obtains half or more of the voting rights held by shareholders present at the meeting. If one vote fails to fill all vacancies of independent directors, revote after eliminating the candidate who has received the fewest votes, and so repeatedly, until all seats of independent directors on the board were taken.

All above are the author's suggestions on improving the current elective mechanism of independent directors. The author also believes that it is a systemic and complicated process to build the independent director system. Therefore, we have to not only pay attention to the election mechanism of independent directors, but also further study motivation, exit, and other mechanisms of the independent director system in order to improve the listed corporations' governance structure in China.

## 5 Conclusions

It is the governance structure of listed corporations adopting single-pattern model under British and American legal system to set up the independent director system, the purpose of which is to introduce the supervision mechanism into the board's decision-making process. By this way, the board could do a better job monitoring the management of the company, the "insider control" problem that usually happens under the circumstance of high concentrated ownership could be avoided, and the defects of the company's administrative unitary pattern could be remedied. In listed companies in China, there exist not only "insider control", inadequate disclosure of information, misleading and inaccurate information, and other problems, but also the issue of majority shareholders damaging minority shareholders' benefit. Therefore, it has a profound practical significance to set up the independent director system in listed companies in China.

For independent directors to play full functions in listed companies, we have to make scientific improvements and innovations on the original independent director system, combining with the present corporate governance structure in China's listed companies and Chinese traditional legal culture. Since the purpose of adopting the independent director system is to solve the violation of minority shareholders' interests by majority shareholders, the reform and perfection of the election mechanism of independent directors is the most urgent work to do. Specifically, for keeping independent directors independence, majority or controlling shareholders' rights to nominate independent directors in listed companies must be restricted, the cumulative voting system should be applied in the election of independent directors, and as well both independent directors and general directors should be elected at the same time. Of course, the corporate governance system of China's listed companies is a structural reform effort, a complicated and systemic project, and not just an isolated institutional reform. In short, we have to not only concern on the election mechanism of independent directors, and but also dig deeper in motivation, dismissal and other aspects of the independent director system.

**Abstract:** The method links the theory research and the practice analyse is used in this article. It is pointed out that effective employee motivation mechanism should be performed with the guidance of proper motivation theories. The article describes the significance of Victor H Vroom's expectancy theory and the principle of using expectancy theory to establish the system of theory and methodology for personnel motivation mechanism, so as to motivate personnel of modern enterprises, and try to build motivation mechanism for the personnel of modern enterprises. It is advanced that the key of the problem is to seek measures to inspire the initiative of the employees and which is also be concerned by the ideological and political works in enterprises.

**Keywords:** Expectancy theory; Personnel motivation system; Modern enterprises

Following the development of science and technology and economy, along with building and perfecting modern enterprises system of our country, the ideological work in modern enterprises slowly meets many new opportunities and challenges. It is very important to start research on personnel motivation mechanism in modern enterprises, so as to strengthen and improve employees' political working behavior, and welcome these new opportunities and challenges.

Motivation, a key term in management psychology, means that manager uses the proper method to encourage an individual worker's behavior and passion towards his/her job and make sure the individual worker reaches and keeps an active level during his/work. Motivation mechanism is an internal system to stimulate motivation, encourage behavior, and arouse the enthusiasm to reach or keep people active. The introduction, establishment and perfection of motivation mechanism is rather important to use the advantage of ideological work, strengthen the management in modern enterprise, enhance employee's quality and practice strategies of invigorating our country through science and education.

## 1 Introduction

In the 1980's, there are four famous writings in which the theory of the foreign enterprise culture management was signed to come into being. They are "the theory of Z" written by William Ouchi, "the art of management in Japanese enterprise" written by Pascale R. theory, J., and Athos, A. G., "the culture of enterprise" written by Allan A. Kennedy and Terrence E. Deal, "the pursuit of excellence" written by Thomas Peters and Robert H. Waterman. These four books are called "four quartets" in enterprises cultural management theory. The first period in which scholars do research on the theory of enterprise culture management is also In the 1980's. It was deemed by Chen Bin fu in Nankai that the extensive attention and research on the organization culture and enterprise culture begin at the 80's, it is the new trend of the development of management science. we are told that the spirit of management is more important than the specific means of management and management method. It was pointed out by Zhang De in Tsinghua University that a lot of enterprises have devote themselves to the construction of enterprise culture when they were deepening the reform of enterprises, they have achieved the initial effect. It was pointed out by Han Xiulan in Chinese Academy of Social Sciences that every enterprise should strengthen the construction of company culture which advocate people-oriented idea when they are in strict scientific management process in accordance with modern production needs.

We can understand that the scholars all are make great efforts to pursue a proper method to agglomerate the will of the employees. So they advocate the enterprises cultural management theory. But we should know that the key of the problem is to seek measures to inspire the initiative of the employees.

## 2 Use Expectancy Theory to Build Personnel Motivation System in Modern enterprise

Effective employee motivation mechanism should be performed with the use and guidance by proper incentive theories. Those driving theories, such as *The Need Hierarchy theory* of Maslow, *ERG*

*theory of Alderfer, Achievement Incentive theory of McClelland, Dual Factors Theory of Herzberg, Adams's fair theory, Field Dynamic Theory by Lewin* are all useful to formulate our policies. Among all these theories, the expectancy theory, which is created by the brilliant psychologist and behavioral scientist Victor H Vroom, is much better to reflect the reality of our society. This theory is to encourage the motivation of employees in modern firms. The Victor H Vroom's expectancy theory can be formulated by the following function:

$$M = V * E$$

From above function, M represents inspiration, a power to encourage individual motivation and potential. V represents target potency. It means the degree of individual tendency. When individual considers the target value is minor important, the value of potency is equal zero. On the other hand, the value of potency is negative while the individual regards the target value as disadvantageous. There is no inspiration from above two consequences. E represents expecting ratio. The expecting ratio is a probability given by specific experiment. This is a probability judged by previous experiences and can be reached to the target value.

According to the expectancy theory, the intensity of the behavior tendency is determined by individual expectation and the attractiveness of the result. To be more specific, when individual worker believes that the excellent appraisal performance can be reached through personal endeavor, he/ she will dedicate to his/her job. The excellent appraisal performance evaluation brings benefit, such as bonus, raising salary and promotion to the individual worker. As a result, employees are satisfied by the incentive premium. The theory focus on three aspects as following:

Endeavor. The relationship between hard working and appraisal performance is the first aspect. The scientific appraisal performance system is crucial in determining whether a person's endeavor is effective in his/her work. A proper appraisal performance system promotes a person's value to a good level. In a word, the person's endeavor reflects the appraisal performance.

Appraisal performance and premium relationship is another aspect. The degree of incentive premium is related to the level of appraisal performance. If the individual worker believes that the excellent appraisal performance evaluation will bring rewards to his/her job, the relationship between appraisal performance and premium is strong and vice versa.

Premium and personal objective relationship represents the level of satisfaction from individual worker and the attractiveness of the rewards. If the reward is the expecting premium of individual worker, the relationship between premium and personal objective is strong and vice versa. It is crystal clear from analysis above that if the three relationships are close related to each other, the level of incentive can be reached to the maximum. In other words, the level of incentive can be best effective if the three relationships reach to the same level.

The expectancy theory of Victor H. Vroom is highly recognized by our society. It is demonstrated that if the expecting ratio is equal zero or negative, there is no need to encourage individual worker to fulfill his/her objective. The motivation mechanism depends on the target potency and expecting ratio. It is possible that the motivation to complete one task is related to the expectation to other tasks.

### **3 The Methods to Build the Employee Motivation Mechanism by Using the Expectancy Theory for Modern Enterprises**

The basic concept of using expectancy theory to encourage employee of modern enterprise is that employees can get rewards such as bonus, giving honor and satisfying their needs by following enterprise's rules and regulations and also obeying enterprise's arrangement. There are four steps which are personal endeavor, achievement, reward and satisfaction included in the concept. Meanwhile, there are following methods to encourage employees in modern enterprise:

#### **3.1 Expected incentive and Objective incentive.**

We can see from the relationship between endeavor and appraisal performance in Vroom's expectancy theory is that the motivation to achieve success in their jobs is the main reason for employees in modern enterprise. They are always willing to dedicate themselves to reach success in their jobs. If employees think their target is difficult to reach and they will not get excellent performance in their jobs. As the result, they will loss their motivation to achieve success. Therefore, the management should make use of expected motivation mechanism and objective motivation mechanism properly and control the probability to achieve the best result. It is also their responsibility to guide employees to set their goal and pursue it.

#### **3.2 Intelligence incentive and competency incentive.**

The world has changed quickly through information, digital and internet technology. There is a common problem that the modern employees are faced with inappropriate construction of knowledge structure and their learning concept is out of date. Therefore, when they expose to the continuing increased competition of job market, they have a strong intention to improve their personal value by keep learning. The modern companies, as a platform for employees, should support their motivation to improve competency. It is better to satisfy employees' objective value and inspire them to compete in the market. The enterprise should also eliminate the stress and negative thinking for employees and create working environment and conditions which can explore their potential and benefit for their future development. At the same time, the enterprise should increase its expectancy to support employees' objective value, guide their direction according to their special needs and to enhance their moral cultivation and mental and physical health.

### **3.3 Spirit reward and material reward.**

The relationship between appraisal performance and rewards in V room's expectancy theory has clearly demonstrated that the employees in modern enterprise are willing to get rewards from their achievement. The reward is combined with material rewards and spirit rewards. If the employee thinks about the rewards after him/her engaging good performance, he/she will have passion to do his/her job. On the other hand, he/she will lose enthusiasm to do the job when nothing is rewarded. Individuals also have special needs for self-approval and honor. The enterprise should give honor to the employees who have excellent performance in their jobs. Offering them spirit reward and material reward is essential to encourage other employees in order to achieve the target for the enterprise. Certainly, the proper penalty is also a way to motive employees. If employees misbehave themselves in their work, it is a good way to teach them by giving penalty. However, the reward and penalty should provide in time and properly in order to maximize the effect of motivation mechanism. Moreover, it is also important to encourage the team reward for the enterprise to cultivate group honor and team spirit.

### **3.4 Behavior incentive and model incentive.**

The elite of V room's theory are that the model employees who have excellent performance in the job, have power to inspire other employees to behave well in their jobs. The management and the model employees should influence other employees by their knowledge, moral conduct and remarks. Meanwhile, they should care about the employees and try to help them out. A powerful incentive is to inspire employee inside from their heart. Model incentive is a concrete behavior model. The model employees must be the individual or group workers who have accepted reward from the enterprise. The model is an important role in the enterprise. It teaches employees what to do and how to work on it. The model changes the enterprise's objective into a real job and improves enterprise's efficiency.

## **4 The Principle to Use Expectancy Theory to Establish Individual Incentive Policies for Modern Companies**

### **4.1 Innovation for incentive policies.**

Once the enterprise has established its incentive policies, it is important to implement without any discount so as to keep the credibility. However, meeting with the new trend and characteristics of the society, the motivation mechanism should be altered based on the employee's special needs. In order to keep the balance of motivation mechanism, the enterprise should continuously adjust the policy content.

### **4.2 The motivation mechanism should be well targeted.**

V Room's expectancy theory has demonstrated that people always wish to get reward to stratify their special needs. However, there is a difference among individual workers. As the change of time and space, the individual worker has changed their needs and level of satisfaction. Therefore, the motivation mechanism should be well targeted in different stage and different needs for individual workers. The enterprise should implement effective strategies to maximize the objective value under different situations. If the management do not treat it seriously and never analyze the situation for the enterprise, there will be no effective consequence for the incentive policies and even result in an opposite effect.

### **4.3 Motivation mechanism should be fair and appropriate.**

Professor J.S Adams in University of North Colorado of the United States introduced Equity Theory according to the unbalanced recognition theory. According to his theory, the individual not only care about his/her income and expenditure, but also care about the relationship between personal and group income and expenditure. The motivation also effects by either absolute value and relative value, that is, the incentive depends on what he gets from the reward and what other people get from the reward.

Only the proper reward and punishment can motivate employee's enthusiasm toward their jobs.

Over reward can make employees satisfied and arrogant, as a result, they lose the intention to improve themselves. Under rewards also can not reach incentive effect and make employees feel less important in their jobs. The significant principle of motivation mechanism for employees in modern enterprise is to treat employees fair, equal and open. Any unfair treatment can lead employees lose their efficiency and emotion for the job. The reward offered to employees who have achieved the same level of performance should award in the same level. Similarly, the same penalty should give to the employees who have made the same mistakes. Otherwise, the motivation mechanism will not work well among different employees. Sometimes, it can result conflict among them.

To treat employees equally must avoid average allocation. The average allocation of reward means nothing for the employees. The individual worker will compare his reward with other person and even compare with the historical reward and social reward. It is often appears that some management never treat problems from enterprise's view, they only think about the personal situations. Therefore, it would destroy many employees' enthusiasm. Indeed, equity is a feeling that every employee can feel about it. The individuals are always focusing on their own benefit, so the management should have an acute judgment based on their difference and make sure individuals keep their enthusiasm.

#### **4.4 Introduce different motivation mechanism for different employees and provide various incentive target and work target.**

According to the psychological principle, only the unsatisfied needs can trigger individual's motivation and effect individual's behaviour. The difference of individual can cause different needs at different time, even the same person has different needs at different situations. Therefore, the motivation mechanism should be changed based on the different needs. In order to satisfy their needs and inspire their motivation, the incentive target should be changed among different situations. According to the psychological theory, the motivation of employee is also influenced by the work targets which are employee's capability, environment condition, and personal relationship. The following reason causes employees have less incentive in their job, such as improper work target, incompetency and over established target. If employees have less competency and they are worked under unfavourable environment and human relations, they can also have negative attitude toward their job. Therefore, when establishing the motivation mechanism for modern companies, the management should consider employees' competency, working conditions and the relationship among workers. The motivation mechanism which has various incentive targets and adjust to different persons can maximize the enthusiasm for employees.

#### **4.5 To prevent inability to implement incentive policies.**

Firstly, the management should avoid high demand with low ability. The management and entrepreneurs must give attention to the establishment of motivation mechanism and focus on the research and implementation. Otherwise, they will lose many opportunities to reach the incentive effect. Secondly, the enterprise should avoid over burden of strategies. The motivation mechanism is well-meaning to the enterprise, but if the enterprise can not manage it well according to different situations, it does not take much to become either incentive or anger. The policy could result in an opposite consequence. Thirdly, the enterprise should prevent from prejudice. The implementation of incentive strategy is not only the responsibility of enterprise's leader, but also the responsibility of every management of the enterprise. It is better to build up the incentive motivation for every manager of the enterprise in order to create a desirable environment and reach the real target of inspiring people.

## **5 Conclusion**

It should be minded by The ideological and political works in enterprises to establish the system of theory and methodology for personnel motivation mechanism. At the same time we should remember that the ideological and political works in enterprises is the important means to improve and perfect the enterprise management.

# An Analysis of the Gender Gap in Science, Technology and Innovation Fields in Japan

Yuko Hayashi

Graduate School of Innovation and Technology Management, Yamaguchi University, Yamaguchi, Japan,  
755-8611

(E-mail: hayashiy@yamaguchi-u.ac.jp)

**Abstract:** As the companies, organizations, and society are globalized, human diversity in ages, sexes, nationalities would be much more important in product, process and service innovation. Especially, how to utilize the ability of women would be a pivotal strategy to promote innovation. But in very few countries, women could work properly and there are many actions should be taken to improve those conditions. In Japan, women's working condition is worse than that of Europe and North America. This article presents analysis of the Japanese women's matters in work focusing on the fields related to science, technology and innovation. Finally, this paper will propose ideas and actions on how to ease the gender gaps in the fields.

**Key words:** Gender gap; science; Technology and innovation; Diversity; Women's matter; Positive action

## 1 Introduction

Japan's Equal Employment Opportunity Law was enacted in 1985. Since then, it seems many women have more chance to get jobs, but the ratio of working women has been growing very slowly and working condition has not been improved as much as expected. Then, the Basic Law for a gender-equal society was enacted 1999. In 2003, the headquarter for the Promotion of Gender equality set a target number, 30 percent as a women's proportion in leadership positions in all sectors of society. However, concrete steps for improving a gender gap have not been made yet so that after 27 years from the first law enacted, progress is very slow. Still now, women's participation in policy decision-making processes is not sufficient in many areas including political, administrative, economic, or academic ones. The third Basic Plan for Gender Equality tackles to promote "positive action" as an effective approach in 2011.<sup>[1]</sup>

The sixth annual World Economic Forum Global Gender Gap Report 2011 shows Japan's gender gap ranking is 98<sup>th</sup> among 135 countries in the world, the 38<sup>th</sup> among 45 high income countries.<sup>[2]</sup> In 21<sup>st</sup> century, as the world has been globalized, human diversity in ages, sexes, nationalities would play a pivotal role to industry and society. To utilized diversity produce various values that would contribute to activate organizations and society. Moreover, many technology issues confronting society and working for technology field is increasing and getting important and responsible than ever. In this field as well, the needs for women's participation are increasing and women should be empowered to contribute to it. However, Women in science, technology and innovation fields remain minority. In these fields, educational facilities should produce many talented women to support the society and work in this area. This article will investigate the current situations and problems of working conditions on Japanese women, focusing on science, technology, and innovation fields. Materials used for analysis are government's statistics, white papers, related report and surveys, journals, and discussion on the related committees.

## 2 Present Situation and Problems

### 2.1 Quantity of female in science, technology field

56.0% of men and 45.8 percent women go to universities. (undergraduate) Men is 10 points higher than women. Women, however, 10.4 percent of the total go on to 2-year junior college. (undergraduate) When the rate of advancement to this junior college is combined, women's enrollment rate will be 56.2 percent. In recent years, the trend for women to go to universities (undergraduate) has risen and the percentage of women to go to junior college peaked 24.9 percent in fiscal 2006, and the rate continues to decrease since then.

Figure 1 shows that the rate of female undergraduate students who belongs to cultural science or social science exceeds 50 percent. Students that belong to science, engineering, or agricultural department are very small number, 2.0 percent, 4.1 percent, 2.9 percent, consecutively. Among science

and technology related departments, a department of medicine including medical science, public health, pharmaceuticals, dentistry, or nursing is more popular among female students than other departments.

**Figure 1 Percentage of Female Students at Each Department in Undergraduate**  
 source: the Ministry of Education, Culture, Sports, Science and Technology 2009

Figure 2 shows female employment rate after students graduate each department of undergraduate school. In every department except the art department, more than 80 percent of students go to work, higher educational facilities, or trainings.

In science, engineering, and agriculture departments, students tend to go to higher education such as graduate schools rather than working. These departments have low percentage of female students than other departments as Figure one shows.

In a medical department, students tend to go to work or training for work in medical facilities. The training is obligated to work for some medical area.

The undergraduate students majoring non science and technology fields including education, social science, cultural science and art tend to be employed after their graduation.

**Figure 2 Female Employment Rate of Each Department in Undergraduate**  
 source: the Ministry of Education, Culture, Sports, Science and Technology 2009

Table 1 shows sciences or arts majored Men's or Women's differing views on important factors in choosing the major, department, and university. The most notable difference between women majoring

sciences and arts is to obtain qualifications and licenses. It would tell that the percentage of majoring medical department is higher than other department. The second significant difference is about tuitions. Departments of sciences tend to higher tuition fees than liberal arts department. And private universities have higher tuition fees than national university have.

The third one is whether there is a graduate school or not. So women in science need higher education and expertise. Given that the women majoring liberal arts regard commuting from home, good school spirit or good atmosphere in campus, or tradition and recognition of a school as important, it can be seen that women in non-science seek general education, while women in science emphasize expertise.

**Table 1 Sciences or Arts Majored Men's or Women's Differing Views on Important Factors in Choosing the Major, Department, and University**

○○ ○○	female		Male

In terms of the employment rate of women, the Figure 3 shows that female employment rate keep constant number for long years while male's employment rate are gradually decreasing year by year. After 1985, when Japan's Equal Employment Opportunity Law was enacted, the female employment rate increased a little but soon after shifted to constant level. Some of the factors of male's decreasing are decrease in population and aging society which declines working population. Moreover, while the employer is reduced in the manufacturing sector and the construction industry, increased employment in the field of medical and welfare where women's employment tends to work. These changes of the industrial structure would effects on increasing of employment.

Some other factors, though some of them are negative ones, help increasing of women's employment rate. The aging society with a low birthrate decreases the total number of labor force, so women could get more chance to work than before. . . The possibilities for women to come back to job in a long life is increasing, too. Unfortunate economic problems also force women to work. Moreover, because of low wedge of labor, one family needs double income.

**Figure 3 Employment Rate in Japan**

Source: Statistics Bureau, Ministry of Internal Affairs and Communication

The Figure 4 shows female labor force participation rate by age group in Japan. M-shaped curve indicates that women leave jobs when they get married, give birth, or raise children and come back to labor force after children grow up. Women’s working ratio still shows M-shape curve in 2010 which is not be seen in the U.S. Sweden, or Germany, even though its incline became gentler. The peak of labor force participation rate shifted from age group 20-24 to 25-29 because the people tend to get married late recently.

In age group 40-45, the ratio of employment is as high as the peak when they return to work. However, a quality of role is different as before. Sometimes, it is difficult to find same level of job. When a woman return the same company, she falls behind to colleagues in climbing up the career ladder.<sup>[3]</sup> Women sometimes find more junior job to give them a balanced life. Proportion of non-regular workers of employed women is more than half so that the level of salaries of the women’s workers is about 70 percent of the men’s workers.<sup>[4]</sup>

In science, technology and engineering sector, especially in advanced technology sector, the fact that knowledge moves on so quickly makes it difficult for female workers to return after an extended carrier brake.<sup>[5]</sup>

**Figure 4 Female Labor Force Participation Rate by Age Group in Japan**

Source: Statistics Bureau, Ministry of Internal Affairs and Communication 2011

### 2.3 Quality of female in science, technology field

As Figure 5 shows, in highly specialized occupations or leadership position of occupations, women’s ratio is not so high in Japan. A pharmacist is the highest percentage in the occupation, followed by dentists, medical doctors in science and technology fields. In universities, people should finish 6-year course to graduate a medical school. These three occupations need national licenses in order to practice and people should pass a national examination after graduation.

33.2 percent of members of councils is female. This figure is the second largest in the proportion of women in leadership positions. When the target number was designated in 2003 as 30 percent of women should be in leadership positions in all sectors by the headquarter for the Promotion of Gender Equality, the gender equal bureau set the quota as 30 percent for female percentage of members of the council of government. This quota would be the one of the factors of higher figure compared with others.

**Figure 5 Women's Ratio in Each Occupation**  
source: White paper 2010 Cabinet Office

Women’s serving period tend to prolonged in 2011, the ratio of more than 10 years of women’s service period account for approximately one-third of female labour. In leadership positions, As Table 2 shows, serving periods of women tend to be shorter than men’s one. In a medical sector, the percentage of female employment is high as I said above, but still the serving period is not so long. Although 6-year programs in universities and license should be taken in order to practice as pharmacists, dentists, and medical doctors, serving period is not long enough.

**Table 2 Serving Periods of Female And Male**

Occupation	Female	Male	difference
cabin attendant	10.1	2.5	-7.6
Lawyer	8.5	6.2	-2.3
Pharmacist	6.9	8.1	1.2
Dentist	4.6	5.8	1.2
Researcher	9.2	10.5	1.3
medical doctor	3.8	5.5	1.7
Journalist	9.4	13.7	4.3

Source: Basic Survey on Wage Structure, Health, Labour and Welfare Statistics 2009

The percentage of the researchers is growing year by year but the number of the female representatives is still small, 13.8 percent compared with 87.2 percent for male researchers. Japan’s

percentage of female researchers is the smallest among the countries in Europe and America as Figure 6 shows. The percentage of Korean researchers exceeded Japan in 2009.

**Figure 6 International Comparison on Percentage of Female Researchers**  
**Source: Cabinet Office, White Paper On Gender Equality 2011, p115**

\*The value of EU countries was created from EU “Eurostat” and includes the estimated value and the provisional value. The data of Slovakia, Russia, Czech are as of the year 2010. Switzerland, South Korea are 2008. Greece is 2005. Other countries are as of the year 2009.

\*Japanese figures are based on the “Report on the Survey of Research and Development in 2011,” the Ministry of Internal Affairs and Communications. March 31, 2011.

A figure in the United States is on the basis of "Science and Engineering Indicators 2006" of the National Science Foundation including a part of the humanities and social sciences researchers. A figure is as of the year 2003.

The large-scale survey on gender equality in science and technology professionals by Liaison Committee for Academic Society of Gender Equality shows the reasons why there is fewer female researchers. One reason is the difficulty in balancing working and family care, and second one is difficulty in returning after a period of childcare. Third one is that consideration for childcare and elderly nursing care<sup>is lacking.[6]</sup> Recently, some policy has been incorporated to solve childcare and elderly nursing. For examples, Grants in Aid for Scientific Research provides special funds for the person who returns after carrier break for having children or child care. National Universities offers family leave. The other reason is that evaluators tend to give priority to male researchers. These working conditions should be improved. The proportion of women in higher education stage is 42.6 percent in undergraduate, 29.5 percent in graduate school for master degree, and 32.7 percent in graduate school for Ph.D. Taking these numbers in to account, a higher percentage of female researchers could work for in future if working conditions are arranged.

About the affiliation of researchers, 60 percent of the male researchers belong to the companies while 30 percent belong to the universities. As for female researchers, about 60 percent belong to the universities while around 30 percent belong to the companies.<sup>[7]</sup> In universities and other research institutions where a substantial portion of female researchers belongs to, about 50 percent of the researchers is female in the fields such as Nursing and Pharmacy. On the other hand, in the field of engineering women account for only 8.8 percent and even in agriculture or science sectors, only 10 percent of the researchers is female. This number is related to the proportion of the students in Universities. There is a possibility to increase the percentage of women researchers in Universities, if the number of the students in universities, which is a parent set of future researchers, increases.

Even in the research fields where relatively high proportion of women researchers work for, probabilities are consistently getting lower against women climbing higher as lecturer, associate professor, and professor in the carrier ladder.<sup>[8]</sup>

Some government agencies are promoting science technology policies for women. The 4<sup>th</sup> basic plan for Science technology indicates that the target number of employment of female researchers should be 30 percent which is higher than the number set in the 3<sup>rd</sup> basic plan for Science and technology. The plan supports for arranging the research system for women to compatible with research and delivery or child care by incorporating flex-time, stay home work and a new personnel evaluation system. Council for Science and Technology Policy, Cabinet Office eases an age restriction for women to obtain a competitive fund. Science Council of Japan promotes female researchers to join decision making process in science and technology.

Japan Science and Technology Agency designated the programs to encourage high school female students to go to Universities and major science. It holds temporary science laboratories, guidance consulting, and networking events at high schools.

### 3 Conclusions, Implications and Actions

The analysis suggested that the improving employment and education circumstances of women are important for women sector in japan as well as for women sector in science. Many problems still exist in other sectors, too. The analysis suggested following implications and actions.

Returning to jobs is difficult for women after they leave a company when they have children or have commitment with families. Once women leave occupation, it is hard to return to the same level of work. By utilizing parental leave and child care facilities, women should keep occupations . As a positive action, this facilities and laws should be arranged. To advise women to stay jobs and support them to return to work is important as well.

Licenses and qualifications help women's work. The percentage of leader's position of women with licenses and qualifications is relatively high , especially in a medical field including pharmaceuticals, medical doctors, and dentists. However, their serving period is not so long in spite of their long studying period. This tendency should be reformed by supporting work conditions.

- Establish a mentoring system for women in science technology and innovation field. Because there is a possibility that the image of the profession and fixed idea of gender roles in society has affected the course selection, educational opportunities and providing information about career choices to wide range of women is important.

Staying on jobs or prolonged service period of female work are very important. Indicating some roll models that show women's carrier paths and some mentoring system for women help these problems.

Organize some symposia in order to do guidance counseling and carrier building counseling for women in science in high schools and universities. Mentor high school students, university students to give them right information.

Discuss top managements of companies on women's matter in order to obtain their commitment.

- Send out questionnaire to top managements to investigate the current situation. Survey to know the current situation is very important and statistical number is effective to know the present state.

To legislate or amend bills to support empowerment of women is essential. For examples, family leave, parental leave, childcare facilities, tax incentives should be incorporated properly.

Quota system among positive actions sometimes propels the targeted number as the proportion of members of government council shows. Government sectors should utilize it.

In future, I am planning to do interviews to advance countries abroad in gender equal policy to determine the causes of the difference from Japan. However, characteristics of Gender gaps and countermeasures often depend on the country's culture, customs, and political philosophy. Incorporating ideas from other countries, it is important to have country-specific approach to solve the problems.

# Research on Rural Human Resources Development in Hunan Province under the Rising Strategy of Central China\*

Cheng Huijun

Central South University of Forestry and Technology, Changsha, P.R.China, 410004

(E-mail: smchj\_cn@163.com)

**Abstract:** This article uses the comprehensive analysis way to put forward that Hunan Province shall greatly develop and utilize rural human resources to satisfy the urgent demands of new rural construction. On the research's opinion, the most importance of developing and utilizing human resources is the establishment of rural evaluation index system. Therefore, it systematically forges rural human resources developing evaluation index system in Hunan Province and puts forward greater controllable strategies and measurements based on this.

**Key Words:** Rise of central China; Human resources development; Rural science and technology Co-operation

## 1 Introduction

Throughout the world, the developed countries are taking a lead in human resources development and utilization in theoretically and practically, and among them, America, Germany, Japan and Korea are more representative with different characteristics. In 1995, Robert Lucas, the winner of Nobel Economic Prize, pointed out that efficiency benefits would be increased as the accumulation of human resources. Currently, there are more relevant researches on human resources area, but there is not so much academic achievements involving in rural human resources development, especially based on Hunan Province and systematically studying this issue from the point of view of economics and sociology. The topic of this paper is taking this as the basic starting point.

## 2 The Important Meaning of Rural Human Resources Development in Hunan under The Rising Strategy of Central China

Central China plays an important role in overall economic society development in our country and makes great contribution to economic society development in the whole country for a long time.<sup>[1]</sup> In the six provinces of Central China, no matter the geographic location, historical culture, or educational tradition, Hunan has the insurmountable potential compared with other provinces or cities, and it should be the top priority of the strategy of Central China. The realization of the rising strategy of Central China is to firstly settle the Three Rural Issues. As the major agricultural province, Hunan plays an extremely important role in the whole country and the Central China, and the Three Rural Issues in Hunan are the most outstanding one.<sup>[2]</sup> The peasants account for 70% of the 68 million persons in Hunan, and the rural labor force resources in the labor age level are 35 million persons, which can show that the rural human resources in Hunan is very rich, but the proportion is strictly imbalanced, as well as the low-effective use or set-aside of general labor force and the extremely lack of high-qualified labor force is specially outstanding. The key of the Three Rural Issues is the agricultural industrialization and peasants' income problem. Basically speaking, there ultimately needs to effectively develop and utilize the rural human resources of our province to settle the Three Rural Issues in Hunan.<sup>[3]</sup>

### 2.1 Develop the rural resources of our province and change the peasants' ignorant and outdated ideas

Hunan has a long history, which is one of the cradles of Chinese civilization, and at the same time, the feudal thought in the countryside is also deep-rooted. Compared with the coastal and eastern developed area, the ideology of unproductive, setting for less, and lockstep is very serious, which ties up the pace and speed of economic development, pursuing progress of the peasants in our province. Besides the conservative ideology and lower cultural quality, they are also lack of market economic thoughts and educational conscious, and the cultural educational cause in the countryside develops very slowly. Certainly, some typical poor and remote mountain areas are also lack of effective means to use the advanced culture to guide and educate the peasants and lack of expanded cultural educational atmosphere.

---

\* Project Achievements of Soft Science Project in Hunan Province    Project No.: 2010ZK3065

## **2.2 Develop the rural resources of our province and improve the peasants' science and technology cultural level**

In order to increase the agricultural production, improve the quality, optimize the agricultural planting structure in our province, the free use of agricultural science and technology requires the peasants to have better scientific and cultural qualities. Statistics showed that: although quantity of rural human resources in Hunan is large, the comprehensive quality is generally on the low side, which largely limits the process of new rural construction in Hunan. In every 100 rural labor forces, the quantity of lower than junior high school level accounts for 88.7%, the senior high school level for 11.2%, and the quantity of more than senior high school level only accounts for 1%. The cultural quality must lead to the lower level of peasants in our province currently.

## **2.3 Develop the rural resources of our province and fasten the process of agricultural modernization and industrialization**

Make full use of technology-enabled, specialization, and elaboration to improve the agricultural production, quality and value-added realization, which is not only the important means to realize the increasing ways of agriculture in Hunan, but also the important links to decrease the agricultural product cost and increase the income of peasants.

## **3 The Problems Existing in Human Resources Development in Hunan Province**

### **3.1 The rural human resources education level of our province is on the low side**

As the survey data showed, the overall level of taking compulsory education of rural population is at the low side. The population of taking elementary education accounts for 49.6%, taking intermediate education for 39.75%. Most peasants' cultural level is at the low side, without technology and with older age, relatively lower ability for learning and handling the technology, and the ones who can insist on the training are even less.

### **3.2 The stress on rural human resources development of the government is not enough**

In the process of rural human resources development and management, the rural social political, economic, and human resources development and management functions of government are very important. As the investigation and research showed, there is still a certain lack of government functions on rural human resources management in Hunan Province: such as the insufficient investment of rural educational expenditures. In recent years, although the development of rural education of our province is very fast, it is still slower than the economic development. The proportion of public educational expenditures of our country to GNP is wandering at about 2.5% for many years, which is lower than the average level of 4% in the developing countries. In such small public educational expenditures, we mostly invest the public expenditures into the urban important schools with good foundation, and invest few public educational expenditures into the rural and remote areas, which lead to the worse school running conditions of quite a few rural compulsory educations.

### **3.3 Lack of systemized developing plan and organisational system of rural human resources**

Our province is lack of unified recognition on rural human resources development and partial regions and counties have no unified labor developing management institutions or no systemized working policies and ways for rural labor developing management. Therefore, it is lack of overall investigation and research on rural human resources development, lack of initiative, positive and sense of urgency and lack of analytic hierarchy process in personnel training, which is rather blind, without forming unified organisational and planned system.

## **4 Build Rural Human Resources Development Evaluation Index System in Hunan Province**

Rural human resources development evaluation index has very important value for guiding rural human resources development work. By using multiple index comprehensive evaluation ways and through estimation on rural economic development level in Hunan Province, it needs to settle down two key technical problems: one is to scientifically confirm the weight of each index in the whole index system; the other is to scientifically make index dimensionless processing and confirm the "Quantized Value" of each index's actual value.

### **4.1 Conform the weight of each evaluated index in the whole evaluation index system**

Each index in weight system of rural human resources development level comprehensive evaluation system is a kind of measurement relative to contribution of rural human resources development level and different weight coefficients always lead to different evaluation results. The

valuation of weight system always has bigger randomness, and due to the different view of value, knowledge level and psychological concept etc., different people have different understanding of the importance of the same index, and even the same people would make different knowing and understanding of the same index in different time and social background. Therefore, it should always be the important area of that kind of research to strive to the scientificity and rationality of weight coefficient valuation of index system.

From the status qua of index system coefficient research at home and abroad, there are two types of subjective weighting and objective weighting for the confirmation of weight coefficient, but due to the subjective and physical influence of people, it is not only very difficult but also very incorrect to directly and simultaneously analyze and judge the weight of several indexes. In order to more scientifically confirm the contribution to overall objective of each index, we adopt the Analytic Hierarchy Process (AHP) and Delphi Method (Delphi) put forward by Professor T.L.Saaty, the American Scholar, to confirm the weight of each index. Firstly, it uses AHP to divide the index system into objective level, principle level and index level, and then focusing on each specific index, it adopts Delphi to analyze the weight of the principle level belonging to that.

**4.2 Eliminate the index dimension and make index "Value" quantized**

At present, there are many ways to make dimensionless processing to the index data, that is "Value" quantized. Considering two types to evaluate the index of homonymous index and contrary index, there is no clear quantity limitation of "Good" and "Bad" between indexes, which is with a certain fuzziness in a large part. Therefore, it adopts the fuzzy membership functions way put forward by L.A.Zadeh, the American scholar, to make dimensionless processing on each index.

All kinds of fuzzy membership functions expressions and charts are as the followings:

4.2.1 The homonymous index

We use half-up trapezoidal fuzzy membership functions quantification, that is:

$$\phi_1 = \frac{e_{ij} - m_{ij}}{M_{ij} - m_{ij}} \begin{cases} 1 & e_{ij} \geq M_{ij} \\ \frac{e_{ij} - m_{ij}}{M_{ij} - m_{ij}} & m_{ij} < e_{ij} < M_{ij} \\ 0 & e_{ij} < m_{ij} \end{cases}$$

The chart is as the following:

4.2.2 The contrary index

We use half-drop trapezoidal fuzzy membership functions quantification, that is:

$$\phi_1 = \frac{M_{ij} - e_{ij}}{M_{ij} - m_{ij}} \begin{cases} 1 & e_{ij} \geq M_{ij} \\ \frac{M_{ij} - e_{ij}}{M_{ij} - m_{ij}} & m_{ij} < e_{ij} < M_{ij} \\ 0 & e_{ij} < m_{ij} \end{cases}$$

After our summary, the survey result is as the following:

Principle Level (Level A)		Index Level (Level B)		
Index of Level A	Weight	Index of Level B	Weight	
Comprehensive Evaluation Index System of Rural Human Resources Developing Level	0.3	A1 Resources Distribution Condition of Rural Human Resources	B1 Proportion of rural workers accounting for the total population	0.18
		B2 Proportion of non-agricultural employees accounting for rural agricultural workers	0.19	
		B3 Proportion of per capita salary income accounting for net income	0.22	
		B4 Per capita agricultural output	0.21	
		B5 Proportion of peasants with junior college degree and above educational level	0.20	
	0.3	B6 Per capita life expectancy	0.18	
		A2 Guarantee Level of Rural Human Resources	B7 Number of village doctors and health workers in per thousand agricultural population	0.21
		B8 Death ratio	0.17	
		B9 Proportion of national investment to rural healthcare, social security and social welfare accounting for total investment to rural	0.22	
		B10 Proportion of rural residents medical care expenditure accounting for living expenditure	0.22	
0.4	A3 Developing Ways of Rural Human Resources	B11 Proportion of national investment to rural education accounting for total investment to rural	0.34	
	B12 Proportion of national investment to rural culture, sports and recreation accounting for the total investment to rural	0.32		
	B13 Proportion of rural residents stationery and recreational products and services expenditure accounting for living expenditure	0.34		

## 5 The Solutions and Suggestions on Improving Job Performance of Rural Human Resources Development

### 5.1 Optimize the governmental functions of human resources management in Hunan

Firstly, the government can establish and specify the systems of rural human resources support and guarantee and increase the investment on rural education, culture and healthcare to build good external environment of human resources development as far as possible. For example, it can increase the support to the county-level financial resources, realize the effective investment on rural education, set up preferential policies for introducing rural talents as far as possible, and attract excellent talents to dedicate into the construction of new rural. Consideration could be made to build mutual cooperation relationship with the local schools, especially the rural schools, and invite experts as well as relevant professional personnel back to the rural to make technology guidance regularly or irregularly.

Secondly, optimize the social security functions. The government can widely open the financing channels to appropriately develop and perfect different forms of security systems of rural endowment insurance, unemployment insurance and rural cooperative medical and form the multi-level rural social security system combing with social insurance, social relief, social welfare, special care and placement and social mutual aid, personal savings accumulated security systems.

### 5.2 Actively build the training system for rural education in Hunan

For the rural human resources development, the most effective and direct way is to strengthen rural education. Through various ways, we can actively develop the rural educations systems including preschool education, basic education, adult education, job education and skills education etc., renew the educational content and reform the teaching ways and means to virtually ensure that the content of rural educational training is consistent with the actual requirements of the rural production activities, especially clearing out the objective of rural job and technology education. The main tasks of rural job and technology education are to promote agricultural technology and truly allow the peasants to be the practicality talents of handling technology and scientific farming. In educational practice, there are not

only to instill the theoretical knowledge to the peasants but also to adopt the participating training ways to connect the theory with practice so that the peasants can improve their skills through mutual learning. In adult education, it needs to specially strengthen the training on instructing a child, health care, self-protection and productive skills for women.

### **5.3 Construction of the new rural science and technology service system**

In the countryside, the rural science and technology service system is the strong force on promoting the progress of science and technology, with profound influence on the countryside development and even the overall development and progress of rural social economic of our province. It is the important organisational guarantee on promoting the science and technology progress and the middle bridge on realizing the conversion of science and technology to practical productive forces. Therefore, our province urgently needs to construct the new rural science and technology service system.

Firstly, actively develop the rural science and technology co-operation

Rural science and technology co-operation are a kind of new science and technology service mode sprang up in recent years. It is the new mutual cooperation organization combining the peasant households engaged in planting, cultivation, farm products processing, technology, and marketing etc. to form the economic community of interests and facing the mass peasants to provide services of agricultural production information, science and technology training, science and technology information etc. In Hunan, especially after the establishment of the rural science and technology co-operation in Shuangfeng County, Loudi City, it set up 16 unions, 320 branches and nearly 9,000 members, set up the rural science and technology demonstration base, undertook the municipal important science and technology project and gained the obvious achievements. Now, our province shall widely promote the rural science and technology co-operation and make actively development and growth to play its functions covering the whole province.

Secondly, strengthen the peasants' professional cooperation organization in our province.

Peasants' professional cooperation organization is the organization based on household contract management, with the main members of peasants, to carry out the mutual help and cooperation around the related links of one profession or product, and is a kind of organization form for self-service, self-development, and self-protection of peasants. The organizations can be the effective means and ways to rapidly speed up the agricultural development, push forward agricultural scientific and technological progress, and promote the increasing income of peasants. The countryside in our province can greatly strengthen and promote the construction of peasants' professional cooperation organization through the advanced experience of other provinces and cities.

Thirdly, make full use of the civil organization to implement the development job.

Civil organization is the effective means for cultivating the new peasants with culture, technology and operation ability. The training to the peasants pays more attention to the practicality, pertinence and effectiveness of the educational content. It not only correctly guides the changes of the peasants' ideology, but also provides positive guidance on the information technology. It can also advocate the ideas of life-long learning, all people learning and mutual learning in the countryside and build the learning environment and atmosphere to truly and effectively develop the rural human resources and improve the quality of rural population. The rural area in Hunan shall make fully use of the flexibility, practicality and local nature of the civil organization to implement the rural human resources development job into practice.

## **6 Conclusion**

In conclusion, the rural human resources condition in our country is worrying, which is not compatible with the characteristic of large quantity. From the developing history of developed countries, the rapid increases of agriculture are all benefited from investment on human resources. On this study's opinion, under the situation of economic competition globalization and knowledge economic domination, developing rural human resources in Hunan Province in our country under the rising strategy of Central China and building modern agriculture have great theoretical and practical value.

## Research on the Basic Mode of the Innovation

Xu Dianlong

Chief Editor of Economic Information Daily, Beijing, P.R. China, 100101  
(E-mail: dianlongxu@163.com)

**Abstract:** Innovation is about doing things no one has done before, or things most people have not yet known or recognized. This paper examines innovation from five aspects. Uncontroversial innovations are considered non-innovative. Independent innovation is not private innovation. Conceptual innovation represents the highest level of innovation. Innovation should be moderate. We should be kind to innovation and be adept at innovating. This paper proposes that innovation will definitely cause controversy and conceptual innovation is the premise for all the other kinds of innovation. It concludes that if a company wants to survive and develop in the market, it must be kind to innovation and get adaptation at innovation. The paper gives some basic mode of the innovation, further to recognize the essentiality of the innovation.

**Key words:** Uncontroversial innovation; Private innovation; Conceptual innovation; Basic mode

### 1 Introduction

It is no exaggeration to say that all innovations or inventions, from natural sciences to social sciences, from system to management, from Newton's universal gravitation to the Wright brothers' aircraft, and from China's Four Great Inventions to the never-ending technological revolutions, could cause controversy at all times and in all countries. Both history and reality have told us that innovation will certainly cause controversy and uncontroversial innovations are considered non-innovative.

### 2 Uncontroversial Innovations are Non-innovative

Innovation, except in the economic context, generally refers to doing things no one has done before, or things most people have not yet known or recognized. Accordingly, it means a challenge to the existing concepts, practices and results to do things unprecedented or not widely recognized and accepted. It also denies past conclusions and creeds, breaks the recognized order and violates original rules, thus inevitably arousing considerable controversy and probably encountering encirclement and suppression.

For innovations and innovators, being controversial is neither a curse nor a derogation. Instead, it is a sign of progress, a process coming before being recognized, understood and accepted, and thus it should be seen as a praise. Since ancient times, countless innovators have been ridiculed and even sacrificed their lives both in China and in foreign countries. For example, the world-renowned inventor Edison who invented the light bulb and the phonograph were often cursed by others as a fool. Copernicus who rejected the geocentric theory having been accepted for over 1,000 years and developed the heliocentric theory of the solar system, was obstructed by the church in every possible way for upholding the truth. On the contrary, in the face of challenge and controversy, some adventurous innovators who have the courage to sacrifice individual interests and to withstand the pressure of failure, become dumb and withdraw from advancing, and ultimately give up halfway. That is because they cannot interpret the controversy over innovation in a right way.

In the course of China's reform and opening up in the past 30 years, every little progress and advancement has aroused considerable controversy. Some people argued that the establishment of Shenzhen Special Economic Zone was not a socialist practice; some people said that the principle that practice is the sole criterion for testing truth was a comeback of the traditional concepts; some people maintained that the market economy with socialist characteristics was a form of capitalist. In the face of these arguments, Deng Xiaoping pointed out: "Reform and opening up involve great courage", and "If we don't have the pioneering spirit, if we're afraid to take risks, if we have no energy and drive, we cannot break a new path, a good path, or accomplish anything new. Who dares claim that he is 100 per cent sure of success and that he is taking no risks? No one can ever be 100 per cent sure at the outset that what he is doing is correct." Deng Xiaoping put a daring and innovative interpretation on the relations between innovation and failure, and between innovation and argument.

Innovation and controversy rebound upon each other. The basic mode of this opinion is that:

Figure 1 The basic mode of the innovation in controversy

It is innovation and controversy that decorate historical development and social progress and save human thought and spiritual civilization from being stagnant. With them, the world has painted brilliant pictures, left people wonderful memories, and created considerable spiritual and material wealth. The controversies whether they are right or wrong are among the heroes who strive for reforms, promote technological and social progress, and challenge the existing order and rules are born. It is also through these controversies that we see the reality behind illusion and conservatism, and see the twists and turns behind events. To settle these controversies, innovators should keep a low profile to bide their time, keep themselves from distractions, and always keep advancing. Moreover, history and practice will make proper conclusions.

### 3 Independent Innovation Is Not Self-appointed Innovation

Nowadays, the concept of independent innovation and its importance have been widely recognized and accepted. It arouses great enthusiasm and a conscious action that a top-down and a bottom-up innovative practices which have been launched throughout China.

However, some enthusiastic leading cadres and businessmen have a biased understanding of innovation, and believe that independent innovation should take place domestically, locally, or within enterprises, and that the innovation process should be mostly based on secluded innovation. In fact, the main body of independent innovation is the self, but it does not mean to seclude oneself from other countries or other people. Instead, it requires an open mind to actively introduce and absorb all the advanced technology and experience.

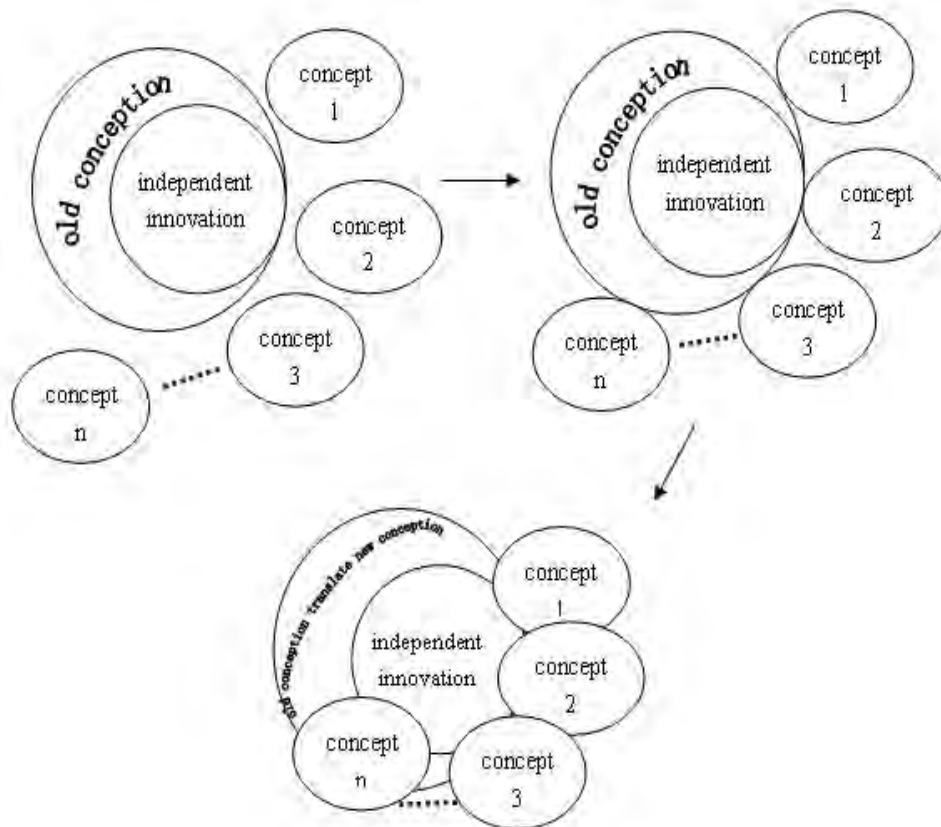

According to authoritative experts, independent innovation advocated by the CPC Central Committee has three meanings: first, to strengthen original innovation, and strive to obtain more scientific discoveries and technological inventions; second, to strengthen integrated innovation, center on products and major industries, organically integrate a variety of related technologies to form competitive products or industries; third, on the basis of introducing advanced foreign technology, to enhance digestion, absorption and re-innovation abilities. These three points are interrelated and equally important.

Independent innovation is not secluded or private innovation. Scientific discoveries and technological inventions are the products of the continuous interaction of different ideas. Therefore, the premise of innovation is openness and extensive exchanges. We should absorb other people's research findings all over the world as much as possible so that we can start from a new departure and make new progress. So the basic mode of the independent innovation is that:

China has made certain achievements in terms of original innovation and integrated innovation, and has thought high of introduction of advanced technologies, but little of digestion, absorption and re-innovation. The relevant data show that Japan and South Korea, in the economic take-off stage, spent 5 to 8 dollars on the absorption and re-innovation of the introduced technology worth 1 dollar. However, the figure in China in 2004 was only 0.18 dollar, resulting in a serious imbalance between technological introduction and technological absorption and re-innovation.

Some people say that Chinese people are able to produce satellites, missiles, and spacecraft on their own, not to mention other products, and therefore they do not need to rely on foreign technology. It should be noted that innovations in satellites, missiles and other non-market products are completely different from those in market products. The former category is not subject to the laws of market competition. Some countries may focus their national strength on developing the atomic bomb even if they have lagged behind other countries for decades, but their atomic bomb is equally lethal and influential. The vast majority of other products are subject to the constraints of market competition, and they must race against time and fight for opportunities. Once missing the opportunity, a company will

have few market shares even it has developed the same product as other companies who have already occupied the market.

**Figure 2 The Process of the Independence Innovation**

In the era of economic globalization, it is by no means an easy thing to make innovations in all products just behind closed doors. In a sense, independent innovation requires us to use international resources, to move forward quickly from atop the shoulders of our predecessors, and to put more effort into the integration of global resources for our own use. As we improve domestic experience in technology and management, we should also legally and proactively absorb and utilize the innovative resources, technical resources, and human resources of any other country or company. Therefore, only with a more open mind and more open measures will our road of independent innovation be broader, longer and more effective.

#### **4 Conceptual Innovation Represents the Highest Level of Innovation**

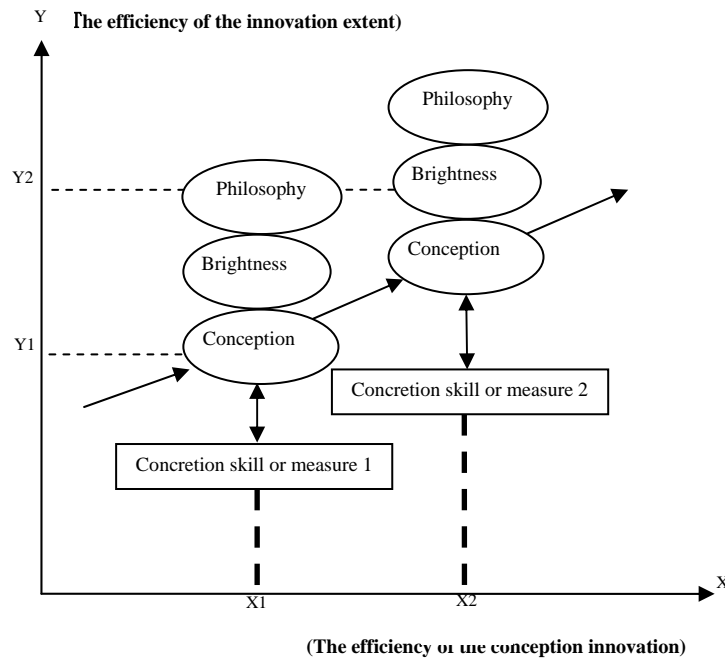

The concept of innovation was first proposed by the Austrian-American economist Schumpeter in his book *The Theory of Economic Development* in 1912. From an economic perspective, Schumpeter defined innovation as a new combination of means of production and listed five major types of innovations, namely, a new good, a new method of production, a new market, a new source of raw material, and a new organization. Nowadays the concept of innovation has gone beyond its economic significance and covered the fields of economics, sociology, behavior science.

Innovation, as a cognitive and practical ability specific to humans, has three levels which are the sense of innovation, the spirit of innovation, and the innovation ability. In terms of its contents, it can be divided into theoretical innovation, institutional innovation, technological innovation, conceptual innovation, management innovation, technical innovation, product innovation, service innovation, organisational innovation, marketing innovation, cultural innovation, and so on. In today's rapidly changing world, a company's speed of making innovations in its products becomes a sign of market dominance. To survive and develop, companies must keep up with the constantly changing situations,

and take a proactive role in making innovations in management, technology, products and so on, so as to ensure its dominant position in the market. Product innovation is based on technological innovation, the basis of which is conceptual innovation. Consequently, conceptual innovation is a prerequisite for all types of innovation, plays a decisive role in business development, and gives an inexhaustible impetus to business prosperity.

Concept, also known as knowledge or thought, is the sum of the ideas and notions developed from existing knowledge and long-term practice. Conceptual innovation means to change some wrong, outmoded and impractical established ideas and modes of thinking, observe things from a new viewpoint, then draw a new conclusion or form a new idea, and ultimately adopt a new attitude and approach to acting. Conceptual innovation, in essence, represents a revolution in ideology. So the basic mode of the conceptual innovation is that:

**Figure 3 Efficiency Conception Innovation Curve**

Figure 3 give the relationship between the efficiency of the conceptual innovation and the efficiency of the innovation extent. The formula like that:

- 1) Set the efficiency of the conceptual innovation as X
- 2) Set the efficiency of the innovation extent as Y
- 3) Set the extent as n

Innovation extent is as follow:

$$Y = X^n$$

Form this chart and formula the efficiency of the conceptual innovation will growth so faster when the efficiency of the conceptual innovation is more.

Conceptual innovation is a process of self-denial and self-transcendence. It transcends not only the traditional ways of thinking, but also the established patterns of interests and regular practices, which means that it is a painful and difficult process for companies to make conceptual innovations. Firstly, conceptual innovation requires the quality of self-denial. Self-denial means to give up outmoded ideas, to break the old work mode and mindset, and to establish a new concept. Instead of sticking to established practice and blindly copying others, a company should learn from others' successful experience to explore and create distinctive ideas and methods in accordance with the actual conditions of the company. Secondly, conceptual innovation is not about doing unconventional things without foundation, and it must be based on itself on certain theoretical knowledge and innovative knowledge. Thirdly, conceptual innovation requires creative thinking. Creative thinking is a thinking activity with groundbreaking significance, it is not an application or a representation of established knowledge, but a way of thinking through which one can get rid of the fixed concepts, rethink a problem form a new

perspective, and finally get a creative answer. With creative thinking, a company, according to its internal conditions and external environment, will become adept at discovering and seizing the opportunity to quickly make decisions, and making a new combination of business elements at critical moments concerning the fate of the company, so that the company will win in the market competition for novelty and persistence.

As for a pile of wood, if used for burning in fires, it is almost worthless; if sold as materials for furniture, it may be worth tens; if made into furniture by a carpenter, it will be worth several hundreds; if it is further collected by an artist or a collector and then sold as a work of art in an auction house, its value will be doubled many times. According to the rules of market economy, there is no other way out but to make conceptual innovations. Slavish imitations of others hardly bear fruit today. Ideas determine the way out, concepts create wealth, and different concepts bring about different results.

It is noteworthy that there is no end to conceptual innovation because the new concepts today may become old ones a few years later.

## **5 Innovation Should Be Moderated**

Almost all the people who fight in the market know very clearly that they must surpass their competitors in terms of business, technology, and even products, in order to lead the trend and gain the upper hand. This principle of "a half step ahead" is frequently heard in business circles.

Theoretically speaking, there is nothing wrong to be ahead in terms of development. But in practice, it is not that easy to determine the extent of being ahead and whether being ahead will give impetus to development. Like in a sports game, the one that runs ahead of the others is just temporarily leading, and he may not be the final winner.

At the end of the last century, the Iridium Program launched in the United States caused a tremendous sensation in the high-tech industry. As a Chinese Long March rocket participated in the launching of several Iridium satellites, the author got the opportunity to know something about this program. From 1987 to 1998, Iridium Communications Inc. had spent over 5 billion dollars launching 66 satellites, and had built a wireless communication network covering every corner of the world, so that mankind for the first time was able to directly communicate with one another without depending on the terrestrial network. Even today, the Iridium satellite constellation is technically leading-edge. But precisely because of its excessively advanced technology, calls made to and from Iridium phones were as high as nearly \$30 per minute, the bulky brick-like handsets were priced up to \$3,000, and territorial maintenance systems and facilities were extremely expensive. The Iridium satellite phone thus was regarded as the noble phone. The competition from other mobile communications providers that provided lower call charges and smarter phones was another major factor in the company's failure. A series of cruel facts dragged the business operation of Iridium satellite into a trough, and ultimately led the Iridium satellite phone network to bankruptcy.

Similarly, in the 1970s, Sony Corporation first developed the home portable video recorder. However, in order to bring its products to market, Sony had to choose one of the two competing technical standards of tape cassettes, namely Beta and VHS. The Beta format was more sophisticated in recording quality, and required small-sized cassettes, thus reducing the size of the video recorder, but a Beta cassette could only record one hour. The only advantage of the VHS format was a longer two-hour recording time. Which one to choose? Sony's technical director said with confidence that as long as they had developed good products with the leading technology, customers would naturally be attracted. Obviously, the "technological" Sony believed that the leading edge in technology would undoubtedly bring success, and therefore chose the Beta format which it considered better. Panasonic, however, formally adopted VHS in 1977. In less than a year, Panasonic gained a 33% market share, the same as Sony's. Sony took this as the biggest humiliation since its founding. The reason is that recording quality as a notion only making sense to experts was beyond the perception abilities of ordinary customers. What consumers cared about most was the recording time. Morita Akio, the founder of Sony Corporation, introspectively remarked: "A video recorder with a two-hour recording time is undoubtedly better than one with a one-hour recording time. The root cause of our failure is the gap between our excessively advanced technology and the market."

It should be noted that Iridium Communications and Sony have learned bitter lessons from the fierce competition in the multi-market where great differences exist between the ideal and the reality, between technology and market, and between the subjective and the objective. If a company relies on only one advantage like technology or quality while lacks the grasp and control of the various elements

of the market economy, and if it cannot combine its products with the market, consumers, environment, and product performance, it will not be able to win in the marketplace and make profits, and it will be trapped in a predicament and finally go bankrupt instead.

Advances in innovation and development should be moderate. The contradiction between advance and moderation will change qualitatively if it cannot be handled properly. How should a company deal with this contradiction to make advances moderate? Actually, it needs to mainly deal with three aspects, the first of which is consumer affordability in terms of consumer psychology and consumer habits. Some products are so fashionable and ahead of market expectations that consumers may not accept them because they are not in line with consumer habits. The second aspect is consumer affordability of the cost. Generally speaking, the more advanced a product is and the more functions it has, the higher it will be priced. If a product is moderately advanced and cost-effective, it can satisfy consumer curiosity at affordable prices. The third aspect is technological sustainability. Advances in development will not be possible without advanced technology. Under normal circumstances, if a company divides technological development into stages of different levels, and finds new ways of doing things from old theories step by step, it will achieve maximum results with little effort.

By examining the lessons learned by our predecessors, we can find that anyone who commits to the theory and practice of advanced development must have the vision and courage to size up the situation and accurately learn himself in the market. Otherwise, haste makes waste, and the hero became a martyr.

## **6 We Should Be Kind to Innovation and Be Adept at Innovating**

Innovation is an everlasting theme of humans, and the fundamental driving force for social development. Innovation is an exploratory journey full of both frustrations and opportunities. Innovators should possess courage, mettle and perseverance all the way, and they may turn all the previous labours to nothing at any moment. Once at a company's year-end summing-up meeting, the technical staff who received handsome bonuses for their achievements in scientific research said emotionally that they would not have achieved such results without the support of their superiors and the tolerance of their co-workers. An entrepreneur said: "Innovation involves an adventurous spirit, and adventure means risks, which may cause failures. Only fearlessness in the face of failure will bring success." It was his words that aroused my sentiment that we should be kind to innovation.

To be realistic, no one wants to fail in innovation, but no one can avoid failure. The American inventor Thomas Edison invented the light bulb after he had carried out 1001 experiments. After having experienced painful failure for countless times, Wright Brothers invented the airplane, and Bell invented the telephone. Kindness to innovation and tolerance of failure will make people steadfast and earnest in their work. If someone is impatient, impetuous, and also eager for quick success, and if he cannot wait to get instant results and feel utterly discomfited in the face of failure, he will ultimately receive the opposite results and get more a loss than gain. Harsh demand for success will trammel innovators and put an pressure on innovation in an invisible manner, causing people to follow the beaten path, hesitate to move forward, and even unscrupulously resort to deception. Science is about taking pragmatic approaches to problems. Science is honest learning, allows not one iota of falsehood and involves hard work. By admitting, allowing, and tolerating failure, we can advocate an innovative and risk-taking value, provide an open and tolerant cultural spirit, and create a peaceful, practical and innovative social atmosphere.

In fact, failure also means a kind of wealth. Many companies and entrepreneurs at all times and in all countries have attributed their success to their tolerance of failure. Each step and leap in the history of human civilization has gone through various kinds of hardships and difficulties. By learning lessons from the numerous failures, humans have succeeded in making progress. As a virtue and a state of mind, tolerance of failure has now become a stress-relieving encouragement to innovators, the best recipe for motivating losers to turn defeat into victory, and a new thinking mode and a new mechanism to encourage and protect innovation as well.

It is no wonder that the president of Johnson & Johnson has treated failure as their most important product. That is because a tolerant environment will expand the room for innovation in an invisible way.

The Dutch-American writer Hendrik Willem van Loon in his immortal masterpiece *Tolerance*, basing on the major events and important figures in Western history, made rational thinking on the importance of the tolerance of society and people. As the result of human rationality's transcendence of human nature, and as the product of the evolution of human civilization, tolerance can effectively eliminate mutual hostility and cool down conflicts, and thus becomes extremely valuable.

However, tolerance of failure does not mean to connive in irresponsible and aimless behaviors, or to act in haste and with indifference. Instead, it means to stimulate people's spirit of challenge and courage to overcome all difficulties, to treat failure as a stepping stone, to always maintain the passion for innovation, and to tirelessly climb to the heights of science.

## 7 Conclusion

Innovation is not like a river without source, or a tree without roots. Innovation is neither a blind and unconscious behavior innovation nor a whimsical notion. Moreover, innovation cannot abandon its nature characteristics separate itself from history, and proceeds without guidelines. It must base itself on a full understanding of things. To fully understand things and find out their laws and relations, innovators must see through the appearance to the essence. In a sense, to be brave to innovate is hard to be good at innovation is much harder. The former is an idea and a spirit while the latter is a kind of ability and a skill. Innovation is the product of the continuous accumulation of theory and practice. We should constantly work over new situations and solve new problems, in order to create more and better innovations that correspond to and promote social and economic development.

# The Brand Operation Based on the Design Management

Zeng Jin

School of Art & Design, Wuhan University of Technology, Wuhan, P.R. China 430070  
(E-mail: cbstudio@163.com)

**Abstract:** Based on the point of the design management, from four aspects, recognition design, brand story, perceptual pursuit, and service design, discusses practice experience that design how to cut and service in brand management. Reached the following conclusion: (a) Successful enterprise and brand innovation is all through the highly strategic image design achieve. (b) Enterprise and the value of the brand once be styling for story, the story was given brand theme.(c) Experience marketing is the ultimate goal for consumers to create integrated experience. (d) The products should be from the perspective of service design consumers and the users of the Touchpoint.

**Key words:** Design management theory; Brand management; Identify design; Brand story; Perceptual appeal; Service design

## 1 Introduction

“Design is a process of consumer satisfaction and company earnings for the optimization. This process is through the creative use product, environment, information and enterprise recognition associated main design elements (efficiency, quality, durability, appearance and cost) to fulfill.” As defined above points out, the designer combine consumers’ demand and enterprises’ goal, and create the right performance, excellent quality, positive aesthetic features, and have effective function on products and services. Obviously, the design is a kind of complexity of interdisciplinary activities. Nowadays, the design uses innovation as the main body to contact with the whole society and become to a multidisciplinary integrated activity of fusion art, technology, management.

“Design is a very important, has enormous potential management resources, like any other management resources, vulnerable to guide and control of wisdom.” Design process need to be effective management, as enterprise activities need to test and control mechanism. Effective design management has become one of the most important elements of enterprises’ success. Design management is the related design activity through formal rigorous program to organize in the enterprise internal, and a process of making design into practice. Or rather, design management is the process of management used in innovation and design process. And because design widely expansion, design management is no longer limited to the interests of the enterprise or create the future management of the enterprise, its significance has expanded to practical field. In short, design management can be understood as a strategic means of innovation, including management methods to establish the enterprise image.

In simple terms, the brand is refers to the special character of the organization, products and services. The concept of brand start from advertising goods, and now is across business and others. The development team, band, charity, and even the urban and country began to think of brand management, its meaning is gradually expanding. The of the so-called brand management, to consumer, it is emphasized and uniform to put forward the behavior “what is the kind of relationship of company or product”, and “what exists for?” Making the design for visual brand, in order to understand the brand’s prospect and the recognition and how to perform strategic. In other words, if the brand is the communications media between enterprise and consumer, design is the important channel between the enterprise and the consumer for depth of dialogue. Design management related brand has absolute effect on the ascension of the brand value. Based on this, researching on the design how to cut and service in the practice of brand marketing has the full meaning.

## 2 Identify Design

Brands have become the standard of consumers’ choice as for those commodities are neither been bought nor been used. The function features are tending to standardizing nowadays, so products need being differentiation to survive in the competition. It has been the most important topic for companies to establish their own exclusive features and keep consistent image or style.

Now design is not just packaging or decorating the appearance, it has already extended to multiple activities including product and environment, the enterprise and the consumer. Enterprises begin to pay close attention to all the elements of visual impact. for commercial identification industry, it will be fully necessary to contact strategic with diversified, especially the recognition design, which is a field to

complete speedy multi-function integration programming. **Balmer** think Business Identity represent the integrity of company or group and the product or service, but Identity Design is to build relevant designs of brand integrity. Today identify design is not just graphic design or brand concept, it tends to develop products directly. This diversified operation is helpful for building consistent brand image and innovation application.

“Design should have the function of the overall and consistency in business communication. The visual image is not only the package and product design but also to introduce consumers the whole process of the products’ effect being extended. From those successful brands such as Dyson, Apple or Stanley toys, we can see that the product design and the brand image has a very close combination.”

In order to lead such a success brand not only leading tide but also being always integrity, trademark or packaging has being regarded as specific elements to perform product itself Brand Identity. Dividing internal organization with strategic and skillfully is the key for brand design and design service. The application and feedback stage before and after the completion of the image design is indispensable. The revision of business image in practical application should be together with reinforcing the management process. The related enterprise engaged in image design should not simply to carry on the design, but to focus more on changing the strategic management of enterprises. Seeing from the current globalization trend, successful enterprise and brand innovation are all achieved through the highly strategic image design.

The so-called differentiation strategy is how to perform the management philosophy of enterprises centered in social and cultural background. We are looking forward to brand information and consulting company with a better understanding of the country, industry and district, which can not only reflect the world trend but also realize the integration of brand strategy and design, and enhance the national design competition finally.

### 3 The Brand Story

Owing to the standardization and generalization of technology, the differences between product function and quality have been narrowed. And the consumers often decide whether to buy or not through invisible spirit rather than tangible technology and function. **Jensen** predicted that the future of the enterprise will pass to provide customers with dreams and the genotype perceptual experience to create value. The global market has witnessed the success of enterprises, such as Apple, Nike, and Ferrari. They plant exclusive designs in their unique interactive experiences with customers and at the same time, make the connotation shared by all the members of the enterprises. In the past, most enterprises would promote all kinds of uses of their product through limited media and reach. Nowadays, enterprises can employ two-way interaction media to convey the brand story and connotation more effectively through customer experience and perceptions.

The story is a major means for human communication. In modern business field, beyond the preexisting story significance, people-oriented value is now playing a growing role in evaluation. **Fog** found that in modern business field based on a modern society dominated by the characteristics of perceptual brand building, let the story happen, highlight its importance, and make the customers enter the story and realize the brand value through interaction. As soon as the enterprise and the value of the brand are contained in the story, the story takes on a brand theme. Tell of the story is not monotonous but joined by the core value of the enterprise and the brand, which aims to strike an impression on customers with brand through an interactive way, and to regenerate within the story. The story may have a “rest” since the consumers might find perceptual resonance with the core value of the brand and enterprise, and their positive attitudes and loyalty to the brand may develop.

**Riel** and **Fombrun** believe that the brand story is itself an advertisement or brochures or other forms of promotion to convey its true purpose, that’s to say, the nature of the enterprise through various media integration. Obviously, customers have access to diversified contact points with the brand, and the brand story enhances the interactive effect. Flagship store transcends the general conception of sale and purchase, and it also provides chances for customers to directly experience the brand connotation. Flagship store can convey enterprise features and uniqueness through various direct experiences, and the brand can differentiate itself through media. In order to avail of flagship store in telling brand story, the enterprise needs to decide a brand positioning, the characteristics and considerations toward enterprise reputation, the value of the brand, even the tone and manner of the shopping guide included. These are necessary elements of the story. Thus, the enterprise can reach to the consumers by unique charm and stand out among many other brands, boasting experience of distinctions, rather than pure functional

competition. And this makes brand development becomes possible.

#### 4 The Perceptual Appeal

After the 21st century, society quickly changed from mainly attaching importance to the products producers to brand creation and consumer experience of the orientation of the consumer environment. Consumers didn't focus the functions of products but to pay more attention to consumer experience. Consumers spending, are more likely to seek for meeting perceptual Desire consumption, rather than functional Needs. In order to meet their needs, consumer now expects to understand their brand culture and life style through the design of perceptual experience, .

**Marc Gobe** thinks, "The designs of perceptual brand lies in consumers' personal and objective perspective. They need to have a strong connection with the brand, which gives credibility and personality to the brand. The ultimate goal for consumers marketing of experience is to create integrated experience." According to the consumer sensibility understanding of the requirements, to realize the brand and the consumer "perceptual connection" between the brand designs, that is the enterprise survival strategy, but also the most effective method to improve the market share.

In addition, now the consumer thinks, enterprise not only has the obligations for employees as employers, they should also be to implement their social responsibility, and has led the prospects of the social advancement and leadership. When enterprise accord with these conditions, consumers will give brand reputation, the performance of trust and loyalty. **Fombrun** think, in various elements for forming the reputation of the enterprise, perceptual appeal is the most important one. To judge the reputation of the enterprise, the biggest factor for the consumer is the past experience according to the evaluation by the personal feeling. In use of the products, firstly consumers experience the part of the beauty and significance, thus create perceptual experience, with the intervention of subjective judgment. Enterprise should be realized the importance of consumer perception experience, through the appropriate catalysis, and guide the positive feelings for the consumer, and then set up a good brand image and value cognition.

The building is able to provide the perceptual experience space; the building is able to provide the perceptual experience space, through the variety of space design, it provides differentiation image of the buildings, plays the important role that tracts consumers' positive emotions. Now in so fierce economic competition, according to various elements of the image consumers will evaluate enterprise, the enterprise should not stay in narrow sense of brand management that is related to the enterprise image. **MIT** architecture professor **Anna Kelinmann** pointed out that, for economic and cultural evolution, it can use the building to be strategic communication medium to do the concept of performance brand. Especially the automobile industry, in this industry, technology and enterprise image is in the difference and reliability is very important. The car is not just a pure product; it is the perceptual and the integration of the sales experience. Making building space into experience, the representative enterprise is Mercedes-Benz. Located in Stuttgart, Germany Mercedes museum, it makes the history of the enterprise as the center, and shows the company's core model. In the museum, there are exhibition cars, it gets rid of the pure display the identity of the products, it is considered to be the cultural and scientific development of axis, so that visitors can know the history of Mercedes-Benz. Mercedes museum architecture's internal and external form, bearing the brand culture and history of the cars, and using the interactive display to experience the perceptual content, from different senses level will "the enterprise leading the auto history is Benz", so rich memory in the visitors heart imprints, greatly enriched the brand image experience.

#### 5 Sustainable Design Services

As technology and social development's compound development, the products should choose the perspective of service design to cut consumers and the users' Touchpoint. Service design, that is, through the design promote service provider (Enterprise) and services (Customer) beneficiaries' communication, the ultimate goal is to create value through the communication with customers. Britain's representative service industry **Engine Group** said: "service design is the definition of opportunity of the service and characters, through the Touchpoint offers service experience to customers. In order to be sustainability, the focus should be on developing enterprise organization system and procedure of things."

Service design is the foundation of modern innovative tools' concept evolution. Technology high speed development, product cycle short, consumer orientation and consumption environment change,

under the guidance of these requirements, providing the appropriate products and service is the successful way of enterprise and brand. "How good Products and services is, how strong brand is, it still need good operation system to support. In order to provide better service to customers, it should have the right resources to fit the market, customers, designers, manufacture industry, and also have the answer system." Dell is the best example set up a good brand through Mass Customisation. This user generated strategy, it not only the customer get diversity products, but also make the enterprise reduce the financial burden, improve the price competitiveness; Promoting relations between the enterprise and customers, and also to improve the customer brand loyalty.

Sustainability and Green Design is considered to be synonymous time has past now enterprise's pursuit is Sustainability, including with social, environmental and economic integration vision, guiding design products, space or service. People expect enterprise in addition to obey the law, also have the morality, rational to promote society's harmonious development. Enterprise should consider including reducing costs, protecting the environment, improving local quality of life, and many other aspects, from this can keep a more intimate and stable relations with consumers. so as to achieve long-term goals and value.

Stylist should have their own responsibility between producers and consumers must give value to their position and role. The designer should take responsibility to the environment consciously. In order to promote the social and economic values and interests, they should have a more profound understanding of the concepts and make it into practice actively. In the Design, through the so-called Design Review regular meeting, collecting all field experts, as far as possible to exchange ideas and research the sustainability of products.

## 6 Conclusion

(1) Successful enterprise and brand innovation is all through the highly strategic image design achieve.

(2) Enterprise and the value of the brand once be styling for story, the story was given brand theme.

(3) Experience marketing is the ultimate goal for consumers to create integrated experience.

(4) The products should be from the perspective of service design consumers and the users of the Touchpoint.

# The Analysis of the Policies on Service Innovation in Service-Oriented Enterprise

Zhang Shaojun

Nanjing University of the Arts, Nanjing P.R.China,210013

(E-mail:nyzsj@yahoo.com.cn)

**Abstract:** The service sector is a significant part of the national economy, the level of development of the service industry is an important symbol to measure the degree of social economic life in modern society. For service enterprises, service innovation is an important source to push forward the development of enterprises. Combined with the current development of our national service enterprises, we believe that we should raise our awareness to strengthen organisational leadership and co-ordination, and implement various incentive policies to promote innovation, creating an innovative environment to nurture innovation objects, giving full play to the linking role in production and spreading, enlarging international and regional exchange and cooperation and activating the enterprise innovation ability ,in order to promote the innovation of China's service-oriented business services.

**Keywords:** Service sector; Service innovation; Countermeasures

## 1 Introduction

The service sector is the fastest growing industries in the world economy. At present, in some developed countries, the service industry has accounted for about 55 percent of the gross domestic product and few countries even reached 75% or more. With the rapid speed, the service sector and its production far beyond the average level of growth of the service sector. In 2007, On Accelerating the Development of Services (issued by state [2007] 7) pointed out “the service industry is an important part of the national economy, and the level of the service sector is an important symbol of the degree of modern social life and economy.”CPC Central Committee and State Council has always attached great importance to the development of the service industry and formulated a series of policies to encourage and support the service industry with remarkable achievements.

The new service format constantly hastens the service sector. In China, the new formats are emerging services directly spawned by technological progress, among them, the rise and development of the mobile Internet is the notable example. The mobile Internet integrates the characteristics both of the mobile communication network and Internet and there are some new services derived from it, including mobile advertising, mobile payment, mobile positioning, and mobile streaming media. Because of some new technologies, especially the continuous integration and penetration of IT and traditional industries, there are many rising service with new technologies and new patterns based on traditional services ,for example, web publishing relying on the Internet to provide publishing services, tele medicine providing long-distance medical treatment , teleeducation for long-distance education, e-commerce for shopping and transaction service and environmental protection services by using energy conservation and clean technologies.

The development of service industries shows the geographical trend. Geographical trend of China's service industry is mainly distributed in the Yangtze River Delta, Pearl River Delta, etc. In 2011, the added value of 16 cities in the Yangtze River Delta is up to 3.8144 trillion, reaching 46.5% of GDP. Among 16 cities, 11 cities in total value added to more than 100 billion. In July 2011, the Jiangsu provincial party committee, the provincial government also specifically introduced On to Further Expedite the Development of Modern Service Industry, to illustrate the general ideas of the development of modern service industry in five years, after 2011. “The Reform and Development Plan of Pearl River Delta of China (2008-2020) requires the Pearl River Delta to build a modern industrial system, giving priority to the main industry group linking modern service industry to advanced manufacturing, forming the high-class industrial structure, industry agglomeration and high-end modern industrial system of the industrial competitiveness. In 2011, in Pearl River Delta, the added value in services throughout the year is up to 2.380846 trillion, accounting for 45.2% of GDP. In accordance with the Plan, by 2012, the proportion of value added in services in the Pearl River Delta will reach 53%, and the index is up to 60% by 2020.

In the process of development of service industries, a number of innovative demonstration enterprises have emerged. In July 2011, the Ministry of Science and Technology released the "12th

Five-Year "Science and Technology Development Plan in China", proposed to expedite the implementation of the support of scientific and technological innovation of the modern service industry and technological innovation, the development of knowledge and technology-intensive service industries, to build a support system connected technological innovation in service industry with the development of industries, which will vigorously promote China's innovation capability of modern service industry. On October 26, 2011, the Ministry of Science and Technology issued one file titled the Notice- First Batch of Modern Service Industry Innovation and Development of model enterprise .It indicates that, in accordance with the Notice - on the Recommendation of Demonstration Enterprises Involved Modern Service Industry Innovation and Development, the Ministry of Science and Technology has identified 49 companies for the first batch of model enterprise in modern service industry ,with the recommendation from the local technology sector. and the experts .

## **2 The Problems of Service-Oriented Enterprise Service Innovation**

For service businesses, continuous service innovation capability is the important driving force to promote enterprise move forward. However, at present, China's service sector enterprises to innovate still exist many problems.

The lack of innovative talent. Many factors affect the development of modern service industry. Among which plenty of creative talent supply are basic conditions. The so-called creative talent is those that have excellent quality, outstanding intellect, and strong will, those that are with a strong sense of innovation and creative spirit, are familiar with the principle of innovation, master innovative approaches and make the performance of innovation in their own innovative thinking and innovative labor in a variety of social practice. But China's service sector enterprises are most lacking the kind of innovative talent at present. The scarcity of Innovative talent results in high dependence of foreign technology. It is difficult to form enterprises' characteristics, which causes a vicious cycle at last.

The lack of innovation in the service-oriented enterprise. Innovation ability determines whether a company has its own place in the highly competitive market and relates to the direct economic benefit and the success or failure of the company. Service innovation is not only the most powerful engine in the company future development but also the core competitiveness of the company. According to a more consistent international view, enterprises whose enterprise research funds account for one percent of the sales are difficult to survive, whose for two percent barely maintain, whose for five percent have a strong competitiveness. But research and development that the majority of service-oriented enterprises in our country put into service innovation are far below the level of developed countries in the world. Services that those enterprises provide are imitated, so the core technology still lies in the hands of imitated large enterprises at home and abroad. Because of a lack of core technologies, services homogenization problem is serious. Therefore, peers have nothing but to compete through the price war.

There is international cooperation on service innovation of service-oriented enterprise. The most prominent manifestation in the Internet age is the increasing international cooperation of innovation in the technological globalization. On one hand, due to the assembling of all mankind wisdom is needed to solve the common problems faced by all mankind and to explore the major issues in the nature; we centralize the huge investment of resources. On the other hand, every country has also recognized that the decisive factor in supporting a country's international competitiveness is to enhance the ability of technological innovation and it has become an inevitable choice for the government and enterprises to join the tide of world science and technology and master the cutting-edge dynamic through international technical cooperation. But as to Chinese service-oriented enterprises, international cooperation is not much during the process of technological innovation by now, neither the national policy guidelines nor the specific practice guide

The infrastructure construction in service-oriented enterprise service innovation is not quite good, especially not having formed a public service platform on service innovation of Produce, Academia and Research. The combination of the three is the core of enterprises' technological innovation also a shortcut to speed up the development of technological innovation. During the process of developing the service industry, focusing on the cooperation of principle parts on various resources, including the collaboration of government, research institutions and universities, which also equips industrial extension ability, and then a complete industrial chain can be formed. From global perspective, the United States, Germany and other countries have achieved great success in the cooperation of produce, academia and research; especially made a significant contribution in promoting national development of SMEs. But in the field of technological innovation of service-oriented enterprises in China, a

foundational, public welfare and opened technological innovation service platform of produce, academia and research has not being universally formed

### 3 Conclusions

We should raise awareness and strengthen organisational leadership and co-ordination. Combing the characteristics of regional economic development, every region should establish the service industry development center or industry management office as soon as possible assuming the duties of development plan, layout adjustments, policy making and coordination of management functions of service industry in the regional economy so as to effectively speed up the development of service industries. Every province should make policies to promote innovation in the service sector: The government should strengthen the exchange of industrial enterprises, service industries and research institutions, establish the tripartite Economic Forum of political, business, academia, strive to explore the problems of economy integration, growth pattern change in service sector, listen to the needs and views of all parties and collaborate the ideological and pace of various parties. Government should coordinate the relationship between service and industrial sectors and strengthen the leadership, define goals and tasks in relevant departments. The government should quantify the medium and long term goals of service industry development gradually, master the specific goals to be completed each year so as to implement the task with decomposition, responsibilities distinction and annual test. The Government should further transform its functions by strengthening macro-control over service industry, making industrial and technological policies and encouraged independent innovation policy measures to create a favorable external environment.

We should implement and promote various incentive policies of innovation, creating an innovative environment. Services should be driven towards healthy and fast track of development. Relevant policies of services development need to be constantly improved within the region. Through the implementation of other incentive policies to prompt the service enterprises to become the main innovation about tax and financial, we should encourage and guide service enterprises to have independent innovation and ensure legitimate interests and good operation of the main services. We need to do the following

- 1) incent service enterprises to implement the policy of innovation and tax cuts
- 2) promote the implementation of government procurement of self-dependent innovation
- 3) encourage the police implementation of manufacturing companies to use the service initiatives
- 4) speed up the rule files' promulgation of intellectual property in service industry.

We should nurture innovation main body and play the role linking the production to dissemination. Service enterprises is the main body of innovation and plays a critical part in connecting with the production and spreading of knowledge .And, to a large extent, the capability and level of innovation in service enterprises have a impact the ability of other innovative subjects in the region. In order to enhance the innovative capacity of the service enterprises, we must make them become real subjects of innovations. Therefore, we should promote service enterprises to gather strength, capital, talent and a variety of innovative elements, making it grow into the main body of decision-making, investment, interests, risk –sharing and regulation of investment efficiency.

We should enhance the serving capabilities and serving performance of service enterprises and we should expand exchanges and cooperation of international and regional business and activate the innovation capability of enterprises. The government has set up a platform to enhance exchanges of domestic counterparts and international peers in service sector and boost close cooperation between universities and research institutions. Our government should support our services enterprises to "go abroad", expand exports of high technology and its products and encourage and support service companies to set up overseas research and development institutions or industrialized base. Increase the efforts for attracting investment and further expand opening up. To expand financing channels by exchange property rights for capital, stock for increment, resources for technology and market for projects. To actively seek World Bank's low interest rate, interest-free loans, fight for listing more projects in state's plan and provincial plan and get national and provincial policy support. The same time, to comprehensively improve the innovation capability of China's service industry our government should set a clear standard in attracting capital and investment and focus on bringing in key developing fields, emerging industries and fields of weakness through transformation, upgrading and driving by leading enterprises. Under the circumstance that the international competitiveness of service industry in China is still relatively weak, while attracting capital and investment, we should take full advantage of

preferential policies for developing countries who assume the obligation in the General Agreement on Trade in Services. First opening up superior branches in service industry, while implement protective policies on weak branches, adhere to the principle of equality, mutual-benefit and progressive liberalization. To promote international development of service industry step by step with limit and focus, China is supposed to make medium and long-term opening up plans to develop various industries.

# Analysis on Management Organization and Regulation Establishment of Postgraduate Instruction

Sha Chengyu

School of Graduate, Wuhan University of Technology, Wuhan, P.R.China,430070

(E-mail:1262056251@qq.com)

**Abstract:** With the increasing demand of postgraduate education in China, management organization and regulation establishment of it has become more and more significant. On the basis of analyzing the current situation and existing problems of management organization and regulation establishment of postgraduate education in China, the paper gives some suggestions, including improving the recruitment and education mechanism of postgraduates, perfecting the selecting ways of tutors and college work, improving the development planning of postgraduate education and construction of tutor team, as well as improving its management system of postgraduate education.

**Key Words:** Postgraduate Education; Management Organization; Management System Game theory

## 1 Introduction

Currently, with the quick development of national economy, people's living standard is continuously improving and the demand for higher education, especially that of postgraduate education is also increasing. Meanwhile, the quality of postgraduate education draws more attention. The management organization and regulation establishment in postgraduate education is the core to guarantee the quality. The cultivation and management of postgraduates, including school organization, system establishment, scientific research, talents development and material construction, is an essential part of university planning. Perfect management organization and regulation establishment is the important means to guarantee postgraduates' quality, push university planning and intensify the quality.

The internal management organization of graduates in present China is the three-level management of the university (graduate school), school and department<sup>[1]</sup>. The graduate education has developed to a new stage rapidly and stably. However, not all the universities and colleges have formed perfect management pattern and operation system. Thus, how to reasonably set up management organization with the principle of capacity, efficiency and optimization as well as how to coordinate and cooperate within two-level or three-level management organization with the principle of the unified position, right and obligation to push the management of postgraduates to perfection and standardization has become an important topic. From the perspectives of management organization and regulation establishment of postgraduate, this paper proposes the related suggestions and counter-measures.

## 2 Present Situation and Problems of Graduate Education

### 2.1 The status quo of management organization and regulation establishment

#### 1)The status quo of graduate management organization
